Offline detention basins incorporated hydraulic structures which would by-pass the lower portion of the storm hydrograph and intercept flow during the critical point of the hydrograph to maximize the attenuation. The proposed structures incorporate some form of side-weir or lateral spillway section. The detailed evaluation of the hydraulics associated with the side-weir was not performed at this engineering level since it involves a spatially varied flow problem because of the variable flow and depth along the weir crest.

8.3 Low-level Outlet Requirements

The low-level outlet for the detention basins will provide the controlled release rate and the sizing of the facility is dictated by the required peak attenuation from the reservoir. The hydraulics associated with the outlet works is a critical component which determines the operation of the detention basin and the effectiveness in attenuating the peak flow rate. The preliminary design of the outlet for the basin involved an optimization process to select the most effective outlet configuration based upon achieving the maximum attenuation within the physical constraints of the basin.

The low-level or primary outlet intake configuration would consist of a staged concrete outlet similar to other VCFCD regional detention basin installations. The intake tower would require (1) low-flow riser to prevent debris and sediment from entering the facility and (2) a trash rack at higher stages or elevations. Access to the intake tower would be from an elevated catwalk or footbridge. The intake tower would be connected to an independent outflow pipe system through the dam embankment to the downstream toe of the dam. Selection of the outflow pipe is designed so that the hydraulics of the pipe should be independent of the intake structure.

8.4 Hydrologic Routing Approach and Methodology

The evaluation of the storm hydrograph movement through a detention basin is performed through a reservoir routing analysis. Hydrologic routing using modified puls method was applied through VCHYDRO. The final simulation of the reservoir routing was performed in VCHYDRO combined with VCRAT in order to accurately compare the regional watershed impacts. Modified Puls method requires developing the stage-storage and stage-outflow relationships from known information on the basin geometry and outlet condition. Conceptual layout of the basins was prepared in order to develop these rating curves to provide the storage-indication relationship for reservoir routing.

8.4.1 Basin Stage-Storage Relationships

Stage-storage relationships for each basin configuration were determined based upon preliminary grading concepts prepared for each of the basins. The minimum basin floor elevation was either determined from (1) maximum height of the required debris storage for sediment, or (2) lowest elevation which would still provide a gravity outlet. Stage-storage volume relationship for each basin site were derived as a discrete function or series of points. The surface area of each contour interval was

determine, with the storage in any increment Δh equal to the product of the average area and the depth of the increment.

8.4.2 Basin Inflow/Outflow Characteristics

The outlet works associated with each basin configuration influenced the hydraulic operation of the controlled release downstream of the basin. The hydraulics of the outlet structures were assumed to be operating as inlet control which facilitated development of outlet rating curves for the facilities. The design of the connecting outlet pipe to the outlet tower will be developed to ensure that the tailwater does not influence the outlet structure.

The only basin which the stage-discharge relationship was developed for a different outlet configuration was the Gabbert Canyon Basin. The hydraulics for the outlet structure of this basin utilized a "two-staged covered riser" for the by-pass inlet system. The hydraulics for the 96-inch diameter riser were analyzed utilizing the procedures developed by the SCS (1965). The results of the rating curve for this riser configuration are provided in the following table.

Table No. 8.4 - Proposed Gabbert Basin Operational Rating Table
Upstream Debris Basin

Q_{in} (cfs.)	Water Surf. Elev (ft.)	Basin Vol (ac-ft)	Bypass Chnl. 96" RCP Q_{out} (cfs)	Emergency Outlet Q_{out} (cfs)	Total Q_{out} (cfs)

9 Alternative Drainage Systems Investigated

9.1 Development of Alternative Drainage "Systems"

In the original study, **alternative drainage "systems"** were investigated which represented a composite or combination of various feasible conveyance and storage elements which would achieve equivalent levels of improved flood protection within the main channel system. The effect of regional drainage improvements must be evaluated on a watershed basis or application of a "systems" approach.

Formulation of the alternatives relied on an initial planning process which screened the feasibility of numerous alternatives that were considered. This included evaluation of an "all-channelization" alternative since this provided a benchmark with relationship to the maximum amount of channel improvements and construction costs to gauge of systems which were developed. The different combinations of alternatives were developed in order to evaluate most economic combination of channel reconstruction and detention basin implementation. There is a delicate balance between attempting to preserve the maximum amount of existing channel improvements through construction of stormwater storage facilities and reconstruction of these facilities. The multiple alternatives investigation attempted to define the most economic system for all systems. In addition, the most effective system with regards to providing the maximum storage, or minimum required land acquisition, or minimum capital improvement costs were all investigated to facilitate the selection process of the recommended system.

9.2 Comparison of Alternative System Features

The essential features associated with the Original Selected Alternative-B drainage system and the Revised Alternate-B drainage system are summarized in *Table No. 9.1 - Summary Description of Alternative Channel Systems*. In addition, watershed schematics and watershed facility layouts have been prepared for all eight alternative drainage systems. All the system plans provide the same level of flood protection through different combinations of features. Some general descriptive comparisons of the various drainage systems can be developed which assist in understanding operation requirements and potential impacts.

Table 9.1 - Summary Description of Alternatives

Alt. No.	Gabbert Basin Modification	Additional Detention Basins	Gabbert Channel Reaches	Walnut Channel Reaches	Diversion Channel System	Channel Outlet Relocation
B	Improved to 145 AF Detention Storage	0,1,2,3 (V_{total} = 145 AF)	2	2	300 cfs	Walnut
B-Revised	Improved to 145 AF Detention Storage	0,1,2,3 (V_{total} = 295 AF)	2	2	100cfs in-channel Bypass	Walnut

9.3 Alternative No. B

9.3.1 System Description: (Least Total Costs Alternative)

This alternate proposes to relocate only Walnut Canyon Channel to a new outlet at the Arroyo Simi and maintain the existing Gabbert Canyon Channel outlet in its current configuration. This proposed system would result in parallel channels on either side of the Smith-Holst Ranch which flow to the Arroyo Simi. The relocated Walnut Canyon Channel outlet system from Arroyo Simi to Los Angeles is approximately 3,000 feet and consist of an earthen channel with rock rip-rap side slopes. The channel is designed with velocities less than 8 fps without influence of backwater. The earthen channel is consistent with the landuse planning for this property. An additional flow diversion is proposed in Walnut Canyon Channel near Shasta Avenue which would divert the initial 300 cfs in the channel directly to the Arroyo Simi. The diversion system would consist of a 14-foot wide underground box section that is 3,035 feet in total length. A flowrate of 300 cfs represents the maximum possible flow diversion based upon the conveyance system and the limiting physical constraints. The limiting physical constraint is the corridor which is available at the existing utility crossing and storm drain system. A 48-inch storm drain at Los Angeles Avenue would join the diversion and was accounted in the hydraulics. An off-line detention basin is required at the diversion location which would provide 70 acre-feet of storage with a release rate of 9 cfs. In addition, the Gabbert debris basin will be modified to provide 145 acre-feet of storage with a separate debris basin which has a debris capacity of 53 acre-feet. Three on-line detention basins are required along the Walnut Canyon Channel or its tributaries which would provide a total storage volume of 140 acre-feet. Gabbert Canyon Channel would be reconstructed from the Walnut Canyon Channel confluence upstream to the existing debris basin. Approximately 1,900 lineal feet of Walnut Canyon Channel would be reconstructed downstream of High Street from the confluence of Moorpark Drain No.1.

Storage Elements

- *Improved Gabbert detention basin 145 acre-feet storage*
- *New Gabbert debris basin*
- *3 online and 1 offline detention basin (total storage 140 acre-feet) Basins 0,1,2,3*

Conveyance Elements

- *Gabbert Canyon Channel improvement to reach 2 (total length = 913 feet)*
- *Walnut Canyon Channel improvements to reaches 2 and part of 3 (total length = 1,900 feet)*
- *300 cfs underground diversion channel adjacent to Shasta Avenue (length=3,035)*
- *Relocated Channel outlet to Arroyo Simi for Walnut Canyon Channel*

Estimated R.O.M Costs: Total costs of the alternative is $13,294,000 of which construction capital costs are $10,550,000 and land acquisition is $2,744,000.

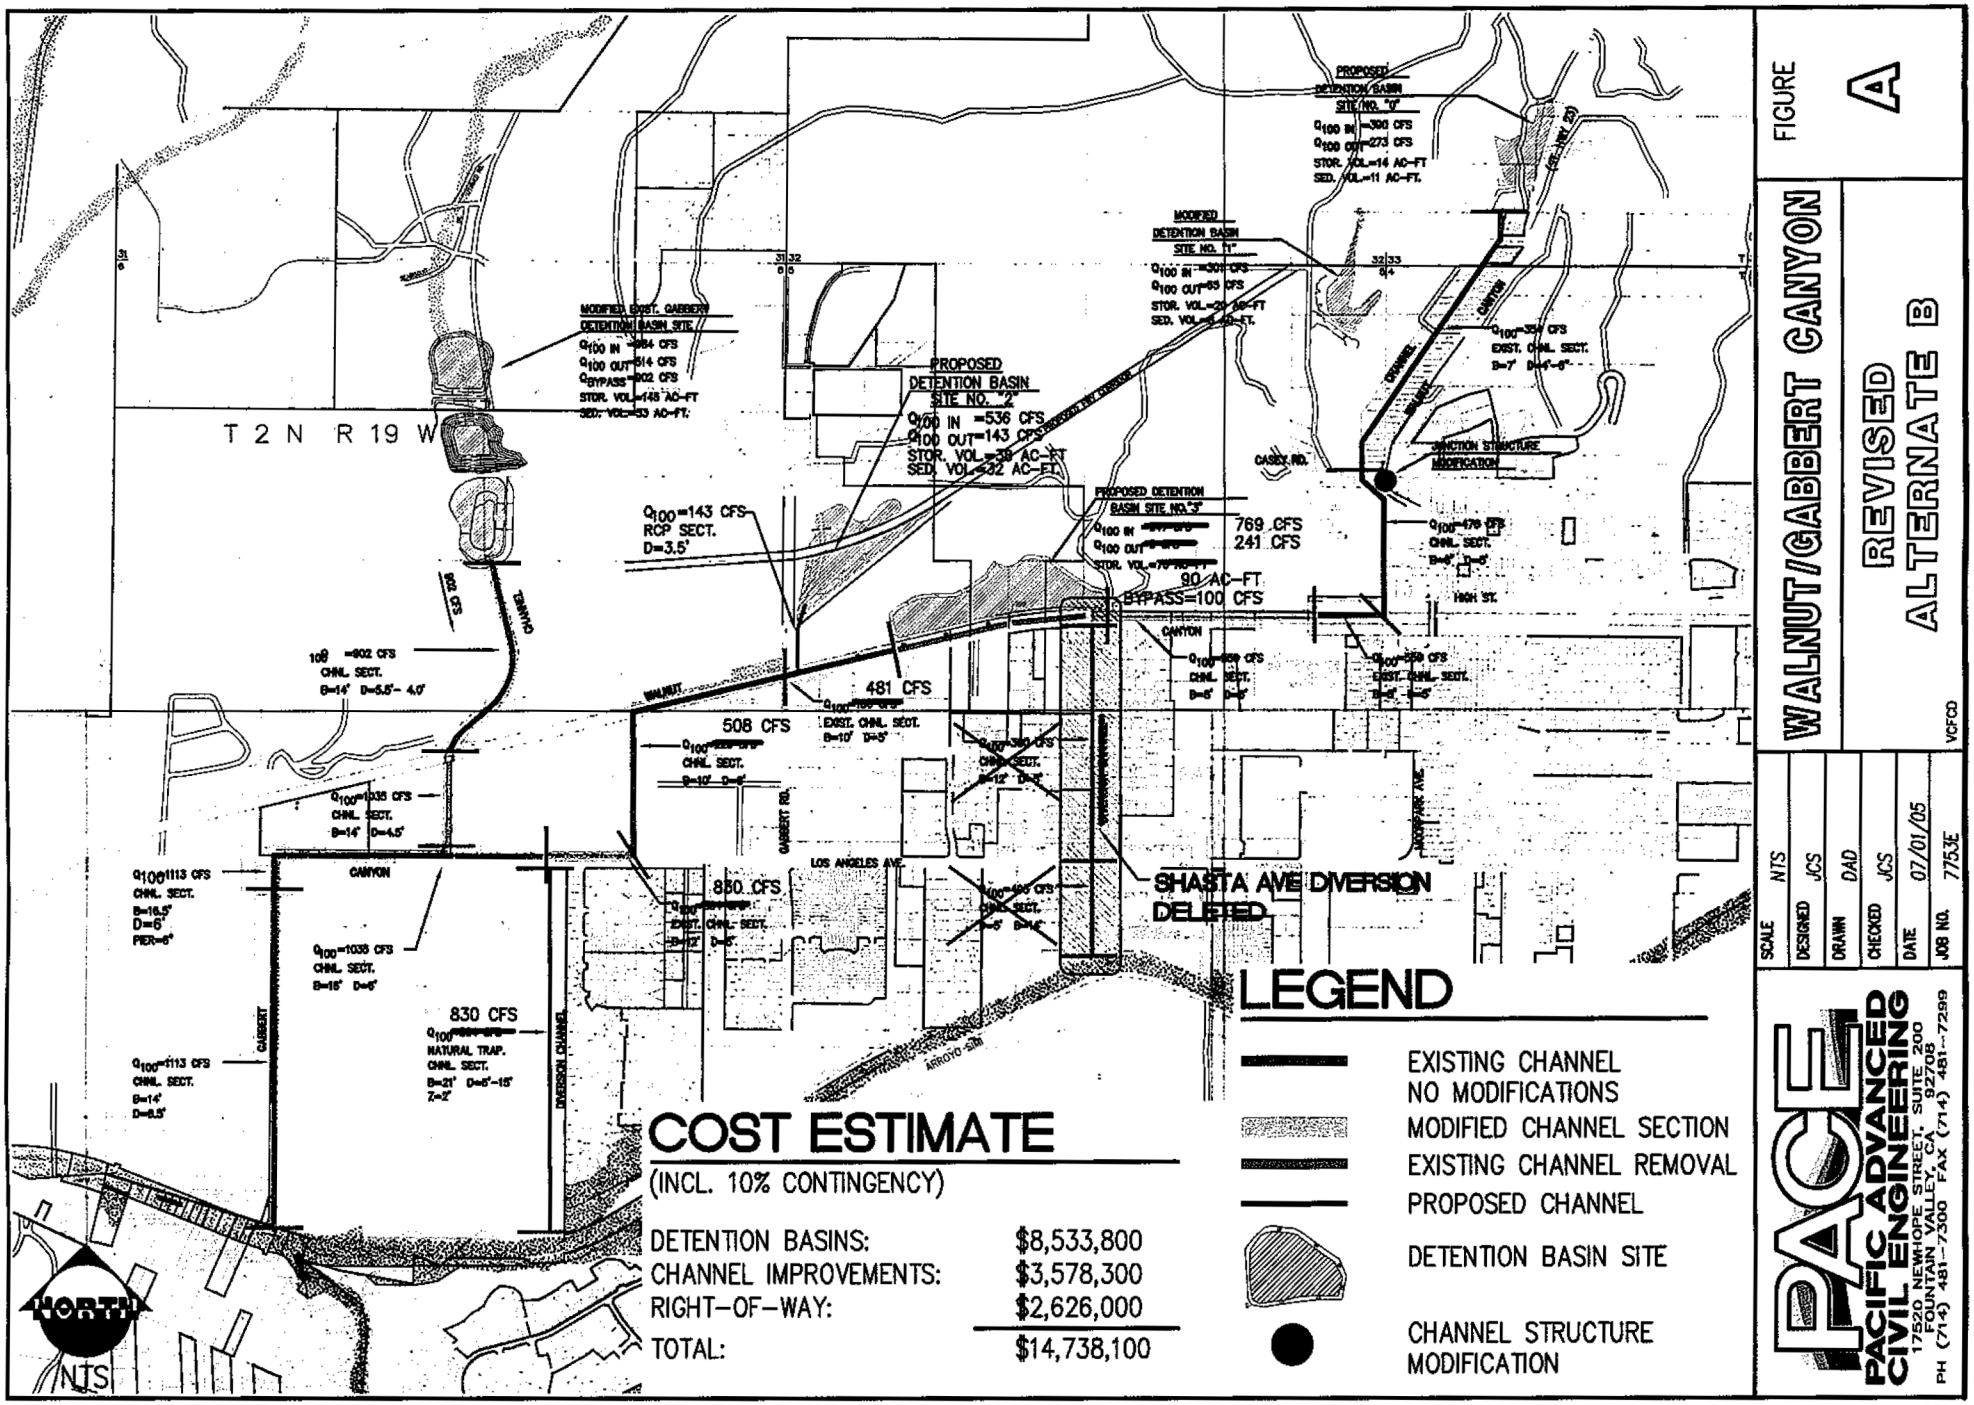
Property Acquisition: Required total amount of right-of-way is 51.2 acres, which includes 6.5 acres for channel relocation, 42.5 acres for detention basins, and 2.2 acres for diversion systems

9.4 Alternative No. B-Revised

9.4.1 System Description: (Least Total Costs Alternative with Modification)

This alternate proposes to relocate only Walnut Canyon Channel to a new outlet at the Arroyo Simi and maintain the existing Gabbert Canyon Channel outlet in its current configuration. This proposed system would result in parallel channels on either side of the Smith-Holst Ranch which flow to the Arroyo Simi. The relocated Walnut Canyon Channel outlet system from Arroyo Simi to Los Angeles is approximately 3,000 feet and consist of an earthen channel with rock rip-rap side slopes. The channel is designed with velocities less than 8 fps without influence of backwater. The earthen channel is consistent with the landuse planning for this property. An in channel detention basin bypass is proposed in Walnut Canyon Channel near Shasta Avenue which would bypass up to 100 cfs in the channel downstream in the Walnut Canyon channel. The bypass system would consist of a in channel side weir structure. A flowrate of 100 cfs represents the maximum effective flow bypass based upon the conveyance system and the cost benefit comparison. An off-line detention basin (basin-3) is required at the bypass location which would provide 90 acre-feet of storage with a release rate of 241 cfs. In addition, the Gabbert debris basin will be modified to provide 145 acre-feet of storage with a separate debris basin which has a debris capacity of 53 acre-feet. Three on-line detention basins are required along the Walnut Canyon Channel or its tributaries which would provide a total storage volume of 160 acre-feet. Gabbert Canyon Channel would be reconstructed from the Walnut Canyon Channel confluence upstream to the existing debris basin. Approximately 1,900 lineal feet of Walnut Canyon Channel would be reconstructed downstream of High Street from the confluence of Moorpark Drain No.1.

Storage Elements



- *Improved Gabbert detention basin 145 acre-feet storage*
- *New Gabbert debris basin*
- *3 online and 1 offline detention basin (total storage 160 acre-feet) Basins 0,1,2,3*

Conveyance Elements

- *Gabbert Canyon Channel improvement to reach 2 (total length = 913 feet)*
- *Walnut Canyon Channel improvements to reaches 2, 3 and part of 4 (total length = 2,600 feet)*
- *100 cfs in-channel bypass*
- *Relocated Channel outlet to Arroyo Simi for Walnut Canyon Channel*

Estimated R.O.M Costs: Total costs of the alternative is $13,637,000 of which construction capital costs are $11,011,000 and land acquisition is $2,626,00.

Property Acquisition: Required total amount of right-of-way is 49.0 acres, which includes 6.5 acres for channel relocation, and 42.5 acres for detention basins.

10 Estimated Construction Costs

10.1 Standard Construction Elements

The various drainage facilities are composed of standard features that are common elements of the facilities and were included in developing the construction costs estimates. Standard features for the channel reconstruction include the concrete rectangular channel section, channel fencing, and adjacent access roads. The channel reconstruction always required removal and disposal of the existing concrete channel lining. The detention basins include perimeter roads, access ramps, slope and erosion treatment, spillway, outlet tower, and energy dissipators. In addition, if the detention basin volume was based upon an embankment, then this included clearing and grubbing, foundation excavation and preparation, and embankment construction. For purposes of comparison the unit costs for the revised recommended alternative are the same as the unit costs used in the original study in 1997.

10.2 Unit Construction Costs

Construction cost estimates were generated for each of the drainage system alternatives in order to provide an economic comparison of the systems. Standard unit prices for flood control facilities were applied in the preparation construction cost estimates based upon previous regional drainage projects and similar estimates at this level of detail. The costs presented in this study are based upon 1997 dollars and reflect the total capital costs to construct the facilities based upon the current planning level of detail associated with the concept plan. A 20% contingency factor has been applied to provide an allowance for potentially intangible or unknown construction items that cannot be determined at this time. An additional 10% factor was applied for mobilization, engineering, and administration. Consideration was given to the existence of major utilities (see *Section 7.3 Utilities*) in the layout and alignment of the proposed facilities, however, not costs of relocation or special relocation costs have been applied since it would depend on specific location of the facilities. The standard unit costs which were used in the estimate are summarized in the following table

Table No. 10.1 - Construction Unit Cost Database

Item Description	Unit	Price
Excavation - Basin Embankment Foundation	c.y.	$5
Embankment Compacted Fill	c.y.	$6
Channel Excavation	c.y.	$5
Reinforcing Steel	lb.	$0.55
Structural Concrete	c.y.	$650
CMB Access Roadway	c.y.	$40

Table No. 10.1 - Construction Unit Cost Database		
Item Description	Unit	Price
½ ton Rock Rip-Rap	c.y.	$45
Concrete Removal	c.y.	$100
Outlet Riser	l.f.	$400
Channel Excavation	c.y.	$5
Clear and Grub	ac.	$500
Reinforced Concrete Pipe	ft -inch diameter	$3

Table No. 10.2 - Summary of Estimated R/W Costs (Per VCFCD)	
Location Description	Price
Diversion System	$53,600/acre
Upper Walnut Basin	$53,600/acre
Diversion Channel	$53,600/acre
Gabbert Basin Expansion	$53,600/acre

Note-this cost is based upon the 1997 preliminary estimate of R/W acquisition costs of $25,000 per acre and was adjusted for inflation of 10% per year for 8-years for a total increase of 114% to reflect an updated cost more indicative of the current real estate value escalation.

10.3 Preliminary Estimate of Construction Quantities and Costs

Generally four primary types of costs are associated with the implementation of the regional drainage system. These costs include (1) right-of-way or land acquisition, (2) construction or capital costs, (3) engineering and administrative costs, and (4) contingencies. If public financing is used such as bonds or assessment district then these additional costs should be applied. The quantities associated with for the various system elements such as channel reconstruction or detention basins are based upon preliminary design and layout of these facilities. Exhibits illustrating the conceptual design of the facilities have been included and were the basis for preparing the quantity estimates.

A detailed breakdown of the costs for specific design elements which include the detention basin alternatives, Gabbert Detention Basin, outlet channel relocation, and diversion

systems are presented in the following tables. A more detailed breakdown of the cost estimates for the individual system alternatives is provided in the *Technical Appendix.*

10.3.1 Comparison of Alternative System Capital Costs

A summary of the major cost elements is provided in *Table 10.3 - Summary of Alternative Systems Construction Costs.* The table provides useful comparisons between the various components of the drainage systems. A total is also provided with and without right-of-way costs. The summary of the total indicates that Alternative "B" has the lowest overall total costs. The construction cost estimates have been updated to reflect the 2005 estimation of costs. The California Construction Cost Index (CCI) developed and published by the State of California reflects the escalation of construction costs month to month since 1995. The CCI is based upon the Building Cost Index (BCI) cost indices produced by Engineering News Record (ENR). The CCCI for March 1997 was 3488 and the CCCI for June 2005 is 4421. Therefore, taking a ration of the indexes yields a construction cost escalation of 26.75% from March 1997 to June 2005. A factor of 1.2675 has been applied to the construction costs as estimated in March 1997 to yield a 2005 estimate of construction costs.

Table No. 10.3 - Summary of Alternative Systems Construction Costs
(Cost in thousand of dollars)

Alt	Detention Basins			Divert Chann	Walnut Chann	Gabbert Chann	Outlet Chann	Capital Cost Subtotal	R/W	**Total Costs**
	0,1,2	3,4,5	Gabbert (Alt. B)							
B	$1,768	$744	$3,179	$2,872	$167	$378	$1,442	**$10,550***	$2,744	**$13,294**
B-Rev.	$1,768	$2,811	$3,179	$0	$531	$378	$2,344	**$11,011****	$2,626	**$13,637**

* - note this cost is based upon the March 1997 preliminary estimate of construction and was adjusted to reflect the escalation of construction costs since March 1997 to June 2005. The basis of the escalation is the California Construction Cost Index developed by the State of California using the Building Cost Index (BCI) cost indices produced by Engineering News Record (ENR).

** - note this cost is based upon the 2005 preliminary estimate of construction costs.

11 Financing

11.1 Financing Methods Available

The financing of public facilities by local agencies have a variety of financing mechanisms available to fund the infrastructure costs. Many methods cannot be used by private organizations or individuals, but offer great flexibility to public agencies. The two major categories of public work funding include **pay-as-you go** financing and **debt** financing (pay-as-you-use). Pay-as-you-go financing requires governments to pay for infrastructure costs directly from current revenues. These programs for pay-as-you-go include: creation of special assessment district, levying special property taxes, creating a special district, impact fees from new developments, grants or aid from the State and Federal government. Debt financing requires local governments to tap credit markets and raise funds through the issuance of dept obligations. The use of debt financing involves various type of financing tools which include: short term notes, unlimited tax general obligation bonds, limited tax general obligation bonds, and revenue bonds. Another type of financing is **pay-as-you-need** which is defined as a form of pay-as-you-go, which involves impact fees or assessments to support loan or bond payments. In this form of financing, payments collected vary depending upon the benefit received. The benefit in this case is not necessarily one of need, but rather one of forecasted or predicted need based upon potential flood damage. Assessment must be apportioned upon any basis which will reasonably measure these benefits. The advantage of this method is that only users benefiting from the improvements need to pay for them. The following table outlines some of the most common California laws used as authority for levying special assessments which are available and their applicability according to the elements in the implementation of the recommended project. **However, recent passage of Proposition 218 may influence the ability for the public agency to levee rates/charges, or establish fees to support the financing for construction, operation, and maintenance of public facilities.** The costs for long term maintenance and monitoring may be a consideration in the selection of the financing mechanism, since many of the procedures do not include maintenance, but only consider capital construction.

Table No. 11.1 - Project Related Allowable Uses of Assessment Laws

Description of Act	Drainage	Flood Control
Improvement Act of 1911	Capital	Capital
Municipal Improvement Act of 1913	Capital	Capital
Benefit Assessment Act of 1982	Capital & Maintenance	Capital & Maintenance
Mello-Roos Community Facilities Act of 1982	Capital & Maintenance	Capital
Improvement Bond Act of 1915	Capital	Capital
Map Act Areas of Benefit	Capital	------

** The table reflects the associated allowable uses based upon the specifics of each Act. The table indicates uses for either *Capital Improvements* or *Capital Improvements and the Operation and Maintenance* of the facility.

Stormwater Utility Fees is a utility approach to financing public drainage facilities. Stormwater utilities are public utilities that are financed by dedicated user charges. User charges for an individual property are based on the contribution of the property to the total volume of stormwater that must be managed. A general approach to developing a utility rate structure involves estimation of a charge per "equivalent runoff unit" (ERU) and then estimating the charge per parcel. In some areas the charge to the parcel is increased if located in a floodplain and the charge can be reduced if on-site detention is provided as part of the development.

Exactions is the practice of requiring developers to provide certain physical facilities is one of the most important and well established means of financing infrastructure. In California subdivision exactions are worth over five times as much as all development-related fees and assessments, and now account for nearly half of the annual public capital formation in the state. Provisions with the State of California Subdivision Map Act include certain sections which provide for the dedication of land related to drainage systems. Section 66478.1 ensures that local agencies must require public easement along banks of rivers and streams and Section 66479 allows local ordinances to require that property be reserved for certain public facilities. There are certain requirements which must be satisfied by the public agencies in order to impose land reservations by local ordinance and the primary issues include: (1) the requirement of land reservation be based upon adopted specific plan or general plan, (2) the amount of land reserved will not make the development of the remaining land economically unfeasible.

Drainage Fee Assessment Programs are possible through state legislation which enables the implementation of a drainage fee program by a public agency. Section 66483, Division 2 of Title 7 of the State of California Government Code (Subdivision Map Act), as amended January 1, 1994, allows the creation of ordinances which require payment of fees for the purposes of defraying costs of constructing planned drainage facilities. Some of the specific requirements associated with the creation of a drainage fee program include the following:

- An ordinance must be adopted to require the payment of a drainage fee as a condition of approval of final subdivision maps.
- The ordinance must particularly refer to a drainage plan adopted for specific areas.
- Prepare a drainage plan which includes (1) a map of the drainage area or areas showing the boundaries and locations, type and size of planned drainage facilities, and (2)an estimate of construction costs of the drainage facilities for each area.
- The government entity must adopt the drainage plan with a finding by resolution that the development of property within the planned drainage areas will require construction of the described drainage facilities, and a finding that the fees proposed are fairly apportioned on the basis of wither the benefits of, or the need for, drainage facilities created by proposed development

- A "Planned Drainage Facilities Fund" is created for the various drainage area and funds are maintained separately. The basic source of funds are drainage fees collected on a per-acre basis.

VCFCD Land Development Fee This fee was initially established in 1967 at $400 per acres and is updated annually based on the Engineering New Record Construction Cost Index for the Los Angeles Area. The VCFCD policy indicates that these monies can be utilized three ways, preferably to finance construction of VCFCD *red line* facilities, which include: (1) financing of improvements within a city, (2) finance construction outside the city that will be of benefit to the city, and (3) use all or part of the "local share" money required to finance federally funded construction.

Two popular financing mechanisms which have been primarily utilized to development special assessment districts based upon the benefit from public improvements are the Mello-Roos Community Facilities Act of 1982 and the Municipal Improvement Act of 1913/1915. The Mello-Roos Community Facilities Act of 1982 was enacted as an alternative method for local governments to provide facilities to serve their communities. It provides an alternative to making dedication and paying in-lieu fees as the method of satisfying requirements to provide certain public capital facilities and services. While not a true assessment, the "special tax" upon land offered by this Act provides a financing tool that is treated in part like an assessment.

The **Mello-Roos Act** allows the formation of "community facilities districts" in specified areas within their jurisdictions. A community facilities district is a special financing entity through which a local government is empowered to levy special taxes and issue bonds authorized by a **two-thirds vote** of the qualified elector of such district. In areas with less than twelve registered voters, the qualified electors are the landowners. Prior to initiation of proceeding to form a community facilities district, the developer may be required to enter into an agreement with the Issuer which will set out term under which the legislative body of the Issuer will form the community facilities district. Usually the developer will be required to advance all costs incurred by the public agency to form the community facilities district. The costs may include estimated engineering, planning, inspection, and administrative costs and expenses. These costs will be repaid to the developer from bond proceeds. Generally, with the cooperation of all parties involved, the proceedings to form a community facilities district may be completed and bond proceeds received in **five to six months** after the proceeding are initiated.

The **Municipal Improvement Act of 1913/1915**, currently the most frequently used Assessment Act in California, allowed local agencies to impose assessment on benefited property to finance the construction of various public improvements, the acquisition of real property rights, and the maintenance and repair of improvements constructed with this Act.

Another funding mechanism which specifically focuses on flood control projects is the **Benefit Assessment Act of 1982**. This Act authorizes local agencies to impose assessments on benefited property to finance the operation and maintenance of drainage,

flood control services, and the installation and improvement of drainage and flood control facilities. In the case of an assessment for flood control services, the Act provides that the benefit may be determined on the basis of the proportionate storm water runoff from each parcel.
Special assessment districts are a common funding program using a convenient designation for properties that receive a special benefit and are subject to the special assessment. The special assessment is designed to recover the costs of an improvement that directly benefits an individual property and these assessment are based on formulas that relate the charge against a parcel to the benefits. The capital is generated for the construction of the improvements through the sale of general obligation bonds.

Tax Increment Financing (TIF) uses increases in property values attributed to a capital project to recover the project's costs. Under this approach, a special tax increment district is created by the adoption of a plan for development of the infrastructure of a particular geographic area. Although the use of tax increment financing in rural area is not uncommon, this method is usually used to finance redevelopment in deteriorated areas characterized by declining property values.

A more detailed description of the process associated with the 1913/1915 Act have been provided, however, most of the other special assessment acts previously indicated follow similar procedures. Logic diagrams have been developed for the Special Assessment District and the Mello-Roos Community Facilities District proceedings which graphically illustrate the process for the major elements associated with each funding mechanism (See Exhibit 58 - Special Assessment District Flow Chart, and Exhibit 59 - Mello-Roos CFD Flow Chart). The general process for the 1915 Act when used in conjunction with the 1913 Act are generally as follows:

- The public agency adopts the Resolution to order the improvement, briefly describing the proposed improvement, specify the exterior boundaries of the assessment district, providing for issuance of improvement bonds, declaring its intention to levy assessments to maintain, repair or improve the facility.

- The agency directs preparation of an *Engineers Report* which contains: plans and specifications of the proposed improvements, description of lands and easements to be acquired, an estimate of the cost of the improvement and costs of lands and easements. The report is filed with the public agency. A preliminary approval is adopted and a public hearing is set for not less than thirty days after passage of the resolution. Bids for the construction of the improvements and sale of the bonds can be called for before the hearing. The notice inviting construction bids must be first published at least fourteen day days before the date set for receipt of the bids.

- Prior to public hearing on the assessment district the public agency shall adopt a resolution describing the boundaries of the district. Notice of adoption of the resolution and of the public hearing are published and posted at least twenty days prior to date set for the public hearing.

printing, trustee/paying agent, letter of credit or insurance premium, and other miscellaneous costs.

The determination of the funding for the maintenance of these facilities is important during the initial development of the special assessment district since many procedures do not allow maintenance costs to be included. An example is general obligation bonds are generally issued by public entities only for the purpose of acquisition and construction and may not be used to finance ongoing maintenance and operation costs. Additional limitations may be provided by the statutes of the local agencies and these should be investigated during the initial planning process.

11.2 Financing Issues and Policy Considerations

Several issues must be considered when evaluating public financing and these include (1) allocation of costs by benefit, (2) economic feasibility, (3) County policies, and (4) specific types of charges and implementation measures. Assessment fees can either be distributed based upon actual benefits received from implementation of the drainage improvement or based upon considering the negative impacts which result from development of property. The most obvious benefit received from construction of drainage improvements is the reduction or elimination of potential flood damage which could occur to property. The problem with assessing specific benefits is that of determining the value of an individual property is difficult and subjective. The "negative impact basis" is based on the concept that the charges to a parcel should be based on the contribution to the problem of flooding and proportional cost of a system designed to alleviate that problem. This is a superior approach both on the basis of reasonableness as well as simplicity in determining assessment.

An important aspect to consider in setting fees is legal constraints and statutory restriction on impact fees and assessments. Statutes (Section 66483 of the California State Government Code) governing the assessment of fees and charges to cover both operation and improvement or construction of new facilities state that "...fees should be reasonable, fair and equitable..." or "...fees should be fairly apportioned...on the basis of benefits conferred on the property..." Other restrictions limit charges on individual properties to a prorata basis according to the acreage, and limit charges to cover only the cost of facilities which are not in existence at the adoption of any master plan for the area.

Another key element is the economic feasibility of development-related financing based upon the relationships of the financial burden to the underlying land values. If the burden is large, relative to land value for a particular use, the that use may be rendered uneconomic.

11.3 Allocation of Financial Burden to Land Uses

Establishes a fee structure within the watershed requires that the infrastructure costs outlined for the proposed drainage system be apportioned by some fair and reasonable method. In addition there must be a **nexus** to establish an assessment which provides a relationship between the land and the proposed infrastructure improvements. A Dwelling Unit Equivalent (DUE) can be utilized to determine the relative responsibility of an acre of land in each landuse category compared to an acre of land in the single family residential category. Generally the DUE procedure are based on a "causes or uses" test : the cost of the drainage facilities are sized to accommodate the peak runoff were allocated in proportion to the extent to which each land use category contributes to the peak runoff amount. Application of a DUE cost schedule provides the basis for a valid development impact fee.

11.4 Selection of the Financing Technique

The decision regarding the financing method depends on several considerations which include: (1) cash flow, (2) landowner preferences, (3) adopted county policy. The time at which a particular drainage improvement must be implemented is compared to the amount of development impact fees that would have been collected up to that time. If the total collections are adequate or if an imbalance can be corrected over relatively few years, then impact fees are useable. It has been increasingly common in California for a comprehensive financing plan to include a mix of development impact fees and bonded debt. Bonded debt, is authorized to pay for those major improvements that are required immediately to implement the master plan of drainage. Development impact fees are used to pay for improvements that can be staged over the planning period.

Impact fees would appear to be most effective and simplest form of financing. Impact fees may be charged at the time the property is subdivided, at the time building permits are issued or a combination of both. If these drainage facilities are to be implemented prior to the development occurring in the upper watershed then some form of debt financing must be considered and drainage fees can be used to repay the debt. Exactions in the form of land reservations for stormwater storage detention basins or additional channel right-of-way will fulfill the land requirements in order to implement the drainage systems.

12 Revised Recommended Drainage System

12.1 Recommended System Components

Based upon the costs and feasibility of implementation, drainage system **Alternative "B"** was selected as the least-cost alternative and was the recommended alternative. The updated Rough Order Magnitude (R.O.M.) costs for this system include $10,550,000 in capital construction costs and $2,744,000 for land acquisition, which totaled an estimated R.O.M. cost of **$13,294,000**. The **"Revised-Alternative-B"** has an estimated R.O.M. cost of $11,011,000 in capital construction costs and $2,626,000 for land acquisition, which totaled an estimated R.O.M. cost of **$13,637,000**. The total right-of-way required for this alternative is approximately 34.5 acres. The different project alternatives were developed with the goal of achieving a balance achieving the flood protection goal and providing the most economic solution. The primary system components associated Alternative "B" include: (1) reconstruction of Gabbert Debris Basin to provide detention storage through modification of the existing basin and construction of another storage reservoir upstream as well as a separate debris basin at the headworks which will provide 145 acre-feet of flood control storage and 53 acre-feet of debris storage, (2) a 14 acre-foot detention basin at the headworks to the Walnut Canyon Channel, (3) a 20 acre-foot detention basin at the location of an existing reservoir site in a tributary canyon at Casey Road, (4) a 36 acre-foot detention basin located in the tributary canyon adjacent to Gabbert Road, (5) constructing a 100-cfs in-channel basin bypass system from Walnut Canyon Channel, (6) relocation of the channel outlet for Walnut Canyon Channel along 3,000 feet of earthen trapezoidal channel from Los Angeles Avenue to the Arroyo Simi, (7) reconstruction of the Gabbert Canyon Channel from the debris basin to Los Angeles Avenue, and (8) construction of an 90 acre-foot off-line detention basin at the in-channel bypass location on Walnut Canyon Channel. There is the potential for additional alternatives to be evaluated through refinement of the proposed system. The storage capacity within the Gabbert Canyon detention basin can be further optimized if a portion of the storage is utilized in the proposed upstream debris basin. Further study of the grading design and relative elevations of the interconnected ponds will assist in refining the hydraulic operation for the basin. However, the current analysis provides a conservative evaluation of the system while maximizing the flood control benefits.

Recommended Detention Requirements for Future Development Projects

General recommendations and guidelines are provided for future private development projects to ensure that hydrologic impacts are mitigated. The objective of this program attempts to maintain the existing hydrology on a watershed basis similar to current conditions studied as part of this investigation. The proposed Hitch Ranch development hydrologic impacts have been accommodated in the proposed detention basins located on their property. A drainage ordinance should be implemented on a watershed basis which outlines the specific requirements that can be used in planning the development projects. General guidelines include the following:

1. The peak outflow from one or more detention basins within a development project area under fully developed conditions should not exceed 90 percent of the peak flow under the existing pre-development conditions for **all storm frequencies up to and including the 100-year frequency** and a single storm duration of up to 24-hours.

2. Follow the requirements outlined by VCFCD for detention basin design.

3. Provide an ungated outlet large enough to permit the complete draining of each basin within 24 hours following a storm.

4. Multi-use detention basins are acceptable and encouraged, including meeting the stormwater quality requirements for the project.

5. The regional effect of the local development project detention basin on the watershed must be evaluated to ensure that it does not have a negative effect on downstream flowrates in the main channel. The potential for increasing the peak flowrate at other downstream locations within the watershed must be avoided in the design of the basin.

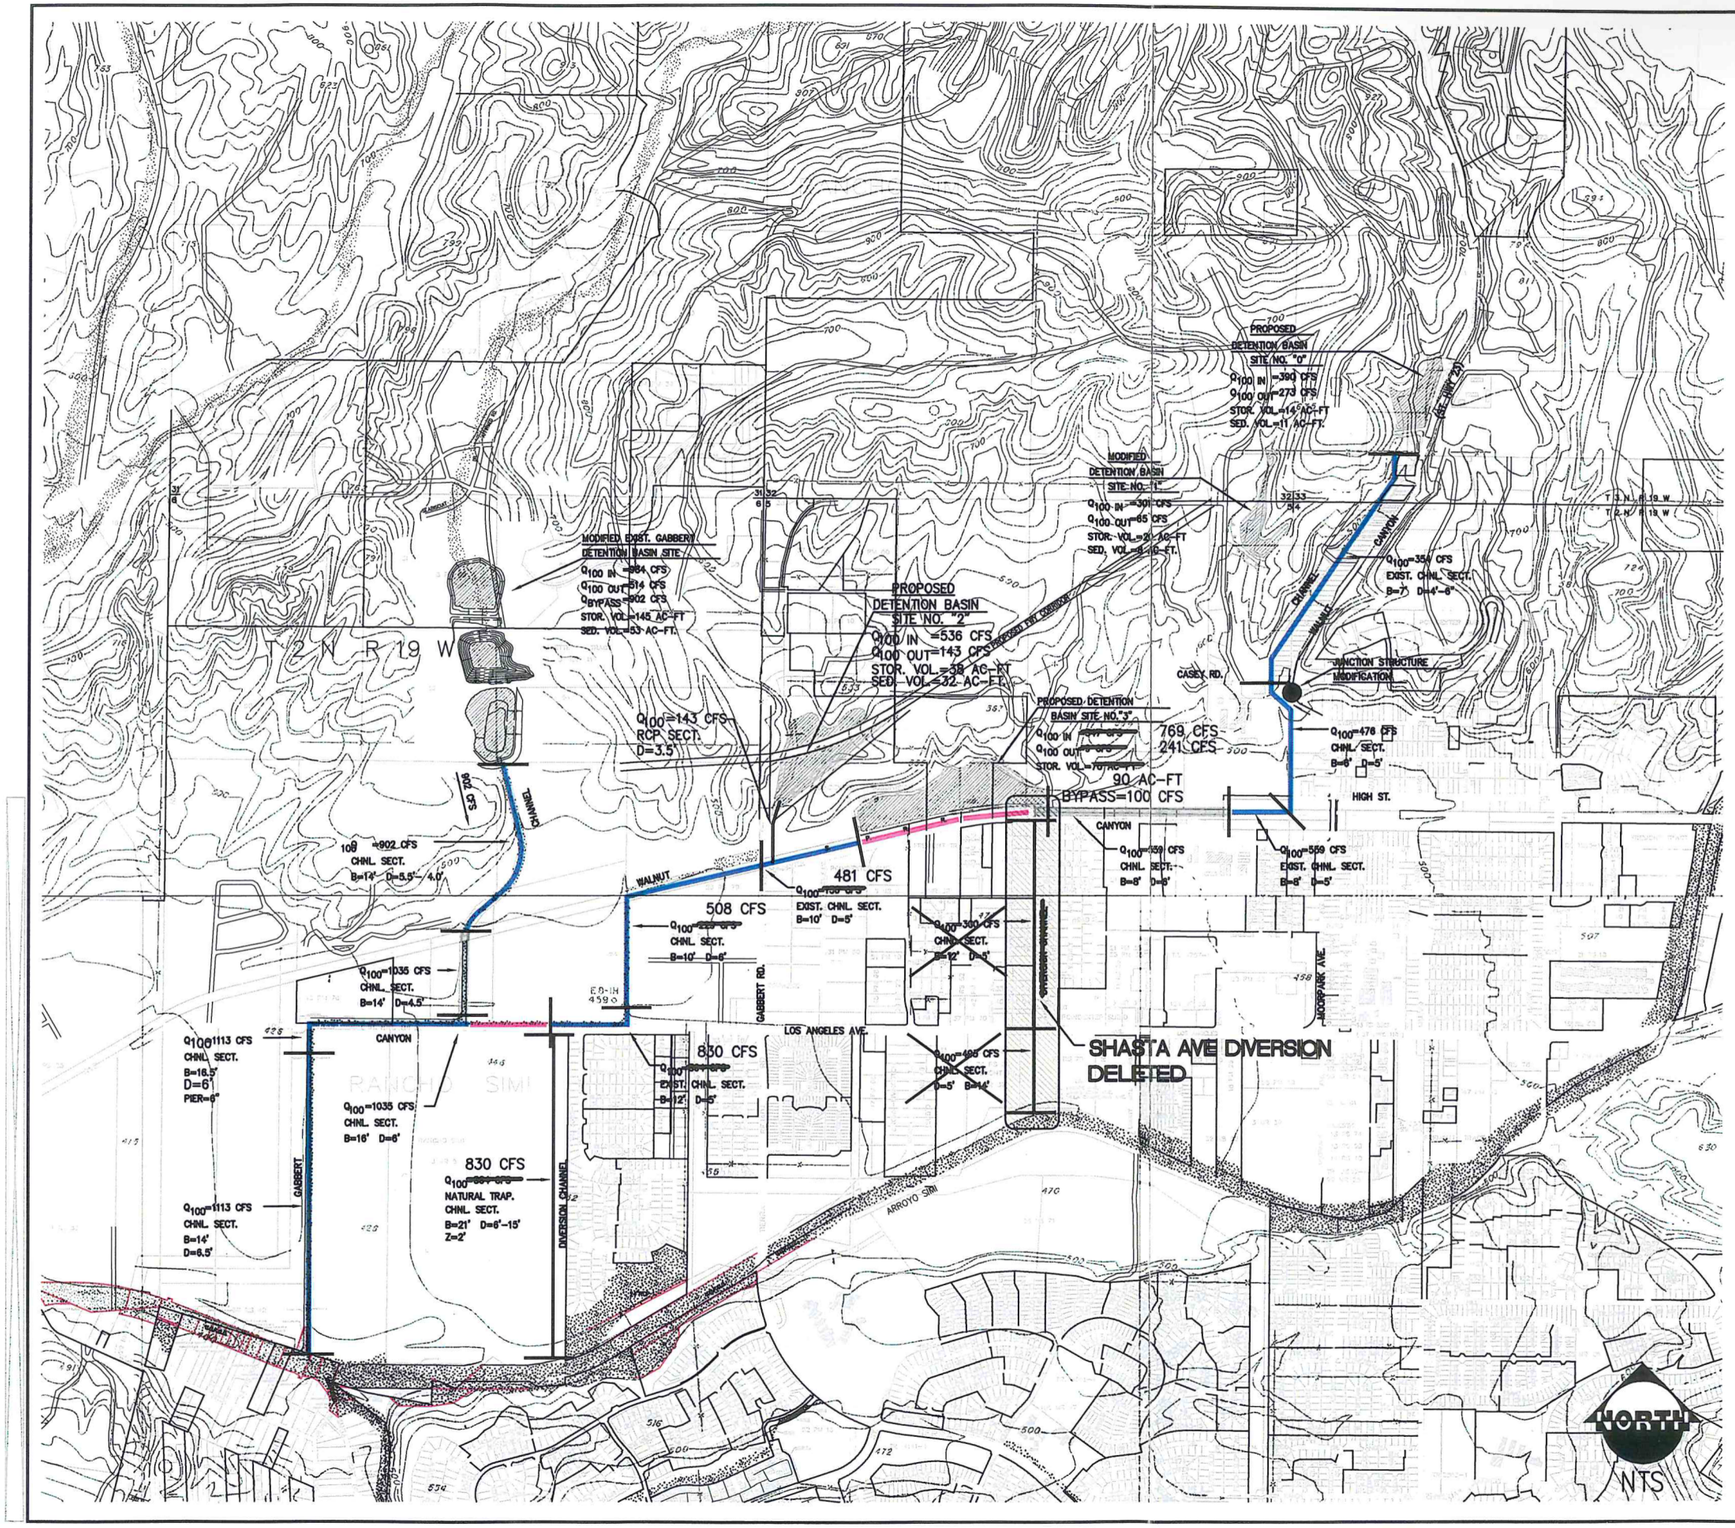
In addition, it may be appropriate to consider utilizing a 10-year storm frequency for the design on the on-site storm drain systems within the developments rather than a 50-year frequency adopted by the City. The 10-year design frequency is consistent with the current VCFCD guidelines and provides conveyance of the 10-year storms but residence are still protected from the 100-year in order to satisfy FEMA requirements. The effect of changing the design frequency allows the ability to take advantage of local storage within the streets during large peak storm events and minimizing the impact on the flood control system with reduced efficiency of the local storm drain.

12.1.1 Operation and Maintenance

Implementation of the recommended watershed drainage system improvements will generally result in higher annual maintenance costs primarily associated with the addition of the detention basins. The basins will require the periodic removal of sediment trapped to maintain the require minimum flood control storage volume. Long term development within the upper portions of the watershed will result in reducing the sediment production and in turn lowering some of the maintenance costs. The relocated outlet for Walnut Canyon will require maintenance since the proposed section is an earthen trapezoidal section with rock rip-rap side slopes. The total overall amount of channel does not increase from the length that VCFCD currently maintains, however, detention/debris basins are a significant feature requiring additional maintenance. Additional typical maintenance requirements associated with detention basins include: (1) periodic inspection, (2) weed removal, (3) debris /sediment removal, (4) rodent control, (5) vector (mosquito abatement) control, (6) outlet structure and spillway inspection or repair for cracking, movement, seepage, and piping, and (7) inspection or repair of embankment and slopes for seepage, piping, and instability.

There are a variety of elements which will be incorporated into the flood control improvements to facilitate maintaining and provide access to the drainage facilities. Many of these items are standard features for flood control facilities.

Top-of-Bank Maintenance Roads: Maintenance roads would follow the standards outlined by VCFCD for their facilities. The roads would be either six inches of CMB or 3 inches of asphalt over 6 inches of CMB.



Maintenance Road Turnout: The VCFCD maintenance staff has design requirements regarding turnouts at specified interval of long sections of channel maintenance roads. These turnout are generally double wide maintenance road locations which allow passing for vehicles or temporary parking.

Vehicle Turnarounds: Areas to allow maintenance vehicles to turn-around at locations where the maintenance or road dead-ends without access to a major thoroughfare. The turn-around areas would generally consist of an unencumbered 50 foot square area.

Basin Access Ramps and Perimeter Roads: Direct access for maintenance vehicles to the detention or debris basin locations and the ability for heavy equipment to clean out the basin floor, also accessing the basin outlet works.

12.2 Summary

The hydraulic analysis of the existing Walnut and Gabbert Canyon Channel systems has confirmed that in its present condition that it does not meet the desired level of flood protection and there are hydraulic deficiencies which would cause flooding. Further development of this watershed without restrictions to limit the hydrologic impacts will worsen the condition. In order to alleviate the existing flood hazard potential it is recommended that the drainage system be improved to the extent necessary to provide the desired flood protection. The recommended improvement program outlined in this regional drainage system master plan have been formulated and evaluated on a watershed basis, but it must be implemented on a local basis.

13 Walnut Canyon Watershed Hydrology – Technical Discussion

13.1 Proposed Condition Watershed

This study utilized the Ventura County Rational Method (VCRAT) and (VCHYDRO) hydrology models prepared in the original study for the adopted Watershed Masterplan; Alternative-B. The watershed model utilized the land uses indicated in the 1996 area masterplan, which is the same land use indicated in the original study, as well as the RBF study. The soil types represented in the use hydrology models are consistent with the 1969 Ventura County Flood Control District (VCFCD) hydrology manual Moorpark Hydrologic Map, Plate B-10. The Walnut Canyon channel watershed lies entirely within rainfall Zone-A. This study investigated the 100-yr frequency storm event using the precipitation patterns indicated in the VCFCD precipitation data file VCRAIN.

13.2 VCRAT Hydrograph Fattening

The proposed basin will have two (2) inflow sources; one to be located at the northwesterly extent, and the other at the south easterly extent. Therefore, in the hydrology model the concentration 35ab is a confluence point for two streams; streams A and B. The shape of the unit hydrographs developed using the modified rational method do not necessarily generate the correct effective runoff volume or net rainfall since the cumulative mass rainfall curves are averaged. The expected runoff yield based upon local point or isohyetal rainfall data compared to the computed runoff yield from the modified rational hydrograph will typically need to be adjusted to provide the same effective rainfall. This process is known as "fattening" and the adjustment results in modification to the shape of the calculated runoff hydrograph so the area under the hydrograph provides the desired effective or net rainfall. The correct amount of direct runoff volume is a critical factor for the storage routing analysis of detention basins and this required that the inflow hydrographs to detention basins generated from VCRAT were "fattened" prior to routing. The inflow hydrograph for stream-B, located at the north westerly extent of the basin was fattened using a watershed yield factor of 3.2-inches. The yield factor was calculated using the Soil Conservation Service (SCS) method for calculating storm yield (see Table-2.2.1). However, no hydrograph fattening was performed upon the inflow hydrograph for stream-A at the proposed detention basin location. There are two (2) proposed detention basins (Basin-0 and Basin-1) that will be upstream of this proposed basin, Detention Basin No. 3. The inflow hydrograph to each of the upstream basins was fattened at the respective inflow points. So, no additional fattening was performed on stream-A at this location.

Table – 2.2.1 - 100-yr Runoff Volume Calculation *Based on SCS Procedure for Calculating Effective Runoff Volume*						
Sub-watershed	**Area (acres)**	**VC Soil Type**	**SCS Soil Type**	**CN - Pervious Portion**	**Fraction of Imperviousness**	**Weighted CN**
32B	27	2	C	74	0.03	74.7

34B	29	5	B	61	0.03	62.1

Total Area =	**104**	**Composite CN =**	**65.4**
		S =	**5.3**
		50-yr, 24-hr Precipitation, P(in.) =	**6.4**
		100-yr, 24-hr Precipitation, P(in.) =	**7.1**
		Runoff Volume, Q(in.) =	**3.2**

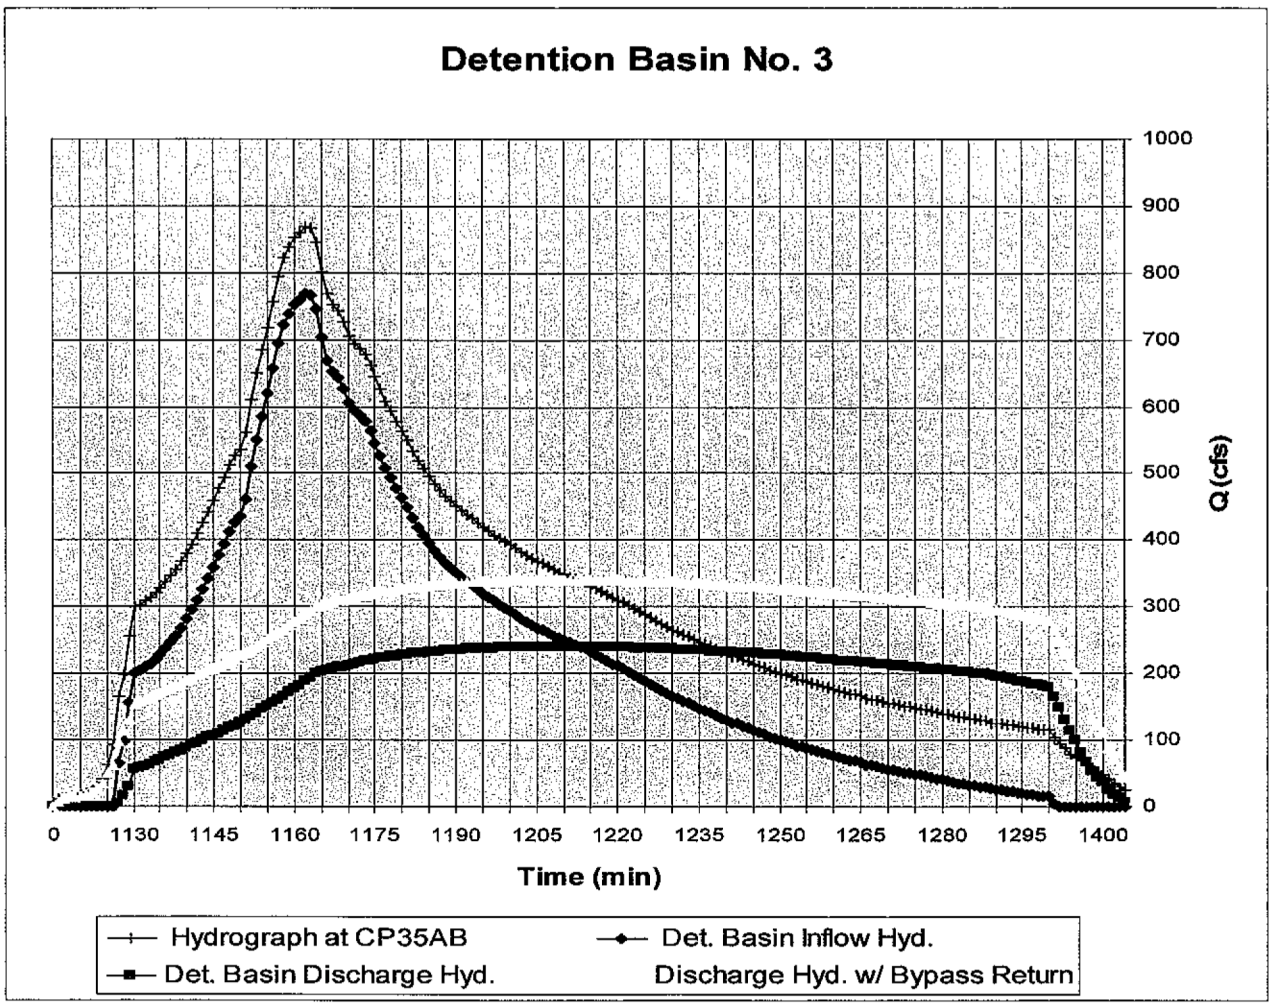
13.3 VCRAT Hydrograph Area Reduction

As the watershed area increases in size, the area-averaged point rainfall values used in the design storm pattern should be adjusted so that the volume of rainfall of the area is accurately represented by the point rainfall characteristics. As the spatial extent of the storm increase, the depth of rainfall decreases. The reduction is made using a depth-area adjustment factor when selecting point rainfall to apply uniformly over the watershed. The modified rational procedure is calculating runoff hydrographs for the individual subareas with the rainfall associated with the smaller drainage area. A larger watershed composed of numerous interconnected subarea hydrographs result in overestimating the point rainfall associated with concentration points further downstream in the watershed. Depth-area adjustment factors were applied to the inflow hydrographs for the detention basins. The depth-area adjustment curve was constructed by VCFCD staff specifically for the Gabbert/Walnut Canyon watershed as a function of total drainage area as indicated in the original watershed deficiency study.

Table-2.3.1 - Detention Basin Inflow Hydrographs Adjustment Factors						
Basin No.	**Conc. Point**	**100-yr. Precip (in.).**	**Drainage Area (acres)**	**Peak Q_{100} Inflow**	**Effective Rainfall (% to inches total)**	**Depth-Area Reduction Factor**
Offline Bypass (Basin-3)	35AB	6.37	1,014	847 cfs	56%	0.915 (0.085)

Because of the size of the drainage area and the unique complexity of the Gabbert and Walnut Canyon watersheds, several unique features were encountered in the application of the VCFCD modified rational procedures to the watershed investigation in the original deficiency study. These features and characteristics were explained in depth. Some of those same unique attributes are inherent in this analysis as well and are worth reiterating to aid in understanding. These items included:

- Depth-area reduction factors were applied to the hydrographs at the detention basins, but were not applied to the main channel hydrographs even though the peak runoff was based upon the smaller subarea precipitation value.



- The configuration of the Walnut Canyon watershed involves several sub-watersheds which were modeled with proposed detention basins and existing confluences. The shape of the hydrographs is very important in accurately determining the resulting total flowrate. Using superposition to add the hydrographs relies on accurate ordinates for both limbs of hydrograph and the shape of the main channel hydrographs were not adjusted, unless reservoir routing was involved. If the hydrographs from any of the several primary streams were "fattened" upstream and then combined, this will result in a different hydrograph from the standard confluence addition.

- The outflow hydrographs resulting from the reservoir routing were fattened hydrographs which were input in the remainder of the modified rational watershed model and combined with additional hydrographs which were "fattened" if there was a detention basin in the corresponding watershed of the additional hydrograph. If not, then no "fattening" was performed.

13.4 Proposed Detention Basin Modeling

In the watershed hydrology models prepared for this and prior studies, the proposed Detention Basin No.3 is located at hydrologic node point cp35ab. In order to optimize the performance and minimize the size of the proposed detention basin, an in-channel 100-cfs bypass is proposed in the design. The bypass will be provided by a horizontal weir inlet structure. The length of the required weir structure will be determined in the preliminary design of the basin. The horizontal weir was incorporated into the hydrology models to allow 100-cfs to remain in the Walnut Canyon channel and bypass the proposed detention basin. The volume of storm runoff contained in the flood hydrograph above 100-cfs will be captured in the proposed basin, detained and routed through the basin and discharged back into the Walnut Canyon channel. The time period associated with routing, the detention time in the basin, creates a 49 minute lag in the time between occurrence of the peak of the inflow hydrograph at basin inlet and the peak of the outlet hydrograph at the outlet from the basin. The inlet location and outlet location for the proposed basin are hydrologically modeled at cp35ab.

The preliminary design of the detention basin is provided in a scaled drawing in the enclosed exhibit map pocket (see Exhibit-2). The detention basin and watershed models were analyzed with two goals to be obtained. The first goal was to limit the discharge peak flowrate from the basin so that the capacity of the existing Walnut Canyon channel downstream of the proposed detention basin and upstream of Los Angeles Avenue would not be exceeded with the ultimate condition detention facilities in-place as indicated in the accepted 1997 watershed masterplan (see Exhibit-3). The second goal was to determine the resultant flowrate of the watershed downstream of Los Angeles Avenue to provide a basis of design for the future re-alignment of Walnut Canyon channel to an earthen trapezoidal channel paralleling the westerly boundary of Tract 3034. The detention basin will be a single stage 90-acre/ft detention facility which would not fall within the California Department of Dam Safety (DSOD) jurisdiction. The proposed basin would have a storage volume of 90 acre/ft covering an area of 10.8-acres (water surface area) and is partially incised (or excavated). The proposed roadway alignments, which bound the detention basin along the south (High Street) and the west (Casey Road), would be raised on fill. The upstream end of the basin would be located at the boundary between the Hitch Ranch property and the Walnut Canyon High School property and would extend a distance of 1,500-feet downstream. The minimum width of the basin floor would be 180-feet and the maximum width would be 270-feet. The basin would have two primary inflow points - west end from the natural canyon watershed north of the basin, and from the east end at the overflow weir structure along the existing Walnut Canyon channel.

The watershed analysis results are summarized in Table 2.2.1. Results from the original study are included as well for comparative purposes. The proposed basin was modeled for the ultimate condition both with a 100-cfs bypass and without to give a more complete picture of the affect the basin has on the watershed hydrology. The basin was modeled for the interim condition, with no upstream or downstream proposed detention basins in place to determine the performance of the existing downstream Walnut Channel. The reach capacity of the existing Walnut Canyon channel downstream of the proposed Detention Basin No. 3 is also indicated in Table 2.2.1.

14 Proposed Detention Basin Characteristics

The basin concept/configuration and general grading for this proposed Detention Basin No. 3 is the same as was determined by RBF Consulting in their study prepared in March, 2003; which was based upon a concept prepared by DPS (D. Hardgrave) as part of the planning effort of the Hitch Ranch Specific Plan. The basin size and shape was dictated topographic constraints, minimizing encroachment upon adjacent property in addition to hydrologic and hydraulic constraints. The basin covers an area of 10.8-acres and will require additional grading area along the steep hillsides along the north side. The basin extends a distance of 1,500-feet and has a minimum and maximum width of 180-ft and 270-ft respectively. Basin invert elevations range from 480-ft to 485-ft at the upstream end. The basin floor slope is approximately 0.003-ft/ft. The top of bank is set at a constant elevation 498-feet around the entire perimeter of the proposed basin. A 15-ft maintenance road has been provided along the perimeter of the basin. The south side of the basin is bounded by the proposed High Street extension (roadway width of 60-feet).

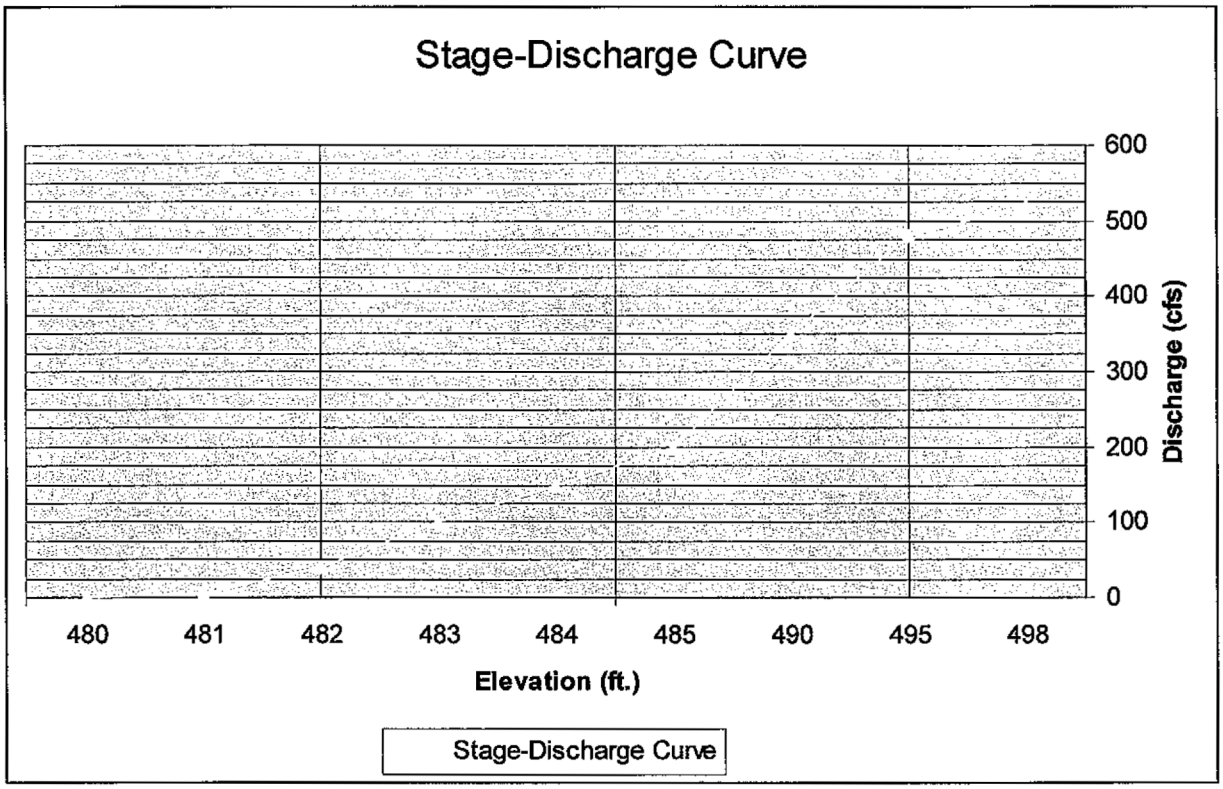
14.1 Maximum Storage Surface Area/ Storage Pool

The proposed detention basin impounds an area of 10.8-acres at a water surface level at the crest of the overflow weir structure (elevation 493.5-ft). At this level, the estimated storage volume is 90-acre/ft.

Chart - 3.1.1

14.2 Embankment/Excavation

The earthen embankment would have a side slope of 2 horizontal to 1 vertical. The embankment would be partially protected with either concrete material or rock riprap. At the west end, where additional flows will be entering the basin, riprap material will be placed to prevent potential erosion/headcutting. A concrete lining along the overflow weir structure is provided. The reservoir storage volume is generated through excavation and partially bound by raised proposed roadways along the west and south sides of the basin. The proposed roadway along the south (High Street) is raised as much as 10-feet above the existing ground level. The basin's emergency spillway crest is located at elevation 496-feet. The height from spillway crest to the downstream toe of the roadway embankment is approximately 5 to 6-feet. The height of 5 to 6-feet from the emergency spillway to the embankment toe will not require the basin to be under DSOD jurisdiction.



14.3 Basin Structures

The structures associated with the basin operation include the overflow weir structure (inlet structure), the outlet structure, canyon overflow spill inlet structure, an emergency spillway structure, and the existing Walnut Canyon channel.

14.3.1 Detention Basin Outlet Facilities

The proposed basin discharge will be regulated by a proposed single cell 7'x 4' reinforced concrete box (RCB) with an opening height of 4-feet and a span of 7-feet. The outlet RCB would extend a distance of approximately 300-feet to confluence with the existing Walnut Canyon channel. The upstream and downstream invert would be 480-feet and 479.4-feet, respectively. The downstream invert of the outlet structure would match the invert of the existing Walnut Canyon channel. Note that this outlet configuration was sized to accommodate the required outflow discharge under the existing upstream watershed condition. Under the regional ultimate watershed condition (with the future construction of upstream detention basins), the outlet structure opening would be modified with an orifice plate (opening size similar to an 18-inch RCP).

Chart - 3.3.1.1

14.3.2 Basin Inlet Features

There are two primary inflow points to the basin; the west end and the east end. Flow along the west end would enter the basin from contributing watershed by flowing along the embankment. This section of the embankment would have riprap protection. The second inflow point is controlled by an overflow weir structure allowing flow to enter the basin from the existing Walnut Canyon channel. The overflow weir crest is at elevation 493.5-feet. Details of these two structures will be provided during later phases of the design.

Table 3.3.1 Summary of Detention Basin Features	
Storage Volume	90 AF
Basin Area (Top of Bank)	10.8 Acres
Top of Bank Elevation	498.0 ft
Basin Invert Elevation (Low Point)	480.0 ft
Overflow Weir Structure	L=120' H=1.5'
Outlet Structure	4'x7' RCB

15 Walnut Canyon Channel Hydraulics

One of the goals in the design and analysis of the proposed detention basin facility was to attenuate the inflow peak flowrate so that the peak discharge rate would result in a peak flowrate downstream of the basin that would be less than the existing Walnut Canyon channel maximum capacity (see Table 4.1.1). Based upon the adopted watershed masterplan, the 1,711-ft portion of Walnut Canyon channel parallel to Los Angeles Avenue with a 12'x 5' reinforced concrete section will be removed and re-constructed. The new reach of 14'x 5 reinforced concrete rectangular channel will be constructed from the Los Angeles Ave 72" storm drain junction with Walnut Canyon channel to the proposed point of re-alignment for the Walnut Canyon channel. The remaining 1,900-ft reach of existing Walnut Canyon channel will be removed from Gabbert Canyon channel to the point of re-alignment. The Gabbert-Walnut Canyon channel confluence will be eliminated per the adopted flood control masterplan. Walnut Canyon channel will be diverted to cross Los Angeles Avenue upstream of the Gabbert Canyon channel and discharge to a proposed earthen channel which will parallel the westerly boundary of Tract 3032.

Table 4.1.1 - Summary of Existing Walnut Canyon Channel Geometry

15.1 Re-aligned Walnut Canyon Channel Cross Section

The proposed Walnut Canyon channel outlet to the Arroyo Simi will be relocated to approximately 1,700-ft upstream of the existing Gabbert Canyon channel outlet to the Arroyo Simi. The invert in the Arroyo Simi channel at the proposed Walnut Canyon outlet is 441.5-ft. The proposed channel cross section will have a 21-ft base width, 2:1 side slopes and a continuously variable wall height ranging from 6-ft to 15-f. The channel will have a longitudinal slope of 0.0027 ft/ft from the Los Angeles Avenue under crossing to the existing 27" sewer located approximately 31-ft upstream of the confluence with the Arroyo Simi. The sewer is shallow and is a physical limitation to the gradient of the channel and as a result becomes a hydraulic control for the design of the Re-aligned portion of the Walnut Canyon Channel. The gradient of the proposed channel downstream of the 27" sewer would be 0.1957ft/ft.

15.2 Hydraulic Analysis

The *Windows* version of LA County hydraulic modeling program Water Surface Pressure Gradient (WSPG) was used to analyze the proposed Walnut Canyon channel re-alignment. Two (2) sets of models were prepared utilizing 1) a 100-year water surface in the Arroyo Simi and 2) critical depth in the Walnut Canyon channel at the proposed confluence with the Arroyo Simi. These two scenarios simulate both extremes of hydraulic controls for the proposed channel and produce a worst case analysis for water surface elevation and flow velocity in the Walnut Canyon channel; respectively. The proposed Walnut Canyon channel outlet was hydraulically modeled at 3-feet above the invert in the Arroyo Simi to provide positive drainage and minimize silt build up or deposition at or in the Walnut Canyon channel. Two channel linings were initially analyzed in the hydraulic modeling of the re-aligned channel 1) earthen channel with Manning's n-value of 0.022 and 2) rock rip-rap channel armoring with Manning's n-value of 0.035. The earthen channel alternative was subsequently eliminated due to the flow velocities present in the channel with the higher N-value. The hydraulic model indicated that maximum flow velocity of the earthen channel at the design flowrate varies along the reach of the proposed trapezoidal channel from 18fps at the upstream extent to 9fps at the downstream with a Manning's n-Value of 0.022. The maximum permissible non-eroding flow velocities for unarmored earthen channels and grass lined channels are 5.0 fps and 8fps; respectively. Grade control could be implemented in the design of the re-aligned Walnut Canyon channel as a means to reduce the flow velocities to a range that is more conducive to soft channel linings such as earth and/or grasses. The velocities would prove to be erosive for an unarmored channel and the alternative was eliminated. Grade control was not investigated in this study as a means of erosion control. Absent of grade control the proposed trapezoidal channel will require rock armoring or similar hardened channel armoring to provide a stable conveyance section at the design flowrate. The hydraulic model indicates that the maximum flow velocity of a rip-rap lined trapezoidal channel ranges from 19fps at Los Angeles Avenue to 9fps at the existing Calleguas Metropolitan Water District (CMWD) 27" sewer crossing just upstream of the Arroyo Simi and an acceleration to 19fps at the Arroyo Simi down stream of the existing CMWD 27" sewer. The CMWD is a shallow facility with approximately 6.5-feet of cover to the top of pipe. The crossing becomes a hydraulic control for the Walnut Canyon channel both upstream and down stream of this point. The Walnut Channel invert was preliminarily designed to be 1' above the top of pipe of the 27" sewer. The sewer would be protected with a full concrete encasement a minimum of 1-foot thick. The channel invert would be a minimum of 2-ft above the top of the encasement at 441.0-ft and the top of the encasement elevation would be 439.0-ft at the crossing. The encasement would also provide a trapezoidal toe-down to protect the sewer from stream erosion damage. The toe-down would extend upstream and downstream at least the width of the sewer pipe plus 5-feet on either side – see Exhibit-2. The concrete encasement would be extended up the side slopes of the channel to provide full protection of the sewer and channel. Please see table 4.2.1 for hydraulic analysis data.

Table 4.2.1 - Proposed Riprap Lined Trap Channel b=21', h=varies, z=2:1 - Hydraulics Table (n = 0.035)

16 Preliminary Walnut Canyon Watershed Improvement Quantity and Cost Estimates

A preliminary estimation of earthwork and improvement quantities is provided for the detention basin and channel realignment. This estimate is based upon the previous estimate prepared by RBF Consulting in January, 2000. It does not include adjacent proposed roadway quantities and costs or general roadway repairs. The construction of the proposed detention basin would have an estimated cut volume of 440,000 cubic yards. The excavated material would be stockpiled at a temporary site for use as fill material for the development of Hitch Ranch.

Table 5.1 provides a preliminary detailed cost estimate. A contingency of 20 percent has been added to the cost. The estimated cost for construction of the detention basin, the inlet and outlet structures, and the downstream channel re-construction and re-alignment is approximately $6.6 million.

Table 5.1 - Preliminary Cost Estimate for The Construction of Detention Basin No. 3 and Walnut Canyon Channel Improvements

Construction Item	Quantity	Units	Unit Cost	Cost
GENERAL				
Mobilization	1	LS	$110,000	$110,000
Payment and Performance Bonds	1	LS	$80,000	$80,000
Develop Construction Water	1	LS	$20,000	$20,000
Traffic Control	1	LS	$15,000	$15,000
General Subtotal				**225,000**
DETENTION BASIN				
Site Clearing and Grubbing	11	AC	$500	$5,500
Unclassified Excavation	440,000	CY	$5	$2,200,000
Overflow Weir Concrete	270	CY	$650	$175,500
Remove Exist 12' x 5' RC Channel	270	LF	$100	$27,000
7'x4' Outlet RCB-Concrete	200	LF	$600	$120,000
Stockpile Excavated Material	440,000	CY	$0.5	$220,000
½ ton Rip Rap	1,400	CY	$45	$63,000
Detention Basin Subtotal				**2,811,000**
WALNUT CHANNEL REACH-IV RE-CONSTRUCTION				
14' x 5' RC Channel	415	LF	$750	$311,250
Remove Exist 12' x 5' RC Channel	415	LF	$100	$41,500
Compacted Channel Base Material	215	CY	$45	$9,675
Unclassified Excavation	250	CY	$5	$1,250
Channel Re-Construction Subtotal				**363,675**
WALNUT CHANNEL RE-ALIGNMENT				
Site Clearing and Grubbing	9	AC	$500	$4,500
14' x 6' RCB	250	LF	$750	$187,500
Reinf. Conc. Channel Transition Struct. 2-50ft	100	LF	$1,200	$120,000
AC Roadway Re-construction	5,000	SF	$2	$10,000

Unclassified Excavation	27,000	CY	$5	$135,000
CMB Access Roadway Base	2,300	CY	$40	$92,000
Stockpile of Excavated Material	27,000	CY	$0.5	$13,500
Filter Material	3,100	CY	$40	$124,000
Non-woven Geotextile Fabric	19,600	SY	$40	$784,000
½ ton Rip Rap	19,400	CY	$45	$873,000
Channel Re-Alignment Subtotal				**2,343,500**
Subtotal				**$5,743,175**
15% Contingency				**$861,476**
Total				**6,604,651**

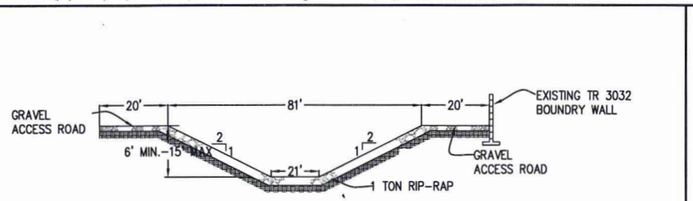
The California Construction Cost index is developed based upon Building Cost Index (BCI) cost indices for San Francisco and Los Angeles produced by Engineering News Record (ENR) and reported in the second issue each month for the previous month. This table is updated at the end of each month.



The ENR BCI reports cost trends for specific construction trade labor and materials in the California marketplace.

1 Introduction

1.1 Project Description

The Commonwealth Studios project site, Tract 5217, owned by Triliad Development Inc. (TDI) will be developed as a 32-acre movie production studio site located in Moorpark, California in southeastern Ventura County. It is located along the northerly right-of-way of Los Angeles Avenue. The Commonwealth Studios project site boundaries are Los Angeles Avenue on the south, Walnut Channel on the east, Union Pacific Railroad right-of-way on the north and Gabbert Channel on the west. As a condition of development, Triliad Development Inc. is required to construct offsite regional flood control improvements as discussed in the *Walnut and Gabbert Canyon Watershed Masterplan* approved in June 2005. The portion of the overall watershed masterplan that will be constructed as a part of this project do not totally alleviate the floodplain issues associated with Walnut and Gabbert Canyon Channels, however, these improvements are a major portion of the necessary improvements. The proposed Regional Basin-3 and Basin-2 Improvements are located offsite on the parcel known as *Hitch Ranch*. The owners of Hitch Ranch and Triliad Development have developed an agreement to allow Triliad to construct the proposed basin improvements on Hitch Ranch property. The regional location and site vicinity map (Figure 1) illustrates the project site from both a regional and local perspective.

Under current conditions, potential flooding could affect the Commonwealth Studios. This flooding would be a result of inundation caused by existing conveyance deficiencies in the Walnut Canyon Channel and Gabbert Canyon Channel. These flood control channels drain a total of approximately 4,365 acres. The existing watershed is largely undeveloped with some residential and commercial landuses. A portion of the watershed masterplan facilities/improvements have been constructed as a part of the development of Tract-5187. The proposed facilities/improvements that would be implemented as a part of this project would be a major step in the elimination of the overall watershed flood control deficiencies. However, the flood control deficiencies in the watershed will not be completely eradicated until the complete masterplan is implemented.

The Regional Watershed Masterplan for Walnut and Gabbert Canyons were adopted by both the City of Moorpark and VCWPD in 2005. *"Gabbert and Walnut Canyon Channels Flood Control Deficiency - Addendum"* dated August 2005, is the title of the Regional Watershed Masterplan that the Commonwealth Studios and Hitch Ranch project sites are subject to. This masterplan identified five (5) regional detention basins along with other channel improvements to alleviate the flooding hazard associated with the Gabbert and Walnut Canyon Channels. One of the basins, known as "Basin-3" is planned to be located adjacent to Walnut Canyon Channel within the Hitch Ranch property. The owners of Hitch Ranch and the Commonwealth Studios sites have created an agreement that will allow the developer of the Commonwealth Studios site, TDI to design and construct the Basin-3, Basin-2, and Basin-2B facilities on Hitch Ranch property. This agreement allows for the development of the Commonwealth Studios site to occur prior to development of the Hitch Ranch site and provides adequate "interim condition" flood protection to the Commonwealth Studios site and adjacent parcels downstream of the proposed Basin-3 facility site in the interim condition.

In the interim condition, Basins-2, -2B and -3 would be regional flood control facilities functioning consistent with the watershed masterplan and designed to meet or exceed minimum Ventura County Watershed Protection District (VCWPD) design standards. The construction of these facilities is referred to as "Interim Condition-1" in this report because there will be subsequent interim condition construction of the masterplan facilities before the ultimate condition is achieved. Basins-2 and 2B outlet structures will be modified in the ultimate condition with the construction of North Hills Parkway. Each of the basins would be dedicated to VCWPD to own, operate, and maintain in the interim and ultimate conditions. Also in ultimate condition Basin 2A will be constructed per Hitch Ranch Masterplan Study (May 2007) The proposed regional basins would meet the performance and design requirements set forth in the Regional Watershed Masterplan for Walnut and Gabbert Canyons and were approved and accepted by both the City of Moorpark and VCWPD in 2006. *"Gabbert and Walnut Canyon Channels Flood Control Deficiency - Addendum"* dated August 2005, is the title of the Regional Watershed Masterplan that the Hitch Ranch

site is a part of. This study determined the minimum performance standards to be met by the individual regional facilities in the interim condition as they are designed and constructed to alleviate the existing floodplain hazard in Moorpark associated with the deficiencies of the Walnut and Gabbert Canyon Channels between High Street and the Arroyo Simi. Figure 2 shows the extent of the existing 100-year Federal Emergency Management Agency (FEMA) floodplain for the Moorpark area.

The development plan for Commonwealth Studios includes the construction of the regional basins (Basin-3 and Basin-2 and -2B), identified in the approved masterplan for this watershed. These basins have been designed for the interim condition to also function in future interim condition phases and in the ultimate condition with minimal modifications. The future interim condition development of Hitch Ranch will construct a regional basin identified as Basins-2A,. The construction of this facility will help to decrease the flooding risk along the Walnut Channel from Casey Road to Commonwealth Studios project site. This interim phase will construct Basin-2, -2B and -3. These facilities were sized such that they will over attenuate the peak flowrate in the Walnut Canyon Channel upstream of the Commonwealth Studios, Tract 5217, site in order to mitigate the increase in peak runoff that typically occurs in a watershed due to development. This over attenuation in Basins-2, 2B and -3 eliminates the need for an onsite detention basin on the Commonwealth Studios site. The resultant peak flowrate at the upstream side (east) (cp62AC) of the Commonwealth Studios site in the Walnut Canyon Channel is less than the masterplan tabled flowrate as determined in the 1997 and 2005 Flood Control Deficiency Studies such that the flowrate at the downstream extent of Tract 5217 shows no net increase due to development; see Section 4.2.

1.2 Study Objective

The purpose of this report is to document and support the design of the proposed interim condition facilities to be built by TDI to mitigate the existing 100-year floodplain hazard(s) at the Commonwealth Studios project site.

The project has identified the following key objectives in the development of an implementable watershed masterplan:

1. A drainage system composed of channel improvements, detention storage facilities that will mitigate the existing flood control deficiencies of the Walnut Canyon Channel.

2. Identify major physical constraints such as utilities, roads, and legal boundaries that are impacted by the recommend improvements.

3. Identify interim condition improvements, their design and operation, their performance targets, and the resultant affect the interim improvements will have on the watershed hydrology.

4. Develop and design an interim condition improvement program that is consistent with the approved Gabbert and Walnut Canyon Channel Watershed Masterplan and which fits within the current Hitch Ranch ultimate condition site plan

5. Demonstrate that the proposed interim condition system improvements would be capable of meeting the ultimate condition watershed flood control performance targets with minimal or no modifications.

The information contained in this report is intended to provide final design level information and data that will facilitate the engineering review and design provided within the construction documents and allow for verification of compliance with the planning for the Gabbert and Walnut Canyon watersheds. This document is intended to provide a record of the engineering design and intent contained in the project construction documents.

2 Project Understanding and Study Area Description

The 32-acre project site is currently undeveloped. The natural topography shows the drainage pattern is north to south and tributary to the Walnut Canyon watershed. Walnut Canyon Channel consists primarily of approximately 2.5 miles of improved concrete channels that were originally constructed by the SCS between 1959 and 1962. These regional drainage facilities are located in Zone-3 of the Ventura County Flood Control District. Due to recent private development on a significant portion of this watershed area and the limited hydraulic conveyance capacity of the existing channel system, flood protection deficiency exists and is documented on the current Flood Insurance Rate Map (FIRM) for the City of Moorpark. Shallow flooding occurring from channel overtopping has been documented.

The City of Moorpark FIRM has defined existing flood hazard zones within and near project site. The FIRM indicated that approximately 20 percent of the site (along the eastern and southern portion) is within the 100-year flood hazard area. An additional 20 percent is subjected to flood hazards associated with Gabbert Canyon Channel (north of the project site) overflow along the western portion of the site. This overflow could extend to the project site up to 500 feet inundation depth of approximately 0.7 feet. The Walnut Canyon Channel would also subject the proposed project site to inundation due to the 100-year floodplain that extends into the project site approximately 250 feet (see Figure 2).

2.1 Field Investigation

A field reconnaissance of the proposed location of Basin -3 and Basin-2 and 2B was performed as part of the this Basis of Design study to observe existing conditions and existing utilities and/or improvements that will need to be relocated or demolished. Photos of the existing conditions, utilities, and improvements near the proposed Basin-3, and Basin-2 and 2B improvements are provided below.

Photograph 1 - Looking east-northeast from the location of Walnut Canyon Channel along the southerly project boundary. The area in the foreground is the proposed location of the Regional Detention Basin.

Photograph 2 – Looking north-northwest and taken from approximately channel station 86+00.00, the area depicted in the photo is the proposed location of the VCWPD Regional Detention Basin-3. The future location of the High Street extension is in the foreground at the fence line.

Photograph 3 - Looking south and taken from approximately channel station 86+42.49, the photo depicts an existing sanitary sewer manhole for the existing 18" VCWPD sewer line. This facility is located approximately 50-ft east of the VCWPD proposed Regional Basin inlet structure(s). The existing Walnut Channel is shown in the background.

Photograph 4 - Looking east and taken from approximately channel station 86+42.49, the photo depicts the existing MTA / Amtrak train tracks located adjacent to the Walnut Channel along the south bank. The area between the tracks and the channel contains several existing utilities below the surface (1) VCWPD 18" sanitary sewer, (2) MCI fiberoptic cable, (3) Sprint fiberoptic cable, and (4) AT&T fiberoptic cable. This is the area or proposed fill to contain the existing overbank flooding upstream of the Basin-3 inlet.

Photograph 5 - Looking north and taken from approximately channel station 86+80.00, the photo depicts an existing 5-ft chain link fence located along the easterly property boundary of the Hitch Ranch property. This fence will be protected in-place and will be located immediately adjacent to the proposed Basin-3 access road along the easterly edge of said road.

Photograph 6 - Looking north and taken from approximately channel station 79+75.00, the photo depicts an existing abandoned pump station and electric pole. These existing improvements are located within the footprint of Basin-3 and will have to be removed.

Photograph 7 - Looking north northwest and taken from approximately channel station 80+00.00, the photo depicts an existing reinforced concrete well sleeve or standpipe shown in the background. This facility is within the footprint of the proposed basin and would have to be removed.

Photograph 8 - Looking north, taken from approximately channel station 75+00.00, the photo depicts existing SCE overhead electricity transmission lines and support poles. The first electric pole shown in the center of the photo is within the footprint of the proposed Basin-3. This facility will need to be relocated outside of the basin footprint. The SCE easement associated with these transmission lines will need to be terminated and relocated / re-dedicated in association with the realignment of the lines.

Photograph 9 - Looking north northwest, taken from approximately channel station 75+00.00, the photo depicts an existing stand of Eucalyptus Trees just west of the SCE overhead electricity transmission lines. This stand of trees will need to be removed and/or relocated as they are within the Basin-3 footprint.

Photograph 10 - Looking north northeast, taken from approximately channel station 45+00.00, the photo depicts the existing condition at the proposed location of Temp Basin-2.

Photograph 11 - Looking north, taken from approximately channel station 45+00.00, the photo depicts the existing condition at the proposed location of Temp Basin-2. In the background, the photo depicts existing SCE transmission lines and support poles / towers. The easterly boundary of the existing SCE easement for the power lines shown will be a common boundary for right-of-way dedicated to VCWPD for the proposed Basin-2 site.

Photograph 12 - There is also an existing cable television and/or buried telephone cable within the SCE easement discussed in the preceding photo. This photo depicts an existing cable junction box located within the easterly shoulder of Gabbert Road, adjacent to the proposed location of Basin-2.

2.2 Description of Existing Channel Facilities

There are no improved channels existing within the Commonwealth Studios property boundaries. All the natural drainage patterns are unimproved and undisturbed. Walnut Canyon Channel borders approximately 2,800-feet of the project site along the westerly as well as southerly border. The Walnut Canyon Channel is owned and maintained by VCWPD. The existing channel cross-section adjacent to the Commonwealth Studios Project site is a concrete rectangular channel section with a 12-foot base width and a 5-foot wall height. The average slope of the channel adjacent to the project site is approximately 0.5%.

2.3 Floodplain Mapping

The potential for flooding directly associated with the limited hydraulic capacity of the Gabbert and Walnut Canyon Channel systems is reflected in the published floodplain mapping for the Moorpark area which indicates the 100-year flooding through the urbanized portions of the city. The current FIRM for the City of Moorpark became effective September 29, 1986 and shown on the FIRM community panel 067120005A which indicates only the mapped flood hazard boundaries within the municipal boundary.

2.4 Previous Hydrologic Investigations

The 1997 RBF study, "*Gabbert and Walnut Canyon Channels Watershed Flood Control Deficiency Study"* thoroughly investigated the Walnut and Gabbert watersheds in order to determine the most feasible flood control solution to resolve the existing deficiencies. This study was accepted by VCWPD and the recommended alternative plan was selected as the flood control masterplan for the Gabbert and Walnut watersheds. This study was the basis for the Commonwealth Studios Corporate Center Flood Protection Project study prepared by RBF in 2000 and further refined the selected alternative identified in the 1997 report.

The 2000 report modified the proposed detention Basin-3 and utilized a larger detention basin flow diversion to the Arroyo Simi. It has since been determined that the proposed detention Basin-3 Arroyo Simi diversion would not be feasible to construct. VCWPD then recommended an inline detention Basin-3 bypass as an additional modification to the selected watershed flood control masterplan.

In July 2005, PACE prepared an addendum to the 1997 Gabbert and Walnut Canyon Channels Watershed Deficiency Study. This study was adopted by both Ventura County and the City of Moorpark as the Watershed Masterplan for the overall watershed that the Hitch Ranch site is within. The 2005 study refined the preferred alternative selected in the 1997 study and 2000 studies and utilized updated information on existing physical constraints

Tract 4928 and Tract 5187 are located in the upstream portion of the Walnut Canyon Channel watershed. Both these project hydrology reports were approved and the projects are under construction. Tract 5187 development include regional basin "BASIN 0" to mitigate the runoff in the existing Walnut Canyon Channel per the 1997 and 2000 RBF Masterplan study(s). The *"Tract 5187 Unit-1 Volume-1 Hydrology Report"* was prepared by *Hall and Foreman* in March 2003.

In May 2007, PACE prepared the *Hitch Ranch Stormwater Management Masterplan*. The Hitch Ranch Project is located in the upstream portion of the Commonwealth Studios project site. This study's emphasis is on both regional and local flood control facilities for the proposed project site plan per previous Gabbert and Walnut Canyons Flood Control Deficiency Studies.

This current study focuses on the design requirement associated with implementation of a large regional stormwater detention with in upper watershed of Walnut Canyon. This basin is also referred is as "BASIN 3" in previous studies. The flood control facilities are based on RBF report *"Commonwealth Studios Corporate Center Flood Protection Project Walnut Canyon Regional Detention Basin."* The proposed basin(s) would be an interim condition solution to the flood control deficiencies of the watershed. They have been designed to meet the ultimate condition hydrologic performance requirements and fit within the current ultimate condition Hitch Ranch site plan with minimal or no modification.

2.5 Design Objective and Criteria

The primary design objective of the proposed flood control basins is to minimize the flood hazards associated with the existing Walnut Canyon Channel deficiencies by reducing the 100-year peak storm discharge downstream of the proposed Basin-3 location, thereby eliminating the flood hazard to the Commonwealth Studios site.

The proposed regional stormwater detention basin is located along the existing Walnut Canyon Channel within the boundary of the Hitch Ranch property in Moorpark. The concept plan, location selection and general configuration of the detention basins were developed in conjunction with the planning efforts of the Hitch Ranch Specific plan with input from the City of Moorpark and the Ventura County Watershed Protection District. The interim condition footprint for Basin-3 is significantly larger than the ultimate condition basin footprint.

The stormwater management program that was developed in this study was created with the goal of achieving a balance between (1) flood protection objectives, (2) providing the minimum cost for the maximum benefit, and (3) compatibility with existing physical constraints and future development. Several alternatives were developed during the master planning and preliminary design process. These alternatives were screened through a feasibility evaluation process, which resulted in the current design configuration being identified as the preferred alternative. The proposed flood control facilities fulfill the following key objectives which were identified in the flood control masterplan for the Gabbert and Walnut Canyon Watersheds.

- Provide a comprehensive flood control program that minimizes the hydrologic impacts on the existing downstream receiving channel system from the proposed site development.

- Provide a regional drainage system that develops the required level of flood protection with the least economic impact.

- Utilize previously identified locations within the watershed where land has been set aside or planned for acquisition by Ventura County for flood control facilities.

- Maximize utilization of existing flood control facilities and right-of-way that integrate into the recommended program.

Ventura County Watershed Protection District and City of Moorpark standards design guidelines and design criteria were applied in designing the proposed basin and channel improvements. Additional criteria related to specific requirements applied in this study are discussed in the following paragraphs.

2.6 General Environmental

2.6.1 FEMA

The Commonwealth Studios project site and the surrounding area are currently listed as subject to Zone-A flooding. Zone- A is defined as areas subject to inundation by the 1% annual chance event (100-year event.). The implementation of the proposed regional flood control basin with the development of the Commonwealth Studios site is an integral part of the necessary improvements to eliminate the existing flood hazard zone downstream of the Hitch Ranch project site associated with overflow from the Walnut Canyon Channel. The entire flood hazard zone will not be eliminated until each piece of the regional masterplan is implemented as identified in the *2005 Gabbert and Walnut Canyon Channels Flood Control Deficiency Study – Addendum* report. However, implementation of the proposed interim condition improvements will eliminate the flood hazard at the project site. Any modifications or encroachment into the published floodplain for communities participating in the National Flood Insurance Program (NFIP) must be approved by FEMA. Communities that participate in the NFIP are responsible for submitting data to FEMA reflecting projects that modify the floodplain or flood hazard zones. Development of the Commonwealth Studios site will require the processing of a Conditional Letter of Map Revision (CLOMR) and Letter of Map Revision (LOMR) with FEMA to map the affects that the proposed improvements will have on the existing floodplain hazards.

2.6.2 Division of Safety of Dams Design Considerations/Criteria

The basic criterion used by DSOD to define a jurisdictional “dam” facility, includes the following:

- Embankments that are more than 25-feet in height measured from the natural stream bed or lowest point at the downstream toe of the embankment.

- Embankments that impound a storage volume exceeding 50 acre-feet.

- Embankments that are less than 6-feet in height, regardless of storage capacity, or which have a storage capacity of 15 acre-feet, regardless of height will not be considered a “dam.”

The proposed basins located in the proposed Hitch Ranch Project site will not come under the jurisdiction of the California DSOD.

2.6.3 Geotechnical Constraints

The primary geotechnical considerations that are generally associated with the construction of the proposed detention basins include: (1) embankment slope stability, (2) engineered fill including material sources, (3) foundation system requirements for the embankment, and (4) settlement, and (5) excavation spoils stockpiles. The embankment design is the critical geotechnical factor to ensure stability and protection of the public. The interior slopes of the basins were designed with a maximum slope of 3 to1 (horizontal to vertical; 3:1) or flatter in order to maximize geotechnical stability and public safety A soils report, will be prepared by the project geotechnical engineer to confirm the stability of the proposed slopes and project grading. The stage-storage-discharge relationships developed for the hydrology

analyses of the detention basins in this study correspond to the embankment slopes and basin volumes shown in the proposed basin grading plans.

2.6.4 Utilities

PACE performed several preliminary site visits and researched records and maps available at the City of Moorpark and Ventura County Public Works – Water and Sanitation Department. The existing utilities adjacent to the proposed drainage facilities or those that potentially interfere have been incorporated into the design to allow relocation or protection in-place. The photo log provided in Section 2.1 indicates each of the identified existing utilities and/or improvements that have been considered in the design. The basin grading plans also indicate the proposed mitigation for each conflicting utility.

2.6.4.1 Local Storm Drains

There are several municipal and private small diameter corrugated metal pipes ranging in size generally from 12-inches to 24-inches which capture tributary flows from the existing canyons of Hitch Ranch and discharge flows to Walnut Canyon Channel. These culverts were constructed to protect the existing access road along the north side of the Walnut Canyon Channel. These facilities will be protected in place. The spillway way pad shown in photo 13A and B below will be protected in-place and will be incorporated into the proposed overflow spillway of Basin-2.

Photographs 13A and 13B - Unconfined surface flow from the undeveloped canyon area adjacent to Gabbert Road is intercepted by Walnut Canyon Channel. Concrete overpour structures or “small canyon side inlets” provide long weir crests along sections of the channel walls.

2.6.5 Dry Utilities

Additional utilities have been identified from either the field investigation or design data indicated on historical improvement drawings. These utilities may potentially influence limits of channel reconstruction, potentially require reconstruction, or special protective measures during construction.

2.6.5.1 Telephone

Adjacent to Walnut Canyon, located on the south side of the channel an underground MCI fiber optic cable has been installed that parallels the channel and is located between the SPRR and the channel. ATT and Sprint fiber optic cables are also in this same area (Photograph 14). The basin grading plans indicate that there will be some minor “offsite” grading in this area to reduce the likelihood that the interim condition Walnut Channel 100-year floodplain upstream of the proposed Basin-3 would bypass the Basin-3 inlet facilities. The proposed grading in the overbank area between the railroad tracks and the Walnut Channel is intended to direct storm runoff in the overbank back into the Walnut Channel at the Basin-3 inlet. The proposed fill is less than or equal to 2-ft.

Photograph 14 - MCI fiber optic cable

2.6.5.2 Electric

The Walnut Canyon Channel is adjacent to the SCE electric substation near the intersection of Los Angeles Avenue and Gabbert Road. Regional transmission lines and towers are in the proximity of this area (Photograph 15). The electric lines, supports, and the substation will not be affected by this project.

Photograph 15 - Walnut Canyon Channel

2.6.5.3 Railroad

The Union Pacific Railroad is located parallel to Walnut Canyon through the central portion of the City of Moorpark (Photograph 16). The distance from the center of the railroad tracks to the center of the channel is 49.5 feet; the distance from the edge of channel to the railroad right-of-way is 8.5 feet. The railroad lines will not be affected by this project. However, the proposed fill in the overbank area between the Walnut Channel and the railroad tracks will require notification of SPRR and coordination between the train schedule and the contractor grading due to the required close proximity of grading equipment to the tracks.

Photograph 16 - Union Pacific Railroad parallel to Walnut Canyon

2.6.5.4 Gas

A high-pressure gas line is located parallel to the Gabbert Canyon Channel, directly adjacent to Los Angeles Avenue and the channel. This gas line will not be affected by the improvements proposed as a part of this project.

3 Hydrology

3.1 Watershed Description

The proposed detention basin and channel improvements will be constructed at an offsite location(s) for the Commonwealth Studios site. The basin location will be on the Hitch Ranch property. An agreement was established between the owners of Hitch Ranch and Triliad Development, which allows for the construction of the basins by Triliad on Hitch Ranch for the mutual benefit of both parties; the downstream property owners, the City of Moorpark, and VCWPD.

The Commonwealth Studios site is an undeveloped fallow 32-acre parcel located below the southeastern foothills of the City of Moorpark, within Zone-3 (Calleguas Creek Watershed) of the VCWPD District Zone Map. The entire project site and watershed is ultimately tributary to the Arroyo Simi River / Calleguas Creek. The proposed project site is located along the Walnut Canyon Channel near Los Angeles Avenue (State Route 118).

The Commonwealth Studios site is presently undeveloped fallow land. The existing drainage pattern is from the northeasterly corner of the project site to the southeasterly corner of the project site at a 1.1% average slope via overland sheet flow. Excess rainfall flows into the existing rectangular concrete Walnut Canyon Channel along the southern border of the site.

The existing condition regional hydrology analysis was performed by modifying the baseline hydrology model provided by VCWPD. This interim condition study utilized the existing watershed condition as of date of the report including the “as built” data for the existing regional Basin-0 constructed with Tract 5187 improvements to analyze the regional watershed for the Walnut Canyon Channel. The proposed interim condition hydrology model includes the existing regional watershed improvements that have been constructed and the improvements proposed as a part of this project.

3.2 Watershed Models

Several hydrology models were created to evaluate the influence proposed improvements have on the regional and local watershed. The models that were created provide the ability to determine if the proposed drainage improvements (i.e. Basins 2, 2B and 3) are in compliance with the Gabbert and Walnut Watershed Masterplan as well as determine the hydrologic affect of the proposed watershed in comparison to the existing watershed.

3.2.1 Baseline Condition

VCWPD prepared a synthetic unit hydrograph model of the entire Gabbert and Walnut Canyon Channel watershed in June 1996, specifically evaluating the current landuse conditions within the watershed. The VCWPD watershed model was then modified to create the Gabbert and Walnut Canyon Watershed Masterplan, which was approved by VCWPD and the City of Moorpark in 2005 as the masterplan and guideline for implementation of identified future regional flood control improvements for those watersheds. This model, the watershed masterplan model is the “baseline condition” for this study.

3.2.2 Interim Condition-1

The currently proposed “interim condition” model was prepared to provide a comparison of the model results with the “baseline condition”, an “Interim Condition-2” model reflecting proposed development of Hitch Ranch, and the “ultimate condition.” The “interim condition-1” model is based on a modified baseline model that was prepared by using the current proposed Commonwealth Studios site plan, “as built” data for the existing regional Basin-0 constructed with Tract 5187 improvements, as-built data for the “extra basin” constructed with Tract 5187 improvements, proposed improvements of this project for regional Basin-3, Basin-2and 2B near Gabbert Road. This “interim condition” does not include future masterplan regional improvements such as Basin 1, 2A and Gabbert Basin, or the Walnut Canyon Channel relocation. See Figure 4 for Interim Condition Watersheds and Drainage features.

3.2.3 Hitch Ranch InterimInterim Condition 2

An “interim condition-interim c-2” model was prepared to provide a comparison of the model results with the approved masterplan target flowrates. The interim condition-interim c-2” model is based on a modified interim condition-ic-1 model which was prepared by using the current proposed Commonwealth Studios site plan, “as built” data for the existing regional Basin-0 constructed with Tract 5187 improvements, as-built data for the “extra basin” constructed with Tract 5187 improvements, proposed improvements of this project for regional Basin-3, Basin-2 and 2B... The regional “Basin 1” is not included in this condition, nor are Gabbert Basin, and the Walnut Canyon Channel relocation.

3.2.4 Ultimate Condition

An ““ultimate condition” model was prepared to provide a comparison of the model results with the approved masterplan target flowrates using as-built data for the existing regional Basin-0 facility, design data for the proposed improvements (Basins 2, 2B, and 3), and conceptual data for future proposed facilities. The “ultimate condition” model is based on a modified interim condition model which was prepared by using the current proposed Commonwealth Studios site plan, “as built” data for the existing regional Basin-0 constructed with Tract 5187 improvements, as-built data for the “extra basin” constructed with Tract 5187 improvements, proposed improvements of this project for regional Basin-3, and Basin-2 and& 2B. This “ultimate condition” includes future masterplan regional improvements such as Basin 1, 2A, Gabbert Basin, and the Walnut Canyon Channel relocation. Please note, the ultimate condition model also includes local (non-regional) detention facilities that will be required to develop the Hitch Ranch site.

4 Hydrologic Analysis Procedures and Parameters

The VCWPD new window-based Modified Rational Method application VCRAT2.5 was used to develop a runoff hydrograph from each individual subarea. The hydrology model corresponds to a "Link-node" model that simulates the physical rainfall-runoff processes occurring in the watershed. Runoff hydrographs are computed within the model for each subarea, routed through the conveyance system and combined with other subarea hydrographs as the analysis proceeds downstream through the watershed.

4.1 Watershed Subarea Delineation

VCWPD prepared the delineation of the existing watershed that subdivided the entire 4,425-acre regional watershed into **79 subareas** for the original 1997 study of the Walnut and Gabbert Canyon watersheds. The subareas ranged in size from 8 acres to 105 acres with individual time of concentrations less than 30 minutes - consistent with VCWPD criteria.

Figure 5 shows post-developed drainage (Interim condition) areas and sub-area numbering as well as pre-developed (Baseline) drainage areas and sub-are numbering for the Gabbert and Walnut Canyon watersheds.

4.1.1 Rainfall

Regional analysis of historical rainfall data throughout Ventura County resulted in the development of rainfall zone designations to classify common rainfall regimens as part of the *Ventura County Hydrology Manual*. **Rainfall zone "J"** was chosen by VCWPD in the watershed analysis as the rainfall zone that best corresponds to the historical rain gage data for the Moorpark area.

4.1.2 Hydrologic Soil Type

General classification of the average soil infiltration rates have been performed throughout the entire County by the SCS (NRCS). The soils were grouped into seven soil groups of hydrologically similar characteristics and are shown on the Ventura County Hydrologic Maps in the *Ventura County Hydrology Manual*. The soils appear to be primarily type 4, but range from type 1 to 7 as indicated in the VCRAT watershed model subarea characteristics prepared by VCWPD staff.

The Ventura County soil groupings correspond to the SCS (NRCS) Soil Groups are shown in Table 1 and Figure 6.

Table 1 - Soil Groups

4.1.3 Land Use

The ultimate landuse designated for the Commonwealth Studios site for this hydrology study was based a preliminary site plan for the proposed movie production studios (see Appendix-D for site plan). The 32-acre parcel will be developed for as a movie production studio complex which would be hydrologically classified as industrial landuse. The percentage of imperviousness for the proposed project site was estimated as 90%. Table 2 shows the County defined land use and corresponding imperviousness.

Table 2 - Land Use

Land Use	% Imp
Open spaces, lawns, parks, golf courses, cemeteries, etc., grass cover on 75% or more	0
Open spaces, etc., grass cover on 50-75%	0

Industrial parks paved parking, etc.	70
Parking lots, roofs, driveways, paved streets with curbs and drains	90

4.1.4 Subarea Time of Concentrations

The existing condition time of concentration was adopted from the county baseline hydrology study, which indicates a time of concentration of 11 min from Commonwealth Studios site. This value was based on existing condition (i.e. Farmland/Natural with Minimal Structures.) In the developed condition, standard drainage improvements will be incorporated into the project consisting of a drainage inlet and pipe conveyance system. This system will reduce the Time of Concentration (Tc) within the watershed from 11 minutes to 7 minutes. Table 3 shows the Tc calculation for the proposed condition for the Commonwealth Studios watershed.

Pipeflow	1450	449.44	448.75

4.2 Proposed Detention Basin Modeling

The detention basin and watershed models were analyzed with two (2) goals to be obtained. The first goal was to limit the discharge peak flowrate from the basin(s) so that the established interim condition peak flowrate in the Walnut Channel downstream of the Commonwealth Studios site, according to the 2005 Gabbert and Walnut Canyon Watershed Masterplan, is not exceeded with the interim condition detention facilities in-place. The second goal was to over-attenuate the discharge from Basins-2 and -3 such that the over attenuation results in a peak flowrate in the Walnut Canyon Channel that is less than the master plan recommended peak flowrate (830 cfs) by difference between the existing condition and development condition runoff from the Commonwealth Studios site. For example, the calculated existing condition 100-year flowrate from the Commonwealth Studios site is 68 cfs and the developed condition flowrate is 133 cfs. The difference is 65 cfs. Therefore, the target maximum interim and ultimate condition flowrates at the junction with Los Angeles Avenue storm drain; hydrologic concentration point 62AC is 816 cfs. The over attenuation in Basins-2, -2B and -3 would allows Triliad Development to develop the movie studio site without need for an onsite detention basin to attenuate the 100-year event runoff. The over attenuation affect that the proposed basins has on the interim and ultimate condition hydrographs is demonstrated in Table 4 shown below. The "attenuation" hydrology analyses are provided in Appendix-A

Table 4 - Attenuation of Hydrology

4.2.1 Interim Regional Basin-3

In the watershed hydrology models prepared for this and prior studies, proposed Detention Basin-3 is located at the Hitch Ranch Property hydrologic node point 39B (Baseline model :cp35ab). In order to optimize the performance and minimize the size of the proposed detention basin, an in-channel 100-cfs bypass is proposed in the design. The bypass will be provided by an inlet structure that will allow 100-cfs to remain in the Walnut Canyon Channel and bypass the proposed detention basin while capturing flows in excess of 100-cfs and up to the 100-year peak flowrate of 945 cfs. The basin inlet structure is composed of a combination of side weirs and inline orifice walls. The orifice walls are located downstream of the weirs to increase the head over the weirs and thereby increase the efficiency of the weirs and reduce the required weir length.

One of the two inline orifice wall structures (Sta. 85+54.00 and Sta. 85+39.00) will each be located downstream of each of the lateral weir structures (Sta. 85+99.9 and Sta. 85+49.00). The inline orifice opening beneath the impact walls will have a non-operable opening of 1.9 ft and 1.5 ft from invert of the channel. These two structures will be located in the main flow path of the Walnut Canyon Channel. The hanging wall or orifice walls were sized such that a minimum flowrate of 100-cfs will pass through the opening at peak stage. In order to maintain a 100-cfs bypass, 4-8'x2.5' rectangular window openings are provided in the north wall of the Walnut Channel. The window openings allow channel flows in excess of

100-cfs to spill through the openings into the 4-8'x4' RCB culverts (lateral structures) and into Basin-3. The build-up of static head at the upstream most orifice wall (Sta. 85+54.00) causes the orifice opening to be surcharged and a flowrate in excess of 100-cfs is discharged beneath the wall through the orifice. The second orifice wall (Sta. 85+39.00) constricts the flow in the channel again. The second set of orifice wall and sidewall window opening operate in the same manner as described above for the first set of wall and openings. The second set of orifice wall and sidewall combination ensure that a maximum peak flowrate of 100-cfs is discharged downstream through the orifice opening at Sta. 85+39.00. All flows in excess of 100-cfs that are allowed to bypass the first orifice wall at station 85+54.00 are conveyed to Basin-3 via the 8'x2.5' sidewall window opening and 8'x3.5' connector culvert. Please see Fig 7.13 and 7.14 for plan view, profile, and design details.

The combination of the inline structures and the side weir structures allows for a 100 cfs bypass of the basin and channel flow in excess of 100 cfs to be captured in Basin-3 at peak flow. The volume of storm runoff contained in the flood hydrograph above 100-cfs will be captured in Basin-3, detained, and routed through the basin, then discharged back to the Walnut Canyon Channel at an attenuated peak flowrate of 467 cfs. A HEC-RAS unsteady or varied flow hydraulic model were created to simulate the storm hydrographs that would be either (1) remain in the channel or (2) be diverted into the Basin-3. This was done by uploading the VCRAT hydrograph into HEC-RAS at the basin inlet. The advantage of using the HEC-RAS varied flow capabilities is the increased accuracy of the resultant hydrograph shape as influenced by the complexity of the multiple combined weir and orifice hydraulic structures.

The resultant hydrographs obtained from HEC-RAS unsteady model were utilized in the interim condition hydrology model (VCRAT). In order to provide a comparison with masterplan target peak flowrates, Basin-3 was designed with an 89.45 ac/ft impound volume. In order to meet the Masterplan recommended peak flows at Los Angeles Ave (Node 62AC), two-tier outlet structure was designed for Basin 3. The low-level outlet from the detention basin will be a 24" diameter RCP outlet pipe. Reducing the size of the low-level outlet and adding a weir controlled high stage outlet alters the hydrograph shape beneficially; which results in an offset peak time that effectively reduces the peak flowrate observed downstream The outlet weir was a drop inlet structure 11-ft long and 8-ft wide. A series of 6-48" diameter RCP outlet pipes will convey spillway flow back to Walnut Creek. The emergency overflow structure was designed to convey the peak flowrate tributary to Basin-3 with a minimum of 1-ft of freeboard to the top of basin. The volume of storm runoff contained in the flood hydrograph above 100-cfs will be captured in the proposed basin, detained, and routed through the basin and discharged back into the Walnut Canyon Channel downstream of the basin. The time lag associated with routing and detention in the basin creates a 52-minute lag time between occurrence of the peak of the inflow hydrograph at the basin inlet and the peak of the outlet hydrograph at the outlet from the basin. The inlet location and outlet location for the proposed basin are hydrologically modeled at hydrologic concentration point cp39bf.

4.2.2 Basins-2 and -2B

In order to meet the masterplan tabled peak flowrate in Walnut Canyon Channel at the Commonwealth Studios site, two extended detention basins (Basin-2 and 2B) are proposed. Basins -2 and -2B have a 17.36 and 11.16 ac/ft impoundment volume; respectively. The basins will be constructed in the arroyo adjacent to Gabbert Road and the Walnut Canyon Channel. These basins are necessary because the unattenuated 100-year storm runoff peak flowrate from the watershed north of Walnut Canyon Channel at Gabbert Road produces a 100-yr peak flowrate that exceeds the tabled masterplan maximum allowable peak flowrate in the Walnut Canyon Channel at the junction with Gabbert Channel. Therefore, in the interim condition, it is necessary to attenuate the flow from this watershed (Subareas-44B thru-51D) in addition to the hydrograph attenuation provided by Basin-3. The Basin-2 watershed is largely rural, low-density developed ranchette land.

Basin-2 and Basin 2B were sized to capture and contain the calculated tributary debris volume (Total 5.88 ac-ft) in addition to the stormwater detention volume. Both basins will be incised below existing grade. The low-level outlet will be a 24" diameter RCP pipe that will discharge attenuated flow to Walnut Channel. The emergency spillway will be a drop spillway 24-ft long and 8-ft wide. Three 48" diameter RCP pipes will discharge emergency overflow from the drop spillway to Walnut Channel.

In the ultimate condition, this Basin-2 facility will be modified by the construction of North Hills Parkway. The embankment of the proposed extension of North Hills Parkway will reduce the available volume of Basin-2. This loss of volume will be regained by the construction of Basins 2A. In the ultimate condition, runoff from the Gabbert Canyon watershed will be attenuated by Basins 2, 2A, and 2B.

4.3 Hydrograph Fattening

Per recent requests of VCWPD staff reflected in a memo in March 2009, the Interim Condition models and Ultimate Condition model are based upon "fattening" the entire watershed upstream of each and all proposed basin facilities. This is a departure from the procedure used during the analysis of the adopted 1997 and 2005 addendum reports which are the watershed masterplan. In the adopted masterplan hydrology analysis the area tributary to Basin-2 was not fattened nor was Line-A tributary to Basin-3. This change in the hydrologic analysis procedure resulted in required revisions to the proposed basins and the associated hydraulic structures compared to the preceding version of this report dated January 2009.

The shape of the unit hydrographs developed using the modified rational method provided by VCRAT do not necessarily generate the correct effective runoff volume or net rainfall since the cumulative mass rainfall curves are averaged. The expected runoff yield based upon local point or isohyetal rainfall data compared to the computed runoff yield from the modified rational hydrograph will typically need to be adjusted to provide the same effective rainfall. This process, known as "fattening," results in modification to the shape of the calculated runoff hydrograph so the area under the hydrograph provides the desired effective or net rainfall. The correct amount of direct runoff volume is a critical factor for the storage routing analysis of detention basins and this required that the inflow hydrographs to detention basins generated from VCRAT were "fattened" prior to routing.

The proposed regional basin (Basin-3) will have two (2) inflow sources; one to be at the southeasterly extent (Walnut Canyon Channel) i.e. Line A, and the other located at the northwesterly extent from Hitch Ranch Watershed i.e. Line B . Therefore, in the hydrology model concentration point 35ab (Baseline Model) is a confluence point for two streams within Basin-3; Streams A and B. The Fattening factor for Basin 3 was computed based on the methodology provided by the VCWPD's memorandum for "Double-Fattening in VCRat**"**. Please see attached Appendix B for detailed fattening factor calculation for Basin 3 line A and B. Line A stream has an upstream basins that includes the regional basin "Basin 0" and Tract Basins "Basin # 1" and "Basin # 2". These three basins were build part of Tract 5187 improvements. These basins were fattened per county guidelines and fattening factor ware based on Tract No 5187 hydrology report prepared by Hall & Foreman. See Table 5 below for summary of yield factors for Basin - 3.

The proposed regional basin (Basin-2) will have two (2) inflow sources; one to be located at the northwesterly extent (future Basin -2A, proposed Hitch Ranch property), and the other at the Northerly extent (Basin 2B- Undeveloped rural area). Therefore, in the hydrology model the concentration at basin -54B is a confluence point for two streams within Basin-2, streams B (Basin -2B) and D. The inflow hydrograph for Basin 2B, located at the northerly extent of the basin -2 was fattened using a watershed yield factor of 2.95-inches. The fattened hydrograph is routed trough basin -2B and confluence with Line D at Basin -2. Therefore, the line D was also fattened with yield factor of 2.75-inches prior to confluence with basin-2. Please see Table 5 and 6 for summary of yield factors for Line A and Line B for Basin 3 and Appendix B for detailed calculation.

Table 5 - Runoff Yield Fattening Factor Calculations for Line A Basin-3

Based on SCS Procedure for Calculating Effective Runoff Volume

Node ID	Location	Basin ID	Tributary Area Ac	Outflow Vol in Acft

Total Area =	**104**	**Composite CN =**	**64.4**
		S =	**5.5**
		100-yr, 24-hr Precipitation, P(in.) =	**6.4**
		Runoff Volume, Q(in.) =	**2.6**

4.4 Areal Reduction

Per recent requests of VCWPD staff reflected in a memo in March 2009, the Interim Condition models and Ultimate Condition model utilize a weighted average Areal Reduction factor. This is a departure from the procedure used during the analysis of the adopted 1997 and 2005 addendum reports which are the watershed masterplan. This change in the hydrologic analysis procedure resulted in required revisions to the proposed basins and the associated hydraulic structures that were reflected in the preceding version of this report dated January 2009.

Areal reduction (AR) factors are typically used to scale down the peak flowrates calculated by VCRAT (VCWPD, 2006, page A-75, Exhibit 16). The total Walnut Canyon channel watershed area associated

with Tract-5217 is 1830 acres and at Basin 3 is 1078 acres. AR values for this study were based on Table 4.2 from the 1997 RBF study, "*Gabbert and Walnut Canyon Channels Watershed Flood Control Deficiency Study", which was approved by VCWPD.* Please see the Table 4.2 for AR values from 1997 study. Also AR values are applied per county guidelines, they recommended using AR at Basin 3 with factor of 0.955 and No AR applied at Basin 2. Also No AR factor applied at the Project site due to watershed size which is less than 600 ac.

5 Detention Basin Design

The geometry of the proposed detention basins was primarily governed by the physical constraints of the site location, the goal to maximize developable land, and an effort to coordinate with the current ultimate condition site plan for Hitch Ranch. The basin concept/configuration and general grading is an extension of the initial concept prepared as part of the planning effort of the Hitch Ranch Specific Masterplan. Portions of the northerly slope above the access road along the top of bank of the proposed basin are the ultimate condition slopes for future developments to occur on the Hitch Ranch site. It is necessary to construct some portion of this slope along with the interim condition basin in order to minimize or eliminate the risk of damaging the Basin-3 access road and north wall during ultimate condition grading of Hitch Ranch. The configuration of Basin-3 along the north slope would be the same in the interim and ultimate conditions.

In order to meet the downstream condition peak flow requirement, the interim condition Basin-3 was designed to operate as an extended detention basin with a 48" outflow pipe. The interim condition will have a larger footprint and storage volume than the ultimate condition Basin-3. The interim condition basin has a storage volume of 134.9 ac/ft and a footprint of 22.26- acres (water surface area). The interim condition basin requires a larger impoundment volume than the ultimate condition basin because the ultimate condition watershed masterplan facilities upstream of Basin-3 (Basin-1) have not been constructed yet.

The smaller proposed interim condition basin, Basin-2, will be located adjacent to Gabbert Road. Please see Figure 7-03 for proposed basin layout. This additional basin has a storage volume of 22.41 ac/ft and 4.42 acres of water surface area.

The smaller proposed interim condition basin, Basin-2B, will be located Northeast corner to Gabbert Road and future road North Hills Parkway intersection. Please see Figure 7-03 for proposed basin layout. This additional basin has a storage volume of 11.16 ac/ft and 2.35 acres of water surface area.

The proposed basins will be excavated below the existing grade. The side slopes will have a maximum of 3:1 (H:V) slope ratio. The basin invert longitudinal slope will be 0.5%. The cross slope of the invert from the toe of the side slope to the flowline at the invert will be 0.1%.

5.1 Proposed Basin Spillway and Low-Level Outlet Design

In the interim condition, Basin-3 will be an extended detention basin with a 24" low-flow outlet structure. The low-level outlet for the detention basins will provide the controlled release rate. The sizing of the facility was dictated by the required peak attenuation from the basin in order to achieve the target peak flowrate downstream. The hydraulics associated with the outlet works is a critical component that determines the operation of the detention basin and the effectiveness in attenuating the peak flow rate. The design of the outlet for the basin involved an optimization process to select the most effective outlet configuration based upon achieving the maximum attenuation within the physical constraints of the basin.

The evaluation of the storm hydrograph movement through a detention basin is performed through a reservoir routing analysis. Hydrologic routing using Modified Puls method was applied through VCHYDRO. The final simulation of the reservoir routing was performed in VCHYDRO combined with VCRAT in order to accurately compare the regional watershed impacts. Modified Puls method requires developing the stage-storage and stage-outflow relationships from known information on the basin geometry and outlet condition. The rating curves for the basin were developed based upon the proposed grading plan and the hydraulic performance of the 24-inch outlet pipe/culvert. The outlet pipe was analyzed using the FHWA culvert hydraulic analysis program HY-8 (see Appendix-E). The combined information provided the storage-indication relationship for reservoir routing.

Basin-3 will have a drop inlet emergency overflow weir spillway that will discharge overflow back to the Walnut Canyon Channel downstream of the basin via 6-48" diameter RCP pipes. (see Figure-7.9 and 7.10). The spillway was designed for the full 100-year peak flowrate tributary to Basin-3 (1040 cfs). In the event of an overflow with the 100-year peak flowrate (1040 cfs) the spillway would have 1-ft of freeboard to the top of slope of the basin. The spillway will be constructed of reinforced concrete and will include cut-off walls along the perimeter of the structure to reduce the likelihood of undermining and piping failures (see Figure 7.10). Table 7 provides a summary of the stage storage discharge for Basin-2.

The outlet works for Basin-2 will consist of a combination of low-flow outlet structure as well as an emergency overflow spillway. The low-flow outlet structure will be a 42" diameter outlet pipe, which was sized to provide the stage-discharge relationship favorable to the effective design of the basin. The low-level outlet will provide positive drainage from the basin at the desired rate above the debris volume. The debris volume was considered to be dead storage in the basin sizing calculations. The rating curves for the basin were developed based upon the proposed grading plan and the hydraulic performance of the 42-inch outlet pipe/culvert. The outlet pipe was analyzed using the FHWA culvert hydraulic analysis program HY-8 (see Appendix-E). The combined information provides the storage-indication relationship for reservoir routing.

Basin-2 will have a drop inlet emergency overflow weir spillway that will discharge overflow to the Walnut Canyon Channel downstream of the basin via 3-48" diameter RCP pipes (see Figure-7.5 and 7.6). The spillway was designed for the full 100-year peak flowrate tributary to Basin-2 (514 cfs). In the event of an overflow with the 100-year peak flowrate (514 cfs) the spillway would have 1-ft of freeboard to the top of slope of the basin. The spillway will be constructed of reinforced concrete and will include cut-off walls along the perimeter of the structure to reduce the likelihood of undermining and piping failures (see Figure-7.5 and 7.6). Table 8 provides a summary of the stage storage discharge for Basin-2.

5.1.1 Basin Stage-Storage Relationships

Stage-storage relationships for each basin configuration were determined based upon the grading plan prepared for each of the basins. The minimum basin floor elevation was either determined from (1) maximum height of the required debris storage for sediment, or (2) lowest elevation, which would still provide a gravity outlet. Stage-storage volume relationship for each basin site was derived as a discrete function or series of points. The surface area of each contour interval was determine, with the storage in any increment Δh equal to the product of the average area and the depth of the increment. See Table 6 and 7 above for Stage discharge relationship for Basin 3, Basin 2 and Basin 2B.

5.1.2 Estimated Debris Volume Generation

The required storage volume for debris basins or the dead storage allowances for detention basins that drain natural watershed areas is based upon the potential debris production or estimated "yield" from the watershed. VCWPD utilizes the formula developed by Dr. Kevin Scott from the USGS to calculate the estimated debris production rate, which is based upon drainage area, 24-hour precipitation, 10-day rainfall, slope failure, fire factor, and watershed shape. The following equation is used to calculate the debris production associated with different storm events:

$$SY = 17.54(A)^{0.828}(ER)^{1.382}(FF)^{0.251}(SF)^{0.375}K^{0.840}$$

where:

SY = Sediment yield (cubic yard)

A = Area of the watershed (square miles)

ER = Elongation ratio (equivalent diameter with watershed area divided by the maximum length of the channel)

FF = Fire factor (value dependent on time after watershed burn, 88 = 6 months after burn)

SF = Slope failure (area of watershed that is prone to landslides, acres per square mile)

K = Dimensionless rainfall factor (product of the square of the 24-hour precipitation and the 10-day precipitation)

Tributary watersheds to a detention basin that are less than five square miles must include allowance for debris storage, which is equivalent to 125% of the 100-year frequency design debris production (see Section 3.2.1 of VCWPD Manual) – The estimated debris volume generation is assumed level in the

basin as a dead storage volume before routing of the hydrograph. Basin-2 will have a dead storage volume dedicated to debris storage.

Table 11 – Debris Production

Sediment Yield, SY (Acft)	4.70	1.54
Design Sediment Yield, 1.25 SY (ac.ft)	**5.88**	**1.93**

6 Hydraulics

The proposed hydraulic structures and operation of the entire improved reach of the Walnut Canyon Channel system was modeled utilizing Hydraulic Engineering Center River Analysis System (HEC-RAS) developed by US Army Corps of Engineers (USACE). HEC-RAS provides several advantages over the hydraulic model that was previously utilized for this study (WSPG). HEC-RAS can be used to model the hydraulic response to a runoff hydrograph in an unsteady flow model. The results of an unsteady flow model more accurately reflect the actual watershed response to rainfall runoff. HEC_RAS also analyzes flow in the overbank areas where it occurs and results in a more accurate water surface profile. Also, HEC-RAS was utilized in the hydrology model for routing of the proposed detention basin-3 facility and for hydraulic model of the basin-3 inlet facility. Utilizing one program for each element of the analysis provides for a seamless and consistent transfer of data between hydrology and hydraulics. This approach was utilized to take advantage of the modeling capabilities provided by HEC-RAS in the analysis of unsteady flow with inline and lateral hydraulic structures.

6.1 Hydraulic Modeling – HEC-RAS

Due to the complexity of the proposed diversion structure at the inlet to Basin-3 and the need to preserve and accurately determine the split hydrograph volume at the Basin-3 inlet, it was necessary to use an unsteady state hydraulic model.

The unsteady flow simulation mode in HEC-RAS performs hydraulic analyses of conveyance systems accounting for channel storage within an analysis reach with regard to time. This procedure is commonly known as Storage-Indication Routing or Modified Puls Routing. The movement of a storm runoff wave or hydrograph down a channel is associated with a change in timing or attenuation of the wave and results in temporal and spatial variations of the hydrograph shape and peak ordinate(s) within a reach of channel or river. In general, the Storage-Indication Routing methodology is based upon and the area of a reach of channel representing the volume of water that fills the available volume within the channel reach over a specified time. Inflow exceeds the outflow of the analysis reach while the reach is filling. At some time, the inflow and the outflow are equal and the maximum channel storage within the channel reach is achieved. In the time subsequent to the filling time, the outflow exceeds the inflow and the channel reach empties. Within the channel reach there is channel storage due to wedge flow storage affects above the normal water surface. Wedge storage is ultimately related to energy losses due to friction that are expressed as a water wave above the normal water surface. This wedge storage affect within the channel results in the attenuation of the peak hydrograph ordinate. There is an associated lag in time that corresponds to the attenuation of the peak, which is expressed as translation. In the hydraulic model(s) provided in this report to support the design of the inlet structures this phenomena can be observed in the slight decay in flowrate as the hydrograph wave moves downstream.

The hydraulic model spans approximately 2,250 feet of the channel, starting downstream at channel station Sta. 67+50.00 and ending at channel station Sta. 90+00.00, just upstream of the inlet to Basin-3. A 100-year fattened hydrograph generated in VCRAT hydrology model at Node 32A was imported in to HEC-RAS model as an upstream boundary condition. At the inlet to Basin-3, the diversion structure splits the inflow hydrograph into a basin inflow hydrograph and a bypass hydrograph. The unsteady flow module in HEC-RAS provides a detailed accurate accounting of hydrograph manipulation as performed by the proposed inlet diversion structure(s) system. Using HEC-RAS, the hydrograph was then routed though lateral structures and inline structures at Basin-3 to analyze the shape of the diversion and bypass hydrographs at the inlet. This capability lent itself to combining the hydrologic analysis and hydraulic operation of the basin facilities. VCRAT does not provide the same capabilities and would leave it to the user to manually split the hydrograph. Once the hydrographs were split and verified for accuracy by superimposing the split hydrograph the inflow hydrograph for the basin, it was then transferred to VCRAT/VCHYDRO for basin routing using “imported hydrograph” option in VCRAT at node 33A for flow contained in the Walnut Channel at the downstream of Hanging wall (Sta. 85+39.00) and at node 38E - flow hydrograph diverted in to Basin-3. The bypass hydrograph, the hydrograph that does not enter

Basin-3, was imported back to VCRAT at node 33A as discussed above. This hydrograph was then routed in VCRAT to node 41AB where it was combined with the routed outflow hydrograph coming from Basin-3.

The results shown below and in Appendix-C indicate that in the existing condition the channel section walls from the basin inlet structure at station 86+00.00 upstream to channel station 90+00.00 would be overtopped and there would be flow in the overbank areas upstream of the Basin-3 inlet. In the existing condition, upstream of the proposed Basin-3 site the Walnut Channel does not have adequate capacity to contain or convey the existing condition peak 100-year flowrate within the confines of the channel. In order to prevent flooding in the overbank area from bypassing the Basin-3 inlet structure grading in the overbank area is provided in the vicinity of the inlet to trap the water upstream of the inlet and train the water back into the channel to be conveyed through the bifurcation of the Basin-3 inlet. Figure-x shows the proposed overbank grading that is provided as a part of this project to cut-off flooding in the overbanks at the Basin-3 inlet. In the ultimate condition, flooding of the overbanks upstream of Basin-3 will be mitigated by the construction of the Regional Basin-1.

The proposed condition HEC-RAS models downstream boundary does not correspond to the existing condition because the peak flowrate in the channel is drastically different (945 cfs Vs. 100 cfs) between the two conditions due to the proposed Basin-3 inlet structure. However, the upstream boundaries do correspond between existing and proposed conditions.

Table 122 – HEC-RAS Hydraulic Model Summary Table (Existing and Interim and Interim Condition 2 Profiles)

6.1.1 Hydraulic Modeling of the Basin-3 Inlet and Bypass Structure

The proposed window openings in the north channel wall were hydraulically modeled in HEC-RAS as lateral structures. The openings operate hydraulically as either lateral weirs or orifices depending on the depth of flow. When the flow depth is sufficient to submerge the entire perimeter of the window, opening it is an orifice. Prior to full submergence the flow through the window opening is weir flow. The general governing equations for both flow regimes are shown below:

Weir Equation $Q= CLH^{1.5}$

Orifice Equation $Q = CA(2gH)^{0.5}$

The presence of the “hanging walls” or “orifice walls” creates a backwater affect upstream of said walls at the location of the window openings. The backwater curve of the hydraulic grade line is observed in subcritical flow due to a downstream control converting kinematic energy via velocity head ($V^2/2g$) to potential energy via static head (y). This is observed as a reduction in flow velocity in the hydraulic model. The reduced flow velocity and increase in static head lend itself to the efficient operation of the sidewall openings and the rapid transition from weir flow to orifice flow.

The openings below the orifice walls represent a reduced flow area or constriction in the channel conveyance area. The backwater affect caused by the hanging walls, as discussed above, provides for the efficient hydraulic operation of the orifice openings below said walls. In HEC-RAS, the openings below the walls were modeled as short length culverts. Because of the short length and the constant base width between the channel upstream of the constriction and the opening at the constriction there is a strong correlation between the hydraulic results when the constrictions are modeled as “inline structures” and “culverts.” A comparison table of the hydraulic operation of the constricted opening below the orifice wall modeled as a culvert and as an inline orifice is provided below for review (see Table 13)

Table 13 – Inlet Structures

Station	Inline Structure	Opening Width ft	Opening Hight from Invert of the Channel ft	Q Discharge cfs
8554	Culvert	8.0	1.9	159
	Orifice	8.0	1.9	167
8539	Culvert	8.0	1.5	100
	Orifice	8.0	1.5	97

6.1.2 Verification with Ultimate Condition Tabled Flowrates

The 2005 Walnut and Gabbert Canyon Flood Control Deficiency Study became the approved watershed masterplan for this area. That report established performance standards for the ultimate condition regional watershed facilities. In order to reduce the "throw-away" cost associated with converting the proposed interim condition facilities to the ultimate condition in the future we have designed as much of the major facilities as possible to operate desirably in both conditions; interim and ultimate. The Basin-3 inlet structure is a large cost item so we have designed it such that there will be no necessary modifications to the facility when it is converted to the ultimate condition basin in the future. A hydraulic analysis was performed on the Basin-3 inlet structure to demonstrate how the system will operate when the ultimate condition Basin-1 improvements upstream of Basin-3 are constructed. The key parameter for verification of the function of the basin inlet structure is the limitation of 100 cfs maximum bypass. In previous studies it was established that a maximum flowrate of 100-cfs could come from the watershed upstream of Basin-3 in a 100-year event in order to ensure operability and containment of flows within the channel section of the Walnut Channel downstream of Basin-3. The hydraulic summary table shown below demonstrates the performance of the basin inlet structure using the ultimate condition peak flowrate tributary to the Basin-3 inlet (see Table 14).

Table 14 – Interim Condition vs HitchRanch Interim Condition and Ultimate Condition

6.2 Basin-3 Culvert Hydraulics

There are two (2) proposed culverts that will convey storm flows intercepted by the proposed Walnut Channel sidewall window openings to Basin-3. The downstream most culvert located at Walnut Channel centerline Sta. 85+46.06 will be an 8.0-ft x 3.5-ft (w x h) reinforced concrete box (RCB) section conduit. The upstream most culvert will be located at Walnut Channel centerline Sta. 85+81.79. This culvert will be a 4-cell 8.0-ft x 4.0-ft RCB. The proposed culverts will convey intercepted flow from the Walnut Channel to Basin-3. Each were hydraulically modeled as culverts using the procedures developed by The Federal Highway Administration (FHWA) in the manual titled, " Hydraulic Design of Highway Culverts"; FHWA-NHI-01-020. The culverts were determined to operate as "inlet control" facilities with normal depth occurring at or near the outfall from the culvert to Basin-3. The invert elevation at the downstream most extent of the proposed culverts would be located above the normal maximum 100-year water surface pool elevation. The impoundment water surface is hydraulically disconnected from the culvert in order to avoid creating a backwater situation in the culvert that could propagate upstream in the culvert to the Walnut Channel sidewall window endings. The culverts are also hydraulically disconnected from the window openings in order to avoid submerged weir affects created by backwater on the downstream side of the sidewall windows. The hydraulic analyses indicate that neither the inlet nor the outlet end of the culvert would be submerged in a 100-year event. The flow will pass through critical depth just downstream of the culvert entrance and flow supercritical in the barrel(s). The barrel flows partly full over its length, and the flow approaches normal depth at the outlet end.

The hydraulic analyses of each of these culverts were performed using the HY-8 software program developed by FHWA for analysis of highway culverts. HY-8 utilizes the procedures and equations discussed in the FHWA manual referenced in the text above. The hydraulic analysis results for each culvert are provided in Appendix-E.

7 Operation and Maintenance

Implementation of the recommended watershed drainage system improvements will require maintenance by VCWPD. Each component and facility proposed as a part of this flood control plan, both interim condition and ultimate condition, will be dedicated to VCWPD either in fee or via easements and agreements. Each proposed facility was designed with the intent to minimize long-term maintenance costs and maximization of long-term value as one of the main goals. Each facility to be dedicated to VCWPD has been designed to meet VCWPD minimum design standards. Through the permit and inspection process, each facility will be constructed to their minimum standards as well. The proposed detention and debris basins will require the periodic removal of trapped sediment and debris to maintain the required minimum storage volume.

7.1 Basin Maintenance Requirements

The typical maintenance requirements associated with detention basins include: (1) periodic inspection, (2) weed removal, (3) debris /sediment removal, (4) rodent control, (5) vector (mosquito abatement) control, (6) outlet structure and spillway inspection or repair for cracking, movement, seepage, and piping, (7) inspection or repair of embankment and slopes for seepage, piping, and instability, (8) access road and ramp repairs and (9) brush and vegetation management.

Subject: January 21, 2020 Hitch Ranch Meeting:
Responses to Draft VCWPD Review Comments Dated January 14, 2020
Hitch Ranch Hydrology Study Report 2020 Update February 12, 2020

Dear Mr. Vargas (Sergio):

On January 21, 2020 we met to go over your draft review comments regarding the report and supporting data provided as part of the Hitch Ranch Hydrology Study Report Update 2020 (August 2019, Revised December 2019).

The attached draft County letter was addressed to Harriet Rapista of Comstock Homes. Our responses to your draft review comments, and the corresponding changes are provided on the following pages.

Also enclosed with this submittal, are the following electronic files:

1. Hitch Ranch Hydrology Study Report 2020 Update - Main Report & Appendices (2-12-2020)
2. Hitch Ranch Hydrology Study Report 2020 Update - VCRAT Model Files (2-12-2020)

A paper copy of this letter, County letter, and the main report, along with a flash drive of the electronic files will be submitted by the end of the week.

Thank for the opportunity to provide our technical responses. If you have any questions or comments, please feel free to contact me or Rich Gleason at (651) 338-2862 or gleason@kasraieconsulting.com.

Sincerely,

Hassan Kasraie

Hydrology

1. **County Comment #1**: Existing condition Tc calculation for Subarea 31c used 18 ac, but VCRAT model uses 23 ac. Please revise materials as necessary.

   Response #1: Comment noted and addressed, see explanation below.

   Under the existing condition, Subarea 31c is 22.5 acres. Due to proposed grading, under the proposed condition Subarea 31c is reduced to 18.3 acres. The drainage area in the VCRAT models are correct.

   The calculated Tcs for existing conditions are revised accordingly. Adjusting the area did not result in a change in Tc for the 25- (12 min), 50- (10 min), or 100-year (9 min) events. The corresponding VCRAT models for these storms were not changed. The 10-year Tc changed from 11 minutes to 10 minutes. The 10-year VCRAT model was changed accordingly.

   Report appendices were also changed accordingly.

2. **County Comment #2**: VCRAT model for Interim and Ultimate Conditions appear to have switched the data for subareas 68c and 70c based on the Tc calculator results. Please revise materials as necessary.

   Response #2: Comment noted and addressed, see explanation below.

   The proposed Tc calculator files have been adjusted accordingly. The 100-year VCRAT Ultimate/Interim modeling did not need to be changed as both subareas had the same Tc of 8 minutes. The remaining events (10-, 25-, 50-) were modified with the correct Tc values.

   Report appendices were also changed accordingly.

3. **County Comment #3:** VCRAT model for Interim and Ultimate Conditions use a 100-yr TC of 8 mins for subarea 62c, but Tc calculator results show 9 mins. Please revise as necessary.

   Response #3: Comment noted and addressed, see explanation below.

   The 100-year Interim and Ultimate Condition VCRAT models were changed to be consistent with the Tc calculator results.

   Report appendices were also changed accordingly.

4. **County Comment #4:** Page 29, Section 6.1, Bullet 1. 100-year Ultimate/Interim Condition flows do not appear to be updated with the most recent modeling results.

   Response #4: Comment noted and addressed, see explanation below.

   The report was revised to be consistent with the VCRAT modeling.

5. **County Comment #5:** Page 33, Tables 11 and 12, Existing Condition Q100 values do not appear to be updated with the most recent modeling results. Table 12 last column is labeled with Interim but should be Ultimate.

   Response #5: Comment noted and addressed, see explanation below.

   The report was revised accordingly.

Hydraulics

6. **County Comment #6:** For regional basin (#3), the report stated that "the project will meet the 830-cfs RMP requirement (2005, 2009) of the post-project 100-year being contained within the existing WCC along LA Avenue" – page 1. However, the objective of the study shall be to use the feasible detention storage on Hitch Ranch Development to maximize the reduction of peak discharges to a level that is below the WCC channel capacity of 830-cfs during 100-year events.

   Response #6: Comment noted and addressed, see explanation below.

   The editorial change was made as requested:

   December 2019 – "The project will meet the 830-cfs RMP requirement (2005, 2009) of the post-project 100-year flow being contained within the existing WCC along Los Angeles Avenue."

   Revised 2020 – "The project will meet the objective of using available, feasible detention storage within the Hitch Ranch Development to maximize peak discharges to level that results in flows at or below the 830-cfs WCC channel capacity along Los Angeles Avenue. This is consistent with previous RMP requirements (2005, 2009)."

7. **County Comment #7:** To maximize the reduction of peak discharge requires optimization of basin operation and design. For example, different by-pass discharges (94 cfs, 100 cfs, and 136/139 cfs in this report) have been proposed in this and prior studies. Which one is the optimal by-pass discharge rate? Please explain why this study uses 136/139 cfs by-pass and not any other numbers. The chart below is from the 2005 report that having a 100-cfs by-pass.

Chart-2.4.1

Response #7: Comment acknowledged. During final design, further adjustments, maininting similar concepts may be made with stakeholder approval to increase optimization. See explanation below.

Where did 94- and 100-cfs by-pass values come from: Previous studies included a single model VCRAT that assumed a constant 100-cfs flow by-pass due to diversion modeling limitations within the software. This was deemed valid as this is a hydrologic feasability study. For consistency, a similar (single model) version was provided in this submittal using 94-cfs.

What is the optimal by-pass rate and why were the previous numbers not used? As recognized in the 2009 study, the "complexity of the proposed diversion structure at the inlet to Basin-3" required a more accurate accounting of the flow/volume split and corresponding timing. To do so, this study used both HydroCAD (to generate basin rating curves for a split VCRAT model/evaluate diversion/outlet configuratons) and HEC-RAS 2D (independent comparison used for feasability validation). The included configuration results in a ***139-cfs*** peak flow by-passing Regional Basin #3.

Optimization of Basin Design: Throughout discussions, multiple alternatives were discussed with County staff including the direct diverson of local Hitch Ranch runoff to WCC in order to maximize the use of available storage. Based on our review, the preliminary design included best optimized conditions within the physical/regulatory limitations and constraints while still meeting the required RFC and LFRs. It shows conceptual feasability.

Note: Table 8 in the report was revised from 136 to 139 cfs for consistency with the models.

8. **County Comment #8:** In table 8, page 23, total inflow (diversion + local) to Basin #3 is 1,183 cfs and peak outflow is 386 cfs. For an offline detention basin, it is more economically feasable if basin outflow is minimized.

   Response #8: The comment is noted, see discussion below.

   "Section 6.1 Considerations Needed to Meet RFC and LFRs" included in the report provides insight into the constraints of the overall system. As previously stated, the goal was to show conceptual feasability. Additional opportunities for optimization that continue to meet required RFC and LFRs may be explored during the design phase.

9. **County Comment #9:** It is not clear of the local inflow to Basin #3 is flow-through or is offline. To maximize the reduction in peak flow rate, an offline basin design is desireable. Please show conceptual low flow inflow structure and/or local flow diversion structure to Basin #3.

   Response #9: The comment is noted, see discussion below.

   What type of basin is Basin #3 (flow through or offline): Basin 3 is a combined flow-through (local drainage) and by-pass (diversion from WCC) facility.

   Offline Basin Design Desireable?: As stated previously, a local drainage by-pass had limitations due to uncontrollable downstream constraints.

   Please show conceptual low flow inflow structure and/or local flow diversion structure to Basin #3: A conceptual schematic of the proposed WCC to Basin #3 diversion structure is included in section 6.1.1 of the report. Currently there are no plans to divert/by-pass

local flows to WCC away from Basin #3. Specific details, plans, and hydraulic modeling of the local drainage (storm drain, catch basin/collection point, and street flow [required to safely carry flow toward basin above SD capacity]) will be provided as part of final design.

10. **County Comment #10:** For all detention and debris basins, please add stage/elevation-storage and stage/elevation-discharge tables and curves. Please show conceptual design of inlet and outlet structures and explain how the rating tables were developed.

    Response #10: Comment noted and addressed, see explanation below.

    For all detention and debris basins, please add stage/elevation-storage and stage/elevation-discharge tables and curves. *Although included in the appendices,* stage/elevation-storage and stage/elevation-discharge tables for the proposed detention basins were added to the main report (section 6.1.1). Basin 2B is a combination debris/detention basin. Debris volume is not included in the tables/curves. Debris basin outlet and storage curves will be provided in final design. However, the required debris volume calculations are included in section 5.1.5 of the report.

    Please show conceptual design of the inlet and outlet structures. As part of this feasibility analysis, the verbal description of the proposed inlet and outlet structures for the detention basins are included in section 6.1.1 of the report. Plans showing the inlet and outlet structure configurations will be included in final design.

    How were rating tables developed? Volumes were determined from the Tentative Tract Maps (TTM). Through an iterative process, rating tables used in VCRAT were generated in HydroCAD with estimated backwater in WCC from HEC-RAS 2D. VCRAT, HydroCAD, and HEC-RAS 2D all provide similar results.

11. **County Comment #11:** For detention basins #2 and 3, please include in the main report all inflow and outflow hydrographs.

    Response #11: Comment noted and addressed, see explanation below.

    Although previously included in the appendices, inflow and outflow hydrographs were added to the main report (section 6.1.1).

12. **County Comment #12:** The low-lying area between basins 3 and 2 is a floodplain of Walnut Canyon under existing condition and an open space under proposed conditions as shown in Figure 2 of the report. The area will still be flooded under developed conditions during 100-year events, as shown in the 2D model results below. Please explain how it will be used under developed conditions and if it will be removed from the 100-year floodplain. The District encourages multi-purpose uses, such as recreation, groundwater recharge, eco-system restoration and so on, of the floodplains or flood control facilities.

    Response #12: The comment is noted, see discussion below.

    What is the proposed landuse of the low lying area between Basin 2 and 3? Based on the most recent TTM it is to remain open space with the potential for use as water quality treatment. It is not intended to be used for flood storage. District preferences for multi-purpose uses are noted.

    Will the area be removed from the 100-year floodplain as shown in the HEC-RAS2D model? The HEC-RAS 2D model was meant to be a general verificaton of the hydrologic

modeling due to the sensitive nature of peak flow timing and downstream constraints. The low lying area will be drained and removed from the floodplain.

13. **County Comment #13:** Table 1, page 3, % of Watershed shall be % of project site.

    Response #13: Comment noted and addressed, see explanation below.

    The report was revised accordingly.

14. **County Comment #14:** Table 2, page 4, please add a column for acreage of each land use.

    Response #14: Comment noted and addressed, see explanation below.

    The report was revised accordingly.

15. **County Comment #15:** Section 4.4, #2, page 10, "a minimum freeboard of 2-feet must be provided above the top of the calculated, unattenuated flow over the emergency spillway", shall be a minimum of 3-feet freeboard. Please make a similar correction for Table 10, page 32.

    Response #15: Comment noted and addressed, see explanation below.

    General Discussion: The 2-foot freeboard value was based on previously approved projects. Based on January 21, 2020 discussions with County staff, this may be acceptable in some instances where there is sump (excavation) condition versus a levee condition. As this is a feasability study, additional description within the report was added to provide insight into the situation for each basin. Final emergency spillway freeboard values will be included in the design phase for approval by the City and County.

    Section 4.4, #2, page 10, "a minimum freeboard of 2-feet must be provided above the top of the calculated, unattenuated flow over the emergency spillway", shall be a minimum of 3-feet freeboard.

    The following change was made:

    December 2019 – "Based on recent detention design requirements on similar projects, the following County guidance was provided:

    1. *The emergency spillway must be designed to pass the unattenuated 100-year flow and is to be located at least 1-foot above the 100-year modeled design (through any primary/secondary outlets) water surface elevation.*
    2. *A minimum freeboard of 2-feet must be provided above the top of the calculated, unattenuated flow over the emergency spillway."*

    Revised 2020 – "Based on detention design requirements within the 1968 VCFCD (VCWPD) Design Manual, the following County guidance is provided:

    1. *The emergency spillway must be designed to pass the unattenuated 100-year flow and is to be located at least 1-foot above the 100-year modeled design (through any primary/secondary outlets) water surface elevation.*
    2. *A minimum freeboard of 3-feet must be provided above the top of the calculated, unattenuated flow over the emergency spillway.*

    Exceptions to the freeboard requirement for non-County facilities may be made at the discretion of County staff. These involve situations where the reduction in freeboard is unlikely to result in increased hazards. An example would be the situation where the 100-

year water surface elevation in a fully excavated basin is below the natural top of ground (non-levee situation). Similar, recent projects have used a 2-feet."

Please make a similar correction for Table 10, page 32: The change was made. An additional note was also made following the table (now Table 14):

"NOTE: This is not a County facility. Consistent with other recently approved projects that are similar, the freeboard requirement may be reduced in consultation with County staff during final design."

Hitch Ranch Specific Plan No 2019-01
APN(s) 511002011, 13, 16, 17, 17, 18, 19 and 511020022
Zone 3 Watershed Protection Project Number: WC2019-0053

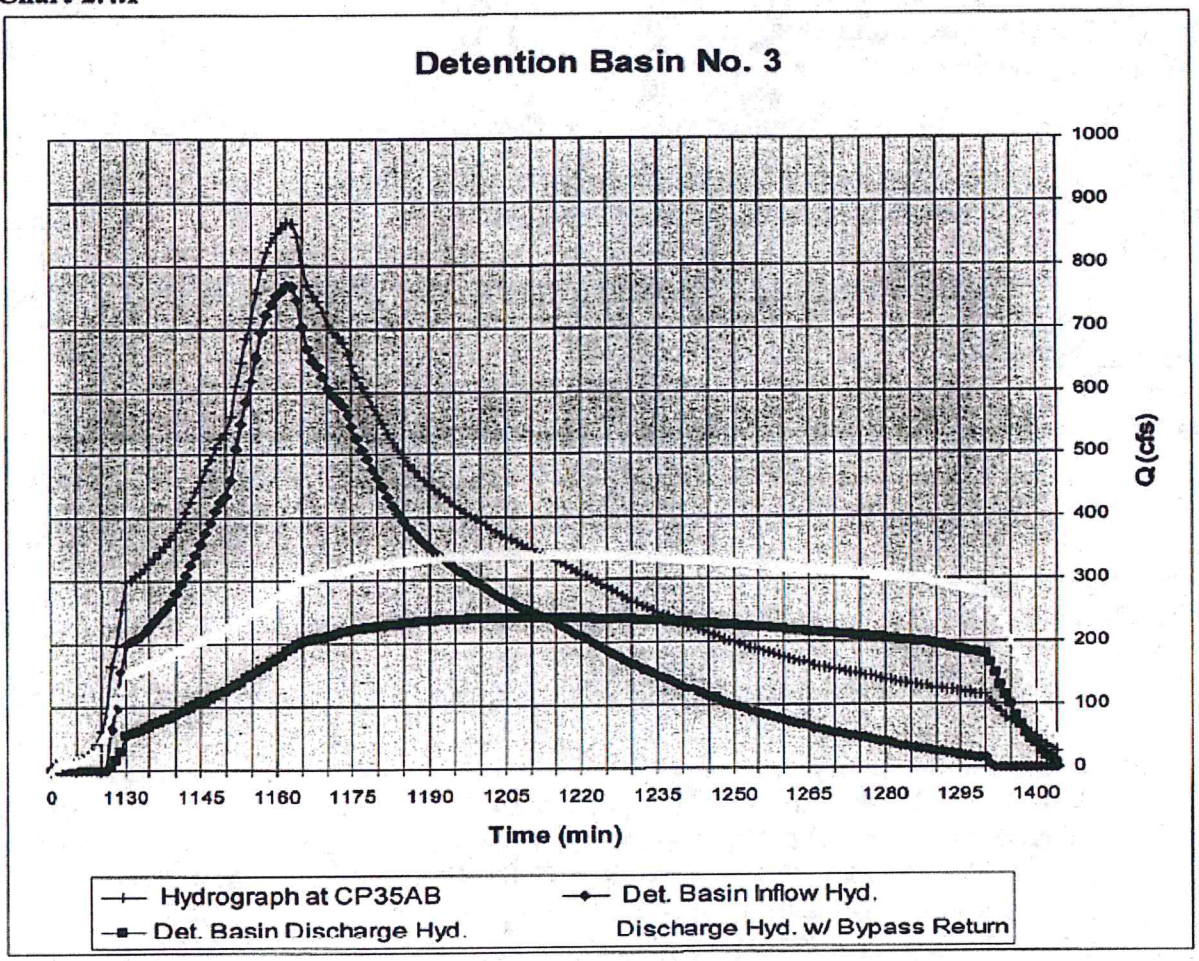
Dear Ms. Rapista:

The Ventura County Watershed Protection District (District) has completed its review of the Hitch Ranch Hydrology Study Report 2020 Update dated August 2019 Revised December 2019. Please address the following comments:

A. Hydrology

1. Existing condition Tc calculation for subarea 31c used 18 ac, but VCRat model uses 23 ac. Please revise materials as necessary.
2. VCRat model for Interim and Ultimate Conditions appear to have switched the data for subareas 68c and 70c based on the Tc Calculator results. Please revise materials as necessary.
3. VCRat model for Interim and Ultimate Conditions use a 100-yr Tc of 8 mins for subarea 62c but Tc calculator results show 9 mins. Please revise as necessary.
4. Page 29, Section 6.1, Bullet 1. 100-yr Ultimate/Interim Condition flows do not appear to be updated with most recent modeling results.
5. Page 33, Tables 11 and 12, Existing Condition Q100 values do not appear to be updated with most recent modeling results. Table 12 last column is labeled with Interim but should be Ultimate.

B. Hydraulics



6. For the regional basin (#3), the report stated that "the project will meet the 830-cfs RMP requirement (2005, 2009) of the post-project 100-year being contained within the existing WCC along LA Avenue" – page 1. However, the objective of the study shall be to use the feasible detention storage on Hitch Ranch Development to

Hall of Administration L #1600

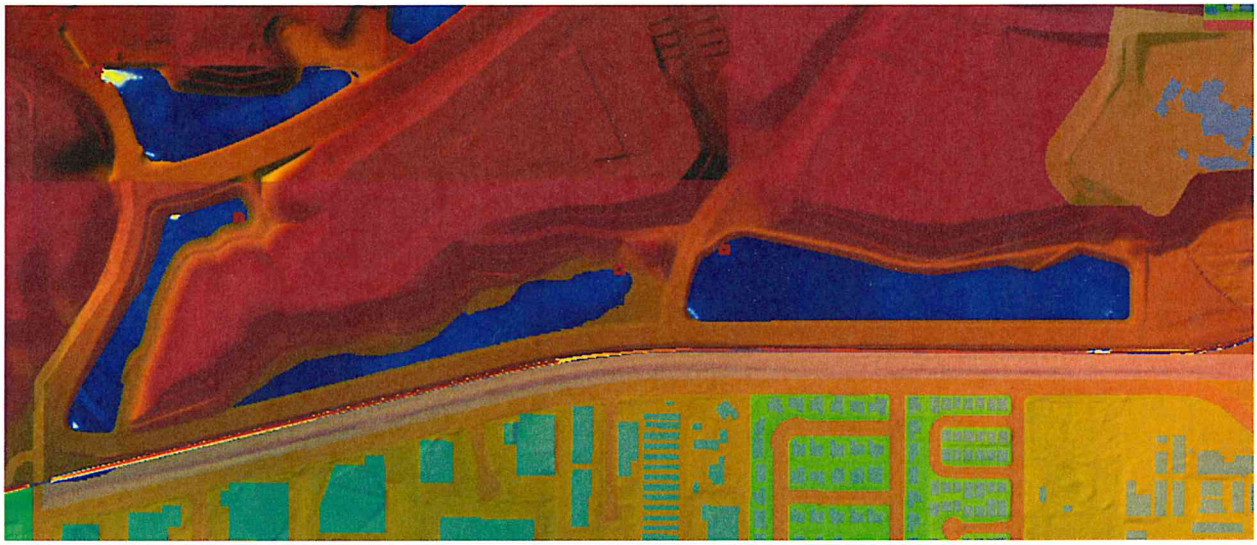
maximize the reduction of peak discharges to a level that is below the WCC channel capacity of 830-cfs during 100-year events.

7. To maximize the reduction of peak discharge requires optimization of basin operation and design. For example, different by-pass discharges (94 cfs, 100 cfs, and 136/139 cfs in this report) have been proposed in this and prior studies. Which one is the optimal by-pass discharge rate? Please explain why this study uses 136/139 cfs by-pass and not any other numbers. The chart below is from the 2005 report that having a 100 cfs by-pass.

Chart-2.4.1



8. In table 8, page 23, total inflow (diversion + local) to Basin #3 is 1,183 cfs and peak outflow is 386 cfs. For an offline detention basin, it is more economically feasible if basin outflow is minimized.

9. It is not clear if the local inflow to Basin #3 is flow-through or is offline. To maximize the reduction of peak flowrate, an offline basin design is desirable. Please show conceptual local flow inflow structure and/or local flow diversion structure to Basin #3.

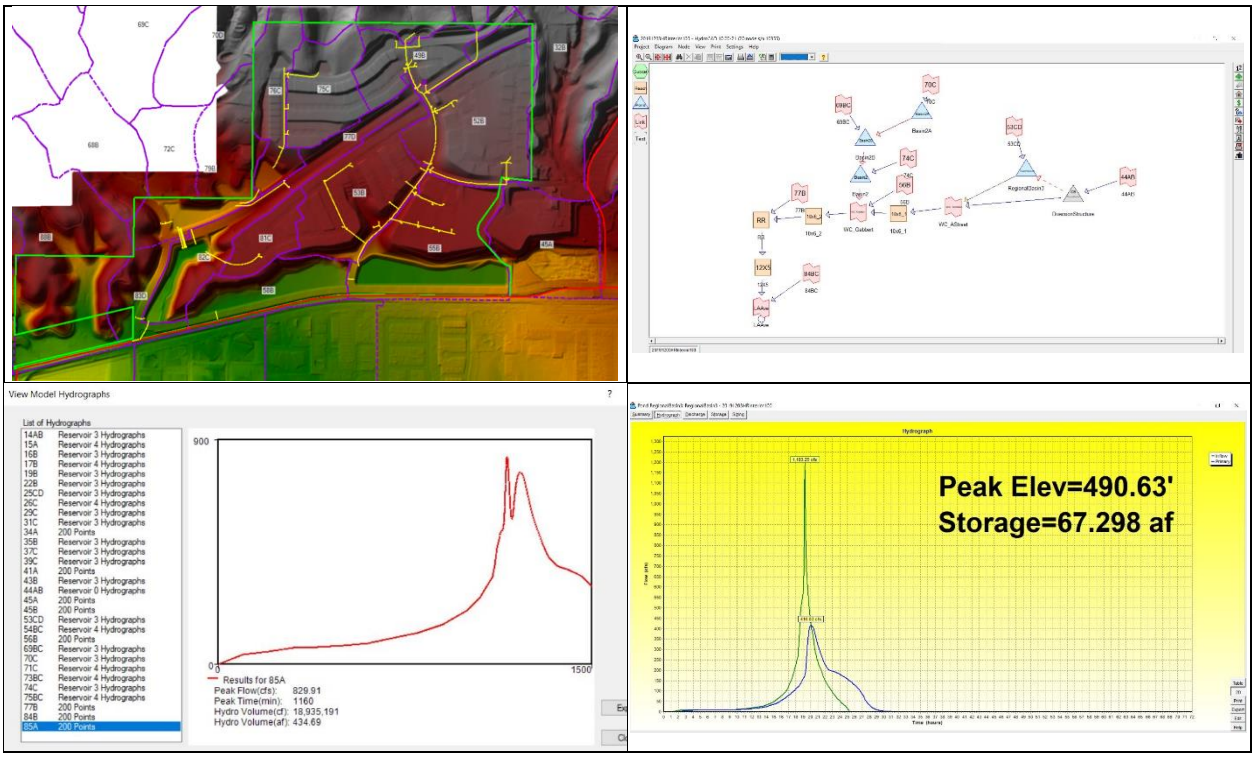
Hall of Administration L #1600
800 S. Victoria Avenue, Ventura, CA 93009 • (805) 654-2018 • FAX (805) 654-3952 • www.VCPublicWorks.org

10. For all detention and debris basins, please add stage/elevation-storage and stage/elevation-discharge tables and curves. Please show conceptual design of inlet and outlet structures and explain how the rating tables were developed.
11. For detention basins #2 and 3, please include in the main report all inflow and outflow hydrographs.
12. The low-lying area between basins 3 and 2 is a floodplain of Walnut Canyon under existing condition and an open space under proposed conditions as shown in Figure 2 of the report. The area will still be flooded under developed conditions during 100-year events, as shown in the 2D model results below. Please explain how it will be use under developed conditions and if it will be removed from 100-year floodplain. The District encourages multi-purpose uses, such as recreation, groundwater recharge, eco-system restoration and so on, of floodplains or flood control facilities.

13. Table 1, page 3, % of Watershed shall be % of project site.
14. Table 2, page 4, please add a column for acreage of each land use.
15. Section 4.4, #2, page 10, "*a minimum freeboard of 2-feet must be provided above the top of the calculated, unattenuated flow over the emergency spillway*", shall be a minimum of 3-feet freeboard. Please make similar correction for Table 10, page 32.

3' if have a berm (sudden failure)

If you have any questions, please call me at 805-650-4077 or Laurie Crain at 805-662-6821.



Sincerely,

1 Executive Summary

The purpose of the 'Hydrology Study Report - 2020 Update' is to present the results of 100-year and 10-year hydrology for the proposed Hitch Ranch Development project along Walnut Canyon Channel (WCC) in Moorpark. Please see Figure 1.

This study is consistent with the accepted 2005 Regional Master Plan (RMP) and the 2009 RMP Update for this part of the City of Moorpark. As stipulated in the RMP, a regional Detention Basin #3 is included along the main stem of the WCC, as well as three on-site local detention basins and related stormwater facilities.

The hydrology study report shows that the proposed local and regional drainage facilities will successfully meet the following drainage requirements:

1. The project will reduce the projected post-development 100-year flow to below the existing pre-development 10-year flow condition at the westerly project boundary along WCC;
2. The project will meet the objective of using available, feasible detention storage within the Hitch Ranch Development to maximize peak discharges to level that results in flows at or below the 830-cfs WCC channel capacity along Los Angeles Avenue. This is consistent with previous RMP requirements (2005, 2009).

Due to of the long history of this project, this 2020 Update builds upon the various hydrology studied in the 1997, 2005, and 2009 reports related to Hitch Ranch and the surrounding developments along WCC. Therefore, this study is considered the most up-to-date for this part of the WCC drainage system.

This project achieves mitigation for hydrologic and hydraulic deficiencies in WCC as identified in the RMP. Structural deficiencies in the downstream reaches of WCC and the Walnut-Gabbert drainage facilities are not addressed in this report.

The latest hydrology software from Ventura County Watershed Protection District (VCWPD) and other technical tools were utilized for this purpose. Hydrology is presented for three conditions; the Existing Condition with no Hitch Ranch Development in place; an Ultimate Proposed Condition with the Hitch Ranch Development and other upstream developments in place; and Interim Proposed Condition assuming a regional detention basin at Casey Road has not been constructed.

2 Background

2.1 Existing/Proposed Site Description

The Hitch Ranch project consists of the conversion of 277.3 acres of naturally vegetated open space to a mix of residential, open space, flood detention, and transportation land uses. It is located in southeastern Ventura County within the City of Moorpark, just north of Poindexter Road in between Walnut Canyon Road and Gabbert Road. Hitch Ranch lies within the Walnut Canyon watershed, which drains a low-lying portion of the Santa Susana Mountains south west into the Arroyo Simi and ultimately into Calleguas Creek. Figure 1 shows the general location of the Hitch Ranch project site.

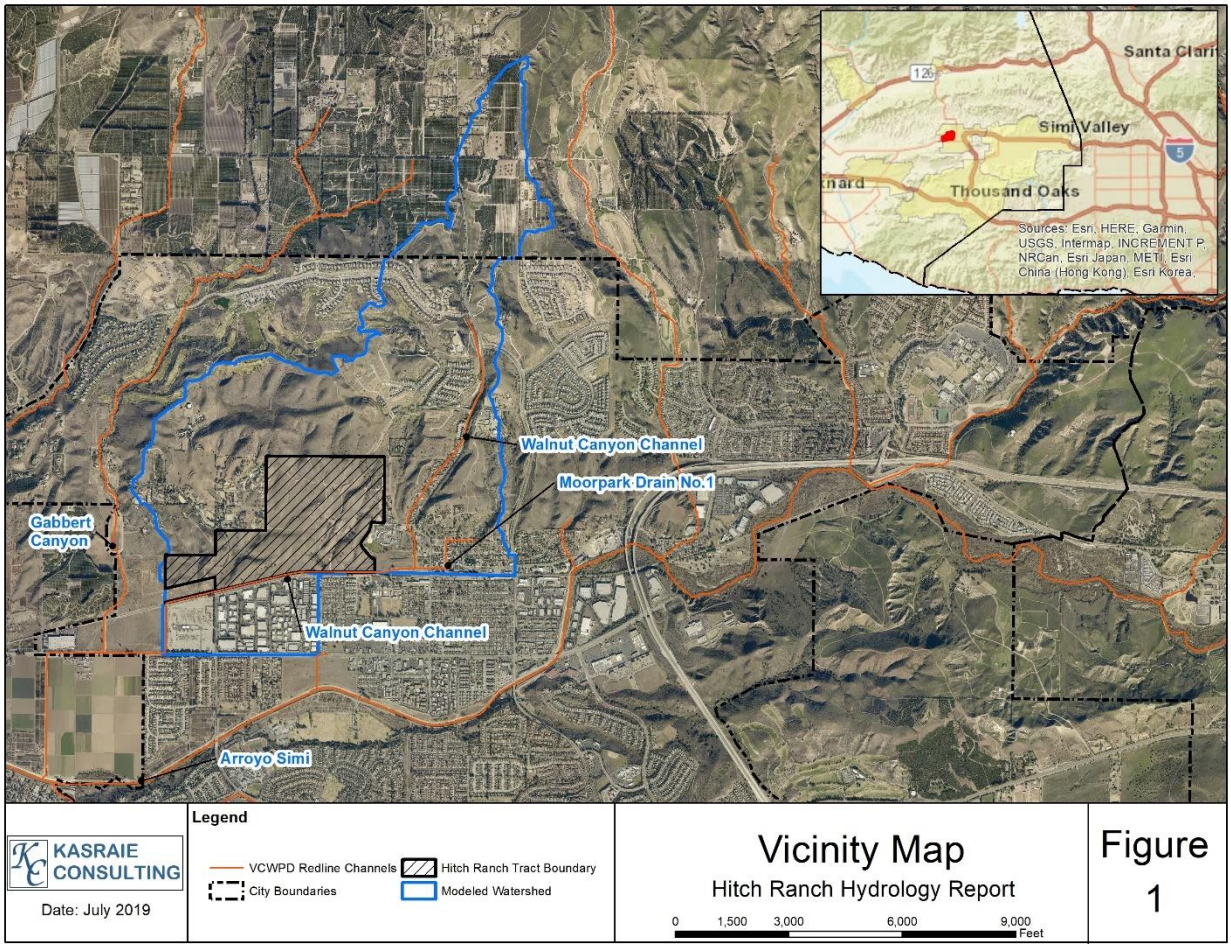

Figure 1: Vicinity Map

Table 1 and Figure 2, on the following page, outline proposed project and main land use categories based on tentative tract maps dated September 2019. Although these design features are not final, future concepts will maintain a similar configuration/percent impervious percentage.

Table 1: Proposed Site Land Use Summary

LAND USE	AREA (acres)	% OF PROJECT SITE
Single Family Dwelling (SFD, 328 Units)	46.9	16.9
Multi-Family Housing (Medium/High Density)	26.5	9.6
Open Space (32 lots)	104.1	37.5
Detention/Debris Basin (4 lots)	27.7	10.0
Park, Rec Space, Passive Rec Space	10.1	3.6
Private Streets	23.5	8.5
Public Streets	31.8	11.5
Not A Part	6.7	2.4
TOTAL	277.3	100

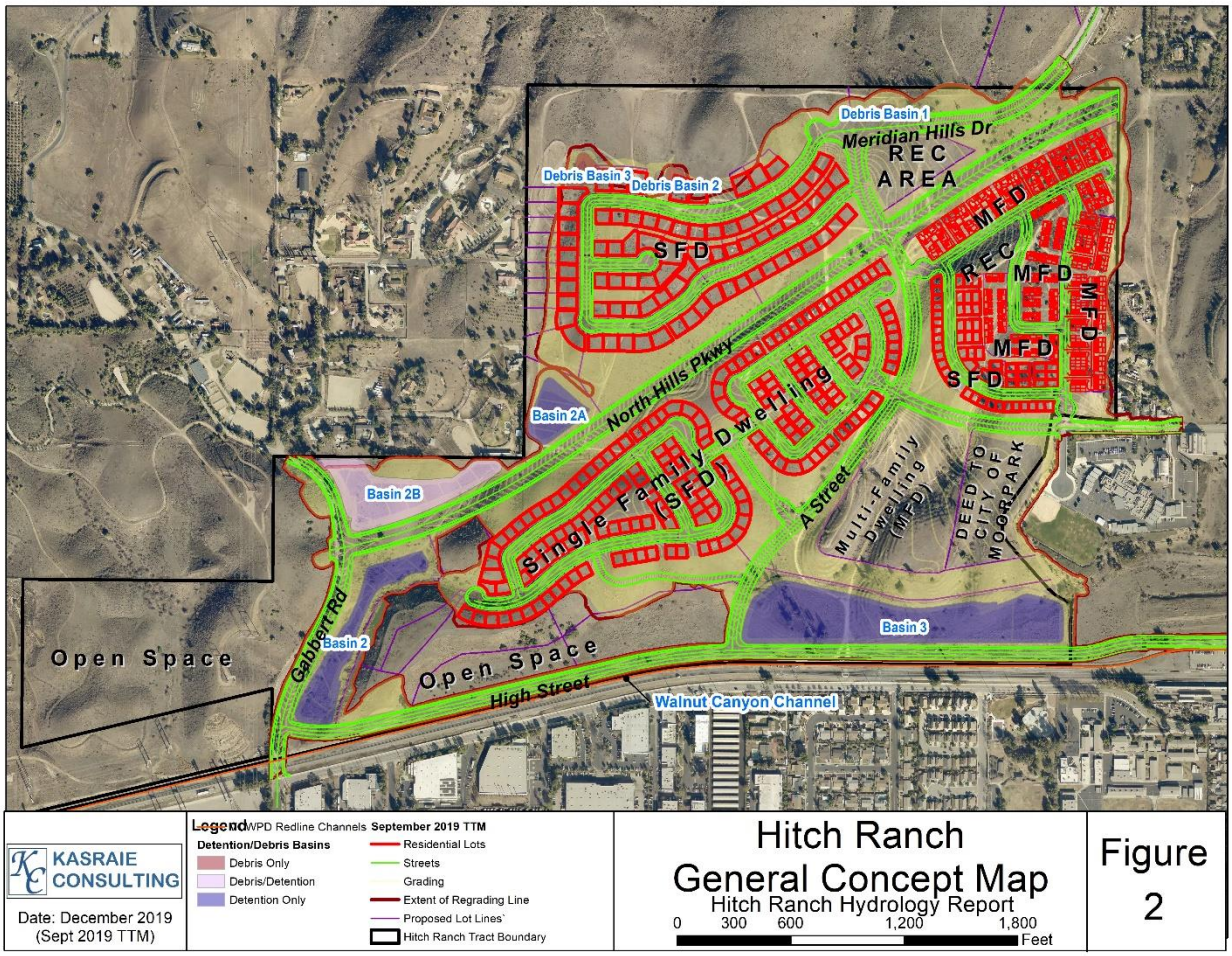

Figure 2: General Concept Map

2.2 Existing Watershed

2.2.1 Description

Walnut Canyon Channel (WCC) drains 2.8 square miles of the City of Moorpark south west approximately 2.3 miles prior to its confluence with Gabbert Canyon channel. This portion of the City lies in the foothills of the Santa Susana Mountains and terrain consists of moderate to steeply sloping hillsides. Approximately 54 % of the watershed remains undeveloped, with the remainder consisting of mixed residential, commercial, industrial, institutional, agricultural and transportation land uses. Table 2 provides a summary of watershed land uses.

Table 2. Walnut Canyon Watershed Land Use Distribution

LAND USE	ACRES	% of WATERSHED
Agriculture- Straight Row + Crop Residue Cover on >5% of surface	27.3	1.5%
Building/Parking Lot	2.2	0.1%
City Hall	3.1	0.2%
Commercial	9.0	0.5%
Detention	3.5	0.2%
Farmsteads- buildings, lanes, driveways, and surrounding lots (2)	22.4	1.2%
Forest	4.0	0.2%
Golf Course	76.8	4.3%
Grass/Yard/Open Space	2.2	0.1%
Industrial Parks, Paved Parking, etc.	107.9	6.0%
Industrial Unpaved Yards, etc.	41.7	2.3%
Library	0.5	0.03%
Open Spaces, Lawns, Parks, Golf Courses, Cemeteries, etc.	4.6	0.3%
Orchard or Tree Farm, 50/50 woods-grass	146.9	8.2%
Paved Streets with open ditches including right-of-way (3)/Transportation and utilities (3)	119.7	6.7%
Public Facilities & Institutions; Includes Schools, Government Centers, Military Bases, etc. (2)	17.5	1.0%
Residential	226.6	12.6%
Rural Building	3.1	0.2%
School/Asphalt	9.0	0.5%
Vacant	964.5	53.8%
Total	**1793**	**100.0%**

WCC was originally constructed by the Soil Conservation Service (currently Natural Resources Conservation Service) between 1959 and 1962 and it is currently owned/maintained by VCWPD. Downstream of the post office, WCC is a rectangular concrete channel running west for 1.25 miles parallel to the Union Pacific Railroad (UPRR) tracks. After passing Gabbert Road and the Southern California Edison (SCE) Plant, the channel veers south under the tracks to Los Angeles Avenue, adding two storm drain junctions from SCE, before it again turns west and picks up flows from a City 72" RCP. It terminates at its confluence with Gabbert Canyon Channel.

Channel depths range between 5 and 8 feet and base widths vary from 6 to 12 feet (see Table 3). Slope within this reach vary from 0.5 to 1.6 percent.

3 Previous Studies

Walnut Canyon Channel has been analyzed numerous times over the last 23 years to assess existing and proposed conditions. These studies are listed below:

- **Baseline Condition VCRAT Modeling [VCFCD/VCWPD, 1996]**
- **Walnut and Gabbert Canyon Channel Flood Deficiency Study [RBF, 1997]**
- Moorpark West Corporate Center Flood Protection Project – Walnut Canyon Regional Detention Basin [2003, PACE]
- FEMA Flood Insurance Study (FIS) – Includes Walnut Canyon Channel [Nolte, 2005]
- **Technical Addendum to Walnut and Gabbert Canyon Channel Flood Deficiency Study (Regional Master Plan) [2005, PACE]**
- Hitch Ranch Watershed Masterplan Study [2007, PACE]
- **Basis of Design Study, Commonwealth Studios – Interim Condition Flood Control Improvements, Walnut and Gabbert Canyon Watershed [2009, PACE]**
- Hitch Ranch Specific Plan Environmental Impact Report (EIR) [2011, PACE]
- FEMA Letter of Map Revision (LOMR) – Walnut Canyon Channel [2011, MRC]

Baseline modeling and subsequent deficiency/design studies in **boldface** provide preliminary conceptual level design alternatives; none of which have been adopted by specific ordinance. Each are described in more detail below.

3.1 Baseline Condition VCRAT Modeling [VCFCD/VCWPD, 1996]

100-year and 50-year VCRAT models of the entire Gabbert and Walnut Canyon watershed intended to represent a baseline condition in anticipation of flow changes due to future development. The 4,425-acre watershed was divided into 79 subareas ranging from 8 to 105 acres in size for VCRAT development.

3.2 Walnut and Gabbert Canyon Channel Flood Deficiency Study [RBF, 1997]

Ventura County Flood Control District (VCFCD, precursor to VCWPD) compared the flood conveyance capacity of the system to the modeled flowrates and determined that the Walnut and Gabbert Canyon flood control channels did not provide the desired level of flood protection. The limited hydraulic conveyance capacity of the existing channel system results in the flood protection deficiency which was documented in the *Walnut and Gabbert Canyon Channel Flood Deficiency Study (RBF, 1997).*

The 1997 study characterized deficiencies and developed a regional masterplan to increase flood protection levels. The plan proposed the implementation of various conveyance-oriented improvements as well as five regional detention basins. While the improvements were designed based on flows resulting from the 1996 land use conditions, it mandates future development

projects mitigate hydrologic impacts from their projects and include allowances for the proposed regional drainage facilities. The chosen, least cost alternative (B) included:

- Construction of a 300 cfs underground Shasta Avenue diversion channel near the current eastern boundary of Hitch Ranch taking flows directly south to Arroyo Simi.
- Separation of the Gabbert and WCC systems by creating a dedicated WCC trapezoidal channel outlet to Arroyo Simi.
- 140 ac-ft of detention storage within the WCC watershed.

This plan was superseded by the Technical Addendum to Walnut and Gabbert Canyon Channel Flood Deficiency Study (Regional Master Plan) [2005, PACE].

3.3 Technical Addendum to Walnut and Gabbert Canyon Channel Flood Deficiency Study (Regional Master Plan) [2005, PACE]

A 2005 Addendum to the 1997 study, referred to as the Regional Master Plan (RMP) from this point forward, similarly mandated that future development projects include allowances for regional flood control facilities and comply with local drainage requirements. This study revises the 1997 regional masterplan to incorporate improvements proposed in the Moorpark West Corporate Center Flood Protection Project – Walnut Canyon Regional Detention Basin prepared in March 2003 by RBF. RMP components are illustrated on Figure 3.

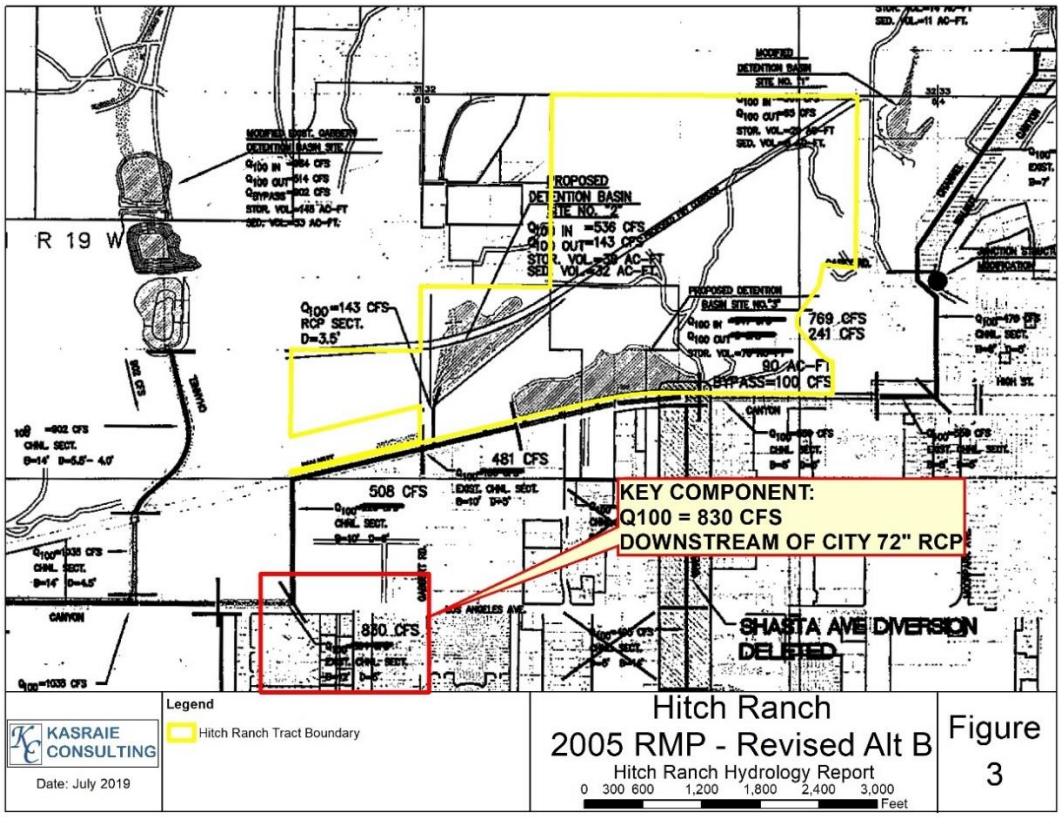

Figure 3: 2005 RMP – Revised Alternative B

The revised Alternative B includes:

- Elimination of the Shasta diversion channel and replaced it with 100 cfs by-pass between diversion from WCC to proposed Basin 3 and corresponding detention outlet back to WCC.
- Increased required storage in proposed Basin 3 from 70 to 90 ac-ft.
- Identified a target flow downstream of City of Moorpark 72" RCP, west of Southern California Edison (SCE) property was determined to be 830 cfs

3.4 Basis of Design Study, Commonwealth Studios – Interim Condition Flood Control Improvements, Walnut and Gabbert Canyon Watershed [2009, PACE]

A 2009 Update study *entitled Basis of Design Study, Commonwealth Studios – Interim Condition Flood Control Improvements, Walnut and Gabbert Canyon Watershed* [PACE] prepared for downstream Tract 5217 (immediately west of Southern California Edison property, adjacent to north and west bank of WCC) outlines their requirement to "construct offsite regional flood control improvements as discussed in the Walnut and Gabbert Canyon Watershed Masterplan approved June 2005" and that previous "owners of Hitch Ranch and Triliad Development have developed an agreement to allow Triliad to construct the proposed basin improvements on Hitch Ranch property". This would infer that there would be a cost sharing among benefitting parties. As of August 2019, Tract 5217 has not been developed.

4 Regulatory Framework

4.1 General Local Design/Hydrologic Mitigation Standards

New developments, such as Hitch Ranch, are commonly required to design localized mitigation for runoff flowing directly on or through their site. General regulatory guidance applicable to the project site include:

- City of Moorpark Municipal Code 17.76.050(76) Development standards states: "Drainage improvements must be designed so that after-development, drainage to adjacent parcels would not be increased above pre-development drainage quantities for any stormwater model between and including the ten (10) year and one hundred (100) year storms, nor will surface runoff be concentrated by this project."
- 2017 VCWPD Design Hydrology Manual: "To minimize the impacts of development on the existing drainage system, and in some cases to remedy existing drainage deficiencies, most Cities require that the consultant use detention to attenuate the 100-yr developed condition peak back to the 10-yr developed condition peak. For some watersheds with severe channel deficiencies, the mitigation goal has been the 10-yr undeveloped condition

peak. For the unincorporated County, the mitigation is normally no increase in flow for any design storm from the 10-, 25-, 50-, or 100-yr frequency."

4.2 Critical Additional Design/Hydrologic Mitigation Standards

During 2018-19, the developer and their consultants met with City and VCWPD staff, holding a series of discussions regarding the project. Updated existing condition and proposed condition hydrology including a regional detention basin (commonly known as Basin 3) peak discharge reduction concept similar to the 2005 RMP, along with a Hitch Ranch-Only mitigation measure involving local on-site detention basin facilities (following the general local design/mitigation standards outlined in the previous section) were provided.

After much discussion and collaboration, the Regional Detention Basin 3 concept was found to be the preferred alternative as it will provide the best opportunity to reduce peak discharges in the downstream reaches of WCC. The purpose of the remainder of this report is to demonstrate that the Hitch Ranch project, as shown on the May 2019 (amended July 2019) Tentative Tract Map (TTM), mitigates for local drainage impacts and supports Regional Flood Control (RFC) objectives and Local Flood Requirements (LFR) as outlined in the RMP (See Table 4).

Table 4: Regional Flood Control (RFC) Objectives and Local Flood Requirements (LFR)

Element		Governing Agency	Criteria
Performance Criteria	Regional Flood Control (RFC) Objectives	VCWPD	flood control components must be designed to achieve either 50-year conveyance in the channel with freeboard, or 100-year conveyance in the channel without freeboard but including super-elevation, whichever is greater
	Local Flood Requirements (LFR)	City of Moorpark	Proposed peak flows must not exceed existing flows leaving project site for the 10-, 25-, 50-, and 100-year storm events

Based on the required RFC and LFRs listed above, all designs are required to meet the following targets:

1. Reduce the projected post-development 100-year flow to below the existing pre-development 10-year flow condition at the westerly project boundary along WCC;
2. Meet the 830-cfs RMP requirement (2005, 2009) of the post-project (ultimate)100-year flow being contained within the existing WCC along Los Angeles Avenue.

This 2020 Update, Hydrology Study Report, builds on all the previous hydrology studies, and it presents a new and up-to-date picture of the drainage improvements that the community has requested of the developer and their consultants.

In addition, VCWPD informed the community that since acceptance of the 2005 RMP, WCC facilities have shown signs of severe structural failures. The 2005 RMP and subsequent 2009 design study only addressed downstream hydrologic and hydraulic deficiencies.

No other remedy is offered to address the existing structural failures in the downstream channels, as they are considered to be outside the control of the Hitch Ranch Development project.

4.3 California Division of Safety of Dams (DSOD)

Large dams that may have a higher potential for public safety hazard are considered Jurisdictional Dams and fall under the oversight of the California Division of Safety of Dams (DSOD). Dams that have:

- A dam height more than 6 feet and impounds 50 acre-ft or more
- A dam height greater than 25 feet and impounds 15 acre-ft or more

Dam height is defined as "the vertical distance measured from the lowest point at the downstream toe of the dam to its maximum storage elevation".

Jurisdiction Dams require significant additional design, construction, and maintenance costs. Designs should minimize the likelihood of this classification.

4.4 VCWPD Detention Basin/Outlet Design Requirements

Based on detention design requirements within the 1968 VCFCD (VCWPD) Design Manual, the following County guidance is provided:

1. The emergency spillway must be designed to pass the unattenuated 100-year flow and is to be located at least 1-foot above the 100-year modeled design (through any primary/secondary outlets) water surface elevation.
2. A minimum freeboard of 3-feet must be provided above the top of the calculated, unattenuated flow over the emergency spillway.

Exceptions to the freeboard requirement for privately owned and maintained (non-County) facilities may be made at the discretion of County staff. These involve conditions where the reduction in freeboard is unlikely to result in increased hazards. An example would be when the 100-year water surface elevation in a fully excavated basin is below the natural top of ground (non-levee situation). Similar, recent projects have used a 2-feet.

5 Approach

To demonstrate that the Hitch Ranch project provides appropriate mitigation measures to meet LFR and RFC objectives outlined in previous Regional Master Plan (RMP), hydrologic analysis of the Walnut Canyon watershed was developed and results were evaluated with respect to the above criteria. Modeling was completed using VCRAT (Ventura County Rational Method Hydrology Model, version 2.64.0.37) for the 10-year/100-year Existing and 100-year Interim/Ultimate conditions summarized in Table 5. 25- and 50-year events will be included in a subsequent hydraulic study that includes design of the on-site storm drain system.

Table 5: Modeled Conditions

Condition	Land Use	Basin Configuration
Existing	Existing land use, no development in HR	Includes Basins 0, 5187-1 and 5187-2
Interim	Proposed land use (includes Hitch Ranch and Essex developments)	Includes Existing Basins (0, 5187-1, 5187-2) plus Proposed Hitch Ranch Basins 2A, 2B, 2, and 3
Ultimate	Proposed land use (includes Hitch Ranch, Mansi[1], and Essex developments)	Includes Existing Basins (0, 5187-1, 5187-2), Proposed Hitch Ranch Basins (2A, 2B, 2, and 3) plus Basin 1 (located immediately north of Casey Rd and the Boys and Girls Club)

[1]No plans are available for Mansi, Percent Impervious was estimated at 45% based on Moorpark Community Economic Development Committee (CEDC) meeting notes/agenda (03/20/2013)

5.1 Hydrology Model Development

Hydrology models for this study were developed in VCRAT 2.64 based on an analysis of the most up-to-date spatial data.

5.1.1 Existing Condition

Subareas were delineated based on Ventura County 2005 LiDAR, H&H Report for Tract 5187 and City of Moorpark Storm Drain geodatabase. Soil numbers, imperviousness, time of concentration, routing, and rainfall parameters were spatially calculated using ArcGIS (V10.5.1) for each subarea within the modeled watershed based on the *2017 VCWPD Design Hydrology Manual* methodology. The final product is a single, contiguous model (Nodes 001A-085AB) for the 10-, 25-, 50-, and 100-year frequencies from the WCC headwater, through the confluence with 72" RCP at LA Avenue (adjacent to the Southern California Edison [SCE] property).

Key Existing Condition model features include:

- Two detention facilities located at nodes 002A and 035B were not included in modeling as it is unclear if they are built to flood control standards.

- The Meridian Hills Drive extension southwest through Tract 5187-2 significantly altered the existing topography. The ridge that formed the natural boundary, forcing drainage in the southeasterly direction, was removed. Based on plan 04-ML- 10748 (Sheet 11), the 100-year flow upstream of Meridian Hills Drive will be conveyed below the road through a 21' wide curb opening catch basin and 24" RCP (s = 0.4792). Road drainage will be captured by the same 24-inch RCP through two 7-foot curb opening catch basins (north and south side). Therefore, the previous flow pattern will be maintained. Subarea boundaries in this area were delineated based on this information. See Figures 4 and 5.

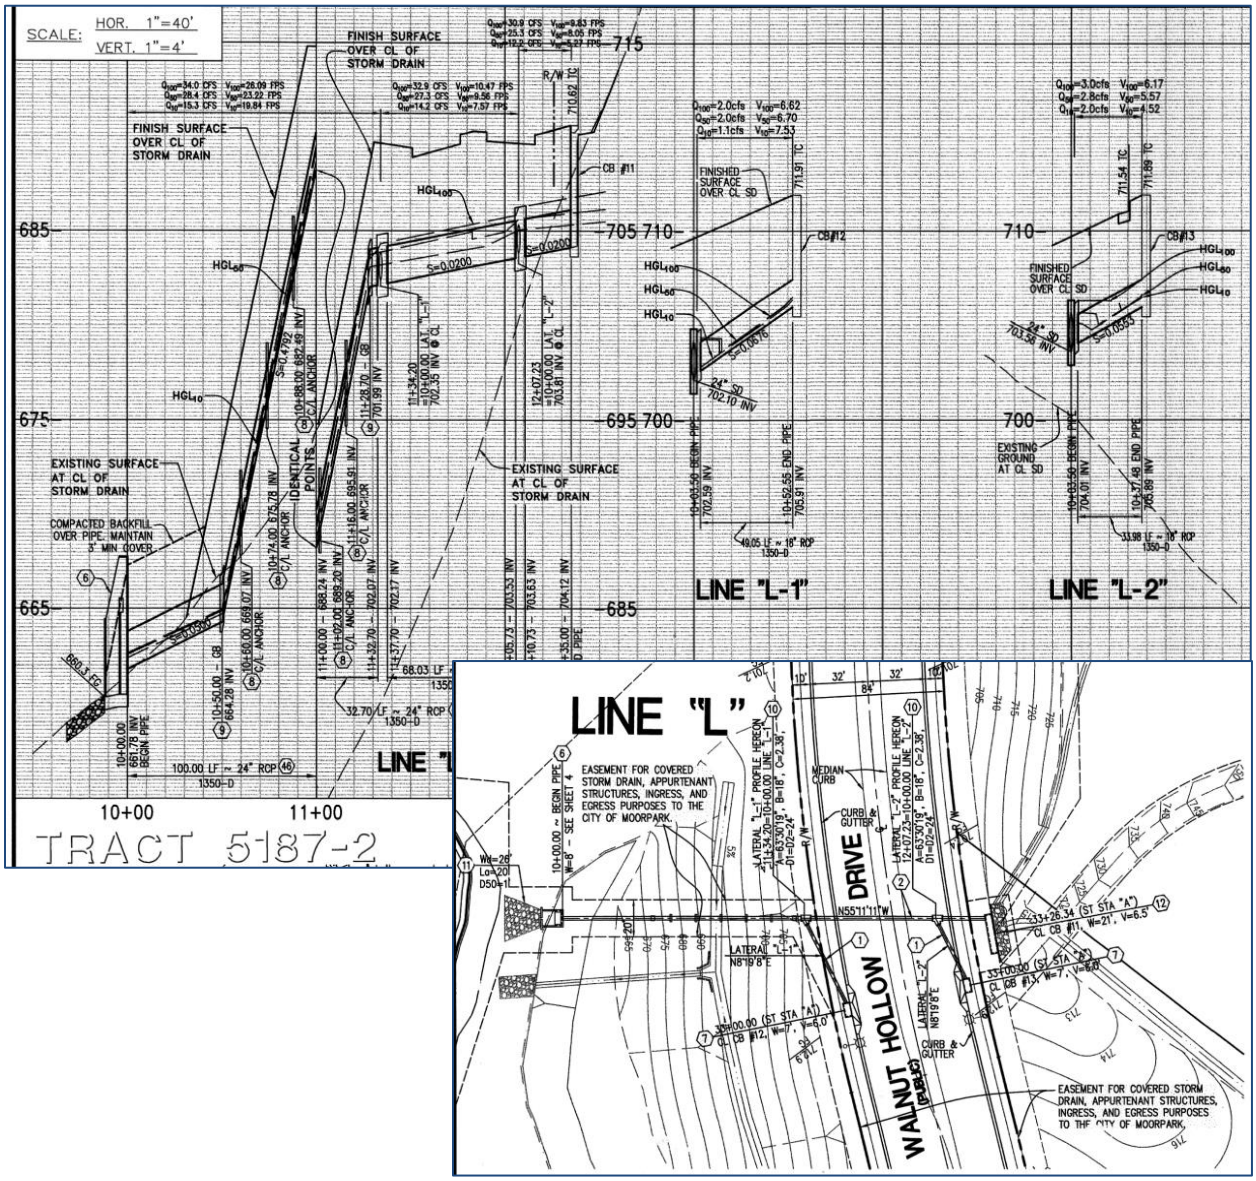

Figure 4: Meridian Hills Pkwy Extension (Plan 04-ML-10748, Sheet 11)

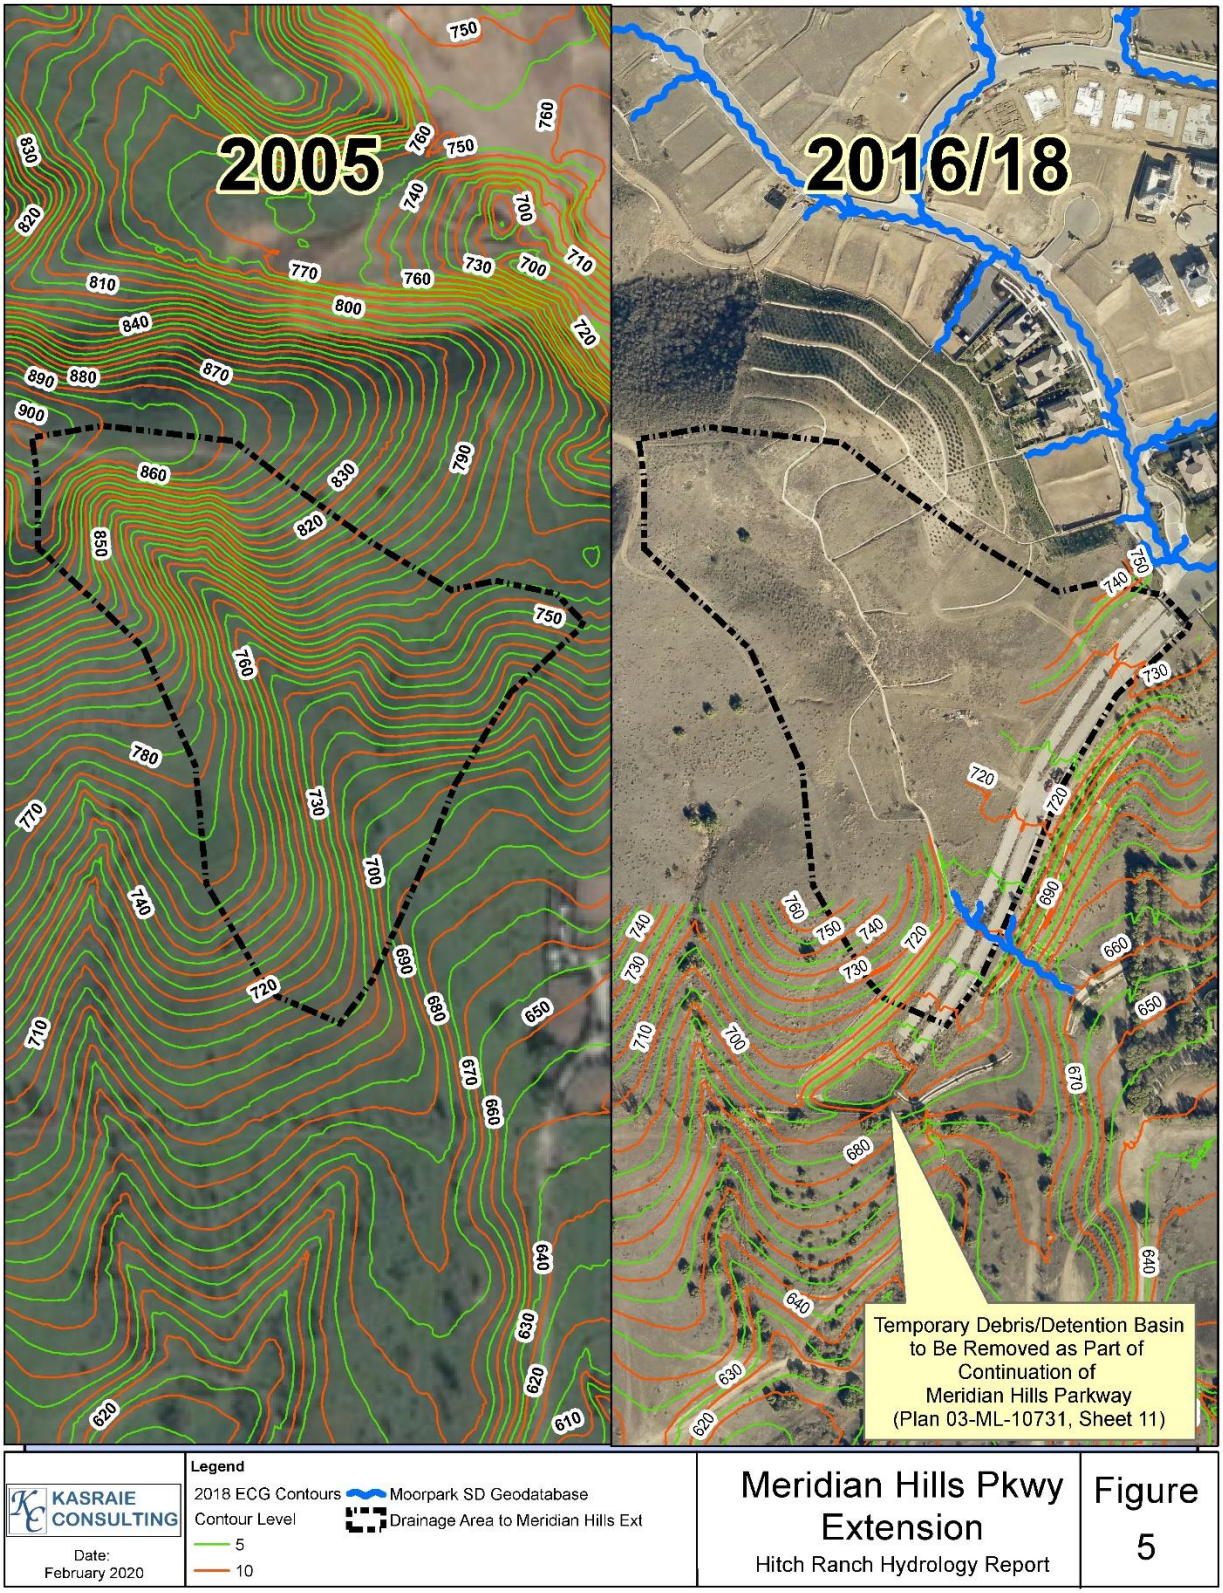

Figure 5: Meridian Hills Pkwy Extension Grading Comparison (2005 vs. 2016/2018)

5.1.2 Proposed Interim/Ultimate Condition

Subareas were adjusted/redelineated within Hitch Ranch and immediately adjacent properties based on May 2019 (amended July 2019) ECG Tentative Tract Maps (TTM). Soil numbers, imperviousness, time of concentration, routing and rainfall were spatially re-calculated. Minor design changes may occur throughout the permitting process, however **general flow patterns and overall percent impervious will not change significantly**. Modeling will be adjusted as part of the final design phase, if necessary.

Key Proposed Interim/Ultimate model features include:

1. VCRAT does not have the direct capability to model complex diversions or detention basins, therefore:
    - The hydrograph split at the diversion and basin outlet rating curves needed to be determined outside the program. HydroCAD (version 10.00-21) was chosen for this purpose due to the ease of modeling complex outlets while connecting the entire system. Hydrographs were exported from an initial VCRAT run for individual and/or linear series of subareas. They were then used as input into HydroCAD as a "Link".
    - Proposed Interim and Ultimate condition evaluations were each split into upstream (Nodes 001A-045A) and downstream (Nodes 045A-085AB) VCRAT models. Outflow hydrographs from HydroCAD diversion calculations were imported into the downstream model to represent the time dependent split.
2. To facilitate the analysis of other storm events, an additional single complete VCRAT watershed model was created to mimic the diversion using a constant 94 cfs by-pass. This is similar to previous RMPs.
3. VCRAT nodes were numbered such that they are the same upstream and downstream of Hitch Ranch. There are **no** changes in parameters for nodes 001A-028B, 032BC-042A, 058B-067BC, and 076AB-085AB.
4. For the Ultimate Condition, a 45% actual percent impervious was used within the proposed Mansi development (nodes 029C-031C). This had not been adjusted in the previous RMPs. Other differences from the Interim Condition include fattening of the incoming hydrograph and inclusion of the rating curve from 2009 *Basis of Design Study, Commonwealth Studios – Interim Condition Flood Control Improvements, Walnut and Gabbert Canyon Watershed* at Node 033B representing Basin 1 (not built as of 2019).
5. Two detention facilities located at nodes 002A and 035B were not included in modeling as it is unclear if they are built to flood control standards.

5.1.3 Parameter Estimation

Per VCWPD guidelines in the Hydrology Manual (VCWPD, 2017), hydrographs in the VCRAT models were fattened prior to reservoir routing at all detention basins (unless fattening resulted in reduced volumes).

A summary of VCRAT model input data sources and methods for parameterization is provided in Table 6. Additional details, background information and model input/output files can be found in the attached appendices.
10-/25-/50-/100-year Existing, Interim, and Ultimate Condition VCRAT output plots are in Appendices 2-4.

Table 6: VCRAT Model Assumptions

Model Component	Data Source(s)	Parameterization Approach
Subareas (Figures 6 and 7)	1) LiDAR Topography (County of Ventura, 2005) 2) Storm Drains (City of Moorpark, 2015) 3) Hydrology and Hydraulic Report for Tract 5187 (Hall & Foreman, April 2004)	Existing Conditions/Proposed Conditions US Walnut Canyon diversion: Previously modeled subareas (PACE 2009) were reviewed and updated in consideration of 5 ft LiDAR contours (County of Ventura, 2005) and the City of Moorpark's digitized storm drain layer. Proposed Conditions (Hitch Ranch): Within the Hitch Ranch parcel, subareas were delineated based on grading and storm drain infrastructure illustrated in Tentative Tract Maps dated May 2019 (amended July 2019) Unique Id = [HK_ID] was assigned to each subarea based on the final VCRAT model.
Rainfall (Figure 8)	1) Rainfall Zones/NOAA Rainfall Contours (NOAA, 2017) were downloaded from the County of Ventura	Model boundaries are entirely within the South Mountain to Moorpark rainfall zone, as defined by the NOAA 2011 analysis. The 24-hr 100-yr rainfall contours were used to create a rainfall depth TIN and grid. Area weighted total depths were assigned to each subarea [100y24h].
Soils (Figure 9)	Soils shapefile, County of Ventura, 2010	Area weighted soil numbers [Soilno]were calculated for each subarea in ArcGIS.

Table 6: VCRAT Model Assumptions

Model Component	Data Source(s)	Parameterization Approach
Time of Concentration (Appendix 1)	1) LiDAR Topography (County of Ventura 2005) 2) Hydrology and Hydraulic Report for Tract 5187 (Hall & Foreman, April 2004) 3) Storm Drains (City of Moorpark, 2015) 4) ECG TTM (May 2019, amended July 2019)	Existing Conditions/Proposed Conditions US Walnut Canyon diversion: Longest flowpaths were estimated for each subarea based on the available topography (2005 LiDAR and H&H Report Tract 5187) and storm drain layers in ArcGIS. Each flowpath was split into segment types (overland, natural channel, pipe, channel) and a corresponding drainage area was delineated. The VC Tc Calculator program (V 2.64.0.37) was used to determine subarea time of concentration values. Proposed Conditions (Hitch Ranch): The same procedure was used as existing, except the May 2019 (amended July 2019) TTM was used for areas within the proposed development.
Stage-Storage-Discharge Curves (included in HydroCAD and VCRAT Models)	1) ECG TTMs (May 2019, amended July 2019) 2) PACE 2009 modeling	Basins 0, 5187-1, 5187-2, and Basin 1: Based on PACE 2009 modeling. Basins 2A, 2B, 2 and 3: Hydrographs from individual and/or series of subareas draining to a proposed basin were exported from an initial VCRAT model and imported into HydroCAD (Build 10.00-21). Preliminary diversion and outlet structures were designed/optimized to meet project objectives. Corresponding rating curves (outlet) and hydrographs (diversion) were re-imported back into VCRAT. **Required debris volume at Basin 2B is not included in the hydrologic model – no double counting issue.**

Table 6: VCRAT Model Assumptions

Model Component	Data Source(s)	Parameterization Approach
Imperviousness (KC Impervious Layers, Figures 10 and 11)	1) Ventura County Parcel Layer (Downloaded Nov 2019) 2) Aerial Photograph (County of Ventura, 2016) 3) KC Sample Percent Impervious Calculations 4) Exhibit 14B, Design Hydrology Manual, VCWPD, 2017 (actual imperviousness) 5) ECG TTM (May 2019, amended July 2019)	Existing Conditions Layer: The latest Ventura County parcel layer was downloaded from https://www.ventura.org/gis-and-mapping/mapping-base/. Each parcel was assigned a [CNCLASS] category consistent with those in the 2017 VC Hydrology Manual. Actual percent impervious [R_PCTIMP2] was calculated for several sample residential parcels representing assigned [CNCLASS] within the WCC watershed and general vicinity. In general, the calculated value was higher than those found in the 2017 VC Hydrology Manual. The higher value was assigned. All other [CNCLASS] percent impervious values (commercial, industrial, …) were directly based on the actual percent impervious values in the 2017 VC Hydrology manual. Proposed Conditions Layer: The latest ECG TTM was split into impervious (pads, streets, multi-family buildings, parking areas, and sidewalks) and pervious areas (detention areas and open space) and used to replace the existing condition data. The proposed Essex parcel and adjacent property to the south was assumed to be developed similar to residential condos at 69% actual imperviousness. A grid for both conditions was created and corresponding area weighted percent impervious was calculated for each subarea. Based on the imperviousness grid was created and used to calculate a spatially averaged value for each subarea.
Fattening/CN Values (KC CN Layers, Table 7)	1) KC 2019 Impervious Layer 2) Soils shapefile, County of Ventura, 2010 3) Aerial Photograph (County of Ventura, 2016) 4) Exhibit 14B, Design Hydrology Manual, VCWPD, 2017 (actual imperviousness)	Curve numbers for each soil number [CN1]-[CN7] were assigned to each [CNCLASS] in the KC 2019 Impervious Layers (existing and proposed) based on the 2017 VC Hydrology manual. This data was intersected with the soils and a single [CN_FINAL] value was calculated for each feature. A CN grid was created for both existing and proposed conditions. Area weighted CN values were assigned to each subarea. For detention basins with no upstream storage facilities, a composite (area weighted based on all incoming subareas) CN and rainfall total was used in VCRAT to fatten the incoming hydrograph. For detention basins downstream of other storage facilities, individual subareas were fattened. Double fattening does not occur since all subareas were modeled off of the main lines (i.e. there are no nodes upstream of a subarea on the same line).

NOTE: Under existing conditions, the peak flow at 075BC is 441 cfs --- the proposed flow of 206 cfs is a 54% reduction from existing conditions.
At UPRR 10'x8' RCB	078AB	1623	N/A	703	703	0	346	346	N/A	2.56	N/A	N/A	NOTE: Under existing conditions, the peak flow at 075BC is 1576 cfs --- the proposed flow of 703 cfs is a 55% reduction from existing conditions.
At LA Ave/72" RCP Inflow to WCC	085AB	1792	N/A	830/857	830/857	0	427	427	N/A	2.86	N/A	N/A	NOTE: Under existing conditions, the peak flow at 075BC is 1857 cfs --- the proposed flow of 830-857 cfs is a 54-55% reduction from existing conditions.

[1]Total area to the diversion is 892 acres.

5.1.5 Debris Volume

For detention basins with tributary watersheds totaling less than five square miles, the volume required for debris storage is 125 percent of the debris volume expected from the 100-yr storm. This volume is assumed to be present in the basin at 0 percent slope prior to any flood routing.

Debris production is calculated in Ventura County based the following equation (Scott and Williams, 1974):

$$SY = 17.54(A)^{0.828} * ER^{1.382} * FF^{0.251} * SF^{0.375} * K^{0.840}$$

where:

SY = sediment yield in cubic yards

A = watershed area in square miles

ER = elongation ratio – ratio of diameter of a circle with the area of the watershed in square feet to the maximum watershed length

FF = fire factor – percentage of non-recovered vegetative cover in burned watershed, design conditions require that FF be determined based on the values recommended for 4.5 years after a fire (FF=20)

SF = slope failures – The area of the watershed in acres that is prone to slipping divided by the drainage area in square miles. Based on the 2005 RMP: "The debris production analysis prepared by VCFCD was performed using … *slope failure varied from 6 acres/square mile to 20 acres/square mile*,…". An SF = 20 was used for all watersheds. The California Geological Survey (CGS) Surveyed Slope Failure map (2017) shows a single 3-acre failure within the drainage area of Basin 2B (SF = 5.6) and no failure for the smaller debris basins. Using an SF = 20 is conservative.

K = dimensionless rainfall factor – Product of the square of the 1-day precipitation value and the 10-day precipitation value for a given storm frequency. Precipitation values used to determine the K factor are based on NOAA Atlas 14 which results in larger debris volume yields.

Note: The temporary debris basin for Tract 5187-2 shown on plan 03-ML-10731 (See Figures 4 and 5, Section 5.1.1) will be removed as part of the Meridian Hills Drive extension. All on-site flows and debris previously draining to this facility will be conveyed to proposed Debris Basin (facility) 2B1B. Several constructed v-ditch, catch basins, and storm drains (04-ML-10748, Sheet 11) were constructed to maintain the existing flow pattern prior to the construction of the existing portions of Meridian Hills Drive. Although shown to be adequate based on the calculations shown on the construction plans to carry the 100-year event, their capacity and function were not independently evaluated as part of this study.

Proposed debris basin results and locations are shown in the following table and figure.

Table 9: Debris Basin Yield Calculations

Basin	DB1A	DB1B[3]	DB2	DB3	Basin 2B
Area (ac)	31.2	10.5	29.1	8.0	343.2

Rainfall P24 hour (100 yr)	6.6	6.5	6.6	6.6	6.7
Rainfall P10 day (100 yr)	15.7	15.7	15.6	15.4	15.7
Rainfalll Factor (K)	677	671	679	664	700
Sediment Yield (CY)	2218	305	1243	467	7710
Sediment Yield (Acft)	1.4	0.2	0.8	0.3	4.8
Design Sediment Yield (Acft) = Sediment Yield x 125%	**1.7**	**0.2**	**1.0**	**0.4**	**6.0**

[1]Area prone to slipping was back calculated based on using a Slope Failure (SF) factor of 20
[2]Value based on CGS SSF (2017) = 3.0
[3]Due to the size of the drainage area and limited on-site space, either a debris basin or trash-rack with clean-out easement will be necessary

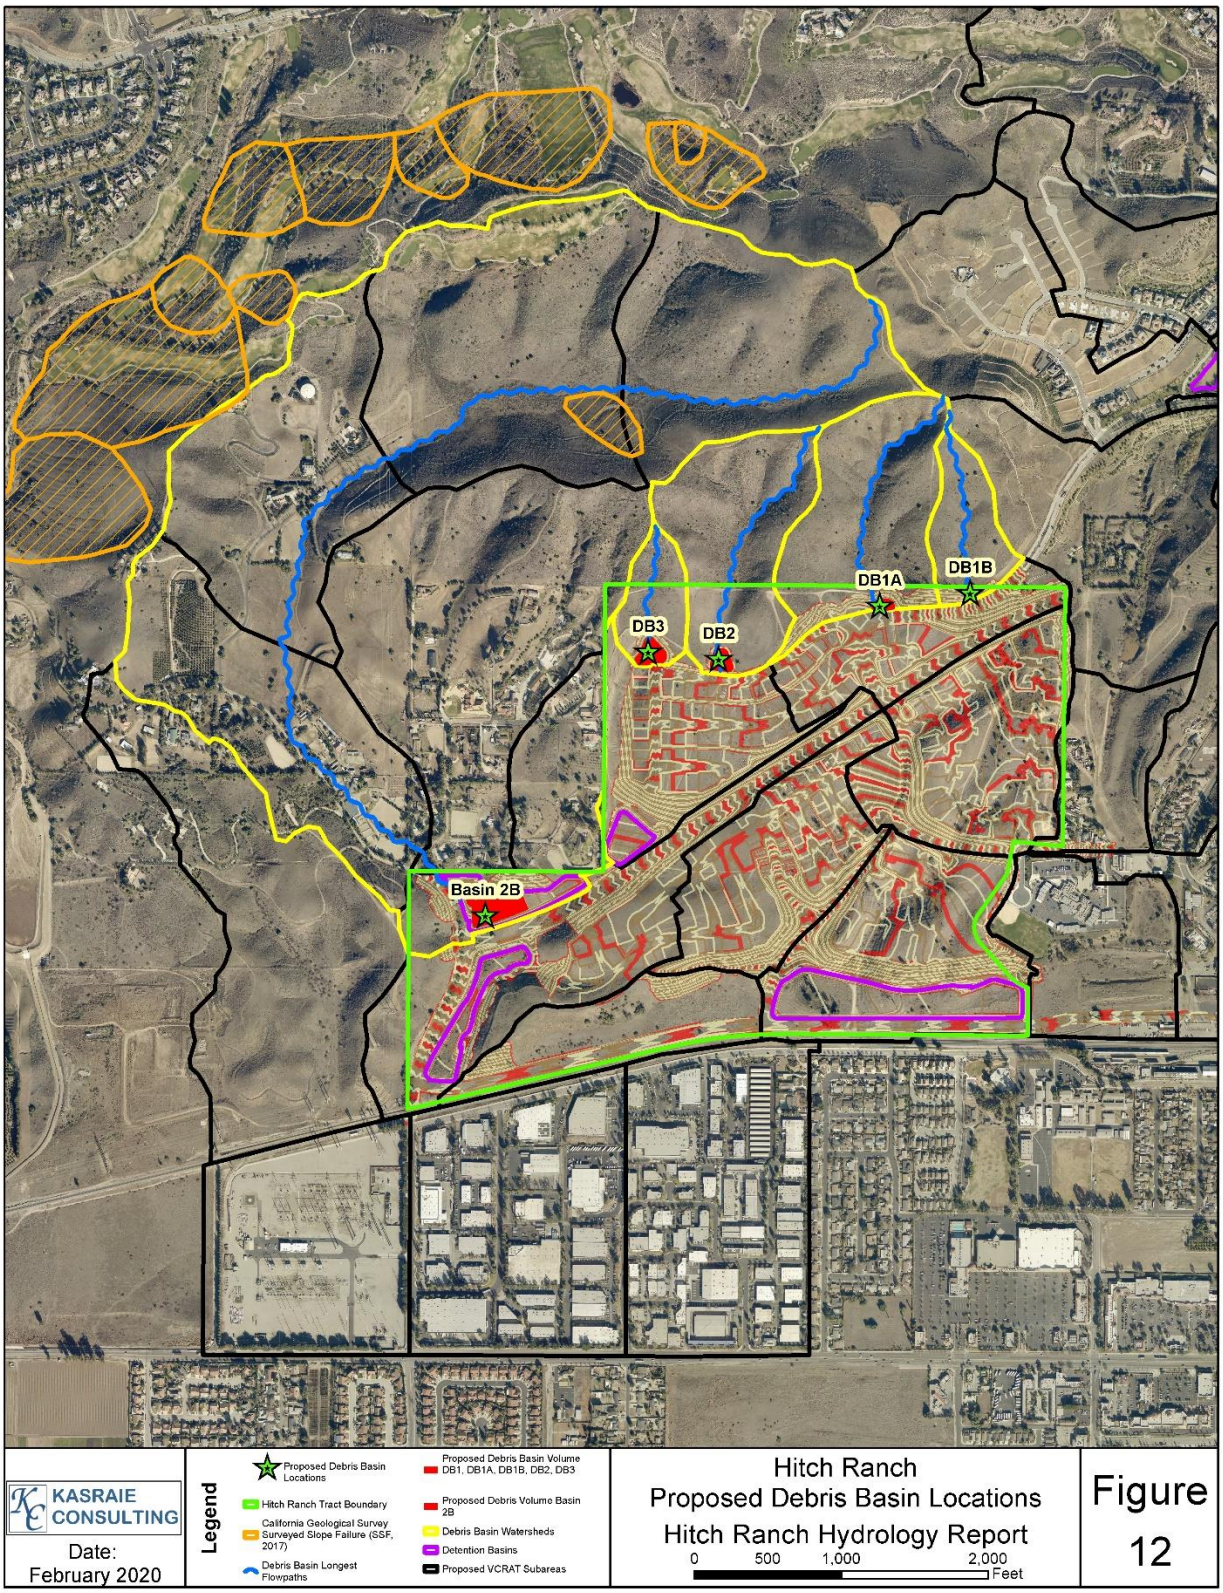

Figure 12: Proposed Debris Basin Locations

5.2 Model Validation

A HEC-RAS 2D (5.0.7) hydraulic model was created using 2018 topography, ECG May 2019 (amended July 2019) TTMs, and inflow hydrographs from VCRAT to internally verify the final hydrologic modeling due to potential backwater and timing constraints. It produced similar results. This model is included as part of this submittal, please see Chapter 7.

6 Hydrologic Design/Results

Four detention facilities are being proposed and were modeled to meet current requirements as identified in *Section 4 Regulatory Framework* section of this report.

6.1 Considerations Needed to Meet RFC and LFRs

The most critical RFC/LFR is the RMP (2005, 2009) requirement that any design results in the post-project 100-year flow being contained within the existing WCC along Los Angeles Avenue (LA Ave). This objective cannot be met by solely treating run-on (runoff that flows directly through the HR from other areas) and on-site flows. It requires the Hitch Ranch development to address off-site deficiencies within the framework of its own tract while addressing downstream features beyond its control (inflows near UPRR 10'x8' RCB and City 72" RCP). Issues include:

1. 100-year Ultimate/Interim Condition flows immediately upstream of Hitch Ranch (Node 044AB) are 797 and 916 cfs. These calculated flows are near or above the target flow of 830 cfs without any addition of attenuated, on-site Hitch Ranch flows to the system. Any added inflow, including the local subarea (77B, 85 cfs) would violate the RMP requirement. Therefore, a portion of upstream flows must be diverted and detained in addition to the on-site runoff (Regional Basin 3). **This is the basis for needing a diversion structure.**
2. 100-year Ultimate/Interim incoming volume (Node 044AB) of flow upstream of Hitch Ranch is 255 and 253 ac-ft respectively. It is not feasible for the entire amount to be detained; therefore, a portion will need to be allowed to by-pass Basin 3. Potential detention basins and outlets need to be optimized to ensure constructability while meeting the downstream target. **This is the basis for the needing a by-pass.**
3. Conceptually, if "no runoff" is allowed into WCC upstream of Gabbert Road, the peak flow at LA Avenue is 454 cfs (Node 085AB) at 19.32 hours into the model. Therefore, upstream flows are limited to 376 cfs at the same time (19.32 hours) which would require time to peak of released flows to be shifted. If 100 cfs flow upstream of HR is allowed to remain in the channel, then the peak at LA Ave is 552 cfs. **This is the basis for limitation, optimization, and lag of outlet flows from the detention basins.**
4. A single, primary outlet must be designed to limit outflow and provide adequate lag while minimizing required detention. Optimizing all three functions is difficult due to the stringent downstream requirement and magnitude of upstream, off-site flows. A dual-outlet system splits the functions such that the primary outlet controls the lag while the secondary controls the impoundment size. This division provides more design flexibility. **This is the basis for a dual-outlet.**

These constraints were outlined in the previous RMPs and lead to a similar conceptual conclusion:

1. A diversion structure at the upstream (eastern) HR boundary will need to be optimized such that flows above a certain threshold are sent from WCC to Regional Basin 3 while the remainder by-passes and continues downstream.
2. Proposed Basins 2 and 3 need to provide a significant lag in peak such that the majority of the flow in the downstream area has passed through the system.

Note: This is preliminary hydrologic design and does not include infiltration of a dead storage area with a low-flow outlet.

6.1.1 Diversion/Outlet Design (12/02/2019)

An in-line 8'x2' (rectangular orifice) hanging wall will be used to create backwater/head diverting flows (>139 cfs) through 6-9.0'x2.5' rectangular side orifices from WCC to Basin 3.

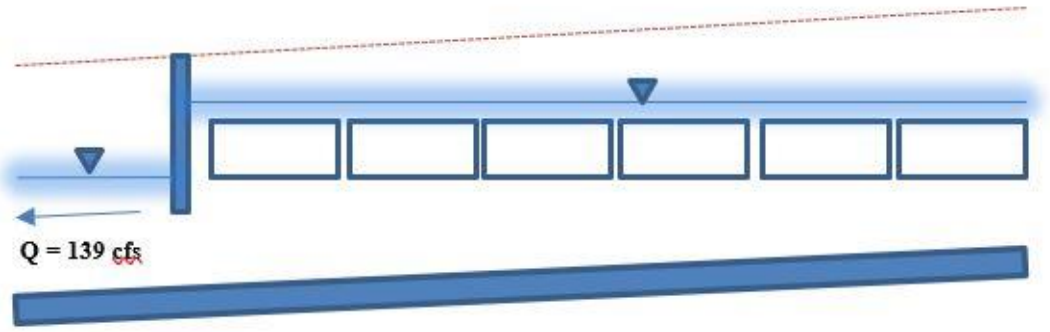

Figure 13: Conceptual Diversion By-pass to Basin 3

Multiple outlet works configurations were initially designed and evaluated (including those from previous efforts) using the current hydrology and available storage (based on May 2019 TTM, revised July 2019) to meet the RFCs/LFRs. The following are descriptions of a selected configuration with the initial outlet works design for each basin. Note that dimensions may be altered to fit standard and/or prefabricated components where necessary during final design. At that time the modeling will be adjusted to reflect the final component plans.

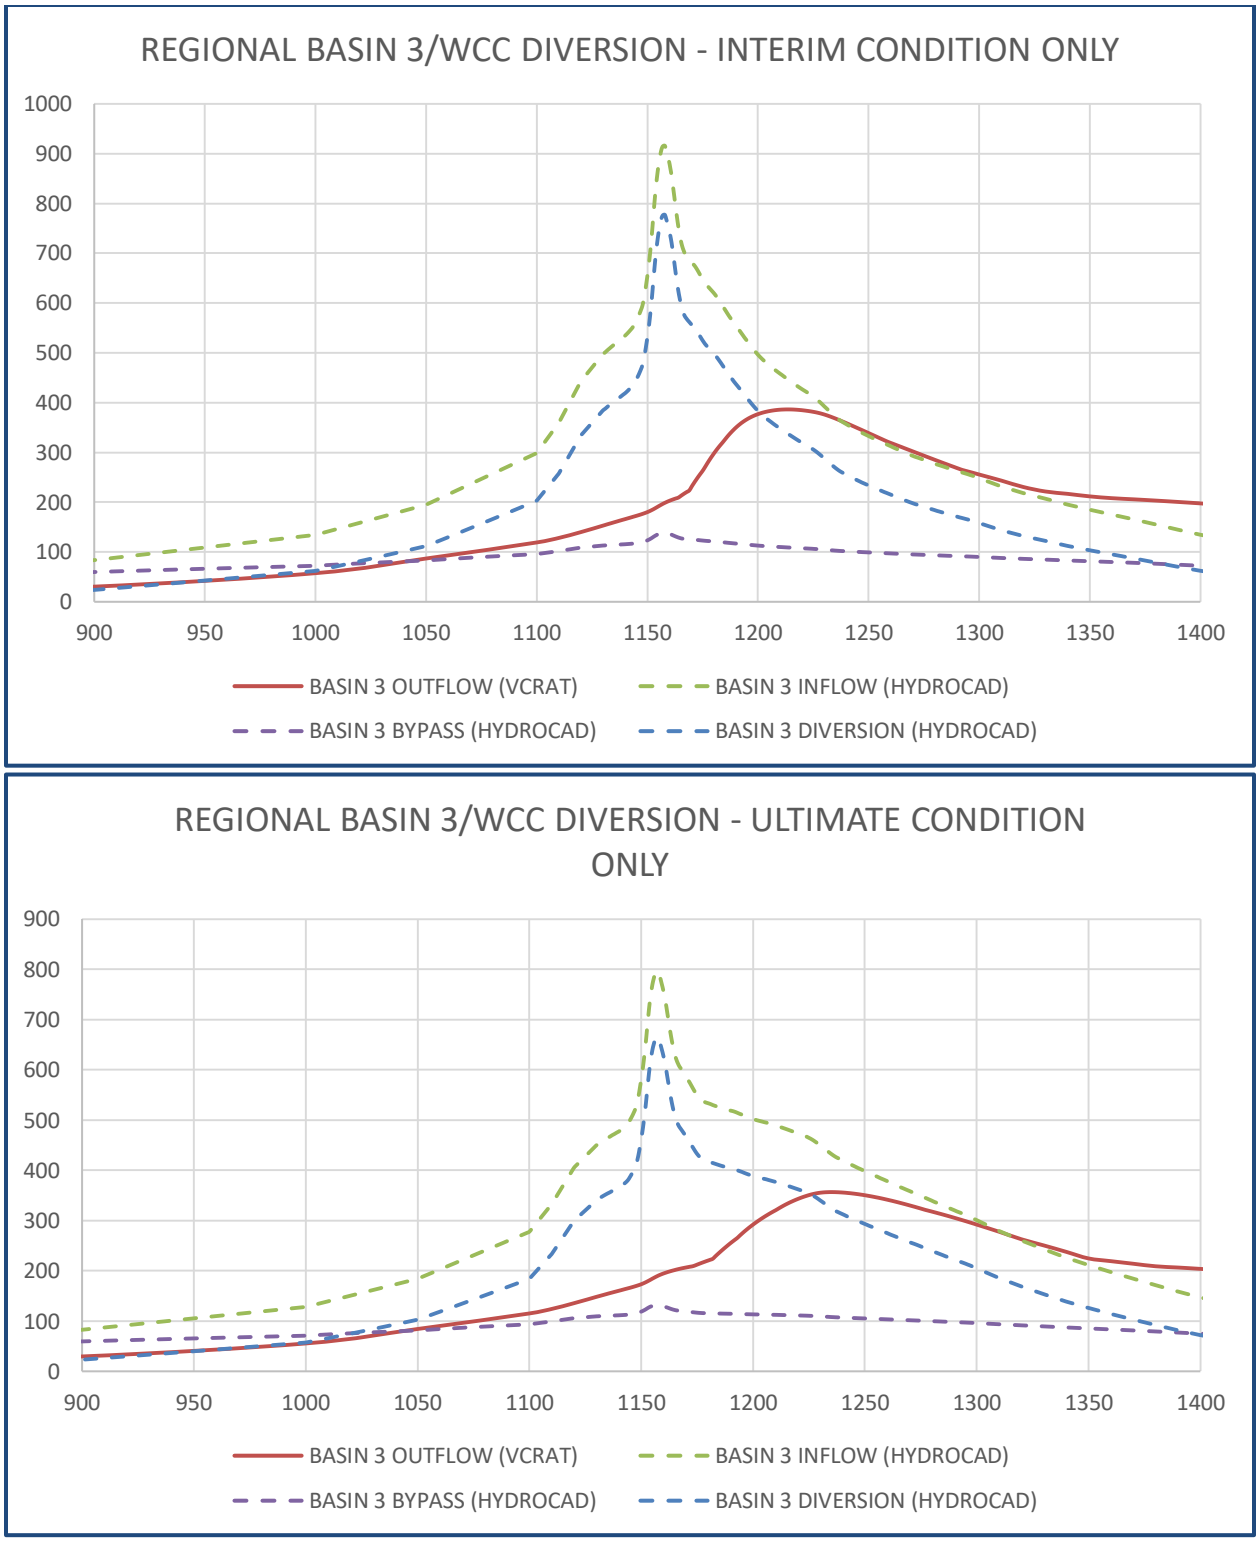

Figure 14: Basin 3 Interim (top)/Ultimate (bottom) Condition Diversion/Outflow Hydrographs

Basin 2A: The outlet will consist of a rectangular, concrete tower having a 27-foot perimeter. The low flow/primary outlet will consist of a single 39-inch, circular orifice opening in the tower. The top of the tower (weir) will serve as the emergency spillway. Two 42-inch RCPs, providing capacity for the unattenuated flow, will exit the tower towards Basin 2B.

516	1.47	61.56	519.2	5.41	216.3			

[1]Olive = Below Emergency Spillway, Rose = Above Emergency Spillway

Basin 2B: The low flow/primary outlet will be 2-18" RCPs that drain to Basin 2. An 87' long weir will serve as the emergency spillway, passing incoming basin flow at 1.5' of head (C = 2.8). It will follow a similar configuration as Basin 0 (Figure 11, 80' weir) with 2-60" RCPs leading to Basin 2. The emergency spillway design has some flexibility. At 2' of head, the weir would only need to be 56' long, but another 0.5' would need to be added to the floodwall to meet freeboard requirements. Required debris volume is below the primary outlet and not included in hydrologic storage modeling calculations.

[1]Olive = Below Emergency Spillway, Rose = Above Emergency Spillway

Basin 2: The outlet will consist of a rectangular, concrete tower having a 34-foot perimeter (similar to Basin 0). The low flow outlet will consist of a single 9-inch circular orifice in the tower, the primary outlet will be a 3'x2' rectangular orifice in the tower, and the secondary outlet will be a weir created by the top of the tower. A 104' long weir will serve as the emergency spillway, passing incoming basin flow at 1.5' of head (C = 2.8). It will follow a similar configuration as Basin 0 (Figure 11, 80' weir) with 2-7.25'x4' RCBs leading to WCC. The emergency spillway design has some flexibility. At 2' of head, the weir would only need to be 57' long, but another 0.5' would need to be added to the floodwall to meet freeboard requirements.

[1]Olive = Below Emergency Spillway, Rose = Above Emergency Spillway

Basin 3: The outlet will consist of a rectangular, concrete tower having a 34-foot perimeter (similar to Basin 0). The low flow outlet will consist of a single 6-inch circular orifice in the tower, the primary outlet will be a 8'x2' rectangular orifice in the tower, and the secondary outlet will be a weir created by the top of the tower. A 146' long weir will serve as the emergency spillway, passing the unattenuated flow at 2.0' of head (C = 2.8). It will follow a similar configuration as Basin 0 (Figure 11, 80' weir) with 3-8.25'x4' RCBs leading to WCC. The emergency spillway design has some flexibility. At 3' of head, the weir would only need to be 79' long, but another 1.0' would need to be added to the floodwall to meet freeboard requirements.

[1]Olive = Below Emergency Spillway, Rose = Above Emergency Spillway

Basins 2 and 3 were excavated to maximize storage which limits the gravity head available for discharge through the primary outlet to WCC. Basin 3 outlet pipes are carried to the channel further downstream to create reasonable slope. To prevent potential backflow from the channel to the basin, flap gates will be installed.

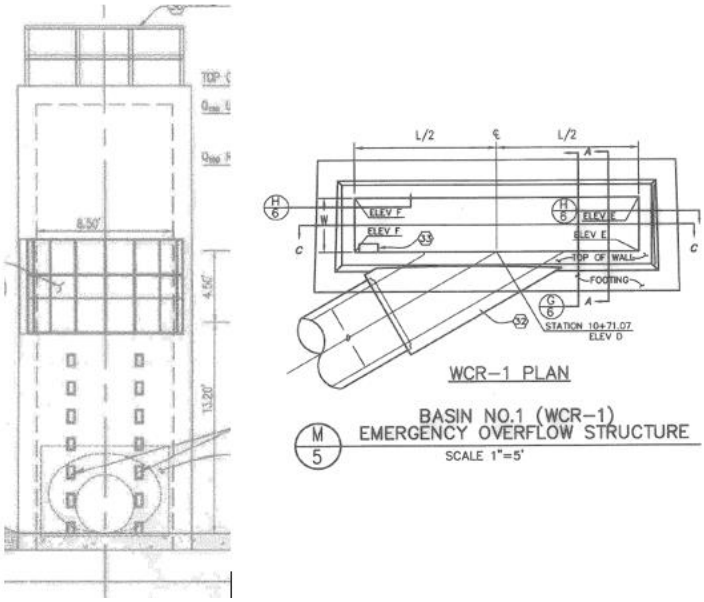

Figure 19: Walnut Canyon Basin 0 Outlet Tower and Emergency Spillway

Critical design features as well as VCRAT 100-yr Interim Condition WSEs are shown in the following table:

Table 14: Proposed Detention Facilities (12/02/2019)

Name	Bottom Elevation	Low Flow Outlet	Primary Outlet	Secondary Outlet	VCRAT 100-yr Interim WSE (Node)	Emergency Spillway	Minimum Top of Basin Elevation (Volume, acft)	Required Floodwall Elevation (Length, ft)[3]
Basin 2A	512.0	None[0]	1-39" Circular Orifice (@512.0)	NONE	516.4 (071C)	27' Weir (@518.4)	522.0 (9.5)	NONE
Basin 2B	498.0[1]	None[1]	2-18" Circular Orifices (@498.0)	24' Weir (@508.0)	509.8 (073BC)	87' Weir (@512.0)	512.0 (37.1[2])	515.5[4] (944")

[0]Low Flow and Primary are the same.
[1]Low flow not modeled as it will below debris line.
[2]Elevation/Volume above required debris volume.
[3] Required Floodwall Elevation = WSE100 + 1' (Emergency Spillway Elevation) + Depth Over Emergency Spillway to Convey Unattenuated Flows + 3' Freeboard
[4] There is potential for additional excavation that can increase flood storage while maintaining necessary debris volume which would reduce the required floodwall.

NOTE: Proposed detention basin facilities will be privately owned and maintained (not County facilities). Consistent with other recently approved projects that are similar, the freeboard requirement may be reduced in consultation with County staff during final design.

Peak flows were evaluated at three locations to identify current deficiencies as well as determine necessary mitigation:

1. At the western, most downstream boundary of the Hitch Ranch development along WCC at Gabbert Road to confirm that local flood requirements (LFR) are met.
2. At the Union Pacific 10' x 8' RCB where WCC flow direction changes from west to south, resulting in added super-elevation considerations.

3. At Los Angeles Avenue, where WCC changes flow direction from south to west, immediately downstream of the incoming City of Moorpark 72-inch RCP west of the Southern California Edison property to verify that regional flood control/regional master plan (RMP) objectives are achieved.

Existing and the Proposed Interim Condition Peak Flows are included following table:

Table 15: Existing and the Proposed Interim Condition Peak Flows

[5]Design Option Diversion Structure Modeled (HydroCAD), Two VCRAT Models (upstream and downstream of the diversion)

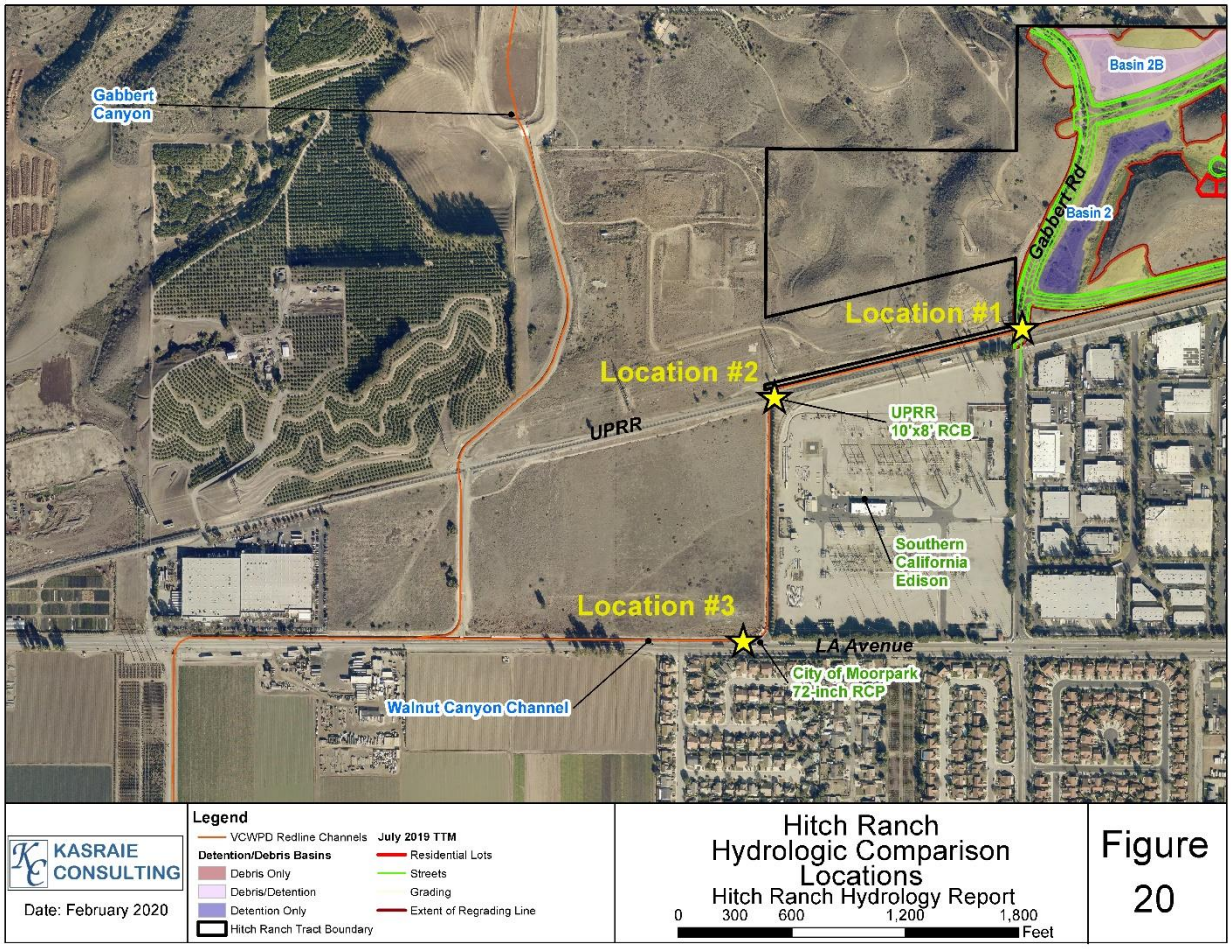

Figure 20: Hydrologic Comparison Locations

Designed diversion and detention facilities provide flow attenuation and time to peak lag which prevent 100-year flows from accumulating beyond the capacity of the downstream system. In addition, proposed Interim Condition 100-yr flows are below 10-yr existing flows along WCC. **Regional Flood Control (RFC) Objectives and Local Flood Requirements (LFR) are met with this design.** This project does not address structural deficiencies or failures of the existing WCC system.

6.2 California Division of Safety of Dams (DSOD) – Jurisdictional Dams

Each proposed detention basin was evaluated based on interpretation of the DSOD definitions as outlined in previous RMPs.

Basins 2 and 3 will be constructed by significantly excavating below the existing surface, creating a "pit" style impoundment. The previous RMPs and *2009 Basis of Design Study, Commonwealth Studios – Interim Condition Flood Control Improvements, Walnut and Gabbert Canyon Watershed* all discuss this type of design to maximize detention without becoming a "Jurisdictional Dam".

The purpose of this report is to outline proposed stormwater facilities to be used to meet required RFC and LFRs. Subsequent design phases will include additional discussion with City and County staff.

7 Walnut Canyon Channel Hydraulic Analysis

An initial hydraulic evaluation of the existing and proposed conditions was completed to:

1. Determine the overall benefit of the proposed system versus existing conditions.
2. Ensure/verify that the proposed system will likely work as intended. The designed stormwater facilities are made up of interdependent features needed to create necessary peak flow attenuation and increased lag time required to meet the RFC and LFRs in the RMP (2005, 2009). Tailwater within WCC is critical to the functionality of the Basin 2 and 3 outlet works. Neither HydroCAD nor VCRAT are able to address these issues explicitly.

The US Army Corps of Engineers (USACE) Hydraulic Engineering Center River Analysis System (HEC-RAS) was used to analyze hydraulics of WCC. A two-dimensional modeling scheme (RAS2D) was chosen since it best represents varied conditions in the overbanks and detention basins versus the main channel over the time and range of flows. Cells are allowed to vary in shape and size based on the visual detail needed within an area. Parameters are determined for each cell such as Stage versus Volume which is based on an elevation grid terrain model. Results are generated on a cell by cell basis within a mesh.

The validation HEC-RAS 2D model provided in this report is not intended to be used or submitted as a FEMA Letter of Map Change (LOMC) at this time.

7.1 RAS2D Model Components/Parameters

7.1.1 Terrain

RAS2D can generate a composite elevation model based on multiple grid sources and the users ranking of accuracies. Where data overlaps, the most accurate data is used. Elevation data sources are described as follows:

- **2005 Bare Earth LIDAR**: 2005 Ventura County Bare Earth LIDAR converted to a 1-foot cell grid.
- **2018 1-foot Site Contours**: Provided by ECG representing existing conditions converted to a 1-foot cell grid.
- **Main Channel**: A geo-referenced one-dimensional geometry HEC-RAS cross-section geometry of the main channel and immediate overbanks were created based on the 2005 and 2018 elevation data. It was then refined/corrected based on VCWPD plans for WCC and then converted to a 0.1' cell grid (Accuracy Order = 1)
- **Proposed Condition CAD**: The May 2019 (amended July 2019) ECG TTM was provided in CAD, digital format. The cut/fill boundary line and 3D breaklines (pad

elevations, street and open space contours) were converted to TIN and then 1-foot cell grid

All data sets were "snapped" to the same origin to ensure minimal resampling/interpolation in overlapping areas. The following table identifies which data sets were used both the existing and proposed terrain, including the assigned order of accuracy:

Table 17: RAS2D Elevation Terrain Sources

	Existing	Proposed
Proposed Condition CAD	NA	2
Main Channel	1	1
2018 1-foot Contours	2	3
2005- Bare Earth LIDAR	3	4

7.1.2 Manning's Roughness Factors

A roughness factor shapefile was created based on 2016 Ventura County aerial imagery and parcel data for existing conditions. The following values were assigned:

Table 18: RAS2D Manning's "n" Roughness Factors

Barren	0.040
Brush/Scrub	0.070
Buildings	2.000
Commercial/Institutional	0.060
Developed Medium Intensity	0.065
Industrial	0.080
Open Space	0.050
Railroad (including ROW)	0.045
Reinforced Concrete Channel (RCC)	0.015
Roadway	0.015
Unassigned	0.060

7.1.3 Inflow Hydrographs

VCRAT Interim Condition hydrographs at were extracted at all local inflow locations to proposed detention basins, WCC channel downstream of Hitch Ranch (HR), and at the WCC 96-inch RCP outlet near the Post Office. To obtain hydrographs in individual subareas contained in a series (VCRAT line), the model was re-run by putting the area of interest into its own bank. These include:

Table 19: RAS2D Inflow Hydrograph Locations

	VCRAT Node	RAS2D Label
Basin 2A	070C	070C
Basin 2B	069BC	069BC
Basin 2	074C	074C
Basin 3	053CD	053CD
Local Area to WCC between East and West HR	056B	056B
WCC 96" RCP Outlet	044AB	044AB
Local Inflow to WCC at UPRR 10'x8' RCB	077B	077B
Inflow from Moorpark Drain 72" RCP	084BC	084BC

7.1.4 Mesh

The "mesh" is a set of regular and irregular polygons draped over the elevation terrain. It was initially created based on 25-foot squares. Breaklines and refinement polygons representing critical features such as roads and channels were used to force adjustments in the mesh to include computation points at their boundaries. For example, a refinement polygon was used to represent the area within WCC, forcing a single cell covering the RCC bank to bank.

7.1.5 Detention Basin Outlet Structures

Detention basin outlet structures consists of a series of orifices, weirs, and culverts. Emergency spillways were not explicitly modeled since the purpose was to identify the system function under normal 100-yr design conditions.

Low Flow and Primary outlets are combined for Basins 2A and 2B, both of which are culvert pipe(s) These features are modeled culverts within as a 2D Area Connection with embankment height based on the proposed terrain.

Basins 2 and 3 each include a rectangular, concrete tower with orifice openings in the front (primary), a weir consisting of the top perimeter (secondary), and culvert outflow pipes in the back (primary + secondary). Modeling the towers explicitly requires using a series of 2D Area Connections (one for the front, one for the back). The low flow, circular orifice was modeled as a short culvert, while the primary outlet, rectangular orifice was modeled as a gate (set to be open the entire model run) on the Front 2D Area Connection. Also, although rectangular and at the top of the tower, the secondary outlet was added as a linear weir to the front 2D Area Connection extending upwards to the hydrologically determined emergency spillway elevation. The back 2D Area Connection Area includes the tower outlet pipes. The area and storage between the connections is minimal.

7.1.6 Boundary Conditions

Boundary condition lines were added to 8 locations at the downstream exterior of the mesh. Normal depth was used at each based on the immediate slope vicinity. Walnut_Out uses 0.0047, the slope of the channel.

7.2 RAS2D Results

Results are included for a general comparison with hydrology routing and are not intended for design purposes. The Mansi and Essex Development timelines for development are unknown and therefore benefits from upstream improvements such as Basin 1 at Casey Road may not be realized for the near future. Both conditions were modeled and included.

7.2.1 Verification of VCRAT Hydrologic Routing and Outlet Works

RAS2D inflow hydrographs are based on VCRAT, however the remainder of the model is independent. Both models produce similar results therefore providing confidence the VCRAT are adequate with respect to routing and outlet functionality.

Table 20: Comparison of RAS2D and VCRAT at Select Locations for Interim Condition

	RAS2D		VCRAT		
	Outflow	Max WSE	Node	Outflow	Max WSE
Basin 2A	67	516.8	071C	66	516.4

[1]Assumes a constant 94 cfs by-pass of Regional Basin 3/Single VCRAT Model

[2]Design Option Diversion Structure Modeled (HydroCAD), Two VCRAT Models (upstream and downstream of the diversion)

7.2.2 Existing versus Proposed (Interim/Ultimate) RAS2D

Proposed facilities provide a significant benefit to the overall system that are not captured in models that solely rely on hydrologic calculations/routing. Flows and water surface elevations at select locations are shown in the following table.

Under existing conditions, there is a significant amount of flow overtopping the UPRR immediately upstream of Gabbert Road, which could impact the industrial/commercial area to the south. This issue will be completely eliminated (does not include problems related to overflow from Arroyo Simi) under the Interim and Ultimate Conditions (See Figure 14).

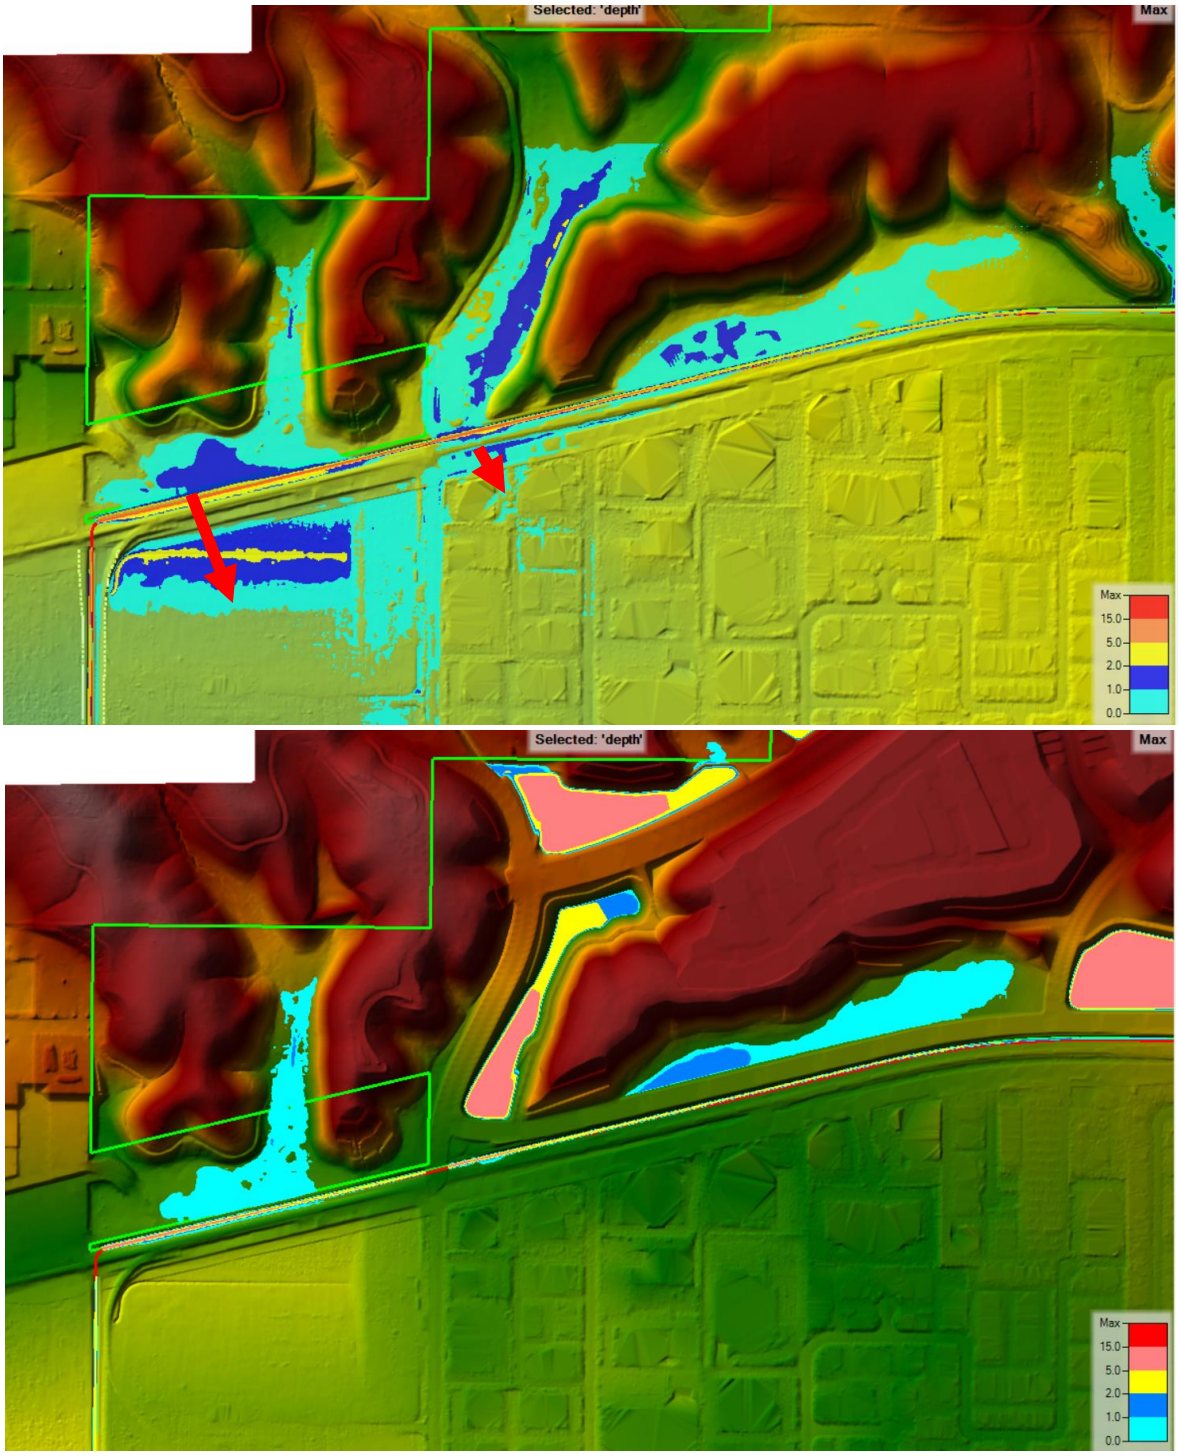

Figure 21: Existing (top) and Interim (bottom) RAS2D Flood Depths between Gabbert and UPRR

SUBJECT: Hitch Ranch Hydrology Study Report 2020 Update
Addendum #1 – Effective Floodplain Map

Dear Ms. Rapista (Harriet):

As requested, this letter is prepared as an Addendum #1 to the Hitch Ranch Hydrology Study Report 2020 Update prepared by Kasraie Consulting dated February 2020. The purpose of this letter is to document that no residential or commercial structures are proposed in the current FEMA flood zone.

The Effective FEMA Flood Insurance Rate Map (FIRM) in the vicinity of the proposed Hitch Ranch development is provided below. Figure 1 shows the effective FIRM Panel 06111C0817E dated January 20, 2010 for Walnut Canyon Drain in the City of Moorpark. The current flood zones within the Hitch Ranch development are designated at Zone X (500-year flood, orange color) along Walnut Canyon Drain shown as an Approximate Zone A along Gabbert Road (100-year flood, blue color).

Figure 1 Effective FEMA Flood Insurance Rate Map Panel 06111C0817E 1/20/2010

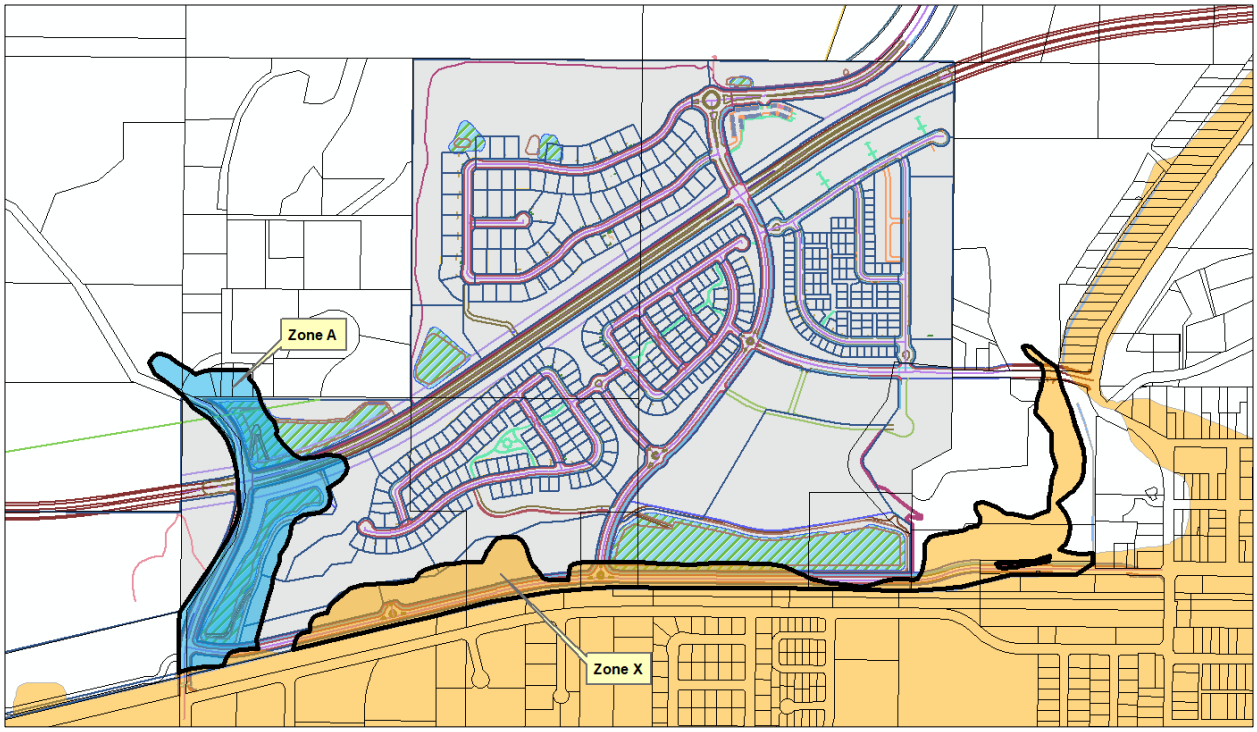

Figure 2 Effective FEMA Flood Zones Within Hitch Ranch

Hitch Ranch is overlaid on top of the FEMA FIRM as shown in Figure 2. The above Figure 2 shows that only the proposed Detention Basins 2 and 2B and Gabbert Road will replace parts of the Zone A floodplain boundary. Along the southern property line, the regional Detention Basin 3 and roads are shown in Zone X flood zones.

Therefore, no homes or other structures are proposed to be built in the Zone A 100-year floodplain, commonly referred to as the Special Flood Hazard Area (SFHA), or the 500-year floodplain Zone X.

However, a FEMA Conditional Letter of Map Revision (CLOMR) will be necessary due to the detention basin construction within the existing Zone A floodplain. The purpose of a CLOMR is to get community and FEMA concurrence that there will be no adverse impacts on adjacent properties and the project meets minimum National Flood Insurance Program (NFIP) standards. Once grading and flood structure construction has been completed, a Letter of Map Revision (LOMR) will need to be submitted based on the as-built conditions. This will result in an actual revision of the FEMA FIRM.

Please feel free to call or email with any questions or comments you might have.

Sincerely,

Hassan Kasraie, PE, CFM
President

APPENDIX 3.10

General Plan – Circulation Element Consistency Analysis

3.10.1 City of Moorpark General Plan - Circulation Element

The City of Moorpark Circulation Element was adopted in 1992. The Highway Network Plan in the Circulation Element was based on roadways needed to accommodate the anticipated growth envisioned in the General Plan Land Use Element while achieving the identified goals for level of service.

This analysis is provided to demonstrate Project consistency with Goal 2 of the Circulation Element, as it is related to Policy 2.1 Level of Service (LOS), and Policy 2.4, the Project's participation in the transportation improvement fee program.

Goal 2: Provide a circulation system which supports existing, approved, and planned land uses throughout the City while maintaining a desired level of service on all streets and at all intersections.

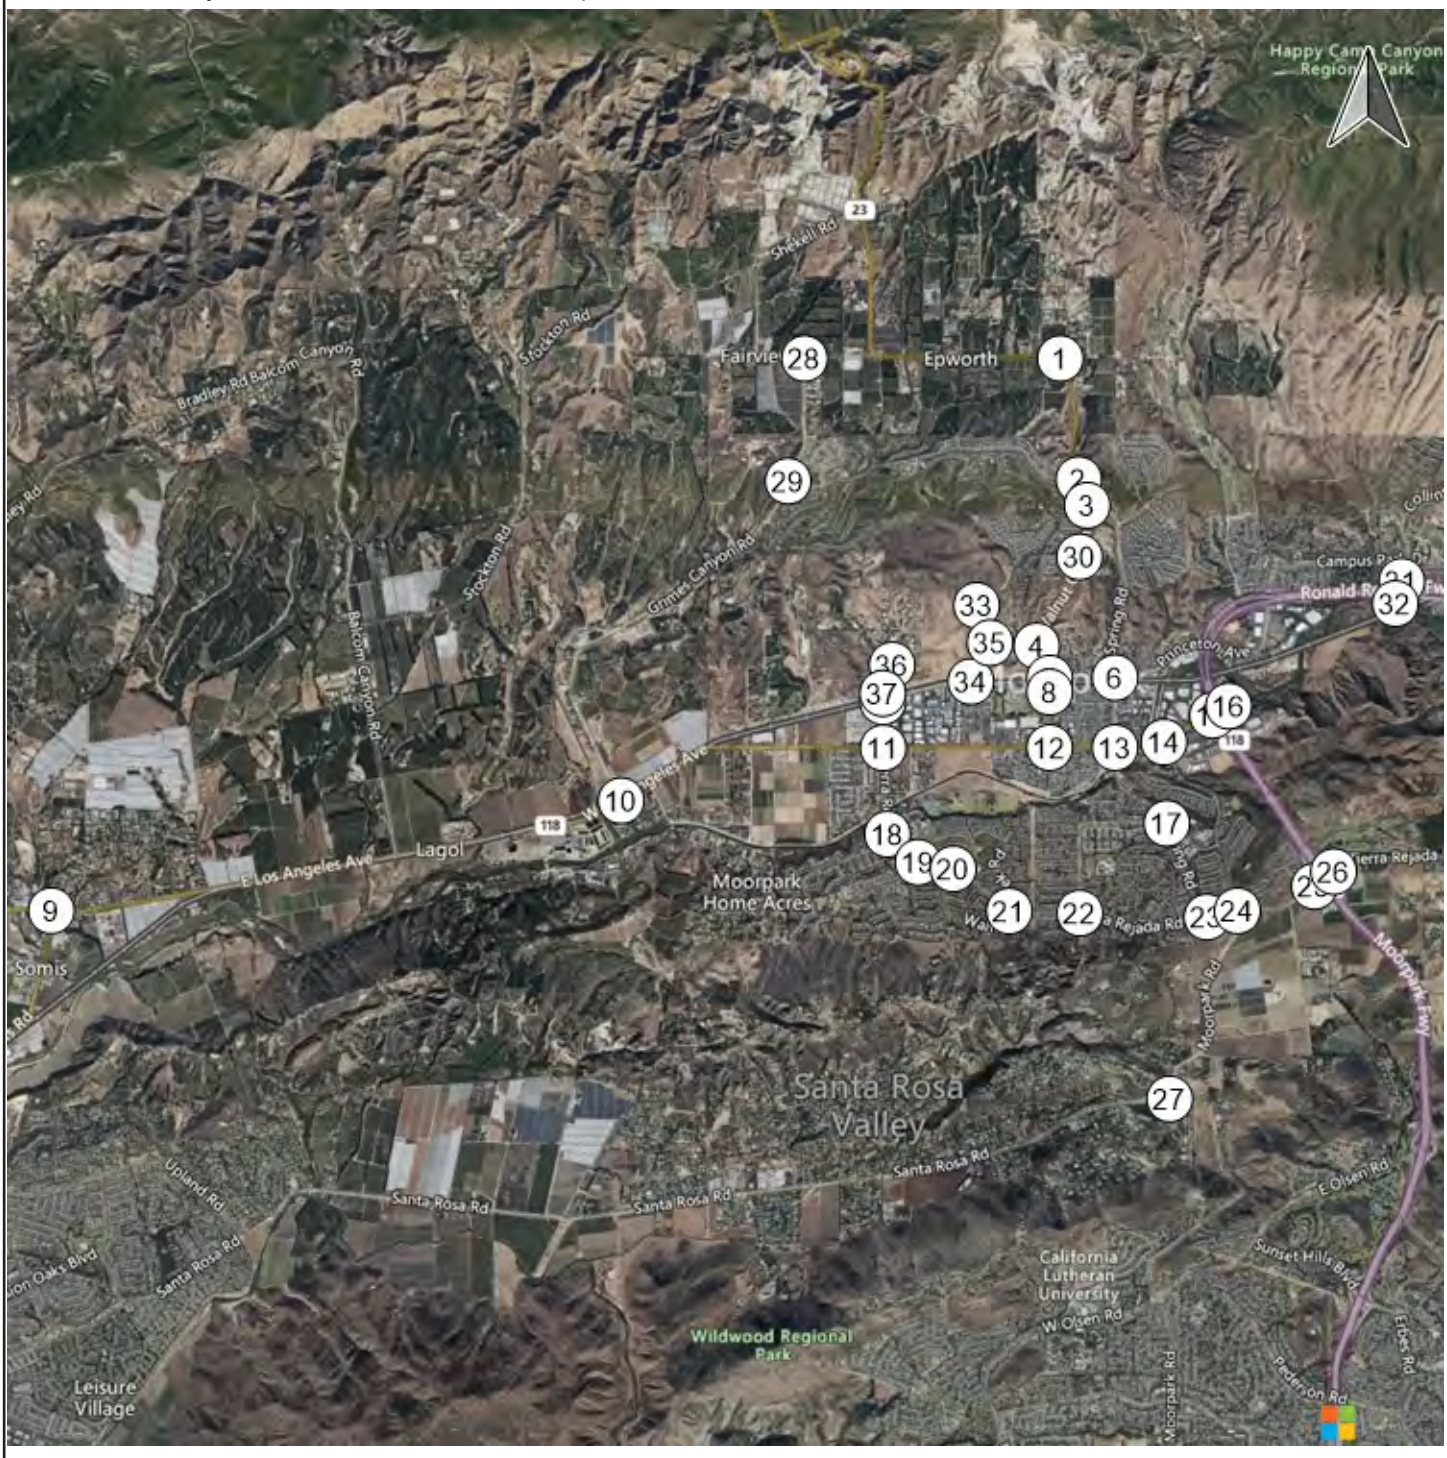
Policy 2.1: Level of service "C" shall be the system performance objective for traffic volumes on the circulation system. For roadways and interchanges already operating at less than level of service "C," the system performance objective shall be to maintain or improve the current level of service.

Policy 2.2: Project phasing shall be coordinated with the construction of on-site and off-site circulation improvements to maintain the performance standards objectives specified in Policy 2.1 and to ensure that improvements are in place when needed.

Policy 2.3: New development projects shall mitigate off-site traffic impacts to the maximum extent feasible.

Policy 2.4: All new development shall participate in a transportation improvement fee program. This fee enables circulation improvements to be funded by new development in a manner that maintains the performance objectives specified in Policy 2.1.

Please note that all analysis provided in this section related to LOS is presented for consistency analysis purposes only, and not for the purpose of determining a significant environmental impact related to transportation under CEQA.



3.10.2 Existing Level of Service Conditions

The transportation study area was defined by the City of Moorpark. The analysis area was defined according to a set of criteria that considered both the amount of project traffic at each intersection in the general area and the capacity of that traffic.

As shown in **Figure 3.10-1, Project Study Area,** the study area for the Hitch Ranch transportation analysis encompasses 32 existing intersections, with an additional five future intersections. As shown in **Figures 3.10-4a** through **3.10-4e, Study Intersections Characteristics,** the 6 of the 32 existing intersections are un-signalized, all of the future intersections would be unsignalized. The study intersections are as follows:

Existing Intersections

1. Walnut Canyon Rd. & Broadway Rd.
2. Walnut Canyon Rd. & Championship Dr.
3. Walnut Canyon Rd. & Spring Rd.
4. Walnut Canyon Rd. & Casey Rd.
5. Moorpark Ave. & High St.
6. Spring Rd. & High St.
7. Gabbert Rd. & Poindexter Ave.
8. Moorpark Ave. & Poindexter Ave/1st St.
9. Somis Rd. & Los Angeles Ave.
10. Grimes Canyon Rd. & Los Angeles Ave.
11. Tierra Rejada Rd. & Los Angeles Ave.
12. Moorpark Ave. & Los Angeles Ave.
13. Spring Rd. & Los Angeles Ave.
14. Miller Pkwy./Science Dr. & Los Angeles Ave.
15. SR-23 SB ramps & Los Angeles Ave.
16. SR-23 NB ramps & Los Angeles Ave.
17. Spring Rd. & Peach Hill Rd.
18. Tierra Rejada Rd. & Countrywood Dr.
19. Mountain Trail St. & Tierra Rejada Rd.
20. Mountain Meadow Dr. & Tierra Rejada Rd.
21. Walnut Creek Rd. & Tierra Rejada Rd.
22. Peach Hill Rd. & Tierra Rejada Rd.
23. Spring Rd. & Tierra Rejada Rd.
24. Miller Pkwy. & Tierra Rejada Rd.
25. SR-23 SB ramps & Tierra Rejada Rd.
26. SR-23 NB ramps & Tierra Rejada Rd.

FIGURE **3.10-2e**

IMPACT SCIENCES

Study Intersections Characteristics

One way to understand existing traffic conditions is to study existing traffic volumes with an analysis of the operating conditions, indicated through volume-to-capacity (V/C) ratios and Level of Service (LOS). LOS was used previously as the primary method for determining CEQA transportation-related impacts, but is now being used for informational purposes. Recent changes in state legislation and the related guidance from OPR have moved analysis to VMT to support statewide GHG goals and encourage multi-modality in our cities. Traditional mitigation measures to address increases in vehicle delay often involved increasing capacity (i.e., the width of a roadway or intersection), which has the potential to induce more trips/VMT and does not support State goals.

As an information metric, LOS is a measure used to describe the condition of traffic flow, ranging from excellent conditions at LOS A to overloaded conditions at LOS F. LOS can be determined by dividing the number of vehicles (i.e., volume [V]) by roadway capacity (C), and the resulting V/C ratio is then used to obtain the corresponding LOS. To determine the operations of the roadway network during peak commute hours, a LOS analysis was conducted for the roadways in the study area.

Figures 3.10-6a-e through **3.10-7a-g, Existing (2019) Traffic Volume – Weekday AM and PM Peak Hour,** illustrate the existing circulation system in the vicinity of the project site together with observed intersection volumes. Traffic volume data was collected in spring 2019 by National Data & Surveying Services, an independent third-party data collection company used in the TIA. Weekday traffic counts were conducted on Wednesday, April 17, 2019, and Thursday, April 18, 2019, from 7:00 to 9:00 am and 4:00 to 6:00 pm.

The traffic conditions analysis was conducted using the Intersection Capacity Utilization (ICU) method for the study intersections. The ICU procedure uses a ratio of the highest combination of conflicting traffic volume (V) to the intersection capacity (C) to define the proportion of an hour necessary to accommodate all the traffic moving through the intersection assuming all approaches were operating at full capacity. For example, if an intersection has a volume-to-capacity (V/C) value of 0.70, the intersection is operating at 70 percent capacity with 30 percent unused capacity.

Once the intersection V/C ratio has been calculated for each time period, a level of service (LOS) grade (A through F) is assigned to estimate the level of congestion and stability of the traffic flow. The term LOS is used by traffic engineers to describe the quality of traffic flow. Level of Service standard D is generally considered the design capacity of arterial intersections and is thereby often set as the performance standard. Definitions of the LOS grades, from the City's General Plan Circulation Element, are shown in **Table 3.10-1.**

Table 3.10-1
V/C Level of Service Definitions

Level of Service	Definition	Equivalent ICU
A	Excellent- Free flow conditions with low traffic density	0.000-0.600
B	Very Good- A stable flow of traffic	0.601-0.700
C	Good- Light congestion but stable, occasional backups behind left-turning vehicles	0.701-0.800
D	Fair- Approaching instability, drivers are restricted in freely changing lanes. Vehicles may be required to wait through more than one cycle.	0.801-0.900
E	Poor- At or near capacity with some long lines for left-turning vehicles. Blockage of intersection may occur if traffic signal does not provide for protected turning movements.	0.901-1.000
F	Failure- Jammed conditions with stoppages of long duration and long queues.	>1.000

Source: City of Moorpark, May 1992

The LOS thresholds for stop sign controlled intersections differ from signalized intersections to reflect different driver expectations. The expectation is that a signalized intersection is designed to carry higher traffic volumes than a stop-controlled intersection.

For the un-signalized intersections, a delay-based analysis was conducted using procedures based on the HCM method. This procedure calculates the control delay as the total elapsed time from the time a vehicle stops at the end of the queue to the time the vehicle departs from the intersection. Using this procedure, the LOS is evaluated on the basis of the total delay per vehicle for selected movements (in seconds per vehicle).

Definitions of the LOS grades for stop-controlled intersections as defined by the Transportation Research Board are shown below in **Table 3.10-2.**

Table 3.10-2
Level of Service Definitions—Stop Controlled Intersections

Level of Service	Average Control Delay (sec)
A	Less than or equal to 10
B	> 10 – 15
C	> 15 – 25
D	> 25 – 35
E	> 35 – 50
F	> 50

Source: Transportation Research Board, 2020

By applying the ICU and HCM procedures, the V/C ratios, delay values and the corresponding LOS for existing traffic conditions were determined for each intersection.

3.10.3 Project Trip Generation

The project site is currently vacant and generates a nominal amount of peak hour and daily traffic. The existing V/C ratios, delay values and the corresponding LOS values for the study area intersections are summarized in **Table 3.10-3**. Using the 2019 traffic counts, all of the study intersections currently operate at LOS D or better, with one exception (Intersection #24), in the AM Peak Hour. In the PM Peak Hour, one intersection operates at LOS E (Intersection #9).

Table 3.10-3
Existing Traffic Conditions Summary

		AM Peak Hour*			PM Peak Hour*

Source: Stantec, December 2021, Impact Sciences, July 2021

Traffic-generating characteristics of residential and park land uses have been studied by the Institute of Transportation Engineers (ITE). The results of the traffic generation studies have been published in Trip Generation, 10th Edition Handbook. This publication of traffic generation data has become the industry standard for estimating traffic generation for land uses.

These trip generation studies indicate that the uses associated with the proposed project generally exhibit the trip-making characteristics per dwelling unit or acre as shown by the ITE trip rates in **Table 3.10-4**. Estimates of the project's traffic were calculated on the basis of these ITE traffic generation rates for the project's proposed land uses.

Table 3.10-4
Project Trip Generation Rates (Weekday)

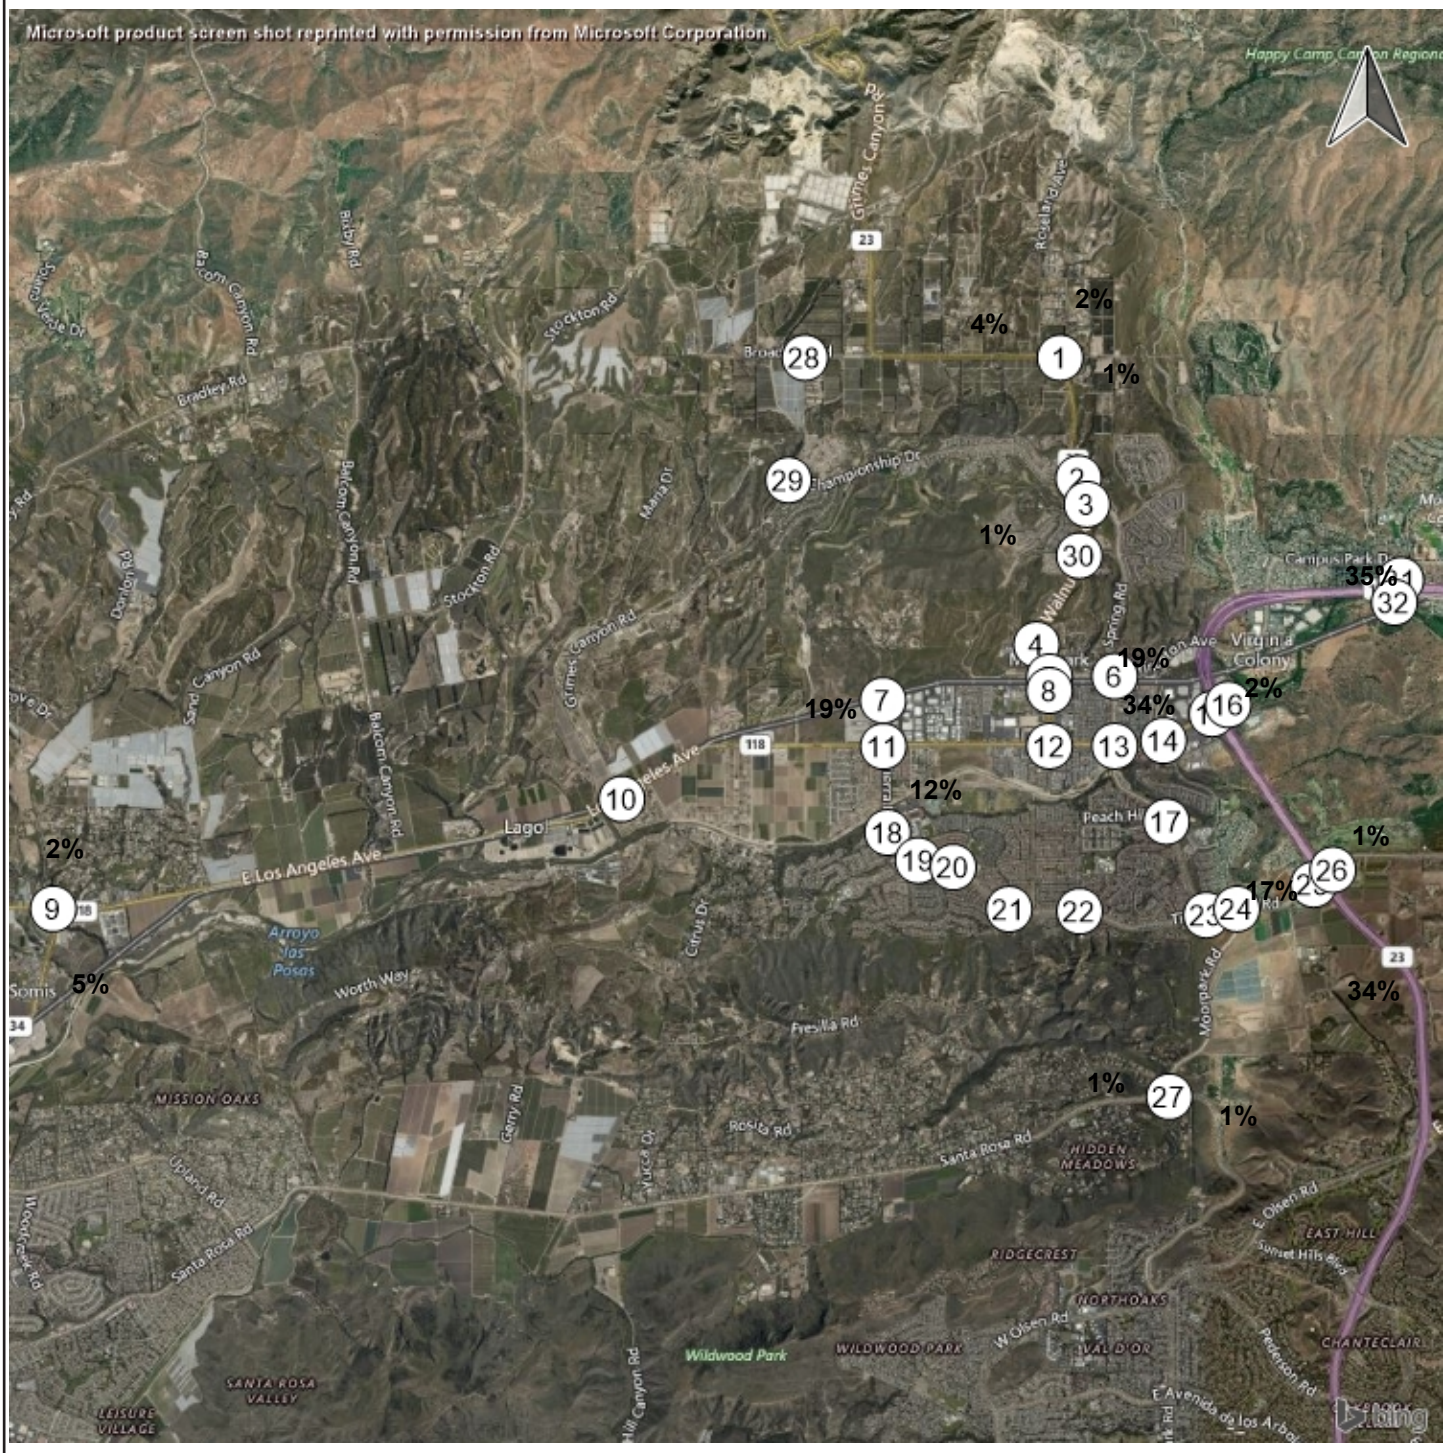
Land Use	ITE Code	Weekday Daily	AM Peak Hour Total	AM Peak Hour In	AM Peak Hour Out	PM Peak Hour Total	PM Peak Hour In	PM Peak Hour Out
Single-Family Detached housing (per Dwelling Unit)	210	9.44	0.74	25%	75%	0.99	63%	37%
Multifamily Housing (Low-Rise) (per Dwelling Unit)	220	7.32	0.46	23%	77%	0.56	63%	37%
Public Park (per Acre)	411	0.78	0.15	67%	33%	0.11	40%	60%

Source: Impact Sciences, 2021

Traffic volumes expected to be generated by the project were estimated by applying the Table 3.10-4 ITE trip rates per dwelling unit or acre for each of the project's land use components.

As shown in **Figures 3.10-8 and 3.10-9, Project Traffic Volume,** the proposed project would add 6,436 daily vehicle trips to the local roadway system, including 467 morning peak hour trips and 608 afternoon peak hour trips (**Table 3.10-5**). In order to conduct a conservative traffic analysis, no vehicle trip adjustments were made to account for internal capture trips (i.e., interaction between residential uses and/or the public park).

3.10.4 Trip Distribution



A primary factor affecting trip direction is the spatial distribution of population and employment centers which would generate project trip origins and destinations. The estimated project directional trip distribution is based on the study area roadway network, traffic flow patterns in and out of the project study area, and other traffic studies recently prepared for the general area.

Table 3.10-5
Project Traffic Generation (Weekday AM and PM Hours)

Proposed Land Use	Daily Traffic	AM Peak Hour			PM Peak Hour		
		Total	In	Out	Total	In	Out
Single-Family Residences	4,301	316	79	237	423	266	157
Multi-Family Residences	2,401	151	35	116	184	116	68
Public Park	4	0	0	0	1	0	1
Total	6,436	467	114	353	608	382	226

Source: Impact Sciences, 2021

Figure 3.10-3, Project Trip Assignment, illustrates the estimated project traffic percentages at the selected study intersections for the morning peak hour and afternoon peak hour. Using the traffic assignment at each intersection and the estimated peak hour traffic volume as provided in **Table 3.10-5**, peak hour traffic volumes at each study location for each study period have been calculated and are shown in **Figures 3.10-4a-e** and **3.10-5a-e Project Traffic Volumes Weekday AM and PM Peak Hours** for the weekday morning and afternoon, respectively. This estimated assignment of the project traffic flow provides the information necessary to analyze the potential traffic generated by the project at the study intersections. **Figures 3.10-6a-e** and **3.10-7a-g Existing (2019) Traffic Volumes Weekday AM and PM Peak Hours** show existing traffic volumes at these intersections.

3.10.5 LOS Performance Objective

The City of Moorpark General Plan Circulation Element, Policy 2.1, states, "Level of Service 'C' shall be the system performance objective for traffic volumes on the circulation system. For roadways and interchanges already operating at less than level of service 'C', the system performance objective shall be to maintain or improve the current level of service." Therefore, the performance standard for this consistency analysis is operation at less than LOS 'C' as stated in Policy 2.1.

Policy 2.1: Level of service "C" shall be the system performance objective for traffic volumes on the circulation system. For roadways and interchanges already operating at less than level of service "C," the system performance objective shall be to maintain or improve the current level of service.

3.10.6 Non CEQA LOS Analysis

This analysis summarizes an approach that is consistent with the City of Moorpark's *General Plan Circulation Element* (as adopted May 13, 1992), and *Guidelines for Preparing Traffic and Circulation Studies* (as revised November 22, 1993). ***All analysis provided in this section related to LOS is presented for consistency purposes only, and not for the purpose of determining a significant environmental impact related to transportation under CEQA.***

This analysis represents a summary of the findings of the following reports, included as **Appendix 3.15** of this EIR:

- ***Supplemental Traffic Analysis for the Hitch Ranch Project in the City of Moorpark****, conducted by Stantec, December 2021.*
- ***Traffic impact Analysis for the Proposed Hitch Ranch Specific Plan****, conducted by Impact Sciences, Inc. July 2021.*

As shown in **Figures 3.10-8a-e** through **3.10-9a-e, Existing (2019) + Project Traffic Volume – Weekday AM and PM Peak Hour,** the proposed project would result in the addition of 467 AM peak hour trips and 608 PM peak hour trips. The effects of these additional vehicle trips on intersection levels of service were calculated for the Existing plus Project condition, and the resulting levels of service are presented in **Tables 3.10-6 and 3.10-7**.

As shown in **Table 3.10-6**, one study intersection would operate below the performance objective in the morning peak hour when compared to existing conditions:

1. Walnut Canyon Road and Casey Road

In addition, as shown in **Table 3.10-7**, traffic conditions at two intersections would operate below the performance objective during the afternoon peak hour when compared to existing conditions:

1. Walnut Canyon Road and Spring Road
2. Spring Road and High Street

Therefore, under the City of Moorpark criteria and based on the level of traffic added at these intersections payment of fees, consistent with Circulation Element Policy 2.4, is required.

3.10.7 LOS Cumulative Analysis

Future traffic volume projections have been developed to analyze the traffic conditions after completion of other planned land developments including the proposed project for study year 2027, when buildout of the proposed project is anticipated. Descriptions of other related projects, their locations and estimated traffic generation are provided in Table A-1 of the ***Supplemental Traffic Analysis for the Hitch Ranch Project in the City of Moorpark****, conducted by Stantec, December 2021*, provided in **Appendix 3.15** of this EIR.

In addition to the traffic generated by the related project list, other projects outside the study area or projects unknown at this time may contribute to the traffic volume in the area. To account for this outside influence, an ambient annual growth factor (1.0 percent) has been applied to the existing 2019 traffic counts to establish the 2027 study year. The use of both the related project traffic volume growth and the ambient growth factor provides a conservative estimate of future traffic growth in the study area for 2027.

Adding the project traffic to the future "without project" conditions provides the information necessary to calculate the future cumulative project traffic at the study intersections for each future scenario. **Table 3.10-8** shows the estimated project traffic for the 2027 study year. Future cumulative peak hour traffic volumes are shown in **Figures 3.10-10a-e** through **3.10-11a-e, Future Traffic volumes without Project Weekday AM and PM Peak Hours**. In the AM Peak Hour, one intersection operates at LOS D, one intersection operates at LOS E, and one intersection operates of LOS F. In the PM Peak Hour, two intersections operate at LOS D, two intersections operate at LOS E, and one intersection operates at LOS F.

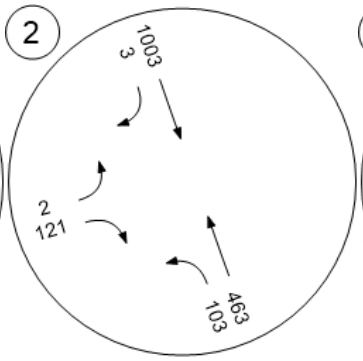
Future cumulative plus Project peak hour traffic volumes are shown in **Figures 3.10-12a-d** through **3.10-13a-f, Future Traffic Volumes with Project Weekday AM and PM Peak Hours**.

As shown in **Table 3.10-9 Future + Project Traffic Conditions (AM Peak Hour), Table 3.10-10 Future (2027) + Project Traffic Conditions (PM Peak Hour),** and assuming all pending and approved projects go forward, the change in traffic flow generated by the proposed project would exceed the City of Moorpark traffic performance objective in the future cumulative condition at seven intersections:



1. Walnut Canyon Road and Casey Road
2. Moorpark Avenue and High Street
3. Spring Road at High Street
4. Moorpark Avenue and Poindexter Avenue
5. Spring Road and Los Angeles Avenue
6. Miller Parkway/Science Drive/Los Angeles Avenue

Shading denotes exceedance of the performance objective based on City of Moorpark criteria.
Source: Stantec, December 2021, Impact Sciences, July 2021

As shown in **Tables 3.10-9** and **3.10-10** under the "Future Cumulative + Project" conditions six intersections would exceed the performance objective:

1. Walnut Canyon Road and Casey Road
2. Moorpark Avenue and High Street
3. Spring Road and High Street
4. Moorpark Road and Poindexter Avenue
5. Miller Parkway/Science Drive/Los Angeles Avenue
6. SR-23 SB Ramps and Los Angeles Avenue

3.10.8 Project's Condition of Approval under City of Moorpark Criteria

When analyzed against existing conditions, the change in traffic flow generated by the proposed project exceeds the performance objective at up to three intersections in the morning and/or afternoon peak hours. The intersections for each project scenario are listed below

1. Walnut Canyon Road and Casey Road
2. Walnut Canyon Road at Spring Road
3. Moorpark Avenue at High Street

When analyzed against future (cumulative) conditions, the following six intersections would exceed the performance objective in the morning and/or afternoon peak hours:

1. Walnut Canyon Road and Casey Road
2. Moorpark Avenue and High Street
3. Spring Road and High Street
4. Moorpark Road and Poindexter Avenue
5. Miller Parkway/Science Drive/Los Angeles Avenue
6. SR-23 SB Ramps and Los Angeles Avenue

As shown, the project contributes to intersections that require improvements due to cumulative growth in the area. As a result, the following **Condition of Approval** would be required to be consistent with the Goals and Policies identified in the City of Moorpark General Plan – Circulation Element:

Area of Contribution (AOC) Fees

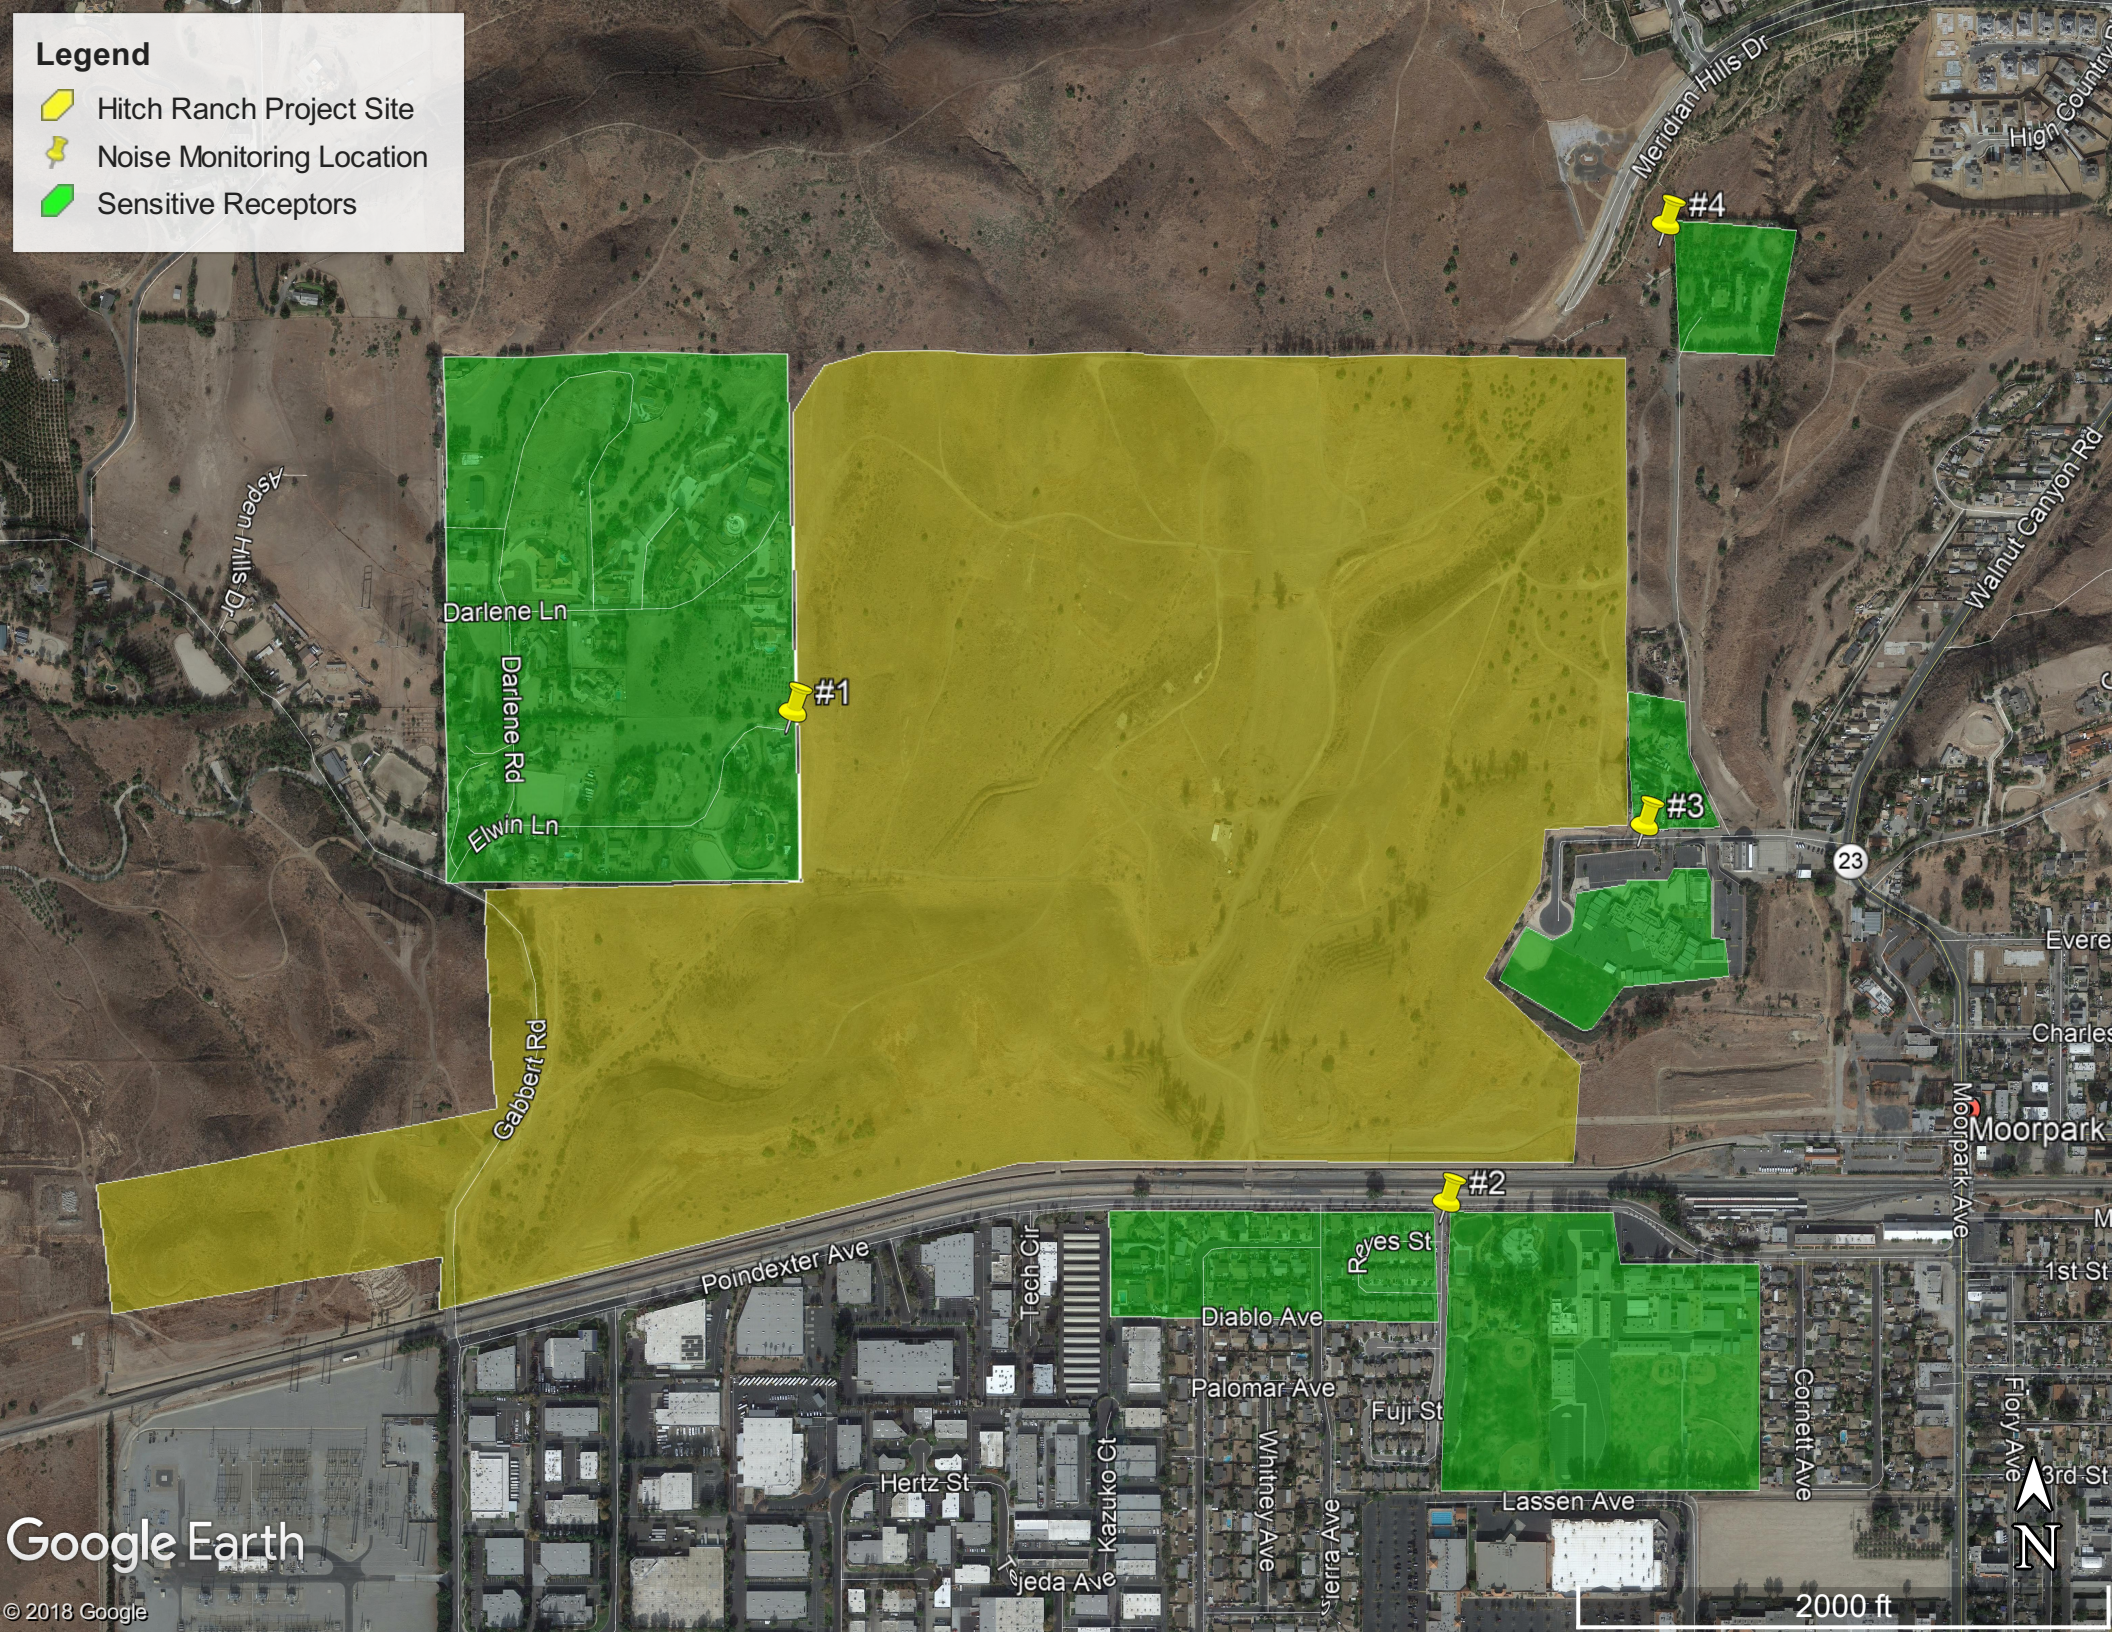
Project Applicant shall pay an **Area of Contribution** (**AOC**) fee based upon the City's currently adopted **AOC** fee schedule (as indicated in the Development Agreement for the Project). The **AOC** fee for each individual dwelling unit shall be paid prior to issuance of a certificate of occupancy for that unit. With the payment of the **AOC** fees, which are intended to be used by the City to fund roadway improvements as

identified in the City's Capital Improvement Program (CIP) list, the Project would be consistent with the Goals and Policies identified in the City of Moorpark General Plan – Circulation Element[1].

Timing/Implementation: Prior to issuance of certificates of occupancy.

Enforcement/Monitoring: City of Moorpark Engineering Department

With the payment of the AOC fees, the Project would be consistent with the Goals and Policies identified in the City of Moorpark General Plan – Circulation Element.



1 The City would update the current Capital Improvement Program (CIP) list to include and address the specific improvements identified in the TIA and STA for implementation of the Proposed Project.

(1) Alpha Factor: Coefficient of absorption relating to the effects of the ground surface. An alpha factor of 0 indicates that the site is an acoustically "hard" site such as aspalt. An alpha factor of 0.5 indicates that the site is an acoustically "soft" site such as vegetative ground cover.

(1) Alpha Factor: Coefficient of absorption relating to the effects of the ground surface. An alpha factor of 0 indicates that the site is an acoustically "hard" site such as aspalt. An alpha factor of 0.5 indicates that the site is an acoustically "soft" site such as vegetative ground cover.

2019 WREA Hitch Ranch Water Usage Evaluation and Hydraulic Analysis

PRELIMINARY WATER USAGE EVALUATION & HYDRAULIC ANALYSIS

Hitch Ranch (Tract 5708)
Moorpark, CA 93021

Developer:
Comstock Homes

Published: June 5, 2019

Prepared by:

WREA

WATER RESOURCE ENGINEERING ASSOCIATES
2300 Alessandro Drive, Suite 215, Ventura, CA 93001
(805) 653-7900 800-25-WATER Fax (805) 653-0610

BACKGROUND

The purpose of this hydraulic analysis is to:

1) Demonstrate that Ventura County Waterworks District 1 (VCWWD1) water facilities can serve the Hitch Ranch (HR) project area with potable water at required pressures and demands

2) Size the Tract water distribution system infrastructure.

All results and conclusions are preliminary and should be verified during final design phase.

HR is located in southeastern Ventura County, within the incorporated area of the City of Moorpark. Boundaries of the project site include north of Poindexter Avenue, approximately 1,600 feet west of Moorpark Avenue (State Route 23), approximately 4,500 feet south of Championship Drive, and approximately 1,400 feet west of Gabbert Road. It is proposed that the development be served by a network of pipes supplied by the VCWWD1 system at four points of connection. Three connections (POC 1-3) will be to the 757 zone and one connection (POC 4) will be to the 944 zone.

Development of the entire HR project as planned will include a maximum of 755 residential units [261 single-family dwelling units (SFDU) and 494 multiple-family dwelling units (MFDU)] on approximately 270.64 acres. Also included in this development is recreational space, open space, manufactured slopes, and public facilities (streets, detention basins, easements, etc.).

Lot 264, which is not a part of the HR project, will include 110 MFDU in an area of 6.66 acres. Although lot 264 is not a part of the HR project, the mainline that will eventually supply the lot 264 development will be provided by the HR project. Therefore, domestic demands for lot 264 are considered in this study.

The HR site plan is attached (Exhibit A, System Schematic for Hydraulic Analysis) providing general statistical data.

Project Breakdown – Site Summary

Planning Area	Land Use	Acres	DU	Irrigated Land (Acres)
1: Lots 1-77, 255-261, A-H	SFD Units	25.86		
	Natural Open Space	19.69		
	Manufactured Slopes	19.41		
	Subtotal	**64.96**	**84**	**19.41**
2: Lots 78-254, J-N, T, U, W	SFD Units	34.08		
	Natural Open Space	7.56		
	Manufactured Slopes	14.91		
	Recreation Lot	2.65		
	Passive Rec Lot	1.32		
	Subtotal	**60.52**	**177**	**16.90**
3: Lots 262 & I	MFD Units	23.46		
	Manufactured Slopes	5.40		
	Recreation Lot	4.10		
	Subtotal	**32.96**	**253**	**7.45**
4: Lots 263 & Z	MFD Units	10.87		
	Manufactured Slopes	5.40		
	Subtotal	**16.27**	**241**	**5.40**
5: Lot V	**Open Space**	**3.37**		**3.37**
6: Lots P-R	**Open Space**	**29.10**		**29.10**
Public Facilities	North Hills Pkwy	11.97		
	"A" Street	4.36		
	Meridian Hills Dr.	3.03		
	Casey Rd.	1.37		
	High St.	6.64		
	Gabbert Rd.	2.86		
	VCWPD Easement	2.70

TOTAL (including Lot 264)	**277.3**	**865**	**118.88**

WATER DEMANDS

Domestic water demands of the HR project are calculated in accordance with Ventura County Waterworks Manual (VCWWM). The potable water demands for the HR project fall into three categories: domestic/residential, landscape/irrigation and fire flow.

Domestic/Residential: Potable domestic water usage was calculated based on the proposed number of dwelling units. VCWWM Compliance Check calculations (Exhibit B) were performed for planning areas 1-4 with 84 SFDU, 177 SFDU, 253 MFDU and 241 MFDU respectively. The overall domestic water maximum day average demand, for this project, was calculated to be 660 GPM.

Planning Area	# of DU's	Demand (GPM)	# of Junctions	Demand per Junction (GPM)
1	84 (SF)	109	9	12.11
2	177 (SF)	230	16	14.38
3	253 (MF)	164	6	27.33
4	241 (MF)	157	6	21.17
Total	**757**	**660**		

Note: Total demands for each planning area were divided by number of junctions in each planning area. That value was then used at each junction in its respective area.

Lot 264	110 (MF)	72	1	72

Landscape Irrigation: Irrigation usage per residential lot was assumed to be included in the Compliance Check calculations provided for each SFDU and MFDU. Landscape irrigation quantities for each planning area reflect the manufactured slopes, recreation lots, portions of the open space, and public facilities which include irrigated medians in the road, parks, detention basins, easements, etc.

In accordance with California Irrigation Management Information System (CIMIS), July 2018 was used as the peak demand month, with an evapotranspiration rate (Et_o) of 7.07 inches/month. For calculating consumptive use, K_c = .5 (crop coefficient for turf grass) was multiplied by Et_o, the area being irrigated (acres), and divided by an irrigation efficiency factor of .75, then converted to gpm. Results for the demands are as follows:

Demand (GPM): $\frac{(K_c) \times (Et_o) \times (\text{irrigated area})}{0.75}$

Planning Area	Irrigated Acres	Demand (GPM)
1	19.41	55.7
2	16.90	48.5
3	7.45	21.4
4	5.40	15.5
5	3.37	9.7
6	29.10	83.4
Public Facilities	37.25	106.8
Total	**118.88**	**341.0**

Note: When determining the irrigated acres for roads in public facilities, the length of the road multiplied by an assumed 10 ft wide median, where landscaping will occur, was used.

Public Facilities demands were prorated and added to the demands of Planning Area's 1-4 for the simplicity of modeling purposes. To get the prorated value, each planning area was divided by the total area of planning areas 1-4, then multiplied by the irrigation demand for public facilities.

[(P.A. 1) / (P. A. 1-4)] x Irr. >> (64.96 / 174.71) x (106.8) = 39.7

Planning Area	Area (Acres)	Prorated Percentage	Prorated Irrigation Demand at Most Remote Junction (GPM)
1	64.96	37.2%	39.7
2	60.52	34.6%	37.0
3	32.96	18.9%	20.2
4	16.27	9.3%	9.9
Total	**174.71**	**100%**	**106.8**

Fire Flow: Ventura County Fire Protection Division (VCFD) provides fire services for the City of Moorpark. Calculations were performed in accordance with VCFD Standard requirements, using 2016 California Fire Code Table B105.1, *Minimum Required Fire Flow and Flow Duration for Buildings*, and assuming Type V-B construction.

The VCFD allows a 50% reduction in fire flow criteria with the installation of fire sprinklers in a structure.

At this time, proposed building sizes have yet to be determined. Building sizes are estimated based on information provided by the developer's consultant team.

For all the SFDU (Planning Area 1 & 2) which have fire sprinklers, the estimated fire flow demand of 1,000 GPM was used.

Planning Area 3 is a combination of 2 and 3 story units in attached housing types ranging from 1400 to 2300 square feet. An average size of 1900 square feet for the 253 units was used.

253 units / 41 bldg = 6.17 units/bldg.

6.17 x 1900 sf = 11,724 sf << say 12,000 square feet, which requires a flow rate of 3,000 gpm. With fire sprinklers installed the required flow rate is 1,500 gpm.

Planning Area 4 is a 3-story walkup apartment building with an average unit size of 900 square feet for 241 units.

241 units / 11 bldg = 21.9 units/bldg.

21.9 x 900 sf = 19,718 sf << say 20,000 square feet, which requires a flow rate of 3,750 gpm. With fire sprinklers installed the required flow rate is 1,875 gpm.

For the purposes of this preliminary study, it is was assumed that the max building size will be approximately 20,000 SF (see calculations above).The governing scenario is dictated by Planning Area 4: Lot 263, the largest sized MFDU, therefore the fire flow demand is estimated to be 1,875 gpm. For this study 2,500 gpm was used to provide a buffer as final building sizes are determined.

MODEL ASSUMPTIONS

Haestad Methods WaterCAD, Version 7.0, hydraulic modeling software was utilized to evaluate the system (Exhibit C). A Hazen Williams friction coefficient of C=140 was used for the new PVC mainlines. The proposed pipelines will be C900 pressure class 305 DR14 PVC sizes 8" (I.D. = 7.68"), 10" (I.D. = 9.42"), and 12" (I.D. = 11.2"). The hydraulic model contains a basic pipe network laid out in accordance with typical infrastructure improvements within public right-of-ways.

Water supply to the proposed 850 zone is entirely provided by storage in the 944 zone through a PR station. For the purposes of this analysis, water supply to the Project's 757 zone is only considered from point-of-connections to the 757 zone. This is accomplished by "closing" the valve at the proposed PR station between 850 and 757 zones to neglect the interconnect during high flow scenarios occurring in 757 zone. Actual contribution through the 850/757 PR station will be determined by VCWWD1 at a future time but should improve performance in the 757 zone over the modeling assumption of zero flow.

The water system requirements for each planning area of the HR project are addressed in 5 different scenarios, as summarized below:

- Scenario 1: Base = (Domestic + Irrigation for all planning areas), No Fire Flow w/ 850/757 PR Station closed
- Scenario 2: Base + Planning Area 1 Fire Flow (1,000 GPM) w/ 850/757 PR Station open
- Scenario 3: Base + Planning Area 2 Fire Flow (1,000 GPM) w/ 850/757 PR Station closed
- Scenario 4: Base + Planning Area 3 Fire Flow (2,500 GPM) w/ 850/757 PR Station open
- Scenario 5: Base + Planning Area 4 Fire Flow (2,500 GPM) w/ 850/757 PR Station closed

General static pressures at points of connection (POC) were provided by VCWWD1 via email:

POC	Pressure Zone	Location	Elevation (ft)	Static Pressure at POC (psi)
1	757	Gabbert Rd.	515	91
2	757	Casey Rd.	565	72
3	757	Poindexter Ave.	493	112
4	944	Meridian Hills Dr.	765	77

Maximum Allowable Pipe Velocities:

- 5 feet per second under normal (Base) conditions
- 15 feet per second during fire flow

ANAYLSIS METHOD

Flow attributed to domestic use was incorporated into the model at network junctions, grouped according to lot configurations and proposed mainline locations.

Fire flow demands at hydrants were simulated at each individual planning area, as indicated on Exhibit A. The highest elevation and/or furthest lot was evaluated in each planning area.

The Title 22 California Waterworks Standards require a minimum system pressure of 40 psi at each point in the distribution system (excluding fire flow). During fire flow Fire Code requirements dictate the conditioned flow rate shall be attained at greater than 20 psi minimum residual pressure throughout the system.

The HR development is located between the 757 and 944 service zones. Based on the varied site elevations, VCWWD recommends the creation of a new pressure zone, with 850' HGL. This requires connections to the 944 zone by way of offsite POC to Meridian Hills Drive. Two pressure reducing stations will be required; one for reducing from 944' HGL to 850' HGL and one from 850' HGL to 757' HGL. The approximate locations of proposed pressure reducing (PR) stations are shown on the schematic. The following table outlines each HR area and project component that will be incorporated into each pressure zone.

Planning Area Pressure Zone and Demand Data

Project Component	# / Type of Units and/or Land Use	Pressure Zone	Domestic Max Day Average Demand (GPM)	Irrigation Demand (GPM)	Fire Flow (GPM)	Total Demand per Planning Area (GPM)
Planning Area 1	84 SFDU & 19.41 Irrigated Acres	850	109	55.7	1,000	1,164.7
Planning Area 2	177 SFDU & 16.90 Irrigated Acres	757	230	48.5	1,000	1,278.5
Planning Area 3	253 MFDU & 7.45 Irrigated Acres	850	164	21.4	2,500	2,685.4
Planning Area 4	241 MFDU & 5.40 Irrigated Acres	757	157	15.5	2,500	2,672.5
Planning Area 5	3.37 Irrigated Acres	757	-	9.7	-	9.7
Planning Area 6	29.10 Irrigated Acres	757	-	83.4	-	83.4
Public Facilities	37.25 Irrigated Acres	757 & 850	-	106.8	-	106.8
Lot 264	110 MFDU	757	72	-	-	72

Total Base Demand (Domestic + Irrigation) = 1,073 GPM

Flow from one fire hydrant within each specific area being evaluated was included during each of the flow scenarios. Additionally, domestic demand for the entire development and irrigation demand was included simultaneously with each evaluation in order to reflect a peak demand scenario.

MINIMUM STORAGE REQUIREMENTS

Water in storage performs the function of supplying higher rates of flow during extraordinary demands on a water system and ensures reliability of service during supply outages. This report utilizes Ventura County Waterworks Manual, Ventura County Fire Protection District standards, and input from Ventura County Water and Sanitation staff to estimate the following storage requirements for the HR development (755 DU):

Emergency Storage: Storage that is required to meet demands during extended periods of service disruption. At a minimum the emergency storage should equal the volume necessary to provide service for a one-hour interruption of electrical power to all system pumps, or a four day "out of service" condition of any one pump in the system at one time. Emergency storage is calculated as follows:

From Compliance Check Calculations (Exhibit B)

V_{E1} = 125,675 gallons
V_{E2} = **385,601 gallons** << Governs

Operational Storage: Storage that is provided to equalize fluctuation in demand that exceeds the capacity of the system. This is assumed to equal 30% of the total maximum day withdrawals (V_0) plus irrigation demands (I). Operational storage is calculated as follows:

From Compliance Check Calculations (Exhibit B)

V_0 = 273,101 gallons

Irrigation Storage Calculation

$$\frac{(7.07\text{ in})(118.88\text{ acres})(43{,}560\text{ ft}^2)(7.48\text{ gal})(0.5)(1\text{ ft})}{(12\text{ in})(31\text{ days})(.75)(1\text{ acre})(1\text{ ft}^3)}$$

= 490,776 gallons/day

Operational Storage

$0.3(V_o + I) = 0.3(273{,}101 + 490{,}776)$ = **229,163 gallons**

Fire Fighting Storage: Storage that provides water supplies for fire protection. Duration of fire flow is established by the Waterworks Manual. Each pressure zone must provide firefighting storage in accordance with the land use and required fire flows within the zone. Using a required fire flow of 2,500 gpm for 2 hours, the firefighting storage is calculated as follows

(2,500 gal/min)(2 hours)(60 min/hr) = **300,000 gallons**

Total Storage Required: The combination of emergency storage, operational storage and firefighting storage. The overall total storage required for HR project is calculated as follows:

385,601 gal + 229,163 gal + 300,000 gal = **914,764 gallons**

RESULTS

The Model Schematic, available fire flow, junction residual pressure, and pipe flow calculation sets are presented for reference, as previously outlined. Examination of individual flow scenarios throughout the system (as preliminarily configured) indicates that none of the domestic junctions or fire hydrants have less than 20 psi residual pressure.

Lots 262 and 263 used a fire flow of 2,500 gpm for calculation purposes. Based on the model assumptions, flow calibrations and pressure zones, the required fire flow can be obtained at greater than 20 psi residual pressure. The following table shows the pressures at the most hydraulically remote junctions during fire flow for each planning area.

Planning Area	Junction at Hydraulically Remote Location	Demand at Junction (GPM)[1]	Pressure at Junction (psi)
1	J-64	1,107.51	89.36
2	J-26	1,099.88	62.55
3	J-52	2,568.93	71.54
4	J-44	2,546.57	60.62
5	J-14	24.08[2]	80.08
6	J-2	83.40	99.07

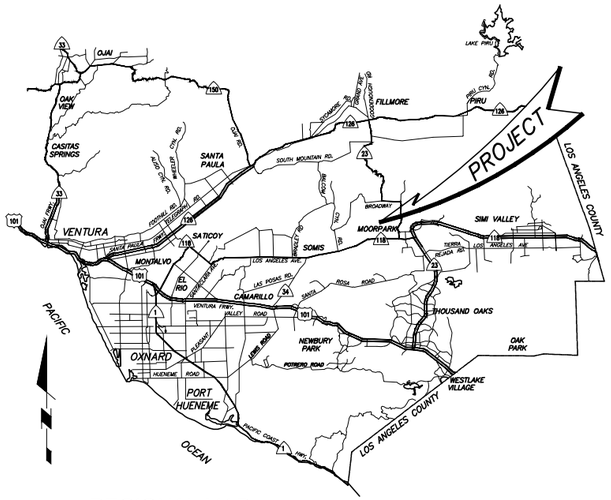
Lot 264	J-43	72	66.65

CONCLUSION

The water system for each of the planning areas as configured in the preliminary model, and shown on the Schematic, will supply the maximum day average domestic demand and irrigation demands, as well as the assumed fire protection for the project.

Prior to the HR Final Design Phase, VCWWD1 will need to provide direction on how the PR station interconnect between 850 & 757 zones is intended to operate so that it can be properly designed. The newly created 850 zone is fully dependent on supply from the existing 944 zone. However, water supply contribution from the 850 zone (via 944 zone) to the 757 zone must be determined and confirmed through District Master Plan. Possible options for the 850/757 PR station may include:

1. Eliminate interconnect if not required.
2. Emergency interconnect only (manually operated).
3. Interconnect contributes water supply from 850 (944) zone to 757 zone under **normal** operating conditions.
4. Interconnect contributes water supply from 850 (944) zone to 757 zone under **high-flow** operating conditions.



[1] For calculation purposes Planning Area's 1-4 have combined flows of domestic demand + irrigation demand + fire flow demand + prorated irrigation demand (public facilities) at the most remote junction for each respective planning area.

[2] Due to location, the demand at J-14 is the demand per junction of planning area 2 (14.38 gpm) + Irrigation for planning area 5 (9.7 gpm).

Ventura County Waterworks Manual: Compliance Check Calculations

County of Ventura Waterworks Manual Compliance Check

Water Purveyor:

System or Zone: (Overall) Hitch Ranch no lot 264

1. Determine Number of Service Connections (N)

Category	Qty	Value	Total	Section	Comments
a. Number of single residential homes or lots =	261	1.0	261.0		
b. Number of 2nd residential units ≤ 1,200 sf =	0	0.5	0.0		
c. Number of 2nd residential units > 1,200 sf =		1.0	0.0		
d. Number of mobile home spaces < 3,000 sf =		0.5	0.0		
e. Number of mobile home spaces ≥ 3,000 sf =		1.0	0.0		
f. Number of multifamily housing units =	494	0.5	247.0		
g. Number of trailer or trailer park spaces =	0	0.3	0.0		
h. Number of commercial and industrial acres =	0	5.0	0.0		
i. Number of agricultural acres =	0	2.0	0.0		
		Maximum Service Connections (N) =	**508**		
		Actual Service Connections Issued =	**0**		
		Connections Available =	**508**		

2. Determine Maximum Day Demand (Q_0) and Storage (V_0) from N

				Section	Comments
a. Temerature in °F =	70	degrees			
b. The System is metered.	TRUE				
b. Maximum Day Average Demand (Q_0) =	660	GPM			
c. Required Storage Volume (V_0) =	273,101	Gal			

3. Determine Minimum Required Fire Flow (F) and Duration (D_F)

				Section	Comments
a. Minimum Fire Flow (F) =	2,500	GPM			
b. Minimum Fire Flow Duration (D_F) =	2	Hours			

4. Determine Required Minimum Total Storage (V_M)

				Section	Comments
a. Domestic Storage Required (V_0) =	273,101	Gal			
b. Fire Storage Required (V_F) = 60 * F * D_F =	300,000	Gal			
c. Total Storage Required (V_M) = V_o + V_F =	573,101	Gal			
d. Actual Storage Available (V_1) =	0	Gal	NG	N/A	

5. Determine Minimum Required Total Supply (Q_M)

				Section	Comments
a. Actual Supply Available in the System (Q_1) =	0	GPD	NG	N/A	
b. Storage Factor (S) =	2.5				
c. Domestic Supply Required (Q_D) = 1440 * S * Q_0 =	2,377,440	GPD			
d. Fire Supply Required (Q_F) =	62,500	GPD			
e. Total Supply Required (Q_M) = Q_D + Q_F =	2,439,940	GPD			

6. Determine Minimum Required Peak Hour Demand (PHD_M)

				Section	Comments
a. Peak Hour Demand Multiplier (M) =	1.3				
b. P_A = (M * Q_0 / 2) + F =	2,939	GPM			
c. P_B = M * Q_0 =	878	GPM			
d. PHD_M = greater of P_A and P_B =	2,939	GPM			
e. Actual Peak Flow Rate (PHD_1) =	0	GPM	NG	N/A	

7. Determine Emergency Requirements (P_E, VE_1 and VE_2)				Section	Comments
a. $P_{ED} = M * Q_0 / 2 =$	439				
b. $P_{EF} = (M * Q_0 / 4) + 0.75 * F =$	2,095	GPM			
c. P_E = the greater of P_{ED} and P_{EF} =	2,095	GPM			
d. $V_{E1} = 60 * P_E =$	125,675	Gal			
e. $V_{E2} = V_0 + 0.75 * 60 * F =$	385,601	Gal			
f. Power Interuption of 1 Hour					
Peak Hour Demand (must be ≥ P_E) =	0	GPM	NG	N/A	
Volume (must be ≥ V_{E1}) =	0	Gal	NG	N/A	
g. Pump Out of Service					
Peak Hour Demand (must be ≥ P_E) =	0	GPM	NG	N/A	
Volume (must be ≥ V_{E2}) =	0	Gal	NG	N/A	
h. Source Interruption					
Peak Hour Demand (must be ≥ P_E) =	0		NG	N/A	
Volume (must be ≥ V_{E2}) =	0		NG	N/A	

8. Comments

Results vary slightly from hand calculations.

This spreadsheet was used to calculate storage and Max Day Average Demand, all other values are N/A

1. Determine Number of Service Connections (N)

Category	Qty	Value	Total	Section	Comments
a. Number of single residential homes or lots =	0	1.0	0.0		
b. Number of 2nd residential units ≤ 1,200 sf =	0	0.5	0.0		
c. Number of 2nd residential units > 1,200 sf =		1.0	0.0		
d. Number of mobile home spaces < 3,000 sf =		0.5	0.0		
e. Number of mobile home spaces ≥ 3,000 sf =		1.0	0.0		
f. Number of multifamily housing units =	241	0.5	120.5		
g. Number of trailer or trailer park spaces =	0	0.3	0.0		
h. Number of commercial and industrial acres =	0	5.0	0.0		
i. Number of agricultural acres =	0	2.0	0.0		

Maximum Service Connections (N) =	**121**
Actual Service Connections Issued =	**0**
Connections Available =	**121**

2. Determine Maximum Day Demand (Q_0) and Storage (V_0) from N

			Section	Comments
a. Temerature in °F =	70	degrees		
b. The System is metered.	TRUE			
b. Maximum Day Average Demand (Q_0) =	157	GPM		
c. Required Storage Volume (V_0) =	78,515	Gal		

3. Determine Minimum Required Fire Flow (F) and Duration (D_F)

			Section	Comments
a. Minimum Fire Flow (F) =	3,000	GPM		
b. Minimum Fire Flow Duration (D_F) =	2	Hours		

4. Determine Required Minimum Total Storage (V_M)

				Section	Comments
a. Domestic Storage Required (V_0) =	78,515	Gal			
b. Fire Storage Required (V_F) = 60 * F * D_F =	360,000	Gal			
c. Total Storage Required (V_M) = V_o + V_F =	438,515	Gal			
d. Actual Storage Available (V_1) =	0	Gal	NG	N/A	

5. Determine Minimum Required Total Supply (Q_M)

				Section	Comments
a. Actual Supply Available in the System (Q_1) =	0	GPD	NG	N/A	
b. Storage Factor (S) =	2.5				
c. Domestic Supply Required (Q_D) = 1440 * S * Q_0 =	563,940	GPD			
d. Fire Supply Required (Q_F) =	75,000	GPD			
e. Total Supply Required (Q_M) = Q_D + Q_F =	638,940	GPD			

6. Determine Minimum Required Peak Hour Demand (PHD_M)

				Section	Comments
a. Peak Hour Demand Multiplier (M) =	2.1				
b. P_A = (M * Q_0 / 2) + F =	3,168	GPM			
c. P_B = M * Q_0 =	335	GPM			
d. PHD_M = greater of P_A and P_B =	3,168	GPM			
e. Actual Peak Flow Rate (PHD_1) =	0	GPM	NG	N/A	

7. Determine Emergency Requirements (P_E, VE_1 and VE_2)				Section Comments
a. $P_{ED} = M * Q_0 / 2 =$	168			
b. $P_{EF} = (M * Q_0 / 4) + 0.75 * F =$	2,334	GPM		
c. P_E = the greater of P_{ED} and P_{EF} =	2,334	GPM		
d. $V_{E1} = 60 * P_E =$	140,032	Gal		
e. $V_{E2} = V_0 + 0.75 * 60 * F =$	213,515	Gal		
f. Power Interuption of 1 Hour				
Peak Hour Demand (must be ≥ P_E) =	0	GPM	NG	N/A

LEGAL DESCRIPTION

ALL THAT CERTAIN REAL PROPERTY SITUATED IN THE COUNTY OF VENTURA, STATE OF CALIFORNIA, DESCRIBED AS FOLLOWS:

PARCEL 1:

LOTS 14 AND 16 AND THAT PORTION OF LOTS 22 AND 23, FREMONT SUBDIVISION OF RANCHO SIMI, IN THE CITY OF MOORPARK, COUNTY OF VENTURA, STATE OF CALIFORNIA, AS PER MAP RECORDED IN BOOK 3, PAGE 39 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY, LYING NORTHERLY OF THE RIGHT OF WAY OF THE SOUTHERN PACIFIC RAILROAD 100 FEET WIDE, AS DESCRIBED IN DEED RECORDED IN BOOK 58, PAGE 590 OF DEEDS.

ASSESSOR'S PARCEL NO: 511-0-020-170

PARCEL 2:

PART OF TRACT "S" AND "T" OF PART OF TRACT "L" OF RANCHO SIMI, IN THE CITY OF MOORPARK, COUNTY OF VENTURA, STATE OF CALIFORNIA, AS PER MAP SHOWING THE TOWNSITE OF MOORPARK AND LANDS OF MADELINE R. POINDEXTER, A RE-SUBDIVISION OF FREMONT TRACT, AS PER MAP RECORDED IN BOOK 5, PAGE 5 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY, DESCRIBED AS FOLLOWS:

BEGINNING AT A POINT WHICH IS COMMON TO THE NORTHEAST CORNER OF LOT "S" AND THE NORTHWEST CORNER OF LOT "T"; THENCE, FROM SAID POINT OF BEGINNING;

1st: SOUTH 89°55' WEST 1320 FEET ALONG THE NORTH LINE OF SAID LOT "S" TO THE NORTHEAST CORNER OF THAT CERTAIN PARCEL OF LAND CONVEYED TO WILLIAM HEDGES, BY DEED DATED MARCH 3, 1909, RECORDED IN BOOK 117, PAGE 217 OF DEEDS; THENCE,

2nd: SOUTH 1964.16 FEET ALONG THE EAST LINE OF SAID LANDS OF WILLIAM HEDGES TO THE NORTHWEST CORNER OF LOT 14, AS SHOWN ON MAP ENTITLED "MAP OF FREMONT" A SUBDIVISION OF LOT "L" OF THE RANCHO SIMI, VENTURA CO., CAL." AND RECORDED IN BOOK 3, PAGE 39 OF MAPS; THENCE AT RIGHT ANGLES,

3rd: EAST 1320 FEET ALONG THE NORTH LINE OF SAID LOT 14, TO A POINT IN THE BOUNDARY LINE BETWEEN SAID LOTS "S" AND "T"; THENCE, AT RIGHT ANGLES,

4th: SOUTH 660 FEET ALONG THE BOUNDARY LINE BETWEEN LOTS 14 AND 16 OF SAID FREMONT TRACT, AND TRACT "T" ABOVE DESCRIBED TO THE SOUTHEAST CORNER OF SAID LOT 16 OF SAID FREMONT TRACT; THENCE AT RIGHT ANGLES,

5th: WEST 330 FEET ALONG THE SOUTH LINE OF SAID LOT 16 TO THE NORTHEAST CORNER OF LOT 23 OF SAID FREMONT TRACT; THENCE, AT RIGHT ANGLES;

6th: SOUTH 429.66 FEET ALONG THE EAST LINE OF LOT 23 TO A POINT IN THE NORTH LINE OF THE RIGHT OF WAY OF THE SOUTHERN PACIFIC RAILROAD; THENCE ALONG SAME;

7th: EASTERLY ALONG A CURVE TO THE RIGHT (THE LONG CHORD OF WHICH BEARS NORTH 88°37' EAST) 330.66 FEET TO A POINT; THENCE,

8th: EAST 990 FEET ALONG THE NORTH LINE OF SAID RAILROAD RIGHT OF WAY TO THE SOUTHWEST CORNER OF THAT CERTAIN PARCEL OF LAND CONVEYED TO ALICE N. GRAHAM, BY DEED DATED OCTOBER 25, 1911 AND RECORDED IN BOOK 130, PAGE 33 OF DEEDS; THENCE, STILL ALONG THE NORTH LINE OF THE RIGHT OF WAY OF THE SOUTHERN PACIFIC RAILROAD,

9th: EAST 588.06 FEET TO THE SOUTHWEST CORNER OF THAT CERTAIN PARCEL OF LAND AS CONVEYED TO LEONARD R. ELVER AND NELLIE B. ELVER, HIS WIFE, BY DEED DATED JANUARY 7, 1931, RECORDED IN BOOK 340, PAGE 198 OF OFFICIAL RECORDS; THENCE ALONG THE WEST AND NORTH LINES OF THE LANDS SO CONVEYED,

10th: NORTH 696.96 FEET TO A 1 ¼" X 6" PIPE; THENCE,

11th: NORTH 61°30' EAST 258.72 FEET TO A 2 X 66" PIPE; THENCE,

12th: NORTH 2230.14 FEET TO A POINT IN THE NORTH LINE OF SAID TRACT "T" IN THE SOUTH LINE OF LOT 32, AS THE SAME IS SHOWN ON MAP ENTITLED "MAP OF THE VALLETTE TRACT, BEING A SUBDIVISION OF LOT 2 OF BLOCK "L" OF RANCHO SIMI, VENTURA CO., CAL." AND RECORDED IN BOOK 3, PAGE 41 OF MAPS, AND AT THE NORTHWEST CORNER OF THE LANDS CONVEYED TO MAXWELL W. WRIGHT, BY DEED DATED SEPTEMBER 10, 1914 RECORDED IN BOOK 144, PAGE 283 OF DEEDS; THENCE,

13th: SOUTH 89°53' WEST 1805.166 FEET ALONG THE SOUTH LINE OF VALLETTE TRACT, AND ALONG THE NORTH LINE OF TRACT "T" TO THE POINT OF BEGINNING.

EXCEPT THOSE PORTIONS OF LAND DESCRIBED AS ESTATES 1, 2 AND 3 IN THE FINAL ORDER OF CONDEMNATION, CASE NO. SC 16973, SUPERIOR COURT OF CALIFORNIA, COUNTY OF VENTURA, A CERTIFIED COPY OF WHICH RECORDED DECEMBER 18, 1997 AS DOCUMENT NO. 97-172929 OF OFFICIAL RECORDS.

ASSESSOR'S PARCEL NO: 511-0-020-110, 130, 160, 180

PARCEL 3:

PORTIONS OF LOT "R" AND "S" AS SHOWN ON MAP OF A PART OF TRACT "L" OF THE RANCHO SIMI, IN THE CITY OF MOORPARK, COUNTY OF VENTURA, STATE OF CALIFORNIA, AS PER MAP RECORDED IN BOOK 5, PAGE 5 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY DESCRIBED AS A WHOLE AS FOLLOWS:

BEGINNING AT A POINT ON THE WEST LINE OF SAID LOT "S" DISTANT NORTH THEREON 660 FEET FROM THE SOUTHWEST CORNER OF SAID LOT "S"" THENCE ALONG THE WEST LINE OF LOTS "S" AND "R",

1st: SOUTH 1617 FEET TO THE NORTH LINE OF THE 100-FOOT RIGHT OF WAY OF THE SOUTHERN PACIFIC RAILROAD; THENCE, ALONG SAID NORTH LINE,

2nd: NORTH 76°10' EAST 1703.46 FEET TO THE SOUTHEAST CORNER OF SAID LOT "R"; THENCE ALONG THE EAST LINE OF SAID LOT "R",

3rd: NORTH 551.76 FEET TO THE NORTHEAST CORNER OF SAID LOT "R"; THENCE,

4th: WEST ALONG THE NORTH LINES OF SAID LOT "R", 330 FEET TO THE SOUTHWEST CORNER OF LOT 16 OF FREMONT TRACT, AS PER MAP RECORDED IN BOOK 3, PAGE 39 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY; THENCE,

5th: NORTH ALONG THE WEST LINE OF LOTS 16 AND 14 OF SAID FREMONT TRACT, 660 FEET TO THE NORTHWEST CORNER OF SAID LOT 14; THENCE,

6th: WEST 1320 FEET TO THE POINT OF BEGINNING.

EXCEPT THE INTEREST IN A STRIP OF LAND 40 FEET WIDE, AS GRANTED TO VENTURA COUNTY FOR "ROAD PURPOSES" IN DEED RECORDED IN BOOK 127, PAGE 326 OF DEEDS.

ALSO EXCEPT ONE HALF OF ALL MINERAL, OIL, GAS AN OTHER HYDROCARBON SUBSTANCES IN AND UNDER SAID LAND WITHOUT, HOWEVER, ANY RIGHT OF SURFACE ENTRY OR ANY RIGHT OF ENTRY IN AND TO THE SUBSURFACE THEREOF AT A DEPTH OF LESS THAN 500 FEET BENEATH THE SURFACE OF OFFICIAL RECORDS THE DEVELOPMENT OR REMOVAL OF SAID SUBSTANCES, AS RESERVED BY SENA BAUER, A LIFE ESTATE, WALTER W. BAUER, CHARLES E. BAUER, ELLEN REGINA BAUER, FRANCES D. ARBOGAST MERICLE, WHO ACQUIRED TITLE AS FRANCES B. ARBOGAST AND SERENA H. BAUER COX, WHO ACQUIRED TITLE AS SERENA H. BAUER, IN DEED RECORDED SEPTEMBER 12, 1961 IN BOOK 2045, PAGE 334 OF OFFICIAL RECORDS.

ASSESSOR'S PARCEL NO: 511-0-020-195

PARCEL 4:

THE EAST HALF OF THE SOUTHEAST QUARTER OF SECTION 6, TOWNSHIP 2 NORTH, RANGE 19 WEST, RANCHO SIMI, IN THE CITY OF MOORPARK, COUNTY OF VENTURA, STATE OF CALIFORNIA, AS SHOWN ON MAP ENTITLED "MAP OF THE RANCHO OF RANCHO SIMI, IN VENTURA AND LOS ANGELES COUNTIES, CALIFORNIA", AND RECORDED IN BOOK 3, PAGE 7 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY, AND PARTICULARLY DESCRIBED AS FOLLOWS:

BEGINNING AT A POINT IN THE CENTERLINE OF THAT CERTAIN PUBLIC ROAD, 60 FEET WIDE, LOCALLY KNOWN AS AND CALLED "LOS ANGELES AVENUE" AT THE CORNER COMMON TO SECTIONS 5, 6, 7 AND 8 OF TOWNSHIP 2 NORTH, RANGE 19 WEST, RANCHO SIMI, AS SHOWN ON THE ABOVE DESCRIBED MAP, SAID POINT OF BEGINNING BEING THE SOUTHWEST CORNER OF TRACT "Q" AS SHOWN ON MAP ENTITLED "MAP OF PART OF TRACT "L" OF RANCHO SIMI, VENTURA COUNTY, CALIFORNIA, SHOWING THE TOWNSITE OF MOORPARK AND LANDS OF MADELEINE R. POINDEXTER, A RE-SUBDIVISION OF FREMONT TRACT" AND RECORDED IN BOOK 5, PAGE 5 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF VENTURA COUNTY; THENCE, FROM SAID POINT OF BEGINNING,

1st: NORTH 2640 FEET TO THE SOUTHEAST CORNER OF LOT 56 OF VALLETTE TRACT, AS PER MAP RECORDED IN BOOK 3, PAGE 41 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY; THENCE, AT RIGHT ANGLES,

2nd: WEST 1320 FEET TO THE SOUTHWEST CORNER OF SAID LOT 56 OF VALLETTE TRACT, AT THE NORTHEAST CORNER OF THAT CERTAIN PARCEL OF LAND, CONVEYED TO MARY FRANCES ESTES, BY DEED DATED OCTOBER 22, 1902 AND RECORDED IN BOOK 87, PAGE 120 OF DEEDS; THENCE AT RIGHT ANGLES,

3rd: SOUTH 2640 FEET ALONG THE EAST LINE OF SAID LANDS OF MARY FRANCES ESTATES TO A POINT IN THE CENTERLINE OF SAID LOS ANGELES AVENUE; THENCE, ALONG SAME,

4th: EAST 1320 FEET TO THE POINT OF BEGINNING.

EXCEPT THAT PORTION LYING SOUTHERLY OF THE NORTHERLY LINE OF THAT CERTAIN STRIP 100 FEET WIDE DESCRIBED IN THE DEED TO THE SOUTHERN PACIFIC RAILROAD COMPANY, RECORDED NOVEMBER 13, 1899 IN BOOK 58, PAGE 596 OF DEEDS.

ALSO EXCEPT THAT PORTION LYING WITHIN THAT CERTAIN STRIP 345 FEET WIDE DESCRIBED IN DEED TO SOUTHERN CALIFORNIA EDISON COMPANY, RECORDED OCTOBER 22, 2010 AS INSTRUMENT NO. 20101022-0015308 OF OFFICIAL RECORDS.

ASSESSOR'S PARCEL NO: 511-0-200-245

EXISTING EASEMENTS (SEE TITLE REPORT FOR FULL ITEM SUMMARY)

2. SIMI LAND & WATER COMPANY EASEMENT, OR ITS ASSIGNS, FOR ENTRY AND WATER COLLECTION AND DISTRIBUTION PER BOOK 29, PAGE 500 OF DEEDS.
3. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR PUBLIC UTILITIES PER BOOK 339, PAGE 109 OF OFFICIAL RECORDS.
4. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR PUBLIC UTILITIES PER BOOK 968, PAGE 442 OF OFFICIAL RECORDS.
5. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR PUBLIC UTILITIES PER BOOK 1001, PAGE 544 OF OFFICIAL RECORDS.
6. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR PUBLIC UTILITIES PER BOOK 1001, PAGE 550 OF OFFICIAL RECORDS.
7. VENTURA COUNTY FLOOD CONTROL DISTRICT EASEMENT FOR FLOOD CONTROL PER BOOK 2141, PAGE 551 OF OFFICIAL RECORDS.
8. VENTURA COUNTY FLOOD CONTROL DISTRICT EASEMENT FOR FLOOD CONTROL PER BOOK 2141, PAGE 556 OF OFFICIAL RECORDS.
9. VENTURA COUNTY FLOOD CONTROL DISTRICT EASEMENT FOR FLOOD CONTROL PER BOOK 2141, PAGE 558 OF OFFICIAL RECORDS.
10. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR PUBLIC UTILITIES AND ROADS PER BOOK 2347, PAGE 225 OF OFFICIAL RECORDS.
11. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR ROADS PER BOOK 3243, PAGE 379 OF OFFICIAL RECORDS.
12. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR PUBLIC UTILITIES AND ROADS PER BOOK 3243, PAGE 387 OF OFFICIAL RECORDS.
13. A-B PROPERTIES, A CALIFORNIA GENERAL PARTNERSHIP, EASEMENT FOR ACCESS ROAD, UTILITIES, AND SLOPE PER AS INSTRUMENT NO. 2001-012562 OF OFFICIAL RECORDS.
16. AT&T EASEMENT FOR FIBER OPTIC CABLE ALONG RAILROAD CORRIDOR PER AS INSTRUMENT NO. 2009-106766 OF OFFICIAL RECORDS.
17. VENTURA COUNTY WATERSHED PROTECTION DISTRICT EASEMENT FOR FLOOD CONTROL PURPOSE OF PERIODIC INUNDATION WITH FLOOD AND/OR STORM DRAINAGE WATER PER AS INSTRUMENT NO. 2012-155707 OF OFFICIAL RECORDS.
18. LEVEL3 COMMUNICATION, LLC EASEMENT FOR TELECOMMUNICATIONS AND INCIDENTAL PURPOSES PER AS INSTRUMENT NO. 2013-146419 OF OFFICIAL RECORDS.
19. SPRINT COMMUNICATIONS COMPANY, LP EASEMENT FOR TELECOMMUNICATIONS AND INCIDENTAL PURPOSES PER AS INSTRUMENT NO. 2013-205739 OF OFFICIAL RECORDS.
20. QUEST COMMUNICATIONS INTERNATIONAL INC., ET AL. EASEMENT FOR TELECOMMUNICATIONS AND INCIDENTAL PURPOSES PER AS INSTRUMENT NO. 2014-011258 OF OFFICIAL RECORDS.

PROPOSED EASEMENTS

1. VARIABLE WIDTH UTILITY AND ACCESS EASEMENT TO VENTURA COUNTY WATERWORKS DISTRICT NO. 1. (CURB-TO-CURB ALONG ALL PRIVATE STREETS/ALLEYS/DRIVES AND ALL OTHER LOCATIONS SPECIFIED ON THE PLANS).
2. VARIABLE WIDTH UTILITY AND ACCESS EASEMENT TO HOA.
3. VARIABLE WIDTH ACCESS EASEMENT TO CITY OF MOORPARK.

UTILITIES

WATER	VENTURA COUNTY WATERWORKS DISTRICT NO. 1
SEWER	VENTURA COUNTY WATERWORKS DISTRICT NO. 1
STORM DRAIN	CITY OF MOORPARK VENTURA COUNTY WATERSHED PROTECTION DISTRICT
ELECTRIC	SOUTHERN CALIFORNIA EDISON
GAS	SOUTHERN CALIFORNIA GAS COMPANY
TELEPHONE	FRONTIER COMMUNICATIONS
CABLE TELEVISION	SPECTRUM CABLE
SOLID WASTE	SIMI VALLEY LANDFILL & RECYCLING CENTER c/o WASTE MANAGEMENT / G.I. INDUSTRIES
FIRE PROTECTION	VENTURA COUNTY FIRE DEPARTMENT

- RW — RECYCLED WATER LINE
- S — SEWER LINE
- SD — STORM DRAIN LINE
- SEWER MANHOLE
- STORM DRAIN MANHOLE

EARTHWORK

EARTHWORK ESTIMATES:

CUT: 2,730,000 CUBIC YARDS
FILL: 2,730,000 CUBIC YARDS
IMPORT: 0 CUBIC YARDS
EXPORT: 0 CUBIC YARDS (NOTE: EARTHWORK IS INTENDED TO BALANCE ON-SITE)

THE ABOVE QUANTITIES ARE APPROXIMATE IN PLACE VOLUMES CALCULATED FROM THE EXISTING GROUND TO THE PROPOSED FINISH GRADE OR SUBGRADE. EXISTING GROUND IS DEFINED BY THE CONTOURS ON THE PLAN. PROPOSED FINISH GRADE IS DEFINED AS THE DESIGN SURFACE ELEVATION OF EARTH TO BE CONSTRUCTED. PROPOSED SUBGRADE ELEVATION IS DEFINED AS THE DESIGN SURFACE ELEVATION OF EARTH TO BE CONSTRUCTED BENEATH PAVEMENTS OR STRUCTURES.

THE EARTHWORK QUANTITIES ABOVE ARE FOR PERMIT PURPOSES ONLY. THEY HAVE NOT BEEN FACTORED TO ACCOUNT FOR CHANGES IN VOLUME DUE TO BULKING, SHRINKAGE, CLEARING AND GRUBBING, OVER EXCAVATION AND RE-COMPACTION, AND OTHER REMEDIAL GRADING CONSTRUCTION METHODS.

LEGEND

SHEET INDEX

1. TITLE SHEET
2. PRELIMINARY GRADING, DRAINAGE, & UTILITIES
3. PRELIMINARY GRADING, DRAINAGE, & UTILITIES
4. PRELIMINARY GRADING, DRAINAGE, & UTILITIES
5. PRELIMINARY GRADING, DRAINAGE, & UTILITIES
6. PRELIMINARY GRADING, DRAINAGE, & UTILITIES

GENERAL NOTES

GENERAL:

1. ALL DIMENSIONS AND AREAS SHOWN ARE APPROXIMATE ONLY.
2. PROJECT SITE IS WITHIN THE MOORPARK UNIFIED SCHOOL DISTRICT.
3. STREETS B-N SHALL BE PRIVATE AND MAINTAINED BY THE HOA.
4. STREETS SHOWN ON THIS TENTATIVE TRACT MAP SHALL BE IN ACCORDANCE WITH THE REQUIREMENTS OF THE CITY OF MOORPARK PUBLIC WORKS AND COMMUNITY DEVELOPMENT DEPARTMENTS.
5. MULTIPLE FINAL MAPS MAY BE RECORDED FROM THIS TENTATIVE TRACT MAP IN ACCORDANCE WITH THE STATE OF CALIFORNIA SUBDIVISION MAP ACT.

UTILITIES:

6. ALL NEW UTILITIES WILL BE UNDERGROUND.
7. NEW UTILITY LOCATIONS AND EASEMENTS ARE APPROXIMATE.
8. NEW STORM DRAINAGE IMPROVEMENTS ON PRIVATE STREETS ARE TO BE PRIVATE AND MAINTAINED BY THE HOA. NEW STORM DRAINAGE IMPROVEMENTS WITHIN THE PUBLIC RIGHT-OF-WAY ARE TO BE PUBLIC AND MAINTAINED BY THE CITY OF MOORPARK OR VCWPD.
9. SURFACE STORMWATER QUALITY TREATMENT FACILITIES SHALL BE PRIVATE AND MAINTAINED BY THE HOA.
10. NEW SEWER MAINS ARE TO BE PUBLIC AND TO BE DEDICATED TO VENTURA COUNTY WATERWORKS DISTRICT (VCWWD) NO. 1. NEW SEWER MAINS SHALL BE PER VCWWD NO. 1 STANDARDS.
11. NEW WATER MAINS ARE TO BE PUBLIC AND TO BE DEDICATED TO TO VCWWD NO. 1. NEW WATER MAINS SHALL BE PER VCWWD NO. 1 STANDARDS.
12. FIRE HYDRANT LOCATIONS TO BE DETERMINED BY VENTURA COUNTY FIRE DEPARTMENT.

SURVEY NOTES

BASIS OF BEARINGS: THE BASIS OF BEARINGS FOR THIS MAP IS THE CALIFORNIA COORDINATE SYSTEM OF 1983 (CCS83), ZONE 5, EPOCH 2017.50 AS DETERMINED LOCALLY BY A LINE BETWEEN CONTINUOUS GLOBAL POSITIONING STATIONS (CGPS) AND/OR CONTINUOUS OPERATING REFERENCE STATIONS (CORS) MPWD & TOST BEING SOUTH 35°20'10" EAST AS DERIVED FROM GEODETIC VALUES PUBLISHED BY THE CALIFORNIA SPATIAL REFERENCE CENTER (CSRC).

COORDINATES AND DISTANCES SHOWN HEREON HAVE BEEN SCALED AND TRANSLATED TO A LOCAL GROUND COORDINATE SYSTEM BASED UPON THE FOLLOWING CALCULATED VALUES AT POINT 204:

COMBINED SCALE FACTOR - 0.9999332300
CCS83 GRID COORDINATE - N 1928392.48, E 6290311.15
LOCAL GROUND COORDINATE - N 928392.48, E 290311.15

BENCHMARK: THE VERTICAL DATUM OF THIS SURVEY IS THE NORTH AMERICAN VERTICAL DATUM OF 1988 (NAVD88); PER GEOID MODELING (GEOID12B) AND LEVEL TIES TO POINTS 23 AND 24 FROM VENTURA COUNTY BENCHMARK (VCPD 139), BEING A 3-1/2" BC STAMPED "VENTURA COUNTY SURVEYOR 1965 BM 37-13" IN A HEADWALL ON THE WESTERLY SIDE OF GABBERT ROAD, SOUTHERLY OF THE UNION PACIFIC RAILROAD.

APPENDIX 3.15

Transportation Impact Analysis

Stantec

Memo

To:	Harriet Rapista Comstock Homes	From:	Daryl Zerfass & Eric Mazzella Stantec
File:	2042629800	Date:	February 1, 2022

Reference: Supplemental Traffic Analysis for the Hitch Ranch Project in the City of Moorpark

Stantec has prepared a supplemental traffic analysis for the proposed Hitch Ranch project (Project) in the City of Moorpark. A comprehensive traffic impact analysis was previously completed for the Project by Impact Sciences in July 2021. The purpose of this supplemental study is to update the cumulative year analysis to include additional new planned development projects in the cumulative horizon. The analysis of two additional future intersections that are associated with the project site has also been included in this supplemental analysis.

Since completion of the July 2021 Traffic Study, the following five additional cumulative projects have been identified by the City and added to the Future (2026) Cumulative Conditions scenario:

1. Oakmont Senior Living
2. High Street Depot
3. Beltramo Ranch
4. Moorpark 67
5. Amazon Distribution Center

A complete listing of all cumulative projects included in this supplemental analysis is provided in the attached Table A-1.

This supplemental analysis has been conducted using the PTV Vistro traffic operations modeling software consistent with the July 2021 Traffic Study. The Vistro model network was updated to incorporate the new cumulative projects, and a desktop review of existing condition traffic signal configurations was performed using Google Streetview imagery to update the operational input assumptions. Additionally, the study area was expanded to include the following two new future intersections:

1. Gabbert Road & North Hills Parkway *(Future)*
2. Gabbert Road & High Street *(Future)*

Refer to the attached Exhibit A-1 for a map showing all the study area intersections.

IMPACT CRITERIA

Consistent with the July 2021 Traffic Study, the City of Moorpark's General Plan Policy criteria are used to identify a project impact to a roadway intersection as follows:

1. Degrades the LOS at an intersection to an unacceptable level of service (LOS) of LOS D or worse.
2. Increases volume-to-capacity (V/C) ratio at a signalized intersection operating at LOS F by 0.020 or more.

3. Increases delay at an unsignalized intersection operating at an unacceptable LOS by 5 or more seconds.

4. Results in satisfying the most recent California Manual on Uniform Traffic Control Devices (CA MUTCD) peak hour volume warrant or other warrants for traffic signal installation at an unsignalized intersection.

For consistency between this supplemental analysis and the July 2021 Traffic Study, Intersection Capacity Utilization (ICU) and Highway Capacity Manual 2010 (HCM 2010) methodologies are used to analyze signalized intersections and unsignalized intersections, respectively.

IMPACT ANALYSIS

The Project's impact on roadway intersections has been recalculated for existing and cumulative conditions to include additional study locations, updates to signal timing inputs, and—for cumulative conditions—to include the additional cumulative projects noted above.

Existing Conditions Traffic Analysis

The Existing Conditions scenario was analyzed with and without the Project generated traffic to identify the Project's impact on study area intersections (refer to the July 2021 Traffic Study for analysis of the Project's trip generation). Consistent with the July 2021 Traffic Study, Project traffic is incrementally added to the Existing Conditions setting using the PTV Vistro software. The base traffic volumes used in the Existing Conditions scenario represent the same 2019 traffic counts used in the July 2021 Traffic Study. The Project's impacts were then assessed using the impact thresholds provided by the City of Moorpark as noted above.

A complete list of Existing Conditions without Project and with Project V/C ratios, delay (if applicable), and LOS for study area intersections in the AM and PM peak hours is shown in the attached Table A-2. **Table 1**, below, summarizes operations of study area intersections where the Project has a direct impact in the Existing Conditions scenario.

Table 1 Project Impacts – Existing Conditions Setting

ID	Intersection	Peak Hour	Existing Conditions No-Project		Existing Conditions With-Project		Project Increment
			V/C	LOS	V/C	LOS	
3	Walnut Canyon & Spring	PM	0.899	D	0.912	E	0.013
4	Walnut Canyon & Casey	AM	0.668	B	0.801	D	0.133
6	Spring & High	PM	0.782	C	0.805	D	0.023

As shown above, there are three intersections in the Existing Conditions scenario that are impacted by Project traffic. One impact occurs in the AM peak hour, and two impacts occur in the PM peak hour. Intersection improvements to offset the Project's impact are discussed in a later section.

Future (2026) Cumulative Conditions Traffic Analysis

The Future (2026) Cumulative Conditions scenario has been updated from the July 2021 Study to include five additional cumulative projects as discussed above. The Future (2026) Cumulative Conditions scenario is

representative of the Project's anticipated buildout year of 2026. Along with the traffic to be generated by the identified cumulative projects, the Future (2026) Cumulative Conditions scenario also accounts for traffic generated by additional growth with the use of a one percent ambient annual growth factor (a total of approximately seven percent growth applied to the 2019 traffic counts), consistent with the July 2021 Traffic Study. In addition, the traffic signal timing and lane configuration assumptions noted above have been carried over to the Future (2026) Cumulative Conditions scenario.

Trip generation estimates for each new cumulative project were prepared using either the ITE Trip Generation Manual, 10th Edition, or where available, rates from completed traffic studies approved by the City of Moorpark. Regarding the High Street Depot project, where the latest description for retail use is unclear, the uses that make up the approximately 13.656 TSF of retail space were proportionately scaled down from the now outdated 15.018 TSF of retail (including a brewery, restaurant, and retail commercial space) found in the Initial Study/Mitigated Negative Declaration (ISMND). A summary of trip generation can be found in **Table 2** for both new and revised projects.

Trip generation rates for the Project and for the cumulative projects analyzed in the July 2021 Traffic Study have not been changed as part of this supplemental analysis.

Table 2 New and Revised Cumulative Project Trip Generation Summary

Category	Amount	Units	AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
Cumulative Projects Added for Supplemental Analysis								
7. Oakmont Senior Living	77	Beds	9	5	14	8	12	20
10. High Street Depot	79	DU	9	28	37	28	17	45
	3.477	TSF	-	-	-	21	13	34
	2.541	TSF	14	11	25	15	9	24
	7.638	TSF	4	3	7	14	15	29
	Project Total		*27*	*42*	*69*	*78*	*54*	*132*
	Internal Capture		*3*	*4*	*7*	*28*	*19*	*48*
	External Transit		*3*	*4*	*7*	*8*	*5*	*13*
	Net External Trips		22	34	55	42	29	71
13. Beltramo Ranch	52	DU	10	29	39	32	19	51
16. Moorpark 67	139	DU	26	78	104	86	51	137
17. Amazon Distribution Center[1]	189.364	DU	-6	-11	-17	29	-17	12
Cumulative Projects Revised for Supplemental Analysis								
1. Casey Road City Parcel	333 (+133)	DU	31	82	113	38	104	142
9. Aldersgate Senior Housing	390 (+132)	DU	68	68	136	94	95	189
11. Grand Moorpark	63 (-3)	DU	14	14	28	16	16	32
[1]The Amazon Distribution Center is a replacement of an existing use.								

Reference: **Supplemental Traffic Analysis for the Hitch Ranch Project in the City of Moorpark**

New cumulative project trips were distributed based on project location and land use. For residential projects, trips were distributed to State Route 118 (SR 118), State Route 23 (SR 23), schools, and other local uses. Trips to and from the only industrial use, the Amazon Distribution Center, were primarily distributed to SR 118 given its proximity to the Princeton Avenue ramps. Where available, trip distribution from prior traffic studies approved by the City of Moorpark was used. Trip distribution assumptions for the Project and for cumulative projects analyzed in the July 2021 Traffic Study have not been changed as part of this supplemental analysis.

The Cumulative Conditions scenario was analyzed with and without the Project to identify the Project's impact on study area intersections. Consistent with the July 2021 Traffic Study, Project traffic is incrementally added to the Cumulative Conditions setting using PTV Vistro software. The Project's impacts were then assessed using the impact thresholds provided by the City of Moorpark as noted above.

A complete list of Cumulative Conditions without Project and with Project volume-to-capacity (V/C) ratios, delay (if applicable), and level of service (LOS) for study area intersections in the AM and PM peak hours is shown in the attached Table A-3. **Table 3**, below, summarizes operations of study area intersections where the Project has a direct impact in the Cumulative Conditions scenario. In total, impacts at six study area intersections were found to be attributable to the Project.

Table 3 Future (2026) Cumulative Conditions Impacts

ID	intersection	Peak Hour	Cumulative Conditions No-Project		Cumulative Conditions With-Project		Project Increment
			V/C	LOS	V/C	LOS	
4	Walnut Canyon & Casey	AM	0.811	D	0.902	E	0.091
5	Moorpark & High	AM	0.700	C	0.841	D	0.141
		PM	0.748	C	0.909	E	0.161
6	Spring & High	AM	0.970	E	1.016	F	0.046
		PM	1.082	F	1.107	F	0.025
8	Moorpark & Poindexter	PM	0.873	D	0.911	E	0.038
14	Miller & Los Angeles	PM	0.794	C	0.828	D	0.034
15	SR 23 SB Ramps & Los Angeles	PM	0.780	C	0.816	D	0.036

As shown above, six intersections are impacted by the Project in the Cumulative Conditions scenario, with two of the intersections impacted in both peak hours. Intersection improvements to offset the Project's impact are discussed in a later section.

INTERSECTION IMPROVEMENTS

Intersection improvements that address the impacts caused by the Project have been identified for each of the impacted intersections identified above in the Existing Conditions and Future (2026) Cumulative Conditions scenarios. The improvements are generally consistent with those identified in the July 2021 Traffic Study, with some modifications to address the updated conditions.

Reference: **Supplemental Traffic Analysis for the Hitch Ranch Project in the City of Moorpark**

Intersection Improvements for Existing plus Project Conditions

Intersection improvements and the resulting LOS for the three intersections identified as impacted by the Project in the Existing Conditions scenario are described below:

3. Walnut Canyon Road & Spring Road – Add a westbound right-turn signal overlap phase. This reduces V/C to 0.733 (LOS C) in the impacted PM peak hour.

4. Walnut Canyon Road & Casey Road – Add an eastbound right-turn signal overlap phase. This reduces V/C to 0.618 (LOS B) in the impacted AM peak hour.

6. Spring Road & High Street – Add a second eastbound through lane (unchanged from the July 2021 Traffic Study). This reduces V/C to 0.738 (LOS C) in the impacted PM peak hour.

The above improvements fully address the Project impacts in the Existing Conditions scenario.

Intersection Improvements for Future (2026) Cumulative Conditions

Intersection improvements and the resulting LOS for the six intersections identified as impacted by the Project in the Future (2026) Cumulative Conditions scenario are described below:

4. Walnut Canyon Road & Casey Road – Same as for existing conditions, above. This reduces V/C to 0.683 (LOS B) in the impacted AM peak hour.

5. Moorpark Avenue & High Street – Add a northbound left-turn lane and convert the existing northbound shared left-turn/through lane into an exclusive through lane. Also, add an eastbound right-turn lane and convert the existing eastbound shared left-turn/through/right-turn lane into a shared left-turn/through lane. This reduces V/C to 0.729 (LOS C) and 0.758 (LOS C) in the impacted AM peak hour and PM peak hour, respectively.

6. Spring Road & High Street – Same as for existing conditions, above (unchanged from the July 2021 Study). This reduces V/C to 0.903 (LOS E) and 0.992 (LOS E) in the impacted AM peak hour and PM peak hour, respectively.

8. Moorpark Avenue & Poindexter Avenue – Convert the existing southbound shared through/right-turn lane into one exclusive through lane and one exclusive right-turn lane. This reduces V/C to 0.703 (LOS C) in the impacted PM peak hour.

14. Miller Parkway & Los Angeles Avenue – Add a southbound right-turn lane (unchanged from the July 2021 Study). This reduces V/C to 0.784 (LOS C) in the impacted PM peak hour.

15. SR 23 SB Ramps & Los Angeles Avenue – Add a second westbound through lane. This reduces V/C to 0.639 (LOS B) in the impacted PM peak hour.

The above improvements fully address the Project impacts in the Future (2026) Cumulative Conditions scenario.

Reference: **Supplemental Traffic Analysis for the Hitch Ranch Project in the City of Moorpark**

CONCLUSION

Stantec has prepared this technical memorandum as a supplemental update to the traffic analysis included in the July 2021 comprehensive traffic study prepared by Impact Sciences. Subsequent to the July 2021 Traffic Study, the following changes have been incorporated into this supplemental analysis:

1. Five new cumulative projects have been identified within the study area
2. Updated land use for three prior cumulative projects, including the Casey Road City Parcel adjacent to the Hitch Ranch site
3. Two new future study area intersections have been included in the analysis
4. Refinements to the traffic signal timing and lane configuration assumptions for some study area locations

The above changes have been accounted for in this supplemental analysis and the intersection LOS results have been updated for the Existing Conditions and Future (2026) Cumulative Conditions scenarios accordingly. In the Existing Conditions scenario, three intersections are identified as impacted by the Project. In the Future (2026) Cumulative Conditions Scenario, six intersections are identified as impacted by the Project. Potential intersection improvements that fully address each of the Project-related impacts in both scenarios are identified as shown in the above sections. Attachment B includes exhibits such as intersection lane configurations and intersection volumes used in the analysis. Attachment C consists of PTV Vistro data worksheets.

As discussed in the July 2021 Traffic Study, the Project would be subject to the following Condition of Approval to address the Project's effect on intersection LOS:

> **Area of Contribution (AOC) Fees**
>
> The Project Applicant shall pay the City AOC fee based upon the current City of Moorpark AOC Fees in effect at the time of issuance of a certificate of occupancy for each dwelling unit. The AOC fee shall be paid prior to issuance of a certificate of occupancy for each unit of the project.

Please feel free to contact us if you have any questions or would like to discuss this analysis in further detail.

EXCUTIVE SUMMARY

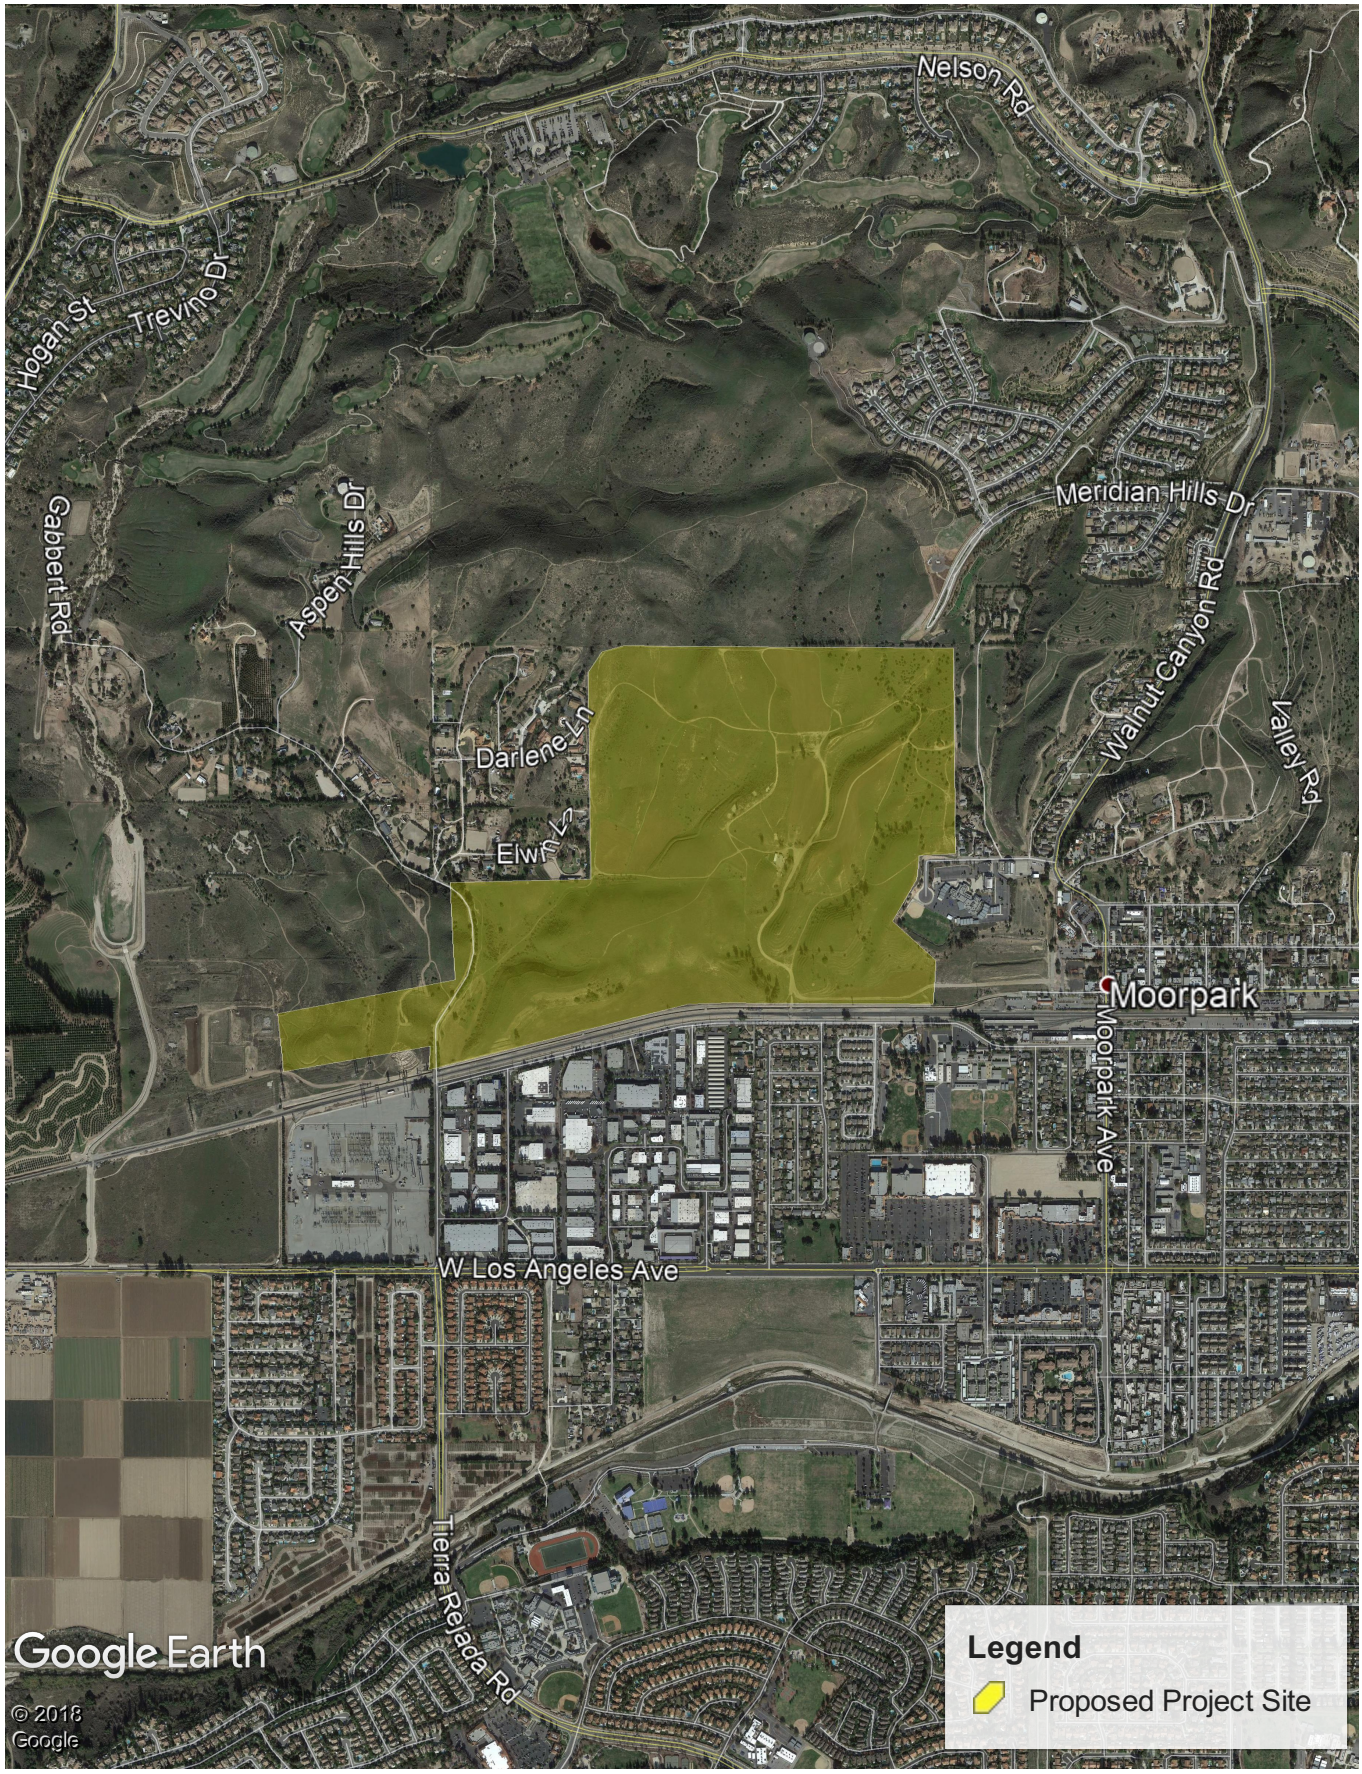
Project Description

The proposed project includes 755 residential units (427 single-family, 328 multi-family), a 6.77-acre public park, over five acres of private recreational areas, and over 112 acres of open space, manufactured slopes, and detention basins. It is anticipated that the specific plan would be completed in six phases beginning in 2022. The 253.94-acre project site is located approximately 1,600 feet west of State Route 23 (SR-23) and extends approximately 1,400 feet west of Gabbert Road, as shown in the following Figure 1, Project Setting. The project site is predominantly undeveloped, containing limited improvements that include dirt and semi-paved roads and remnants of grazing use (e.g., corrals, fences, watering facilities for grazing animals).

This analysis was prepared based on the protocols identified in the Traffic Study Scoping Memo prepared by Impact Science in March 2019, discussed with City staff, and approved by the City of Moorpark in August 2019. This analysis was prepared prior to the effective date of SB 743, which shifted the focus of traffic analyses away from congestion Levels of Service toward assessing changes in vehicle miles traveled.

Project Access

The proposed project would include several new roadways that would be built to provide internal circulation within the project over its two phases. The first phase would include the following major public rights-of-way:



- A local north-south collector road (referred to hereafter as Street “A”) to be built from the extension of High Street, approximately midway between Walnut Canyon Road and Gabbert Road. Street “A” would intersect the North Hills Parkway once it is constructed and terminate at the connection to Meridian Hills Drive to the north.
- Extending High Street through the project site to connect Moorpark Avenue on the east to Gabbert Road. The High Street extension will be built as a two-lane collector roadway generally running parallel to Poindexter Avenue, north of the

Union Pacific Railroad right-of-way. This extension will provide direct access to the future Moorpark Civic Center and Historic High Street east of Moorpark Avenue.

- The proposed project would extend Casey Road west into the site as far as Street "A." The project would also widen Casey Road east of the project site to approximately 440 feet west of Walnut Canyon Road.
- Extending Meridian Hills Drive feet westward from its current terminus northwest of the project site.
- The dedication of corridor right-of-way for the future construction of North Hills Parkway from Walnut Canyon Road to Street "A." Upon completion in Phase 2 this road would have one two travel lanes in each direction with a center median.
- The construction of local roads to serve the first phase of development east of Street "A".

The second phase would include construction of the following rights-of-way:

- Construction of North Hills Parkway from the eastern property line of the project to Gabbert Canyon Road. Right of way dedication will be provided to the western property line.
- The construction of local roads to serve the second phase of development west of Street "A" (i.e., Streets "B" through "P").
- A widening of Gabbert Road from North Hills Parkway to immediately north of the railroad tracks right of way.

IMPACT SCIENCES

Project Setting

1318.002

Estimated Traffic Generation

Estimates of the traffic generated by the proposed project were calculated using the industry standard traffic generation rates developed by the Institute of Transportation Engineers' (ITE) Trip Generation Manual, 10th Edition. The rates for single-family detached housing (land use code 210), multi-family housing (low-rise, land use code 220), and public park (land use code 411) were used to estimate trips generated by the proposed project.[1] Using these definitions, it is estimated that the project would generate 6,436 daily weekday vehicle trips with 467 morning peak hour trips and 608 afternoon peak hour trips.

Table 1
Project Traffic Generation Estimates

Land Use	Daily Traffic	AM Peak Hour			PM Peak Hour		
		Total	In	Out	Total	In	Out
Single-Family Residences	4,031	316	79	237	423	266	157
Multifamily Residences	2,401	151	35	116	184	116	68
Public Park	4	0	0	0	1	0	1
Total	6,436	467	114	353	608	382	226

Project's Potential Traffic Impacts

The focus of this traffic study is to evaluate the potential traffic impact created by the development of the proposed project and identify and analyze the significant traffic impacts that require traffic mitigation. This traffic study provides two baseline scenarios to evaluate the project's traffic impacts: (1) existing 2019 traffic conditions plus the project traffic volume ("Existing + Project") and (2) future 2026 cumulative traffic conditions plus the project traffic volume ("Future 2026 Cumulative + Project").

[1] ITE defines low-rise multi-family housing as "…apartments, townhouses, and condominiums located within the same building with at least three other dwelling units and that have one or two levels…" While the Project includes two- and three-story buildings, this analysis used land use code 220 for all multi-family dwelling units to conservatively estimate trip generation. Public park is described as "…including boating or swimming facilities, beaches, hiking trails, ball fields, soccer fields, campsites, and picnic facilities."

The traffic impacts of the project are considered significant if the project substantially degrades the level of service (LOS) at any of the signalized or un-signalized intersections analyzed for both baseline scenarios. LOS is a measure of the quality of traffic flow. The specific criteria for significant impacts are described in Tables 7a and 7b later in this report.

Significant Project traffic impacts (Existing + Project)

When compared to existing conditions, the change in traffic flow generated by the proposed project would exceed the traffic impact significance criteria at five intersections:

1. The intersection of Walnut Canyon Road and Casey Road is significantly impacted in the morning peak hour prior to the implementation of mitigation measures, with Level of Service degrading from LOS B to LOS D.

2. The intersection of Walnut Canyon Road and Spring Road is significantly impacted in the afternoon peak hour prior to the implementation of mitigation measures, with Level of Service degrading from LOS C to LOS D, though it should be noted that this intersection currently operates at 0.899 V/C (LOS C).

3. The intersection of Moorpark Avenue and High Street is significantly impacted in the afternoon peak hour prior to the implementation of traffic mitigation measures. Level of Service would degrade from LOS C to D.

4. The intersection of Spring Road and High Street is significantly impacted in the afternoon peak hour prior to the implementation of traffic mitigation measures, with Level of Service degrading from LOS C to LOS D.

5. The intersection of Spring Road and Los Angeles Avenue is significantly impacted in the afternoon peak hour prior to the implementation of traffic mitigation measures, as V/C would increase by 0.059 at this intersection that already operates at LOS F.

Significant Project traffic impacts (Future 2026 Cumulative + Project)

Assuming all pending and approved projects go forward, the change in traffic flow generated by the proposed project would exceed the traffic impact significance criteria in the future cumulative condition at eight intersections:[2]

1. The intersection of Walnut Canyon Road and Casey Road is significantly impacted in the morning peak hour prior to the implementation of mitigation measures, with Level of Service degrading from LOS C to LOS D.

2. The intersection of Moorpark Avenue and High Street is significantly impacted in the morning and afternoon peak hours prior to the implementation of mitigation measures, with Level of Service degrading from LOS D to LOS E and LOS C to LOS E, respectively.

3. The intersection of Spring Road at High Street is significantly impacted in the morning peak hour prior to the implementation of mitigation measures, with Level of Service degrading from LOS C to LOS D.

4. The intersection of Spring Road and Los Angeles Avenue is significantly impacted in the morning peak hour prior to the implementation of mitigation measures, as V/C would increase by 0.037 at this intersection that would already operate at LOS F.

5. The intersection of Spring Road and Los Angeles Avenue is significantly impacted in the afternoon peak hour prior to the implementation of mitigation measures, as V/C would increase by 0.059 at this intersection that would already operate at LOS F.

---

[2] Level of Service at Tierra Rejada Road and Los Angeles Avenue would degrade from LOS D to E in the morning peak hour due to the projected baseline V/C of 0.897. Because the project's increase is only 0.006 V/C, this is not considered a significant project impact.

6. The intersection of Miller Parkway/Science Drive/Los Angeles Avenue is significantly impacted in the afternoon peak hour prior to the implementation of mitigation measures, as V/C would increase by 0.048 at this intersection that would already operate at LOS F.

7. The intersection of SR-23 southbound ramps and Los Angeles Avenue is significantly impacted in the afternoon peak hour prior to the implementation of mitigation measures, with Level of Service degrading from LOS C to LOS D.

8. The intersection of Spring Road and Tierra Rejada Road is significantly impacted prior to the implementation of mitigation measures, with Level of Service degrading from LOS D to LOS E.

Project's Traffic Mitigation Measures

Several traffic measures are recommended for eight significantly impacted intersections:

1. Walnut Canyon Road and Casey Road. Add a second right turn lane on eastbound Casey Road. The Project would contribute a fair share contribution towards the cost of these improvements under the City's Area of Contribution (AOC) program.

2. Walnut Canyon Road at Spring Road. Add a second right turn lane on westbound Spring Road. The Project would contribute a fair share contribution towards the cost of these improvements under the City's AOC program.

3. Moorpark Avenue at High Street. Convert the northbound left turn lane-through lane to a dedicated left turn lane and a through lane. Adding a left turn lane on the westbound High Street approach at Moorpark Avenue would also be needed. The Project would contribute a fair share contribution towards the cost of these improvements under the City's AOC program.

4. Spring Road and High Street. Add a second through lane on the eastbound approach of High Street at Spring Road. The Project would contribute a fair

share contribution towards the cost of these improvements under the City's AOC program.

5. Spring Road and Los Angeles Avenue. Convert the right turn-only lane on the eastbound Los Angeles Avenue approach at Spring Road to a shared right turn-through lane. The Project would contribute a fair share contribution towards the cost of these improvements under the City's City's AOC program.

6. Miller Parkway/Science Drive/Los Angeles Avenue. Add a dedicated right turn on the Science Drive approach to Los Angeles Avenue. The Project would contribute a fair share contribution towards the cost of these improvements under the City's AOC program .

7. SR-23 SB ramps and Los Angeles Avenue. Convert the dedicated left turn lane on westbound Los Angeles Avenue to a left turn-through lane. The Project would contribute a fair share contribution towards the cost of these improvements under the City's AOC program.

8. Spring Road and Tierra Rejada Road. Allow permissive signal timing on Tierra Rejada Road. The Project would contribute a fair share contribution towards the cost of these improvements under the City's AOC program.

Parking Supply and Estimated Parking Demand

1. Recommended Parking Requirement

The proposed project will provide parking based on the City of Moorpark's parking demand calculations provided below. The parking demand calculated for the project is 1,676 parking spaces based on the City's Municipal Code.

2. Code Calculations (all new development)

Pursuant to the City of Moorpark's Municipal Code (section 17.32 Off-Street Parking Requirements), the following parking standards would be required:

Single-family dwellings 2 spaces in a garage for dwellings <2,800 sq. ft.

	3 spaces in a garage for dwellings > 2,800 sq. ft.
Multiple dwellings	1 space per unit covered in a garage or carport for each bachelor or studio unit
	1.75 spaces per unit, 1 covered in a garage or carport for each one-bedroom unit (including guest parking)
	2 spaces per unit, 1 covered in a garage or carport for each unit with 2 or more bedrooms, 0.5 spaces per unit for visitors

The focus of this traffic study is to evaluate the potential traffic impact created by the development of the Hitch Ranch Specific Plan.

As part of the environmental review for the proposed project, the potential traffic impact of the development has been evaluated using the Intersection Capacity Utilization (ICU) method for signalized intersections and Highway Capacity Manual (HCM) 2010 method delay methodology for un-signalized intersections.

The ICU analysis method quantifies the operating conditions of an intersection using a ratio of peak hour traffic volume to intersection capacity. The HCM analysis method quantifies the operating conditions of an intersection using a ratio of peak hour traffic volume to intersection capacity. This method was used to analyze six stop sign controlled intersections. Any change to the intersection's peak hour operating condition caused by an increase / decrease in traffic volume (i.e., traffic impact) can be quantified using these analysis methods.

Potential traffic impacts caused by a development project that exceed limits established by the City of Moorpark are deemed significant traffic impacts. All significantly impacted intersections are then evaluated for possible traffic mitigation measures. The following steps have been taken to evaluate the project's traffic impact.

Existing Conditions

(a) Evaluate existing 2019 traffic conditions;

(b) Add proposed project traffic volume to existing traffic volume to evaluate potential "existing + project" impacts;

(c) Recommended traffic mitigation, if necessary.

Future 2026 Cumulative Conditions

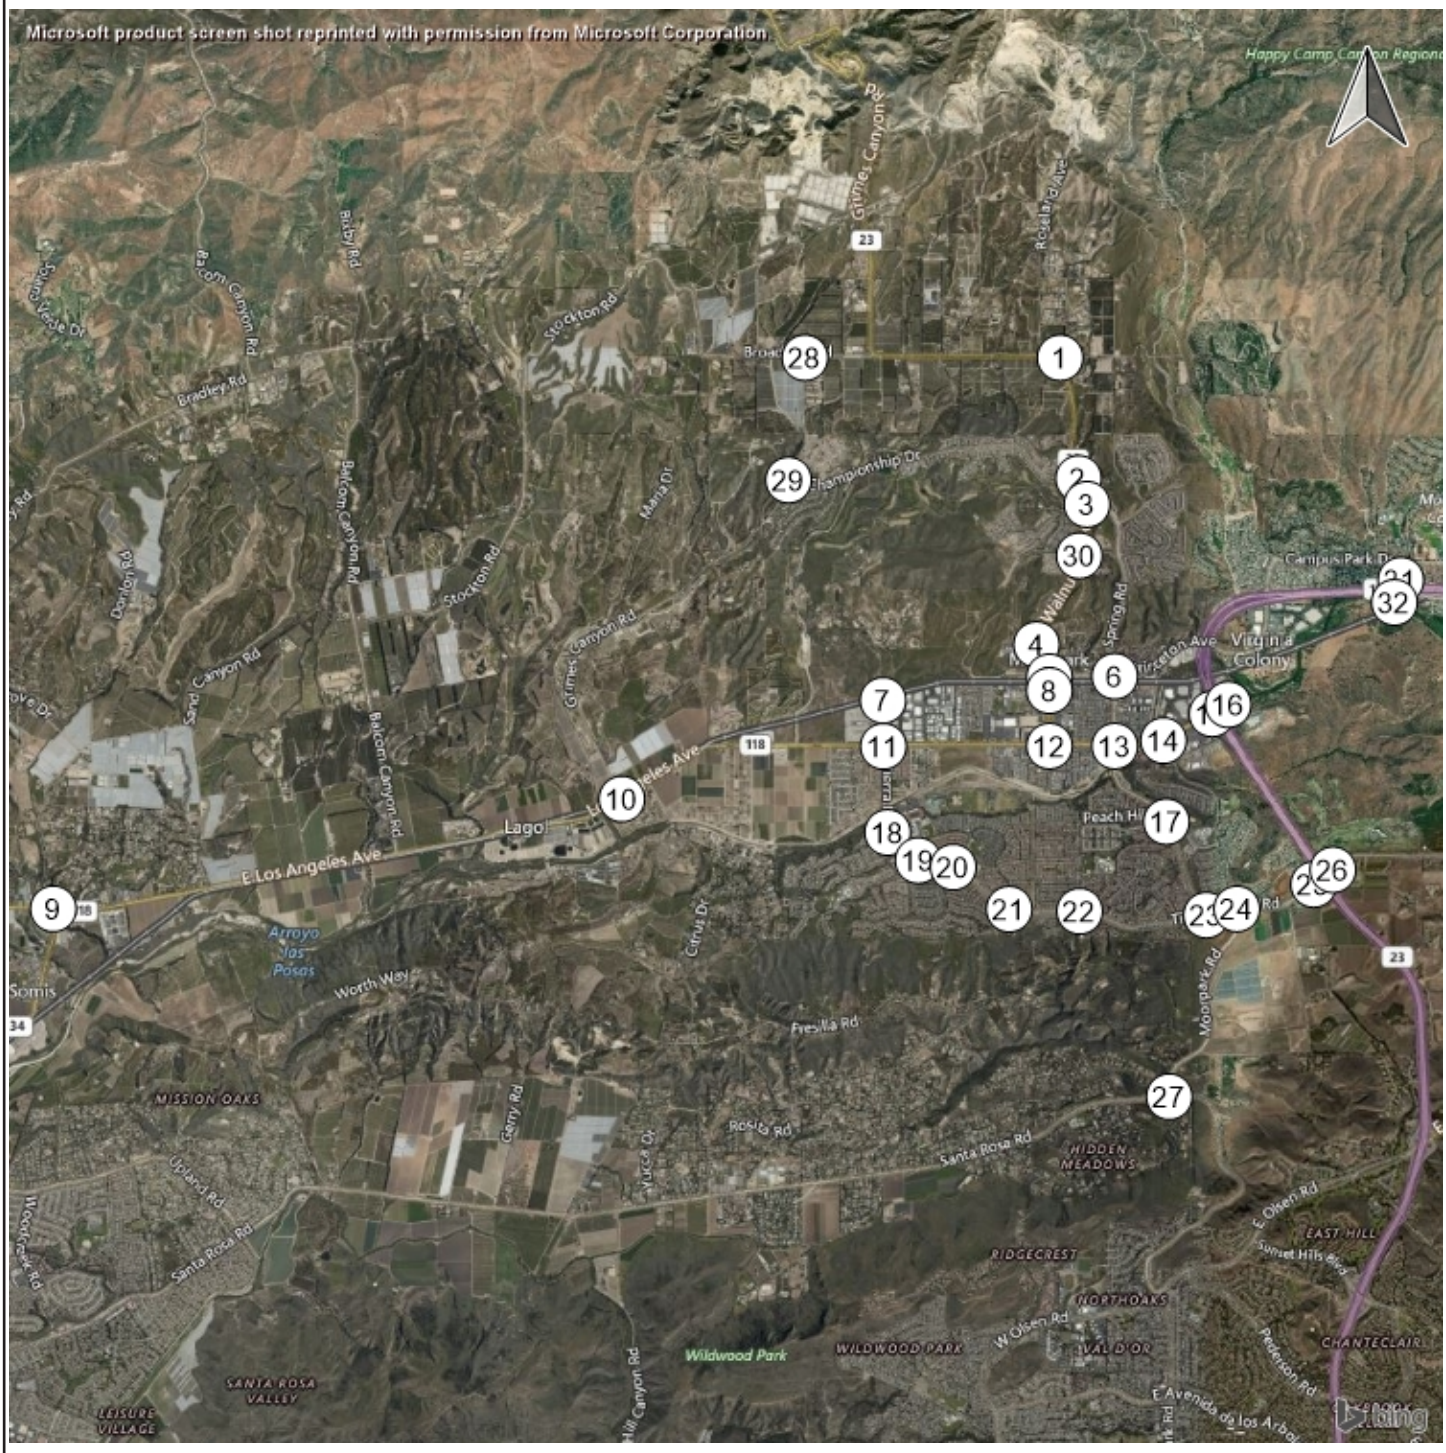
(d) Existing 2019 traffic volumes were increased by an ambient growth factor of 1.0 percent per year growth rate (7.2 percent total growth at 1.0 percent annual growth rate) to the future 2026 study year (year anticipated for buildout project occupancy);

(e) Future traffic generated by other projects in the study area was added to traffic in (d). Future cumulative baseline traffic volume was derived from a related projects list provided by City staff, see Appendix E ("future 2026 without project");[3]

(f) Add proposed project traffic volume to future 2026 without project traffic to evaluate future "2026 cumulative + project" scenario;

(g) Recommended traffic mitigation, if necessary.

An intersection capacity analysis of the existing baseline and future traffic conditions has been completed at those locations expected to have the highest potential for significant traffic impacts. Weekday morning and afternoon peak hour conditions have been evaluated at 32 key intersections selected for review by the City of Moorpark. Low volume intersections or intersections with minimal project traffic are not included in this analysis. The analyses were conducted in accordance with the 2009 Ventura County Congestion Management Program (CMP) and include 24 intersections on the CMP network. For the future cumulative scenario (2026), three new intersections along Street "A" were also analyzed.



Project Study Area

The intersections analyzed in this study are listed below (see Figure 2 for location of the study intersections (asterisk denotes CMP intersection).

1. Walnut Canyon Road and Broadway Road*
2. Walnut Canyon Road and Championship Drive*
3. Walnut Canyon Road and Spring Road*
4. Walnut Canyon Road and Casey Road*

[3] This includes the development of 200 multi-family dwelling units on the City's affordable housing site.

5. Moorpark Avenue and High Street*
6. Spring Road and High Street
7. Gabbert Road and Poindexter Avenue
8. Moorpark Avenue and Poindexter Avenue/1st Street*
9. Somis Road and Los Angeles Avenue*
10. Grimes Canyon Road and Los Angeles Avenue
11. Tierra Rejada Road and Los Angeles Avenue*
12. Moorpark Avenue and Los Angeles Avenue*
13. Spring Road and Los Angeles Avenue*
14. Miller Parkway/Science Drive/Los Angeles Avenue*

FIGURE **2**

IMPACT SCIENCES

Project Location

1318.002

The proposed project includes construction of 755 residential units (427 single-family, 328 multi-family), a 6.77-acre public park, over five acres of private recreational areas, and over 112 acres of open space, manufactured slopes, and detention basins. The 253.94-acre project site is located approximately 1,600 feet west of SR-23 and extends to approximately 1,400 feet west of Gabbert Road. The project site is predominantly undeveloped with limited improvements that include dirt and semi-paved roads and remnants of grazing use (e.g., corrals, fences, watering facilities for grazing animals). Parking for the project would be provided with enclosed garages and additional at-grade surface parking lots for the multi-family residences.

Vehicle Access and On-Site Circulation

Vehicles will access the project site via Gabbert Road to the west, the extension of High Street through the project site to the south, Meridian Hills Drive to the north, and Moorpark Avenue to the east. Internal circulation would be accommodated with a new local collector road (Street “A”), the extension of Casey Road west into the site as far as Street “A,” and the eventual construction of North Hills Parkway. Figure 3 illustrates the circulation plan for the project.

On-Site Street Improvements

Street “A” is a future two-lane local collector road built on-site from the extension of High Street, approximately midway between Walnut Canyon Road and Gabbert Road, and provide the primary north-south access through the Project Site and the two phases of development. Street “A” would intersect the North Hills Parkway once it is constructed and terminate at the extension of Meridian Hills Drive to the north.

Streets “B” through “P” are future local roads that would serve the second phase of development west of Street “A” (i.e., Streets “B” through “P”).

High Street would be extended from its current western terminus at the U.S. Postal Service building (100 High Street) westward through the project site to connect Gabbert Road on the west would provide primary east-west access at the southern boundary of

the project site. The High Street extension will be built as a two-lane arterial roadway generally running parallel to Poindexter Avenue, north of the Union Pacific Railroad right-of-way. It will provide direct access to the future Moorpark Civic Center and Historic High Street east of Moorpark Avenue.

North Hills Parkway is a future two-lane arterial roadway would provide primary east-west access through the entire project site, connecting Walnut Canyon Road on the east, Gabbert Road on the west, and Street “A” in the middle of the project site.

FIGURE 3

Project Site Plan

Environmental Setting

The project site is located north of Poindexter Avenue, between Moorpark Avenue and Gabbert Road in the City of Moorpark. The project site is also located in the Hitch Ranch Specific Plan area. The project site is located adjacent to single family residential detached estate lots to the west, south, east, and northeast; with undeveloped land directly to the north. Commercial and industrial land uses are located to the southwest of the project site. Other notable land uses in the vicinity of the site include: Walnut Canyon Elementary School to the east, Chaparral Middle School to the southeast, Poindexter Park to the south, and the City of Moorpark Civic Center to the east. The study area land use map is shown in Appendix A.

Field surveys were conducted in the study area to determine the roadway and intersection geometry and traffic signal operations. Figure 4 illustrates the study locations, type of intersection traffic control and lane configurations for the project impact analysis.

Freeways

The proposed project would be constructed and operated in the southeastern portion of Ventura County within the incorporated City of Moorpark. Regional access to the study area is provided by State Route 118 (SR-118) and SR-32.

SR-118 is an east-west freeway that travels through the City of Moorpark. Where SR-118 curves and starts to head north and south (just west of Princeton Avenue) the roadway turns into SR-23. At the interchange with New Los Angeles Avenue, the SR-118 turns into Los Angeles Avenue, a six-lane arterial road. West of Tierra Rejada Road, the SR-118 begins narrowing, and west of Buttercreek Road becomes a two-lane collector. The SR-118 provides access to Ventura and Oxnard to the west, and Los Angeles' San Fernando Valley to the east. Caltrans traffic volume data estimate 20,200 vehicles east of Grimes Canyon Road (where the SR-118 is a local collector) and 82,000 west of Collins Drive (where the SR-118 is a freeway) in 2017. In the Ventura

County CMP, the SR-118 is designated as a freeway north and east of the Los Angeles Avenue interchange and designated as a major road west of the Los Angeles Avenue interchange.

SR-23 is a north-south highway that provides access to the City of Fillmore to the north and Thousand Oaks to the south. Caltrans data on traffic volumes Caltrans data for 2017 show an annual average daily traffic of 72,000 vehicles north of Tierra Rejada Road (where the SR-23 is a freeway) and approximately 4,000 south of Spring Road (where SR-23 is a local collector).[4] South of the interchange of SR-118/SR-23/Los Angeles Avenue, the SR-23 is the Moorpark Freeway, designated as a freeway in the Ventura County CMP. North and west of the interchange, SR-23 is a local road (described below).

Local Roads

SR-23 is designated as a major road west and north of the Los Angeles Avenue interchange, running along Moorpark Avenue, Walnut Canyon Road, and Broadway Road:

- **Moorpark Avenue** is a two-lane road designated as a north-south local collector road in the City's General Plan. It connects Walnut Canyon Road to the north and terminates to the south at the Arroyo River.
- **Walnut Canyon Road** is a two-lane road designated as a north-south local collector road in the City's General Plan. It connects Broadway Road to the north with Moorpark Avenue to the south.
- **Broadway Road** is a two-lane road designated as an east-west local collector road in the City's General Plan. It connects Grimes Canyon Road to the west with Walnut Canyon Road to the east.

[4] Caltrans, 2017 Traffic Volumes accessible at https://dot.ca.gov/programs/traffic-operations/census/traffic-volumes/2017/route-22-33

Gabbert Road is a north-south two-lane road that provides access to residences north of Poindexter Avenue, and turns into Tierra Rejada Road south of Los Angeles Avenue. The project site is bordered by Gabbert Road to the west.

High Street is a two-lane road designated as an east-west local collector road in the City's General Plan.

Casey Road is a two-lane road designated as an east-west local collector road in the City's General Plan. This two- to three-lane road starts at Walnut Canyon Road to the east and terminates in a cul-de-sac at Walnut Canyon Elementary School, at the eastern boundary of the project site. It will be extended from its current western terminus at Walnut Canyon Elementary School westward to Street "A." Casey Road would provide primary east-west access to the eastern portion of the project site.

Meridian Hills Drive is a two-lane road that starts at Walnut Canyon Road to the east and terminates 0.6 miles to the west but is closed to public access west of Breezy Glen Drive.

Poindexter Avenue is a two-lane road designated as an east-west local collector road in the City's General Plan. Poindexter Avenue connects Moorpark Avenue on the east with Gabbert Road on the west.

Spring Road is a four-lane arterial road north of Los Angeles Avenue, and narrows to a two-lane collector road south of Los Angeles Avenue. Spring Road connects Walnut Canyon Road/SR-23 to the north with Tierra Rejada Road to the south.

Grimes Canyon Road is designated as a primarily north-south local collector road in the City's General Plan. Grimes Canyon Road connects Broadway Road to the north with Los Angeles Avenue to the south.

Tierra Rejada Road is designated as a four-lane arterial road primarily running east to west. Tierra Rejada Road connects Los Angeles Avenue to the northwest with the SR-23 to the east. Tierra Rejada Road continues outside of the project vicinity to connect to Madera Road in Simi Valley to the east.

Transit Service

Public transportation in the study area is provided by Metrolink, Amtrak, and Moorpark City Transit. These services include:

- Metrolink: The Metrolink Ventura County Line provides trips to Ventura to the west and Los Angeles Union Station to the southeast.

- Amtrak: The Pacific Surfliner route provides access to San Luis Obispo to the north and San Diego to the south, including stops in Santa Barbara, Ventura, Burbank, Glendale, Los Angeles, Anaheim, and Irvine in between.

- Moorpark City Transit: Routes 1 and 2 follow the same route, but in opposite directions. Routes 1 and 2 connect with Moorpark College to the northeast, Moorpark City Hall in the northwest, Moorpark High School in the southwest, and Mesa Verde School in the south, amongst other destinations. The nearest Moorpark City Transit bus stop to the project site is located at Moorpark City Hall. Buses run Monday through Friday, from roughly 6:15 AM to 6:00 PM.

Bicycle and Pedestrian Facilities

There are Class II bicycle facilities throughout the City of Moorpark, including westbound lanes on Poindexter Avenue to the south of the project site.

Regulatory Setting

There are a number of federal, State, and local regulations and ordinances that govern the transportation impacts of new development. This includes, but is not limited to, the following:

State

The California Department of Transportation (Caltrans) administers vehicle-related laws that govern the safe operation of vehicles and the transportation of hazardous materials.

Caltrans manages the State's highway and freeway system, providing inter-city rail services, permits public-use airports, and works with local agencies to improve mobility.

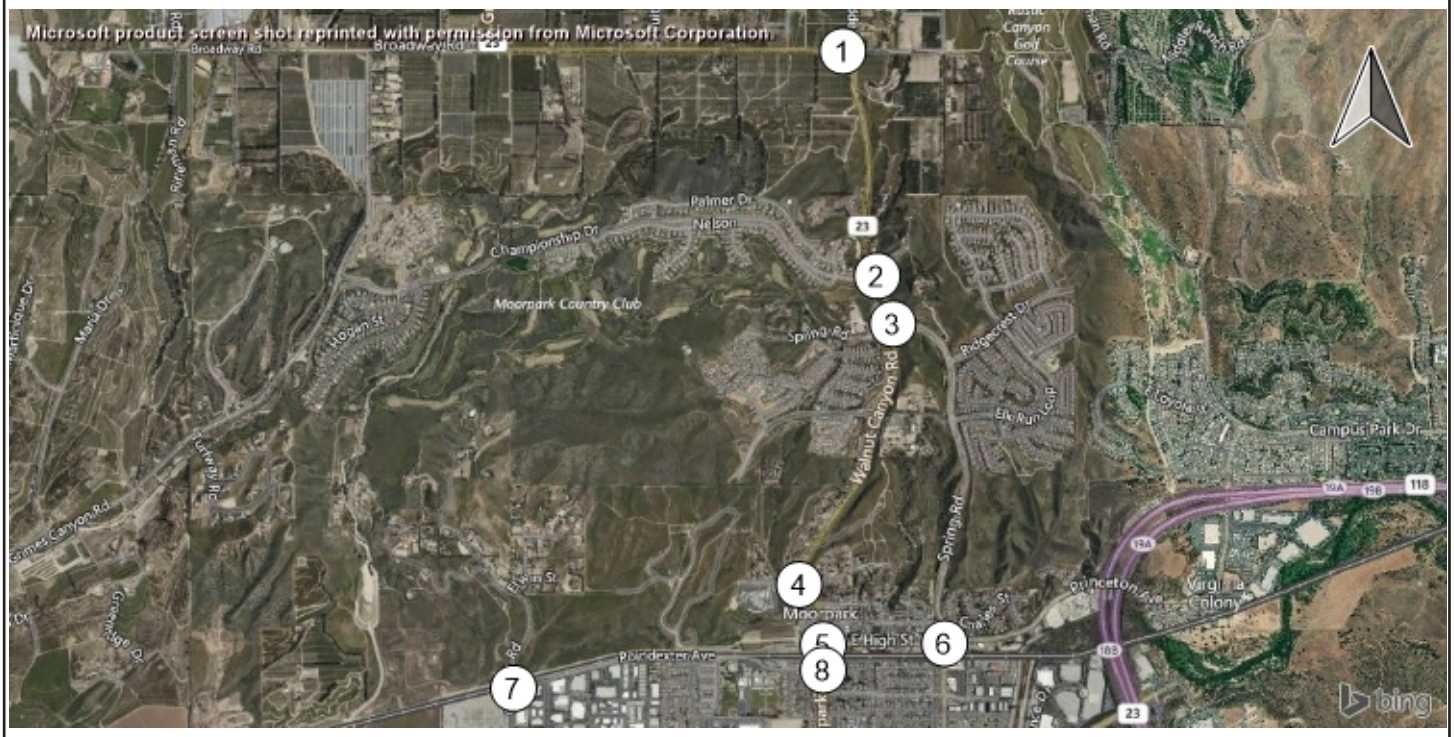
Encroachment permits are required for any activities that involve encroachment within, under, or over the state highway rights-of-way. Examples include utilities, excavations, and driveways that require encroachment permits.

Ventura County

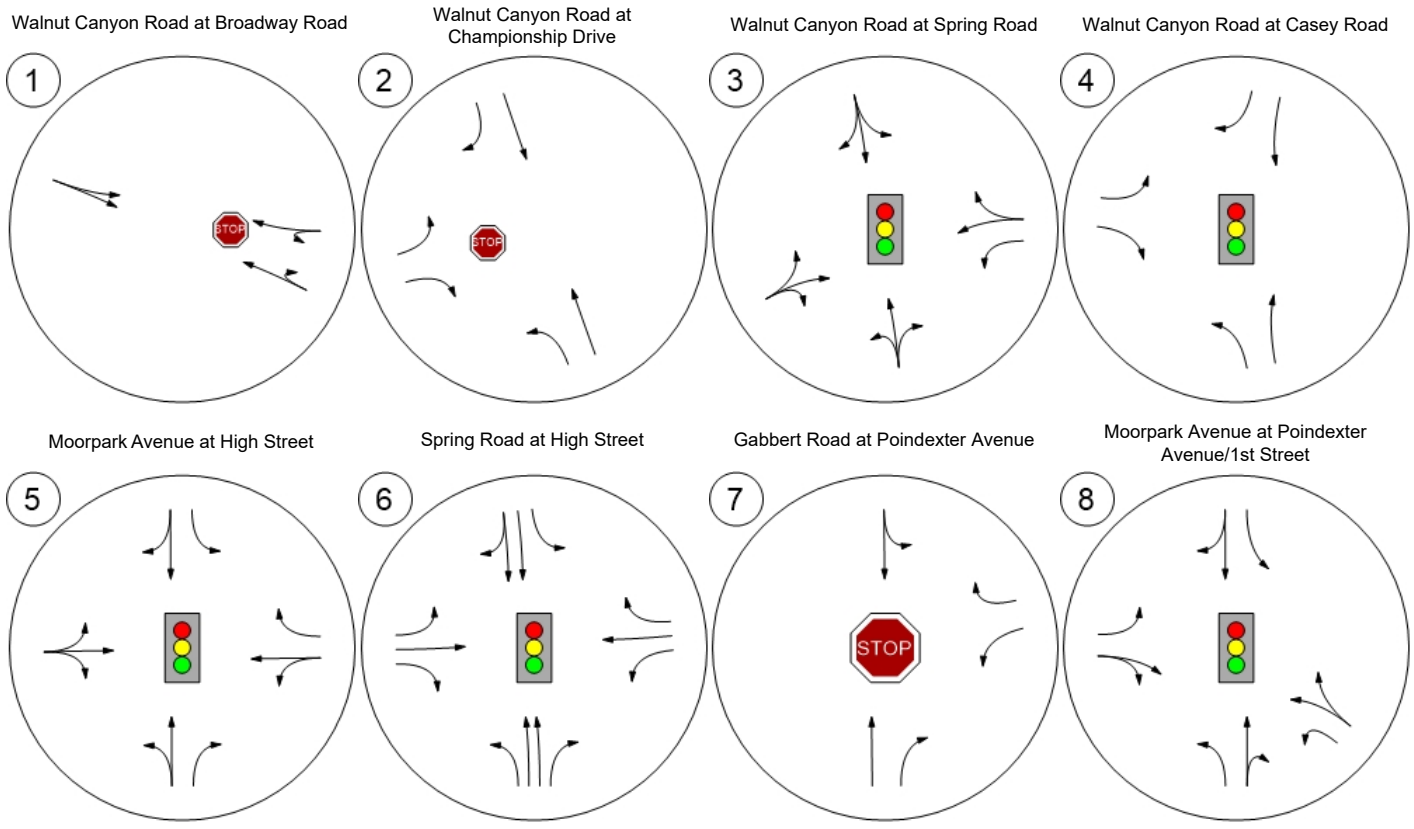
The Ventura County Transportation Commission (VCTC) is the designated Congestion Management Agency for Ventura County and is responsible for coordinating land use and transportation planning. The VCTC's CMP provides guidance and resources to improve mobility throughout the county and assists in the allocation of transportation funds through the State Transportation Improvement Program (STIP) process. In 1991, the VCTC designated the CMP transportation network, which includes all state highways and some arterials within the County. The CMP requires local jurisdictions to prepare and submit a deficiency plan when the LOS on a road segment or at an intersection on the county's CMP network drops to LOS F.

City of Moorpark

The City of Moorpark's General Plan Circulation Element was adopted in 1992 and governs transportation policy within the incorporated jurisdiction. The Circulation Element includes seven goals and more policies relevant for development projects, including:



Goal 2: Provide a circulation system which supports existing, approved, and planned land uses throughout the City while maintaining a desired level of service on all streets and at all intersections.



Policy 2.1: Level of service "C" shall be the system performance objective for traffic volumes on the circulation system. For roadways and interchanges already operating at worse than LOS C, the system performance objective shall be to maintain or improve the current level of service.

Goal 4: Provide a public transportation system which serves the needs of persons living in and/or working in the City of Moorpark.

Policy 4.1: Participation in a public transit system that provides a means of intra-city and inter-city transportation, as a logical alternative to automobile transportation, should be developed or maintained.

Goal 5: Provide a citywide system of safe, efficient, and attractive bicycle and pedestrian routes for commuter, school, and recreational use.

Traffic Generation

Traffic-generating characteristics of residential and park land uses have been studied by the Institute of Transportation Engineers (ITE). The results of the traffic generation studies have been published in Trip Generation, 10th Edition Handbook. This publication of traffic generation data has become the industry standard for estimating traffic generation for land uses.

These trip generation studies indicate that the uses associated with the proposed project generally exhibit the trip-making characteristics per dwelling unit or acre as shown by the ITE trip rates in Table 2. Estimates of the project's traffic were calculated on the basis of these ITE traffic generation rates for the project's proposed land uses.

Table 2
Project Trip Generation Rates (Weekday)

	ITE	Weekday	AM Peak Hour			PM Peak Hour		
Land Use	Code	Daily	Total	In	Out	Total	In	Out
Single-Family Detached. Housing (per Dwelling Unit)	210	9.44	0.74	25%	75%	0.99	63%	37%
Multifamily Housing (Low-Rise) (per Dwelling Unit)	220	7.32	0.46	23%	77%	0.56	63%	37%
Public Park (per Acre)	411	0.78	0.15	67%	33%	0.11	40%	60%

Traffic volumes expected to be generated by the project were estimated by applying the Table 2 ITE trip rates per dwelling unit or acre for each of the project's land use components.

The proposed project would add 6,436 daily vehicle trips to the local roadway system, including 467 morning peak hour trips and 608 afternoon peak hour trips (Table 3). In order to conduct a conservative traffic impact analysis, no vehicle trip adjustments were made to account for internal capture trips (i.e., interaction between residential uses and/or the public park).

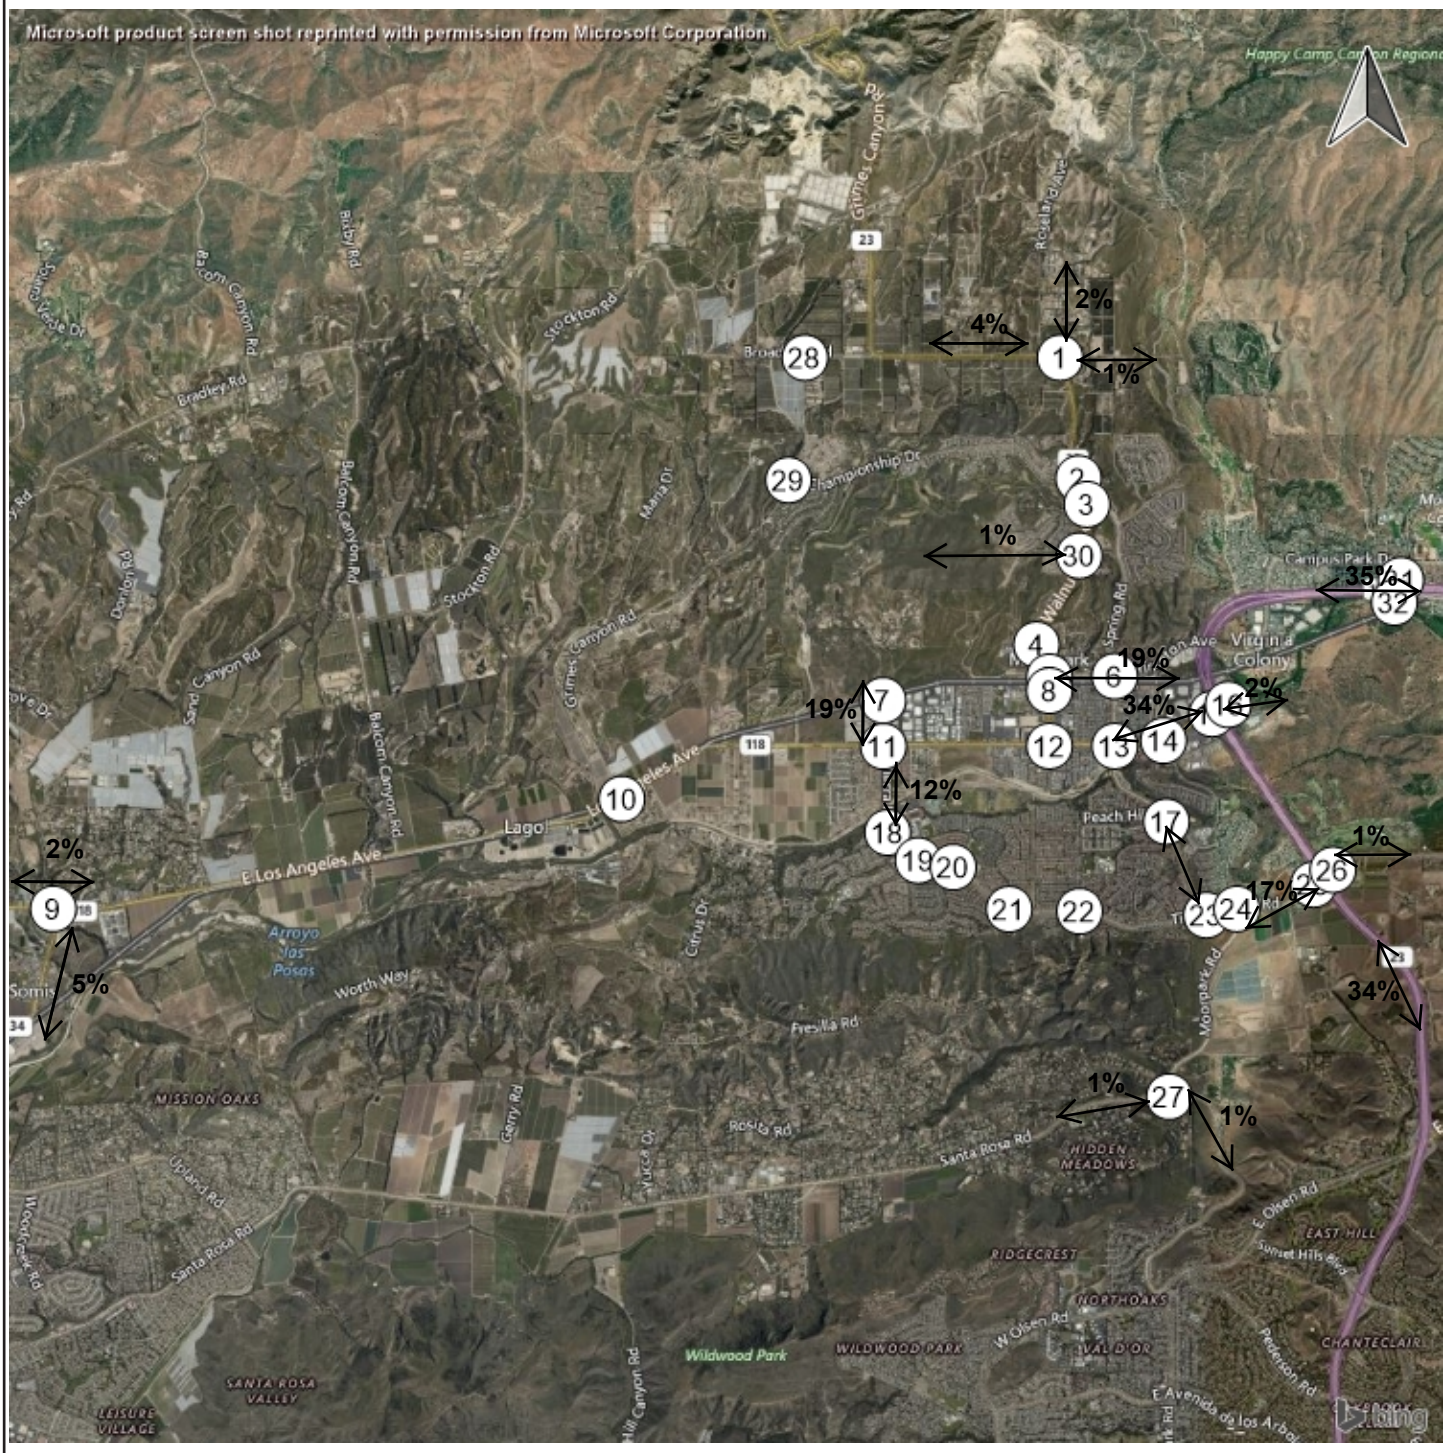

Table 3
Project Traffic Generation
(Weekday AM and PM Hours)

Weekday Traffic Generation	Daily	AM Peak Hour			PM Peak Hour		
Proposed Land Use	Traffic	Total	In	Out	Total	In	Out
Single-Family Residences	4,031	316	79	237	423	266	157
Multi-Family Residences	2,401	151	35	116	184	116	68
Public Park	4	0	0	0	1	0	1
New Traffic	6,436	467	114	353	608	382	226

Traffic Distribution and Trip Assignment

A primary factor affecting trip direction is the spatial distribution of population and employment centers which would generate project trip origins and destinations. The estimated project directional trip distribution is based on the study area roadway network, traffic flow patterns in and out of the project study area and other traffic studies recently prepared for the general area.

Figure 5 illustrates the estimated project traffic percentages at the selected study intersections for the morning peak hour and afternoon peak hour. Using the traffic assignment at each intersection and the estimated peak hour traffic volume as provided in Table 3, peak hour traffic volumes at each study location for each study period have been calculated and are shown in Figures 7 and 8 for the weekday morning and afternoon, respectively. This estimated assignment of the project traffic flow provides the information necessary to analyze the potential traffic impacts generated by the project at the study intersections.

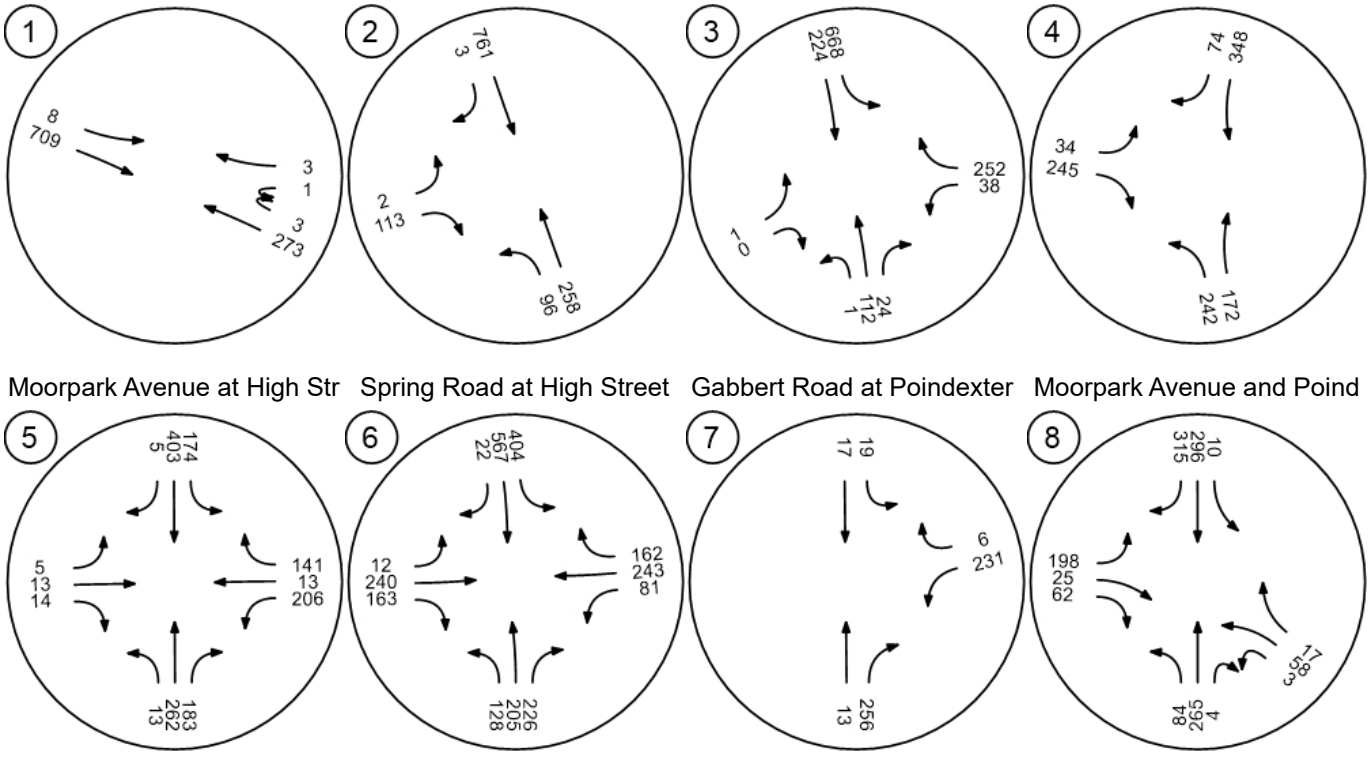
Analysis of Existing Traffic Conditions

To ensure updated, consistent traffic counts to be used for each pending project, traffic volume data was collected in spring 2019 by National Data & Surveying Services, an independent third-party data collection company used in this study. Weekday traffic counts were conducted on Wednesday, April 17, 2019 and Thursday, April 18, 2019 from 7:00 to 9:00 am and 4:00 to 6:00 pm.

The existing 2019 peak hour traffic volumes at each study intersection are illustrated in Figure 9 for the weekday morning peak hour and Figure 10 for the weekday afternoon peak hour. Data collection worksheets for the peak hour counts are contained in Appendix C.



The traffic conditions analysis was conducted using the Intersection Capacity Utilization (ICU) method for the study intersections. The ICU procedure uses a ratio of the highest combination of conflicting traffic volume (V) to the intersection capacity (C) to define the proportion of an hour necessary to accommodate all the traffic moving through the intersection assuming all approaches were operating at full capacity. For example, if an intersection has a volume-to-capacity (V/C) value of 0.70, the intersection is operating at 70 percent capacity with 30 percent unused capacity. The V/C ratios provide an appropriate means for quantifying intersection operating characteristics for planning purposes.

Once the intersection V/C ratio has been calculated for each time period, a level of service (LOS) grade (A through F) is assigned to estimate the level of congestion and stability of the traffic flow. The term LOS is used by traffic engineers to describe the quality of traffic flow. Level of Service standard D is generally considered the design capacity of arterial intersections and is thereby often set as the performance standard. Definitions of the LOS grades, from the City's General Plan Circulation Element, are shown in Table 4.

Table 4
V/C Level of Service Definitions – Signalized Intersections

Level of Service	Definition	Equivalent ICU
A	EXCELLENT - Free flow conditions with low traffic density.	0.000 - 0.600
B	VERY GOOD - A stable flow of traffic.	0.601 - 0.700
C	GOOD - Light congestion but stable, occasional backups behind left-turning vehicles.	0.701 - 0.800
D	FAIR - Approaching instability, drivers are restricted in freely changing lanes. Vehicles may be required to wait through more than one cycle.	0.801 - 0.900
E	POOR - At or near capacity with some long lines for left-turning vehicles. Blockage of intersection may occur if traffic signal does not provide for protected turning movements.	0.901 - 1.000
F	FAILURE - Jammed conditions with stoppages of long duration and long queues.	> 1.000

IMPACT SCIENCES

Existing (2019) Traffic Volume - Weekday PM Peak Hour

The LOS thresholds for stop sign controlled intersections differ from signalized intersections to reflect different driver expectations. The expectation is that a signalized intersection is designed to carry higher traffic volumes than a stop-controlled intersection.

For the un-signalized intersections, a delay-based analysis was conducted using procedures based on the HCM method. This procedure calculates the control delay as the total elapsed time from the time a vehicle stops at the end of the queue to the time the vehicle departs from the intersection. Using this procedure, the LOS is evaluated on the basis of the total delay per vehicle for selected movements (in seconds per vehicle).

Definitions of the LOS grades for stop-controlled intersections as defined by the Transportation Research Board are shown in Table 5.

Table 5
Level of Service Definitions – Stop Controlled Intersections

Level of Service	Average Control Delay (sec)
A	Less than or equal to 10
B	> 10 – 15
C	> 15 – 25
D	> 25 – 35
E	> 35 – 50
F	> 50

By applying the ICU and HCM procedures, the V/C ratios, delay values and the corresponding LOS for existing traffic conditions were determined for each intersection. The existing V/C ratios, delay values and the corresponding LOS values are summarized in Table 6. Using the 2019 traffic counts, five of the study intersections currently operate at LOS E or worse in the AM Peak Hour. In the PM Peak Hour, three intersections operate at LOS E or worse. These estimates include a 0.1 clearance interval applied to the overall ICU value, per City guidance. Supporting capacity worksheets are contained in Appendix D of this report.

Table 6

Existing Traffic Conditions Summary

No.	Intersection	AM Peak Hour*			PM Peak Hour*

* V/C for signalized intersections, delay for unsignalized intersections. Includes 0.1 clearance interval for signalized intersections

Analysis of Existing + Project Traffic Conditions

The project's traffic impact has been calculated by adding the project traffic volumes to the existing traffic conditions.

According to the traffic impact standards provided by the City of Moorpark for this environmental assessment, a traffic impact is considered significant if the related increase in the V/C ratio value equals or exceeds the thresholds shown in Tables 7a and 7b for signalized and un-signalized study intersections, respectively.

Table 7a
Significant Traffic Impact Criteria
(Signalized Intersections)

1. Degrades the LOS at an un-signalized intersection to an unacceptable level of Service (LOS D or worse);
2. Degrades the LOS at a signalized intersection operating at an unacceptable level of Service (LOS D or worse); or
3. Increases V/C at a signalized intersection operating at LOS F by 0.020 or more.

Table 7b
Significant Traffic Impact Criteria
(Un-signalized Intersections)

4. Degrades the LOS at an un-signalized intersection to an unacceptable level of Service (LOS D or worse); or
5. Increases delay at an un-signalized intersection operating at an unacceptable level by five or more seconds; or
6. Results in satisfying the most recent California Manual on Uniform Traffic Control Devices (CAMUTCD) peak hour volume warrant or other warrants for traffic signal installation at the intersection.

Comparing the changes in the traffic conditions (i.e., V/C ratio or delay) between the without and with project traffic volume scenarios provides the information necessary to determine if the project traffic volume creates a significant traffic impact which would require traffic mitigation.

The existing level of service traffic conditions with the added project traffic volume are shown in Table 8. Peak hour traffic volumes for the “existing + project” scenario are shown in Figures 11 and 12 for the study periods.

As shown in Table 8, one study intersection is significantly impacted by the proposed project traffic volume in the morning peak hour when compared to existing conditions:

1. The intersection of Walnut Canyon Road and Casey Road is significantly impacted prior to the implementation of mitigation measures, with Level of Service degrading from LOS B to LOS D.

In addition, the proposed project will significantly impact traffic conditions at four intersections during the afternoon peak hour when compared to existing conditions:

1. The intersection of Walnut Canyon Road and Spring Road is significantly impacted prior to the implementation of mitigation measures, with Level of Service degrading from LOS C to LOS D, though it should be noted that this intersection currently operates at 0.899 V/C (LOS C).

2. The intersection of Moorpark Avenue and High Street is significantly impacted prior to the implementation of traffic mitigation measures. Level of Service would degrade from LOS C to D.

3. The intersection of Spring Road and High Street is significantly impacted prior to the implementation of traffic mitigation measures, with Level of Service degrading from LOS C to LOS D.

4. The intersection of Spring Road and Los Angeles Avenue is significantly impacted prior to the implementation of traffic mitigation measures, as V/C would increase by 0.059 at this intersection that already operates at LOS F.

Table 8
Existing + Project Traffic Conditions (AM Peak Hour)

No.	Intersection	Existing Conditions			Existing with Project Conditions					
		V/C	Delay	LOS	V/C	Delay	LOS	Change (V/C)	Change (Delay)	Signifi-cant?

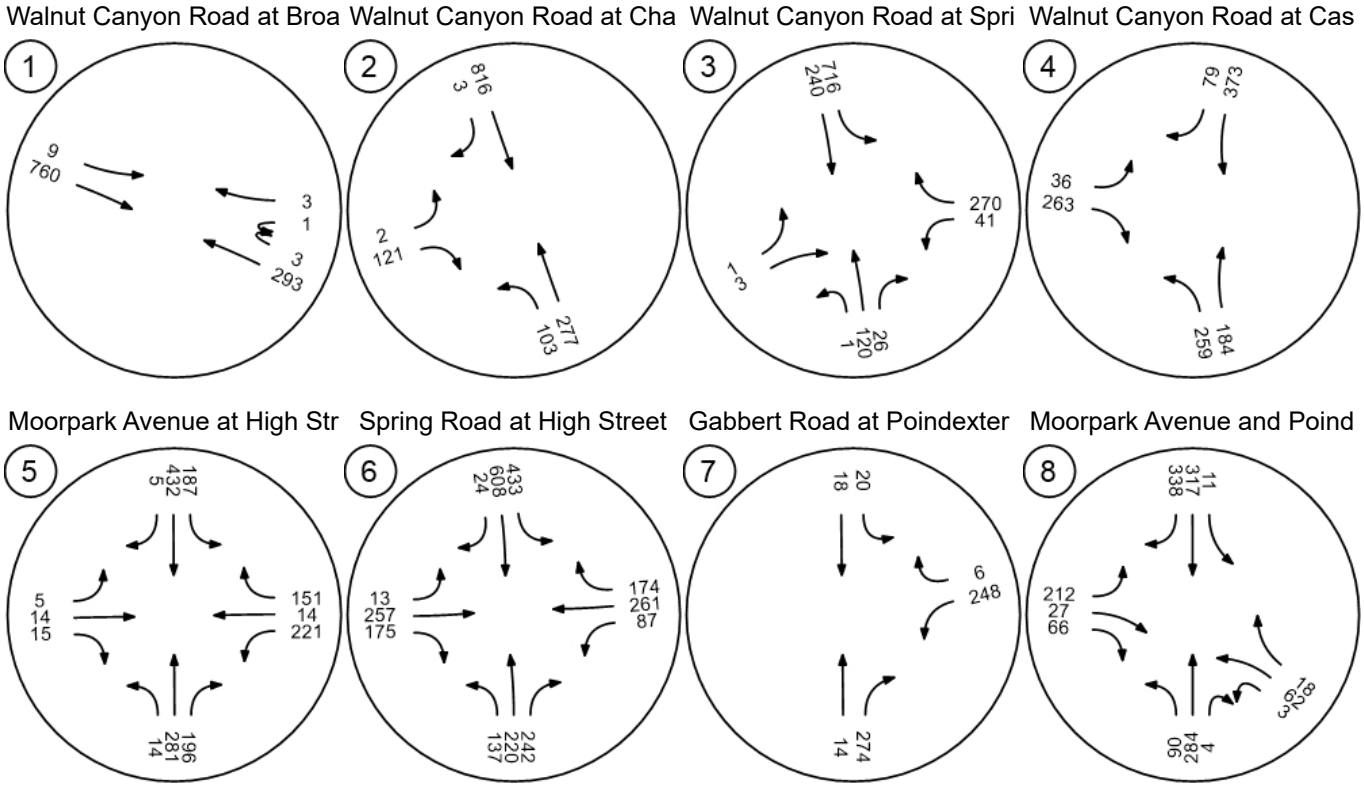
Analysis of Future Traffic Conditions

Future traffic volume projections have been developed to analyze the traffic conditions after completion of other planned land developments including the proposed project for study year 2026, when buildout of the proposed project is anticipated. Descriptions of other related projects, their locations and estimated traffic generation are provided in Appendix E.

In addition to the traffic generated by the related project list, other projects outside the study area or projects unknown at this time may contribute to the traffic volume in the area. To account for this outside influence, an ambient annual growth factor (1.0 percent) has been applied to the existing 2019 traffic counts to establish the 2026 study year. The use of both the related project traffic volume growth and the ambient growth factor provides a conservative estimate of future traffic growth in the study area for 2026.



Adding the project traffic to the future “without project” conditions provides the information necessary to calculate the future cumulative project traffic impacts at the study intersections for each future scenario. Table 10 shows the estimated project traffic impacts for the 2026 study year. Future cumulative 2026 peak hour traffic volumes are shown in Figures 13 and 14 for the study periods. In the AM Peak Hour, four intersections operate at LOS E and five intersections operate of LOS F. In the PM Peak Hour, two intersections operate at LOS E, and six operate at LOS F.

Table 10
Future (2026) Traffic Conditions Summary

No.	Intersection	AM Peak Hour*			PM Peak Hour*		
		V/C	Delay (s/veh)	LOS	V/C	Delay (s/veh)	LOS

IMPACT SCIENCES

Future (2026) Traffic Volume Without Project - Weekday PM Peak Hour

As shown in Table 11, the proposed project will significantly impact traffic conditions at four intersections during the morning peak hour under cumulative 2026 conditions.

9. The intersection of Walnut Canyon Road and Casey Road is significantly impacted prior to the implementation of mitigation measures, with Level of Service degrading from LOS C to LOS D.

10. The intersection of Moorpark Avenue and High Street is significantly impacted prior to the implementation of mitigation measures, with Level of Service degrading from LOS D to LOS E.

11. The intersection of Spring Road at High Street is significantly impacted prior to the implementation of mitigation measures, with Level of Service degrading from LOS C to LOS D.

12. The intersection of Spring Road and Los Angeles Avenue is significantly impacted prior to the implementation of mitigation measures, as V/C would increase by 0.037 at this intersection that would already operate at LOS F.

In the afternoon peak hour, the proposed project will significantly impact traffic conditions at five intersections under cumulative 2026 conditions:[5]

13. The intersection of Moorpark Avenue and High Street is significantly impacted prior to the implementation of mitigation measures, with Level of Service degrading from LOS C to LOS E.

14. The intersection of Spring Road and Los Angeles Avenue is significantly impacted prior to the implementation of mitigation measures, as V/C would increase by 0.059 at this intersection that would already operate at LOS F.

[5] Level of Service at Tierra Rejada Road and Los Angeles Avenue would degrade from LOS D to E in the morning peak hour due to the projected baseline V/C of 0.897. Because the project's increase is only 0.006 V/C, this is not considered a significant project impact.

15. The intersection of Miller Parkway/Science Drive/Los Angeles Avenue is significantly impacted prior to the implementation of mitigation measures, as V/C would increase by 0.048 at this intersection that would already operate at LOS F.

16. The intersection of SR-23 southbound ramps and Los Angeles Avenue is significantly impacted prior to the implementation of mitigation measures, with Level of Service degrading from LOS C to LOS D.

17. The intersection of Spring Road and Tierra Rejada Road is significantly impacted prior to the implementation of mitigation measures, with Level of Service degrading from LOS D to LOS E.

Site Plan Review

- Transit, Bicycle, and Pedestrian Facilities

The proposed project would include construction of 755 residential units, a public park, eight acres of private recreational areas, and 162 acres of open space, roadways, and detention basins. Development of the 270.64-acre project site would not impact the operations of the Moorpark Metrolink station, the platform for which is 890 feet to the southeast of the edge of the project site. Specifically, Metrolink's at-grade right-of-way crossing on Moorpark Avenue is 170 feet south of the project site and would not be impacted by construction or operation of the proposed project. While this traffic study conservatively did not assume any transit mode share, the proximity of the Metrolink station would likely reduce demand for auto trips to and from the project site.

The project would not cross or interfere with existing bikeways or pedestrian facilities. Rather, residents and visitors to the project site would benefit from active transportation facilities in and near the project site. This includes proposed sidewalks within the development will encourage pedestrian travel to the Civic Center area via High Street, as well as travel to the Los Angeles Avenue corridor to the south. In addition, Class II bicycle facilities on Poindexter Avenue to the south of the railroad right-of-way will help encourage bicycle use to and from the project site.

As such, the project would support public transit, pedestrian, and bicycle programs and objectives in the City of Moorpark.

- Emergency Vehicle Access

The project site's internal circulation system does not have any hazardous design features like sharp curves or complex intersections that could impede ingress and egress for emergency vehicles. Specifically, the primary collector roads (e.g., Casey Road, High Street, Street "A", North Hills Parkway, Meridian Hills Drive) are generally two lane roads that would be designed to the City's standards for such roadways. A roundabout at the junction of Meridian Hills Drive and Street "A" would be designed with sufficient radius to allow emergency vehicles to navigate this. Local roads serving the residences would not

include any sharp curves or other design features that would impede emergency access. Cul-de-sacs would be designed with sufficient turning radii for larger emergency vehicles. No roads would be permanently closed during the construction of the proposed project. As such, no structures would be built that could impair execution of emergency response plans or emergency evacuation plans.

In the long-term, development of the Hitch Ranch site would replace dead-end cul-de-sacs at several locations (e.g., High Street, Casey Road, Meridian Hills Drive) with through access to other parts of the transportation network. This would likely improve emergency access by increasing the options for accessing emergency events.

- Construction Impacts

The proposed project would be developed in two multi-year construction phases. The first phase would be completed by 2023 and serve the east part of the site east of proposed Street "A." During this 24-36 month construction process, several new roadways would be built to provide internal circulation within the project during construction. The first phase would include the following major public rights-of-way:

- A local north-south collector road (Street "A") to be built from the extension of High Street, approximately midway between Walnut Canyon Road and Gabbert Road.
- Extending High Street through the project site to connect Moorpark Avenue on the east to Gabbert Road.
- Extend Casey Road west into the site as far as Street "A." The project would also widen Casey Road east of the project site to approximately 440 feet west of Walnut Canyon Road.
- Extending Meridian Hills Drive feet westward from its current terminus northwest of the project site.
- The dedication of corridor right-of-way for the future construction of North Hills Parkway from Walnut Canyon Road to Street "A."

While the transport of graders, rollers, and other construction equipment needed to develop this internal roadway system would include use of High Street, Moorpark

Avenue, and other local arterials, these impacts would be temporary. Once on-site, the staging of construction activities would remain within the perimeter of the project site, minimizing any impacts on the local circulation network outside the project boundaries. Once the internal roadways are complete, construction of the residences on the northeast quadrant of the project site would proceed, with staging and construction activities done within the perimeter of the project site. Once again, impacts on the local roadway network outside the project boundaries would be minimal, aside from commute workers and vendors accessing the site to deliver material.

Following occupancy of the first phase, a second phase of construction would begin to develop the western portion of the project site west of Street “A” for operation by 2026. This would include constructing the rest of the internal circulation system, including:

- The dedication of right-of-way for future construction of North Hills Parkway from Gabbert Road to connect to the Aldersgate project east of Street “A.”
- The construction of local roads to serve the second phase of development west of Street “A” (i.e., Streets “B” through “P”).

Construction equipment needed to build the internal roadway system for Phase 2 would likely use equipment already on-site from Phase 1. As such, impacts of transporting equipment to the site on High Street, Moorpark Avenue, and other local arterials would be minimal. Staging of construction activities would remain within the perimeter of the project site, minimizing any impacts on the local circulation network outside the project boundaries. Once the internal roadways are complete to serve Phase 2, construction of the residences on the western half of the project site would proceed, with staging and construction activities done within the perimeter of the project site. Once again, impacts on the local roadway network outside the project boundaries would be minimal, aside from commute workers and vendors accessing the site to deliver material.

No roads would be permanently closed during the construction of the proposed project. In addition, no structures would be built that could impair execution of emergency response plans or emergency evacuation plans.

Congestion Management Program Analysis

The VCTC adopted the 2009 CMP to regulate and monitor regional traffic growth and transportation improvement programs. Under the CMP's Traffic Impact Analysis guidelines, a project impact is considered significant if it increases traffic demand on the CMP roadway network by more than two percent of capacity (V/C > 0.02), causing or worsening LOS F (V/C > 1.00). As such, a project would not have a regionally significant impact on the countywide roadway network if the CMP facility operates at LOS E or better after the addition of project traffic, regardless of the increase in V/C from the project. If a CMP facilities operates at LOS F with project traffic and the incremental change is 0.02 or greater V/C, the project would have a significant impact.

Under the CMP's Traffic Impact Assessment guidelines, an intersection on the CMP network must be examined if a project would add 50 or more trips during the AM or PM weekday peak hours. As shown in Table 13, the project would add 50 or more peak hour trips in the AM peak hour to six intersections on the CMP roadway network for Ventura County. However, based on the CMP's criteria that define a significant impact, the project would not significantly impact the CMP's roadway network in the AM peak hour.

Table 13
Existing + Project Traffic Conditions on CMP Network (AM Peak Hour)

No.	Intersection	Existing Conditions		Existing with Project Conditions			
		V/C	LOS	V/C	Delay	Change (V/C)	Signifi-cant?
4	Walnut Canyon Road at Casey Road	0.668	B	0.801	D	0.133	No
5	Moorpark Avenue at High Street	0.684	B	0.788	C	0.104	No
8	Moorpark Avenue and Poindexter Avenue/1st St	0.734	C	0.785	C	0.051	No
12	Moorpark Avenue and Los Angeles Avenue	0.701	C	0.717	C	0.016	No
15	SR-23 SB ramps and Los Angeles Avenue	0.441	A	0.453	A	0.012	No
16	SR-23 NB ramps and Los Angeles Avenue	0.496	A	0.519	A	0.023	No
Intersections listed represent areas on the CMP roadway network where the project would add 50 or more peak hour trips Shading denotes significant impact							

As shown in Table 14, the project would add 50 or more peak hour trips in the PM peak hour to seven intersections on the CMP network. However, based on CMP criteria, the project would not significantly impact the regional network in the PM peak hour.

Table 14
Existing + Project Traffic Conditions on CMP Network (PM Peak Hour)

No.	Intersection	Existing Conditions		Existing with Project Conditions			
		V/C	LOS	V/C	LOS	Change (V/C)	Signifi-cant?

Intersections listed represent areas on the CMP roadway network where the project would add 50 or more peak hour trips Shading denotes significant impact							

Project's Traffic Mitigation Measures

When analyzed against existing conditions, the change in traffic flow generated by the proposed project significantly impacts up five intersections in the morning and/or afternoon peak hours. Figure 15 illustrates the location and time period for the impacted study intersections. The impacted intersections for each project scenario are listed below with the recommended traffic mitigation measures for each intersection.

1. Walnut Canyon Road and Casey Road. This impact in the morning peak hour could be mitigated by adding a second right turn lane on eastbound Casey Road.

2. Walnut Canyon Road at Spring Road. This impact in the afternoon peak hour could be mitigated by adding a second right turn lane on westbound Spring Road.

3. Moorpark Avenue at High Street. This impact in the afternoon peak hour could be mitigated by converting the northbound left turn lane-through lane to a dedicated left turn lane and a through lane. Adding a left turn lane on the westbound High Street approach at Moorpark Avenue would also be needed.

4. Spring Road and High Street. This impact in the afternoon peak hour could be mitigated by adding a second through lane on the eastbound approach of High Street at Spring Road.

5. Spring Road and Los Angeles Avenue. This impact in the afternoon peak hour could be mitigated by converting the right turn-only lane on the eastbound Los Angeles Avenue approach at Spring Road to a shared right turn-through lane.

When analyzed against future (cumulative) conditions, the following mitigation measures would substantially reduce impacts at the seven intersections that would be impacted in the morning and/or afternoon peak hours:[6]

1. Walnut Canyon Road and Casey Road. This impact in the morning peak hour could be mitigated by adding a second right turn lane on eastbound Casey Road.

2. Moorpark Avenue at High Street. This impact in the morning peak hour could be mitigated by converting the northbound left turn lane-through lane to a dedicated left turn lane and a through lane. Adding a left turn lane on the westbound High Street approach at Moorpark Avenue would also be needed to mitigate the afternoon peak hour impact.

3. Spring Road and High Street. This impact in the morning peak hour could be mitigated by adding a second through lane on the eastbound approach of High Street at Spring Road.

4. Spring Road and Los Angeles Avenue. This impact in the morning and afternoon peak hour could be mitigated by converting the right turn-only lane on the eastbound Los Angeles Avenue approach at Spring Road to a shared right turn-through lane.

5. Miller Parkway/Science Drive/Los Angeles Avenue. This impact in the afternoon peak hour could be mitigated by adding a dedicated right turn on the Science Drive approach to Los Angeles Avenue.

6. SR-23 SB ramps and Los Angeles Avenue. This impact in the afternoon peak hour could be mitigated by converting the dedicated left turn lane on westbound Los Angeles Avenue to a left turn-through lane.

[6] Level of Service at Tierra Rejada Road and Los Angeles Avenue would degrade from LOS D to E in the morning peak hour due to the projected baseline V/C of 0.897. Because the project's increase is only 0.006 V/C, this is not considered a significant project impact.

7. Spring Road and Tierra Rejada Road. The impact in the afternoon peak hour could be mitigated by allowing permissive signal timing on Tierra Rejada Road.

However, the project's impacts contribute to intersections that require improvements due to cumulative growth in the area. As a result, the following mitigation measure would be required to mitigate all significant impacts:

TRA-1 Area of Contribution (AOC) Fees

The project shall pay the AOC fee based upon the level of traffic added at significantly impacted intersections. The AOC fee shall be paid prior to issuance of a certificate of occupancy for the first phase of the project.

With implementation of the proposed traffic mitigation measures, the project's traffic impacts will be fully mitigated as shown in Table 15 for the "Existing (2019) + Project" conditions.

- Walnut Canyon Road and Casey Road. The proposed mitigation measure would improve conditions at this intersection by reducing existing V/C by 0.002 which would help maintain the current LOS B during the morning peak.
- Walnut Canyon Road and Spring Road. The proposed mitigation measure would improve conditions at this intersection by reducing existing V/C by 0.233 which would improve the current LOS D during the morning peak to LOS B.
- Moorkpark Avenue and High Street. The proposed mitigation measure would improve conditions at this intersection by only increasing existing V/C by 0.046 which would help maintain the current LOS C during the morning peak.
- Spring Road and High Street. The proposed mitigation measure would improve conditions at this intersection by decreasing existing V/C by 0.087 which would improve the current LOS C during the morning peak to LOS B.
- Spring Road and Los Angeles Avenue. The proposed mitigation measure would improve conditions at this intersection by reducing V/C by 0.055 which would

ensure that the intersection, while continuing to operate at LOS F, would reduce V/C.

Table 15
Existing (2019) Traffic Conditions With Project + Mitigation

Intersection	Peak Hour	Without Project		With Project + Mitigation		
		V/C	LOS	V/C	LOS	Impact
Walnut Canyon Road and Casey Road	AM	0.668	B	0.666	B	-0.002
Walnut Canyon Road and Spring Road	PM	0.899	D	0.666	B	-0.233
Moorpark Avenue and High Street	PM	0.735	C	0.781	C	0.046
Spring Road and High Street	PM	0.782	C	0.695	B	-0.087
Spring Road and Los Angeles Ave	PM	1.064	f	1.009	f	-0.055

With implementation of the proposed traffic mitigation measures, the project's traffic impacts will be fully mitigated as shown in Table 16 for the "Future (2026) Cumulative + Project" conditions

- Walnut Canyon Road and Casey Road. The proposed mitigation measure would improve conditions at this intersection by reducing future V/C by 0.096 which would help improve the current from LOS D during the peak morning hour to LOS B.
- Moorpark Avenue and High Street. The proposed mitigation measure would improve conditions at this intersection by reducing future V/C by 0.052 which would help improve the current from LOS D during the peak morning hour to LOS C. In the peak afternoon hour, the measure would limit the increase in V/C to 0.063, resulting in LOS D. Because the projected baseline V/C of 0.795 is nearly LOS D, the project, as mitigated, is not considered a significant impact.
- Spring Road and High Street. The proposed mitigation measure would improve conditions at this intersection by reducing future V/C by 0.075 which would help improve the current from LOS D during the peak morning hour to LOS C.
- Spring Road and Los Angeles Avenue. The proposed mitigation measure would improve conditions at this intersection by reducing future V/C by 0.029 in the morning peak hour which would ensure that the intersection, while continuing to

operate at LOS F, would reduce V/C. The measure would also reduce also reduce future V/C by 0.007 in the afternoon peak hour which would ensure that this intersection, while continuing to operate at LOS F in the afternoon peak hour, would reduce projected V/C.

- Miller Parkway/Science Drive/Los Angeles Avenue. The proposed mitigation measure would improve conditions at this intersection by reducing future baseline V/C by 0.002 would ensure that the intersection, while continuing to operate at LOS F, would reduce V/C.
- SR-23 SB Ramps and Los Angeles Avenue. The proposed mitigation measure would improve conditions at this intersection by reducing future V/C by 0.258 which would help improve future baseline level of service from LOS C during the peak afternoon hour to LOS A.
- Spring Road and Tierra Rejada Road. The proposed mitigation measure would improve conditions at this intersection by reducing future V/C by 0.142 which would help improve future baseline level of service from LOS D during the peak afternoon hour to LOS C.

Table 16
Future (2026) Cumulative Traffic Conditions With Project + Mitigation

Intersection	Peak Hour	Without Project		With Project + Mitigation		
		V/C	LOS	V/C	LOS	Impact
Walnut Canyon Road and Casey Road	AM	0.780	C	0.684	B	-0.096
Moorpark Avenue and High Street	AM	0.818	D	0.766	C	-0.052
Spring Road and High Street	AM	0.871	D	0.796	C	-0.075
Spring Road and Los Angeles Ave	AM	1.049	F	1.020	F	-0.029
Moorpark Avenue and High Street	PM	0.795	C	0.858	D*	0.063
Spring Road and Los Angeles Ave	PM	1.180	F	1.173	F	-0.007
Miller Pkwy/Science Dr./Los Angeles Ave	PM	1.044	F	1.042	F	-0.002
SR-23 SB Ramps and Los Angeles Ave	PM	0.779	C	0.521	A	-0.258
Spring Road and Tierra Rejada Road	PM	0.879	D	0.737	C	-0.142

* Level of Service at Moorpark Avenue and High Street would degrade from LOS C to D in the afternoon peak hour due to the projected baseline V/C of 0.795, which is nearly LOS D. Because the project's increase is only 0.063 V/C, this is not considered a significant project impact.

Traffic Signal Review

The City of Moorpark requires a traffic signal warrant analysis when the level of service of an un-signalized intersection exceeds the City's acceptable limits. Based on the City's three criteria for signal warrants, traffic impacts at the nine un-signalized intersections studied under future conditions would not be considered significant. As a result, further traffic signal warrant analyses are not required.

Traffic Mitigation Fair Share

Several applications for land developments have been recently filed with the City of Moorpark and could occur within a similar time frame with similar traffic impacts. Therefore, the City may apply a mitigation funding mechanism through a fair share process to mitigate the cumulative traffic impacts created by a group of development project, enabling the installation of more traffic improvements.

City of Moorpark Parking Requirements

The City's Municipal Code (section 17.32 Off-Street Parking Requirements) requires off-street parking for residential uses based on the size of dwelling units as summarized below:

Single-family dwellings	2 spaces in a garage for dwellings <2,800 sq. ft.
	3 spaces in a garage for dwellings > 2,800 sq. ft.
Multiple dwellings	1 space per unit covered in a garage or carport for each bachelor or studio unit
	1.75 spaces per unit, 1 covered in a garage or carport for each one-bedroom unit (including guest parking)
	2 spaces per unit, 1 covered in a garage or carport for each unit with 2 or more bedrooms, 0.5 spaces per unit for visitors

Parking Analysis

The proposed project would be expected to provide parking spaces based on the City of Moorpark parking requirements. The parking demand calculated for the project is 1,676 parking spaces based on the City's Municipal Code. This includes 1,556 required parking spaces and 119 visitor parking spaces. The calculation of these parking requirements is provided in Appendix B.

APPENDIX F
VMT ANALYSIS

Overview

As an alternative to the Level of Service-based approach to analyzing traffic impacts, this analysis evaluates the project under an alternative approach that will be required by SB 743 as of July 1, 2020, As signed into law in 2013, SB 743 (Steinberg) calls on future traffic studies prepared under CEQA to use vehicle miles traveled (VMT) as the metric to evaluate a project's transportation impacts. In the absence of any formal guidelines and data from the City of Moorpark, Ventura County Transportation Commission (VCTC), or Southern California Association of Governments (SCAG), this analysis summarizes an approach that is consistent with the intent of SB 743 for informational purposes.

Pursuant to the December 2018 guidance from the California Office of Planning and Research (OPR) ("Technical Advisory on Evaluating Transportation Impacts in CEQA"), lead agencies have the discretion to choose the most appropriate methodology for evaluating project VMT. Based on OPR's recommendations, this analysis includes the following general assumptions applicable to a residential development:

- The VMT metric applies to light-duty vehicles and trucks. Given the nature of residential development, medium- and heavy-duty truck VMT was not evaluated.
- The VMT analysis looks at entirety of VMT, not just travel within the City of Moorpark.
- While estimating VMT is best done through tour-based modeling using a regional travel demand model, this analysis uses publicly-available information.

The following assumptions are made to produce a VMT-based analysis of traffic impacts from the proposed project.

Threshold of Significance

In the absence of formal guidance or policies from local agencies, the project is assumed to have a less than significant impact if daily VMT would be 15 percent or more lower than the average daily per capita VMT in Ventura County.[1][2] Based on data from SCAG and the California Air Resources Board, the average daily VMT per capita would be 18.8 in Ventura County in 2026, the projected operational date of the proposed project.[3] This calculation is based on VMT forecasts from VMT forecasts from the California Air Resources Board and population forecasts from the Southern California Association of Governments' 2016 Regional Transportation Plan adopted growth forecast (see attached worksheets for these calculations). Based on this, a 15 percent reduction would result in an average daily per capita VMT target of 16.0 in 2026

---

1 While OPR suggests that projects that generate or attract fewer than 110 trips per day could be screened out from further VMT-based analysis, the proposed project would exceed this daily threshold and not be exempt from further analysis.

2 OPR finds that certain projects within ½-mile of an existing major transit stop will have a less-than-significant impact on VMT. While the project is near the Moorpark Metrolink station, the residences are generally more than ½-mile from the station's platforms.

3 Assumes 3.67 persons per dwelling unit (SCAG 2016 RTP growth forecast for City of Moorpark in 2026) and 18.8 per capita daily VMT.

Estimating Project VMT

The Proposed Project could generate about 52,092 daily VMT, based on regional based on average household density in the City of Moorpark and the average per capita VMT for Ventura County.[4] However, given the immediate proximity of the Moorpark Metrolink station, a shift in mode share from drive alone commutes to rail transit is appropriate. Assuming modest mode for Metrolink use from the future development, 115 daily vehicle trips from single-family homes and 299 daily vehicle trips from multi-family homes are shifted to Metrolink. The mode shift of future residents from auto to Metrolink reduces 10,787 average VMT per day from baseline daily VMT. Because each Metrolink trip reduces 34.2 miles of VMT, the per capita VMT would be approximately 13.7, a 27.1 percent reduction from the Countywide average.[5,6]

Conclusion

Until the City, VCTC, and/or SCAG develop formal protocols and policies for judging the VMT impacts of projects, this analysis is consistent with OPR guidance. As such, this analysis finds that transit mode share from Metrolink use would reduce 27.1 percent of VMT from the proposed project, resulting in a daily per capita rate of 13.7. Because this result is lower than the 16.0 per capita target that represents a 15 percent reduction from Countywide per capita targets, the Proposed Project would be considered less than significant for traffic impacts using this alternative method of analysis.

---

4 Assumes 3.67 persons per dwelling unit (SCAG 2016 RTP growth forecast for City of Moorpark in 2026) and 18.8 per capita daily VMT.

5 Assumes Metrolink mode share of 2.5 percent for the single-family homes and 5.0 percent for the multi-family homes, based on their proximity to commuter rail service. Represents incremental mode share beyond baseline 0.85 percent public transit mode share (US Census American Communities Survey 5-Year Estimate, 2017). Also assumes a weighted mode share of 0.5 percent for the single-family homes and 1.0 percent for the multi-family homes, which factors in the likely use of Metrolink trains for commute purposes. Assumes 33 percent of average daily travel is commute related and 4.3 average weekly days for Metrolink riders (Metrolink 2018 Origin-Destination Study for Ventura County stations).

6 Assumes average trip length of Metrolink trips from Ventura County stations of 34.2 miles (Metrolink 2018 Origin-Destination study).

TRIP GENERATION SUMMARY

Land Use	Units	Weekday Average Rate	Weekday AM Peak	Weekday PM Peak	AM Entering	AM Exiting	PM Entering	PM Exiting
Single Family Detached. Housing	328	9.44	0.76	1	26%	74%	64%	36%

AB 52 TRIBAL CONSULTATION FORM

August 16, 2019

Barbareno/ Ventureno Band of Mission Indians
Eleanor Arrellanes
Post Office Box 5687
Ventura, CA 93005

RE: Hitch Ranch Specific Plan Project

Dear Honorable Ms. Arrellanes:

This letter is to inform you that the City of Moorpark Community Development Department is reviewing the proposed project described below. The City of Moorpark wishes to initiate tribal consultation for the above mentioned project under the California Environmental Quality Act (CEQA); specifically Public Resources Code 21080.3.1 and Chapter 532 Statutes of 2014 (also known as AB 52). The City of Moorpark, as the lead agency, is consulting with you because your Tribe requested to be notified and provided information under the provisions of CEQA.

The project location is as follows:

> The project site is located in southeastern Ventura County in the City of Moorpark, between the Simi Hills and Little Simi Valley. Locally, the project site is located in the rolling hills north of Poindexter Avenue, and west of Moorpark Avenue (State Route 23). Specifically, the site is approximately 270.64 acres, is located approximately 1,600 feet west of State Route 23, and extends to approximately 1,400 feet west of Gabbert Road.

A brief project description is as follows:

> The specific plan provides for the arrangement of various land uses on the 270.64-acre project site. Proposed land uses include several types/intensities of residential land uses, a neighborhood park site, an institutional use, and flood-control facilities. Other improvements include storm drains, water mains, sanitary sewer lines, electric lines, natural gas lines, and telephone and cable lines.

JANICE S. PARVIN, Mayor | CHRIS ENEGREN, Councilmember | ROSEANN MIKOS, Ph.D., Councilmember | DAVID POLLOCK, Councilmember | KEN SIMONS, Councilmember

Residential uses constitute a primary component of the Specific Plan. Proposed residential uses would consist of 755 dwelling units on 100.24 gross acres including 261 single-family units on 59.94 acres and 494 multi-family units on 34.33 acres. Single-family structures would be one and two stories in height, while multi-family structures would be two and three stories in height. The densities for single-family dwelling units range from 1.29 to 2.92 (gross) dwelling units per acre (low to medium density); multi-family unit density would be 7.68 to 14.81 (gross) dwelling units per acre.

Four private recreation areas are proposed as part of the specific plan.

Additional details regarding this project, including plans, are available online at: www.moorparkca.gov/hitchranch. Thank you for your assistance. Please be assured that any information you provide regarding cultural places will be kept strictly confidential and will not be divulged to the public.

I can be contacted by phone (805-517-6251), or email (dspondello@moorparkca.gov). My full contact information is provided below. Your response within 30 days of receipt of this letter would be appreciated. Please let me know if the lead contact person's contact information has been changed and I will make sure our files reflect this for all future correspondence.

AB 52 TRIBAL CONSULTATION FORM

August 16, 2019

Northern Chumash Tribal Council
Fred Collins, Spokesperson
Post Office Box 6533
Los Osos, CA 93412

RE: Hitch Ranch Specific Plan Project

Dear Honorable Mr. Collins:

This letter is to inform you that the City of Moorpark Community Development Department is reviewing the proposed project described below. The City of Moorpark wishes to initiate tribal consultation for the above mentioned project under the California Environmental Quality Act (CEQA); specifically Public Resources Code 21080.3.1 and Chapter 532 Statutes of 2014 (also known as AB 52). The City of Moorpark, as the lead agency, is consulting with you because your Tribe requested to be notified and provided information under the provisions of CEQA.

The project location is as follows:

> The project site is located in southeastern Ventura County in the City of Moorpark, between the Simi Hills and Little Simi Valley. Locally, the project site is located in the rolling hills north of Poindexter Avenue, and west of Moorpark Avenue (State Route 23). Specifically, the site is approximately 270.64 acres, is located approximately 1,600 feet west of State Route 23, and extends to approximately 1,400 feet west of Gabbert Road.

A brief project description is as follows:

> The specific plan provides for the arrangement of various land uses on the 270.64-acre project site. Proposed land uses include several types/intensities of residential land uses, a neighborhood park site, an institutional use, and flood-control facilities. Other improvements include storm drains, water mains, sanitary sewer lines, electric lines, natural gas lines, and telephone and cable lines.

JANICE S. PARVIN, Mayor | CHRIS ENEGREN, Councilmember | ROSEANN MIKOS, Ph.D., Councilmember | DAVID POLLOCK, Councilmember | KEN SIMONS, Councilmember

Residential uses constitute a primary component of the Specific Plan. Proposed residential uses would consist of 755 dwelling units on 100.24 gross acres including 261 single-family units on 59.94 acres and 494 multi-family units on 34.33 acres. Single-family structures would be one and two stories in height, while multi-family structures would be two and three stories in height. The densities for single-family dwelling units range from 1.29 to 2.92 (gross) dwelling units per acre (low to medium density); multi-family unit density would be 7.68 to 14.81 (gross) dwelling units per acre.

Four private recreation areas are proposed as part of the specific plan.

Additional details regarding this project, including plans, are available online at: www.moorparkca.gov/hitchranch. Thank you for your assistance. Please be assured that any information you provide regarding cultural places will be kept strictly confidential and will not be divulged to the public.

I can be contacted by phone (805-517-6251), or email (dspondello@moorparkca.gov). My full contact information is provided below. Your response within 30 days of receipt of this letter would be appreciated. Please let me know if the lead contact person's contact information has been changed and I will make sure our files reflect this for all future correspondence.

Subject: FTBMI AB52 Hitch Ranch Specific Plan Project

Tribal Historic & Cultural Preservation Department

Project: ***Hitch Ranch Specific Plan Project***

Hello Douglas,

On behalf of the Tribal Historic and Cultural Preservation (THCP) Department of the Fernandeño Tataviam Band of Mission Indians (FTBMI), thank you for the formal notification regarding the Project referenced above. The THCP Department also appreciates the opportunity to review the Initial Study and Project related documents. The Project area is located within the traditional FTBMI ancestral territory and encompasses the lineage-villages from which members of the Tribe descend. This message constitutes a formal request for tribal consultation under the provisions of the California Environmental Quality Act (CEQA) (as amended, 2015) and CA Public Resources Code section 21080.3.1.

The proposed Project is located in a significant Tribal area. There are a number of Tribal Cultural Resource sites within distance of the Project location and includes habitational sites, ceremonial rock shelters, lithic scatter sites, middens, and human burials. The range of known sites and isolate TCR's that have been documented throughout the region warrant precautions when proposing any ground disturbing activities.

Before scheduling a consultation meeting, the THCP Department is interested in knowing more about the Project, including the extent of proposed grading, impacts on native/undisturbed soil and recent investigations. In order to have a better understanding of the

Project and provide the proper comments and recommendations regarding cultural resources, the THCP Department would like to review the following information and documents:

- Geotechnical Report
- Cultural Resource Assessment Report
- Grading/ Excavation Plans

I appreciate your time and look forward to reviewing the information requested for this Project.

Respectfully,

--

Jairo F. Avila, M.A., RPA.
Tribal Historic and Cultural Preservation Officer

RE: Hitch Ranch Specific Plan Project, Ventura County

Dear Ms. Kaufman:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information. If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

Andrew Green

SECTION 1
INTRODUCTION

1.1 Purpose of Water Supply Assessment

The purpose of this Water Supply Assessment is to demonstrate that future water supplies are sufficient to meet the Ventura County Waterworks District No. 1 (District) projected water demands, inclusive of the Hitch Ranch Development Plan.

This Water Supply Assessment has been prepared following the requirements of California Law including the following: Public Resources Code Section 21151.9; Water Code Sections 10910-10912, 10915; and Water Code Sections 10608-10656 (original text approved from California Senate Bill 610, Costa). This law places additional requirements on a public agency (in this case the District as the water purveyor for the Hitch Ranch Project) regarding land use and planning and water supply availability. SB 610 took effect on January 1, 2002, and requires that retail water providers demonstrate that sufficient and reliable sources are available for local agencies to approve large-scale developments and complete the environmental review process for projects. See **Appendix A** for a copy of the California Water Code – Water Supply Assessment.

SB 610 requires cities and counties, which determine a project is subject to the California Environmental Quality Act, to identify any public water system that may supply water for the project and to request those public water systems to prepare a specified water supply assessment to be included in any environmental document prepared for the project. This assessment includes, among other information, identification of existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project and water received in prior years according to those entitlements, rights, and contracts. If the assessment concludes that water supplies are or will be insufficient, the public water system would be asked to submit plans for acquiring additional water supplies.

1.2 Hitch Ranch Project

The Hitch Ranch Project (Project) is located in southeastern Ventura County, within the boundaries of the City of Moorpark (City). Boundaries of the project site include north of Poindexter Avenue, approximately 1,600 feet west of Moorpark Avenue (State Route 23), approximately 4,500 feet south of Championship Drive, and approximately 1,400 feet west of Gabbert Road. **Figure 1-1** indicates the approximate location of the Project.

Development of the entire Project as planned will include a maximum of 755 residential units (approximately 328 single-family units and 427 multiple-family units) on approximately 270.6 acres (Comstock Homes, 2020). Construction and occupation of the residential component of the proposed project would result in a theoretical population increase of approximately 2,515 persons based on 3.33 persons per dwelling unit (District, 2015 UWMP, page 3-5). Also included in this development are approximately 10 acres of active recreational space, 102.8 acres of open space/slopes, and 66.4 acres of public facilities and roads (Comstock Homes, 2020). **Figure 1-2** provides an overview of the proposed Project. **Table 1-1** provides a statistical summary of the Project. Adjacent land uses include residential and open space to the north, residential and institutional to the east, residential and industrial to the south, and residential and open space to the west.

FIGURE 1-2
PROJECT LAYOUT - 755

The District will be the retail water purveyor for the Project. The District distributes potable water (a combination of imported surface water and groundwater from local wells) to local customers. The District also began serving recycled water in 2003. Estimated water demands for the Project are summarized in Section 3.3.

1.3 City of Moorpark Housing Project

The City of Moorpark Housing Project (Moorpark Housing Project) will be located in the southeast corner of the Hitch Ranch property. The Moorpark Housing Project will not be part of the Hitch Ranch Project and will be built by a separate entity. For purposes of this WSA, estimated water demands for the Hitch Ranch Project will be evaluated separately (see Section 3.4) from the estimated water demands of the Moorpark Project (see Section 3.5). Boundaries of the Moorpark Housing Project site include Casey Road (future) to the north, Walnut Canyon Road (Moorpark Avenue/State Route 23) 1,200 feet to the east, High Street (future) approximately 500 feet to the south, and the Hitch Ranch Project to the west. **Figure 1-1** and **Figure 1-2** indicate the approximate location of the Project. Adjacent land uses include residential units to the north, school to the east, open space to the south, and residential units to the west.

Development of the Moorpark Housing Project is anticipated to include a maximum of 110 residential units on approximately 6.7 acres. Construction and occupation of the residential component of the proposed project would result in a theoretical population increase of approximately 367 persons based on 3.33 persons per dwelling unit (District, 2015 UWMP, page 3-5). The Moorpark Housing Project is not anticipated to include additional recreational space, open space, nor public facilities.

1.4 Service Area Characteristics

The District's service area encompasses the City and contiguous portions of the unincorporated County. Moorpark is located in the eastern portion of Ventura County, approximately five miles west of the City of Simi Valley and five miles north of the City of Thousand Oaks. **Figure 1-1** provides a location map for the Project.

1.4.1 Climate

The local climate is characterized by hot summer days, cool summer nights, cool winter days, and cool winter nights. **Table 1-2** summarizes local historical climate data including average maximum monthly temperature, average minimum monthly temperature, average monthly precipitation, and standard monthly average evapotranspiration (ETo). Annual average monthly temperatures range from 48°F to 75°F. Annual average precipitation is approximately 10.44 inches per year, most of which occurs during the winter season (December to March), based on the 2010-2015 data. The value of 10.44 inches per year for local precipitation may be significantly lower than actual due to limited years of data (2010-2015) from these data sources. Annual average evapotranspiration is 55.14.

1.5 Demographic Factors

Historically, land uses within the District's service area have focused primarily on municipal and industrial uses (M&I) with agricultural use being secondary. Thirty years ago, the population in Moorpark was 25,494 (US Census, 1990). Estimated current population within the District is approximately 35,782 (District, 2015 UWMP). Increases in future water demands are expected to come primarily from the residential sector as the District's service area builds out. Estimated population projections are provided in **Table 1-3**. The projected population for the year 2040 is 45,000.

1.6 District's Urban Water Management Plan

SB 610 provides that if the projected water demand associated with the proposed project was accounted for in the Urban Water Management Plan (UWMP) adopted by the retail water purveyor, then relevant information from that UWMP may be incorporated into the SB 610 water supply assessment. The District adopted its 2015 UWMP in June 2016. The Calleguas Municipal Water District (CMWD), supplier of imported surface water to the District, finalized their UWMP in June 2016. The Metropolitan Water District of Southern California (MWD), supplier of imported surface water to CMWD, also finalized their updated UWMP in June 2016.

The District's 2015 UWMP analyzed the water supply needs of a 2015 population of approximately 35,782 and a projected population of 45,000 for the year 2040. The majority of the District's population and water demand are located within the City of Moorpark. Residential water demand accounts for the largest water use sector within the District at 62 percent (see **Section 3** for additional details). The Hitch Ranch development was

accounted for in the City's General Plan and the District's 2015 UWMP. Information in the District's UWMP relevant to this Water Supply Assessment will be identified and incorporated into this Assessment.

1.7 Water Supply Assessment Update

This Water Supply Assessment (WSA) was prepared in February 2020 following meetings with staff from Ventura County Waterworks District No. 1. In general, water supply assessments are prepared by utilizing available data and information from local UWMPs and other relevant sources. The District's 2015 UWMP included available information known at the time. Therefore, data and information presented in this WSA regarding availability and reliability of the District's drinking water is consistent with the District's 2015 UWMP and supplemented by additional information provided by the District.

1.8 Report Organization

The remainder of this Water Supply Assessment is organized as follows:

- Section 2 – Water Supply
- Section 3 – Water Demand
- Section 4 – Water Supply Reliability
- Section 5 – Water Shortage Contingency Plan
- Section 6 – Conclusions.

SECTION 2
WATER SUPPLY

This section defines the current and projected water supplies within the District's service area.

2.1 Existing Water Supplies

The District provides its customers a mix of local groundwater, imported water from Calleguas Municipal Water District, and recycled water (for nonpotable demands). Historically, imported water has made up approximately 80 percent of the District's water supply. The District's current sources of supply are described below.

2.2 Local Groundwater Supply

2.2.1 Introduction

The District's water service area overlies groundwater basins in Ventura County that are managed by Fox Canyon Groundwater Management Agency (FCGMA), whose jurisdictional area encompasses approximately 118,000 acres (185 square miles). The FCGMA was established in Ventura County by a special act of the State Legislature in 1982. The FCGMA was initially created to manage the groundwater in both over-drafted and potentially seawater-intruded areas within Ventura County. The prime objectives and purposes of the FCGMA are to preserve groundwater resources for agricultural, municipal, and industrial uses in the best interests of the public. Protection of water quality and quantity along with maintenance of long-term water supply are included in those goals and objectives. A copy of the FCGMA 2019 Groundwater Sustainability Plan (Executive Summary) is provided in **Appendix B** (FCGMA, 2019).

The basins within the FCGMA are part of the Transverse Ranges geologic province, in which the mountain ranges and basins are oriented in an east-west rather than the typical northeast-southwest trend in much of California and the western United States (District, 2015 UWMP). Active thrust faults border the basins of the Santa Clara River, causing rapid uplift of the adjacent mountains and down-dropping of the basins. The alluvial basins are filled with substantial amounts of Tertiary and Quaternary sediments deposited in both marine and terrestrial (non-marine) settings.

There are seven main or significant groundwater basins within the FCGMA. These groundwater basins include the Oxnard Plain Basin, the Oxnard Plain Forebay Basin, the Pleasant Valley Basin, the Santa Rosa Basin, and the Las Posas Valley Basin. The Hitch Ranch Project is located within the Las Posas Valley Basin.

The Las Posas Valley Basin (LPVB) is bounded on the south by the Camarillo and Las Posas Hills, on the north by South Mountain and Oak Ridge the Santa Susana Mountains to the east, and the Oxnard Subbasin of the Santa Clara River Valley Groundwater Basin to the west (SWRCB 1956; DWR 2003). Previously, the Las Posas Valley Basin was subdivided into West, East, and South basins. However, local investigators now divide the LPVB into two management areas, rather than three basins/subbasins (FCGMA, 2019). The area of the West Las Posas Management Area (WLPMA) is the same area as the West Las Posas Basin. The East Las Posas Management Area (ELPMA) comprises the entire eastern portion of the LPVB and the southern portion of the LPVB.

The primary water-bearing formations from top to bottom in the LPVB are unconsolidated alluvium, the San Pedro Formation, and the Santa Barbara Formation. The Santa Barbara Formation is a lower Pleistocene marine sand, and the San Pedro Formation is a lower to middle Pleistocene shallow marine deposit that grades upward from a white gray sand and gravel basal layer into an overlying series of interbedded silts, clays, and gravels

(SWRCB 1956; Weber and Kiessling 1976; Turner 1975; Jakes 1979). The lower San Pedro Formation hosts the Fox Canyon Aquifer (FCA), the primary aquifer from which the majority of the water in the LPVB is produced (FCGMA, 2019). However,

The Las Posas Valley Basin is not currently adjudicated, however, litigation is proceeding to create an adjudicated LPVB. The Las Posas Valley Basin is not specifically identified as a Basin in an overdraft condition based on California Groundwater Bulletin No. 118 (California Department of Water Resources, CADWR, 2003) and California Water Plan (CADWR, 2013). However, the California Statewide Groundwater Elevation Monitoring Program (CASGEM) has categorized the LPVB as a high-priority basin. Thus, the FCGMA prepared a Groundwater Sustainability Plan for the LPVB (2019).

FCGMA maintains that all areas of the Las Posas Valley Basin are in overdraft relative to the sustainable yields of the Basin (FCGMA, 2019). Some areas of the Basin have been sustained by non-native inflows from wastewater treatment plant discharges, urban runoff, and shallow groundwater dewatering discharges from upstream areas. Since 1992, FCGMA has implemented measures to reduce pumping such as incrementally reduced groundwater allocations Agency-wide by 25 percent. On April 11, 2014, FCGMA further imposed a Temporary Extraction Allocation (TEA) reduction of 20 percent and implemented high penalties for over-pumping.

2.2.2 West Las Posas Management Area

The western and eastern parts of the basin are hydraulically separated from each other by the Somis Fault, a geologic feature that inhibits groundwater flow across it. As a result, groundwater conditions on the west side of the fault in the Fox Canyon Aquifer and Grimes Canyon Aquifer, two primary aquifers in the LPVB, differ from conditions on the east side of the fault (FCGMA, 2019).

Geologic differences between the WLPMA and the ELPMA have resulted in different names being assigned to the hydrostratigraphic units associated with these three water-bearing formations in each management area (FCGMA, 2019). In the WLPMA, the alluvium is referred to as the shallow alluvial system to reflect the hydrologic connection between the WLPMA and the Upper Aquifer System of the Oxnard Subbasin to the west. Underlying the shallow alluvial system in the WLPMA, the San Pedro Formation has been divided into two hydrostratigraphic units: the upper San Pedro Formation and, underlying that, the Fox Canyon Aquifer. The Fox Canyon Aquifer is a principal aquifer in the WLPMA. The Grimes Canyon Aquifer in the upper Santa Barbara Formation, which underlies the Fox Canyon Aquifer, is the deepest aquifer in the WLPMA.

In the WLPMA, groundwater elevations in wells adjacent to the Oxnard Subbasin are influenced by surface water diversions of the Santa Clara River, which are directed to spreading basins in the Forebay area of the Oxnard Subbasin by the United Water Conservation District (UWCD). When UWCD has been able to divert river water to its recharge basins, groundwater elevations have risen in wells in the western parts of the WLPMA (FCGMA, 2019). The influence of UWCD recharge operations is not clear in historical water level records from wells farther east in the WLPMA. In this area, chronic declines in groundwater levels caused by groundwater production have been observed historically. These chronic declines were offset by in-lieu surface water deliveries between 1995 and 2008.

In the WLPMA, the average rate of groundwater production between 1985 and 2017 was approximately 14,000 to 15,400 acre-feet per year (AFY) (FCGMA, 2019). Sustainable yield for the WLPMA is currently estimated to be 11,300 to 13,700 AFY.

2.2.3 East Las Posas Management Area

As previously noted, the western and eastern parts of the basin are hydraulically separated from each other by the Somis Fault, a geologic feature that inhibits groundwater flow across it. As a result, groundwater conditions on the west side of the fault in the Fox Canyon Aquifer and Grimes Canyon Aquifer, two primary aquifers in the LPVB, differ from conditions on the east side of the fault (FCGMA, 2019).

In the ELPMA, the alluvium is referred to as the Shallow Alluvial Aquifer and is constrained to an area adjacent to Arroyo Simi–Las Posas (FCGMA, 2019). The San Pedro Formation is divided into three hydrostratigraphic units in the ELPMA: the Epworth Gravels Aquifer, the upper San Pedro Formation, and the Fox Canyon Aquifer. The extent of the Epworth Gravels Aquifer is approximately 1,600 acres (2.5 square miles) located 2 to 3 miles north-northwest of Moorpark in the ELPMA. The upper San Pedro Formation underlies the Shallow Alluvial Aquifer where it is present, and underlies the Epworth Gravels Aquifer, where it is present in the ELPMA. The upper San Pedro Formation is not a primary aquifer, but rather serves as a reservoir of stored water that through time has been slowly leaking into the Fox Canyon Aquifer below. The Fox Canyon Aquifer is a primary aquifer in the ELPMA. Underlying the Fox Canyon Aquifer is the Grimes Canyon Aquifer in the upper Santa Barbara Formation, which is the deepest aquifer in the ELPMA.

In the ELPMA chronic groundwater level declines were observed before 1970 (FCGMA). In 1970, upstream wastewater treatment plant and shallow dewatering well discharges began reaching the ELPMA and converted Arroyo Simi–Las Posas from an ephemeral stream to a perennial stream. The perennial flow in the Arroyo provided recharge to the underlying groundwater aquifers. This recharge caused water levels to recover in areas of the ELPMA adjacent to Arroyo Simi–Las Posas, while groundwater levels have continuously declined throughout the northern ELPMA, which does not receive recharge from Arroyo Simi–Las Posas. The volume of perennial surface water flows that reach the ELPMA has declined over the past decade, and water levels adjacent to Arroyo Simi–Las Posas have stabilized or declined in recent years in response to the combined effects of the diminished recharge and the drought that began in 2011.

In the ELPMA, the average rate of groundwater production between 1985 and 2017 was approximately 19,000 to 20,000 AFY (FCGMA, 2019), excluding the Epworth Gravels Management Area. Sustainable yield for the ELPMA is currently estimated to be 15,500 to 20,100 AFY.

Salts (i.e., chloride, sulfate) in the groundwater have increased in the eastern and southern portion of the ELPMA as the shallow aquifer filled along Arroyo Las Posas (District, 2015 UWMP). These salts apparently were leached from the shallow aquifer as groundwater levels reached record highs, saturating sediments that have been unsaturated for the historic period. These salts apparently migrated vertically with percolating groundwater into the LAS and then laterally into the main portion of the ELPMA as the recharge mound developed. The District determined that some of this groundwater is currently unsuitable for use.

2.2.4 District Groundwater Extraction

The District produces groundwater from the ELPMA via five wells owned and operated by the District with a total system capacity of approximately 3,500 gallons per minute (gpm; 2,170 AFY). District wells provide redundant extraction facilities should one or more existing wells become inoperative and will allow for increased extraction capacity during emergency situations. **Table 2-1** summarizes the groundwater pumped by the District for the period 2011 to 2015. **Table 2-1** indicates that the District pumped a low of 1,808 AFY in 2015 and a high of 3,519 AFY in 2013. The groundwater meets all State and Federal water quality standards for drinking water with the exception that treatment is required at one of the well sites (Well No. 20) to lower iron and manganese levels below the State Title 22 Secondary Maximum Contaminant Level (MCL) for these two minerals. The groundwater is chlorinated at each well site before being pumped into the potable water distribution system.

As mentioned above, the District has a groundwater allocation from FCGMA. Although each well has an associated allocation, the District has opted to combine the individual well allocations into one allocation for the District. This combined allocation provides the District with some flexibility by allowing them to pump different amounts of water from any given well or wells (up to the total allocation amounts) based on system demands. The FCGMA, the Groundwater Sustainability Agency (GSA), has reduced the District's maximum allocation to 1,756 AFY for groundwater pumping in 2016. Regardless of system capacity, the District will not be allowed to exceed 1,756 AFY from the ELPMA going forward without paying a significant penalty. Therefore, as noted in **Table 2-2**, the District's projected groundwater production is 1,756 AFY for 2020-2040 (Pan, July 2018).

The District is planning the Moorpark Desalter Project, which is a groundwater production and treatment system that could provide up to 2,500 AFY of potable water for customers in the District's water service area by the end of 2023 (District, 2015 UWMP; Pan, July 2018). However, implementation of the California Sustainable Groundwater Management Act (2014) may impact future plans for and construction of the Moorpark Desalter.

TABLE 2-1
DISTRICT GROUNDWATER PRODUCTION 2011-2015

	2011	2012	2013	2014	2015
Existing Groundwater Pumping (a)	2,347	2,796	3,519	2,505	1,808
Total	**2,347**	**2,796**	**3,519**	**2,505**	**1,808**

Notes:
All data in AFY and rounded.
(a) Source: District, 2015 UWMP.

Table 2-2 indicates that the estimated total groundwater extracted will be 1,756 AFY for 2020-2040, excluding additional groundwater pumping associated with the Moorpark Desalter Project (Pan, July 2018). Additional details are provided in Section 2.6.1.

TABLE 2-2
DISTRICT PROJECTED GROUNDWATER PRODUCTION 2020-2040

	2020	2025	2030	2035	2040
Existing Groundwater Pumping (a)	1,756	1,756	1,756	1,756	1,756
Future Additional Groundwater Pumping (b)	0	0	0	0	0
Total	**1,756**	**1,756**	**1,756**	**1,756**	**1,756**

Notes:
All data in AFY and rounded.
(a) Source: District, 2015 UWMP.
(b) Projected groundwater extractions for 2020-2040 were reduced as per District email dated July 2, 2018 (Pan, July 2018). These values represent a decrease of 5,000 AFY (2020-2040) compared to the District's 2015 UWMP.

2.3 Imported Surface Water

2.3.1 Calleguas Municipal Water District

The District purchases imported surface water from the CMWD. The CMWD is an enterprise special district that was formed by the voters of Ventura County in 1953 to provide a safe, reliable water supply. Named for the watershed in which it is located, CMWD is a public agency established under the Municipal Water District Act of 1911. It is governed by a five-member board of directors elected by voters to represent each of the five geographic divisions within the District. In 1960, CMWD became a member agency of the Metropolitan Water District of Southern California (MWD), which provides wholesale water from the Colorado River via the Colorado Aqueduct and Northern California via the State Water Project (SWP).

Calleguas distributes high-quality drinking water on a wholesale basis to 19 local purveyors, including the District, who in turn deliver water to area residents, businesses, and agricultural customers. Approximately three-quarters of Ventura County residents (roughly 630,000 people) depend on CMWD for all or part of their water (District, 2015 UWMP). Water supplied by CMWD currently represents approximately 73 percent of the total municipal and industrial water demand within its service area.

2.3.2 Metropolitan Water District of Southern California

Metropolitan is a wholesale water agency serving approximately 19 million people in six southern California counties. Metropolitan was formed in 1928 and is composed of 26-member agencies, including CMWD which is the fifth-largest member agency in terms of average annual water deliveries. As a wholesaler, Metropolitan has no retail customers and distributes treated and untreated water directly to its 26-member agencies. MWD provides water from the Colorado River and the State Water Project, and obtains additional supplies from numerous storage facilities, water transfers, exchanges, water banking, and land fallowing projects. The CMWD receives treated water from MWD's Joseph Jensen Filtration Facility in Granada Hills. CMWD receives the treated water via MWD's West Valley Feeder and either stores the treated water in Lake Bard to be treated later or distributes the water among its purveyors.

Metropolitan has a legal entitlement to receive water from the Colorado River under a permanent service contract with the Secretary of the Interior. The Colorado River Aqueduct (CRA) transports water from Lake Havasu, at the border of the states of California and Arizona, approximately 242 miles to its terminus at Lake Mathews in Riverside County. The CRA is owned and operated by Metropolitan and has a capacity of 1.2 million acre-feet (MAF) per year (MWD, 2016).

Metropolitan also receives water from the Sacramento River and San-Joaquin River Delta (Delta) in Northern California via the 444-mile-long California Aqueduct (State Water Project, SWP), which is managed by the CADWR. The SWP provides imported water to the MWD service area and has provided from 25 percent to 50 percent of MWD's water supplies. In accordance with its contract with the CADWR, the MWD has a State Water Project Table A allocation of 1.9 MAF per year. The CMWD primarily receives SWP water through MWD with Colorado River water normally available as a backup imported water supply.

MWD's total average water-year supplies from the CRA and SWP are estimated to be 2.8 MAF per year in 2040. MWD's total minimum water supplies for a single dry water-year are estimated to be 2.0 MAF per year in 2040. MWD's total minimum water supplies for a multiple dry water-years are estimated to be 1.9 MAF per year in 2040 (MWD, 2016).

In April 2015, citing continued drought conditions and reduced allocations from the State Water Project and Colorado River, the MWD Board of Directors approved implementing their Water Supply Allocation Plan (WSAP) at a Regional Shortage Level 3 starting July 1, 2015, to cut imported water deliveries to its member agencies by 15 percent. Under a Level 3 WSAP, MWD could impose a surcharge, ranging from $1,480 to $2,960/AF of additional water for any member agency that failed to meet the 15 percent reduction. The allocation plan limits water usage for its 26-member agencies based on their dependency on MWD supplies, local supply conditions, and past water-saving actions. The Tier 1 threshold for CMWD was set at 13.7 percent. The CMWD would pass the surcharge on to CMWD's retail customers exceeding this water allocation threshold. On May 10, 2016, the MWD Board of Directors reduced the WSAP to a Level 2, which is a 10 percent reduction in imported water deliveries, effective immediately, due to lower demands achieved through the region's water-saving efforts and improved supply conditions, particularly in northern California; and declared there would be no WSAP set forth for FY 2017. The CMWD also rescinded its surcharge in May 2016.

Table 2-3 indicates that in 2015 the District purchased 7,717 AF of imported surface water (District, 2015 UWMP). **Table 2-3** also summarizes the projected imported surface water anticipated to be purchased by the District for 2020 to 2040. The District estimates a range of 10,204 AFY to 10,943 AFY for 2020-2040 (Pan, July 2018). Thus, the District anticipates an increase in imported surface water purchases for 2020-2040.

Existing agreements the District has with CMWD do not guarantee the quantity of water the District may purchase. However, to the extent that water is available to CMWD, then CMWD has an obligation to provide water to meet demands of its member agencies, such as the District, by the CMWD's enabling statute, and governing regulations and applicable agreements with the member agencies. CMWD has served the needs of the District without fail, except for a few days following the 1994 Northridge Earthquake.

TABLE 2-3
DISTRICT CURRENT AND PROJECTED IMPORTED SURFACE WATER PURCHASES 2015-2040

	2015	2020	2025	2030	2035	2040
Imported Surface Water (a,b)	7,717	10,204	10,870	10,911	10,880	10,943
Total	**7,717**	**10,204**	**10,870**	**10,911**	**10,880**	**10,943**

Notes:
All data in AFY and rounded.
(a) Source: District, 2015 UWMP.
(b) Projected surface water purchases for 2020-2040 were increased as per District email dated July 2, 2018 (Pan, July 2018). These values for 2020-2040 represent an increase of 2,500 AFY (2025-2040) to 5,000 AFY (2020) compared to the District's 2015 UWMP.

2.4 Water Quality

The District provides water of good quality to its customers. Imported surface water supplied by CMWD meets all State and Federal drinking water quality standards. The District's pumped groundwater meets all State and Federal water quality standards for drinking water with the exception that treatment is required at one of the well sites (Well No. 20) to lower iron and manganese levels below the State Title 22 Secondary Maximum Contaminant Level (MCL) for these two minerals. The groundwater is chlorinated at each well site before being pumped into the potable water distribution system. A copy of the District's 2016 Annual Water Quality Report (also known as Consumer Confidence Report), which summarizes the District's potable water quality, is provided in **Appendix C**. Groundwater from the South Las Posas Basin has high levels of TDS and chlorides and requires treatment prior to potable use and as such has not been utilized by the District. However, with the implementation of the future District desalter facilities, this supply will become available.

2.5 Recycled Water

The District collects sanitary wastewater flows within the District's water service area and conveys the flows to the Moorpark Water Reclamation Facility (MWRF). The District operates and maintains the wastewater collection system and the MWRF. Metered wastewater flows averaged 2.0 MGD (2,240 AFY) for 2015 (District, 2015 UWMP). MWRF is located along California State Route 118 just west of the Moorpark city limits. The MWRF, which provides advanced primary and secondary treatment, has a total treatment capacity of 5.0 MGD and a tertiary treatment capacity of 1.5 MGD. The MWRF is required to discharge a portion of its treated effluent to percolation basins for groundwater recharge, which totaled 0.76 MGD (851 AFY) in 2015. The District provides recycled water to eight customers for agricultural and landscape irrigation, and to the MWRF for facilities operations and landscape irrigation. In 2015, the MWRF provided 599 AFY (0.54 MGD) of recycled water for uses such as agricultural (lemon) irrigation, landscape irrigation, land grading, and dust control.

The District anticipates that recycled water supply will increase to approximately 1,400 AFY by 2020, which could necessitate an expansion of the MWRF's tertiary treatment capacity (District, 2015 UWMP). The District forecasts further expansion of recycled water demand to 2,200 AFY by 2040 (District, 2015 UWMP). Additional details are provided in the District's 2015 UWMP.

2.6 Future Water Supplies

The District anticipates providing its customers a mix of local groundwater, imported water from CMWD, and recycled water (for nonpotable demands) to meet future water demands. The District continually reviews

practices that will provide its customers with adequate and reliable supplies. District staff continues to ensure the water quality is safe and the water supply will meet present and future needs in an environmentally and economically responsible manner. The District consistently coordinates its long-term water shortage planning with CMWD and FCGMA.

The District projects water demand will remain relatively constant over the next 25 years due to slow growth combined with water conservation efforts. Water demands within the District are currently 10,125 AFY (2015) and projected to increase to 13,893 AFY by 2040. The District anticipates that major water supply projects will be implemented to better manage and take advantage of the South Las Posas Groundwater Basin resource (Moorpark Desalter Project, see **Section 2.6.1**), and to increase recycled water use (see **Section 2.6.2**). Additional details regarding District, CMWD, and MWD planned water supply programs are provided in the District's 2015 UWMP.

Table 2-4 provides a summary of the District's projected water resources through 2040. The District anticipates approximately 14,899 AFY of total water resources in 2040 (District, 2015 UWMP). These water resources will include up to a maximum of 1,756 AFY from District wells, 10,943 AFY from imported surface water, and 2,200 AFY from recycled water.

TABLE 2-4
DISTRICT PROJECTED WATER SUPPLIES 2020-2040

Source	2020	2025	2030	2035	2040
Existing Groundwater Pumping (a)	1,756	1,756	1,756	1,756	1,756
Future Additional Groundwater Pumping (b)	0	0	0	0	0
Imported Surface Water (c)	10,204	10,870	10,911	10,880	10,943
Recycled Water (a)	1,400	1,600	1,800	2,000	2,200
Total	**13,360**	**14,226**	**14,467**	**14,636**	**14,899**

Notes:
All data in AFY and rounded.
(a) Source: District, 2015 UWMP.
(b) Projected groundwater extractions for 2020-2040 were reduced as per District email dated July 2, 2018 (Pan, July 2018). These values represent a decrease of 5,000 AFY (2020-2040) compared to the District's 2015 UWMP.
(c) Projected surface water purchases for 2020-2040 were increased as per District email dated July 2, 2018 (Pan, July 2018). These values represent an increase of 5,000 AFY (2020-2040) compared to the District's 2015 UWMP.

2.6.1 Groundwater Supplies

Table 2-4 indicates that estimated District total groundwater extracted will be 1,756 AFY for 2020-2040, excluding additional groundwater pumping associated with the Moorpark Desalter Project (Pan, July 2018). The FCGMA reduced the District's maximum allocation to 1,756 AFY for groundwater pumping from the East Las Posas Basin.

2.6.2 Additional Imported Surface Water Purchases

The District noted that the amount of imported water purchased will increase to meet the growth in water demand for years with insufficient supplies from groundwater extractions and recycled water (Pan, July 2018). **Table 2-4** summarizes the projected imported surface water anticipated to be purchased by the District for 2020 to 2040 (range of 8,380 AF in 2035 to 10,204 AF in 2020). Thus, the District anticipates an increase in imported surface water purchases for 2020-2040.

2.6.3 Recycled Water Expansion

The existing tertiary treatment capacity of the District's MWRF is currently 1.5 MGD. Potential expansion of the recycled water distribution system may serve additional tertiary treated effluent from the MWRF to additional agricultural irrigation and landscape irrigation customers in the service area (District, 2015 UWMP). While this improvement will not impact the District's potable water system, it will enhance water supply within the District by reducing the need for imported water. The District will continue to convert existing uses currently being served from the potable water system to the recycled water system. In 2015, the District distributed 599 AFY of recycled water. The District anticipates distributing approximately 1,100 AFY by 2018 with the conversion of an existing golf course to the recycled water customer base. **Table 2-4** indicates that the estimated demand for recycled water supply will increase to 1,400 AFY by 2020, necessitating an expansion of the MWRF's tertiary treatment capacity by 2025. **Table 2-4** also indicates that estimated recycled water demand will reach 2,200 AFY by 2040 (District, 2015 UWMP).

2.6.4 Other Water Resources

The District does not plan to use self-supplied surface water, storm water, nor desalinated water to supplement existing water resources.

2.7 Effects of Global Climate Change

2.7.1 Introduction

Current climate change projections suggest that California will continue to enjoy a Mediterranean climate with the typical seasonal pattern of relatively cool and wet winters and hot, dry summers. However, climate patterns are different now and may continue to change at an accelerated pace. Increases in global emissions of greenhouse gases are leading to serious consequences for California including, but not limited to, the following: higher air and water temperatures, rising sea levels, increased droughts and floods, decreased amount and duration of snow pack, and extreme variability in weather patterns (CADWR, 2013; California Natural Resources Agency, CANRA, 2009). These changes are anticipated to intensify over the 20-year planning horizon of this Assessment. Even if all emissions of greenhouse gases ceased today, some of these developments would be unavoidable because of the increase in greenhouse gases recorded over the last 100 years and the fact that the climate system changes slowly (Public Policy Institute of California, PPIC, 2011). Many of these climate changes would affect the availability, volume, and quality of California water supplies.

2.7.2 Potential Impacts of Climate Change

State and local water supplies and water demands may be impacted by climate change via one or more processes including precipitation, air temperature, runoff, sea level change, and flooding. Rainfall variability is expected to increase, leading to more frequent droughts and floods. Runoff from snowpack may be earlier and less predictable, and precipitation may fall as more rain and less snow. Air temperatures in California are anticipated to increase by 2 to 9 degrees Fahrenheit by the year 2100 (CANRA, 2009). Higher air temperatures may result in more rain and less snow, diminishing the reserves of water held in the Sierra Nevada snowpack (CANRA, 2009). Spring runoff from snowpack is occurring earlier now than it did in the first part of the 20th century. This change in runoff could affect the availability of spring and summer snowmelt from mountain areas, including State Water Project water from the Sacramento Delta and local rivers and streams. Total annual exports from the Delta for State and Federal contractors may also decrease by 20 to 25 percent by the year 2100 (California Climate Change Center, CCCC, 2009).

Sea levels have risen by as much as 7 inches along the California coast over the last century (CANRA, 2009). According to some estimates, sea level is projected to rise an additional 2 to 5 feet by 2100 (PPIC, 2011; Pacific Institute, 2009; CANRA, 2009; Climate Action Team, CAT, 2008). These sea level increases could significantly impact infrastructure within coastal areas and affect quantity and timing of State Water Project water exports from the Sacramento Delta. Effects of sea level rise in the Delta would be two-fold: (1) problems

with weak levees protecting the low-lying land, many already below sea level; and (2) increased salinity intrusion from the ocean which could degrade fresh water transfer supplies pumped at the southern edge of the Delta or require more fresh water releases to repel ocean salinity.

The CADWR Water Plan includes an assessment of the impacts of global climate change on the State's water supply was conducted using a series of computer models based on decades of scientific research. Model results for California indicate a significant likelihood of increased temperature, reduction in Sierra snow depth, early snow melt, and a rise in sea level (CADWR, 2013). These changing hydrological conditions could affect future planning efforts which are typically based on historic conditions. Difficulties in water supplies planning that may arise include, but are not limited to, the following:

- hydrological conditions, variability, and extremes that are different than what current water systems were designed to manage.
- changes occurring too rapidly to allow sufficient time and information to permit managers to respond appropriately.
- special efforts or plans to protect against surprises and uncertainties.

As such, CADWR will continue to provide updated results from these models as further research is conducted and new information becomes available.

2.7.3 Potential Effects of Climate Change on Water Demand

Climate change may increase daytime and nighttime temperatures and seasonal temperatures. This change may impact the length of the growing season. This general increase in temperatures coupled with greater variability and unpredictability in precipitation is expected to lead to increases in evapotranspiration resulting from warmer seasons; thereby creating an increase in demand for irrigation water and an increase in the year-to-year variability of demand.

Temperate fruit and nut trees such as almonds, pistachios, and apples require adequate winter chill to produce economically viable yields. Increased temperatures daytime, nighttime, and season temperatures may reduce winter chill hours thereby causing adverse effects on the yield of some crops. Some farmers are beginning to overcome this change by planting trees closer together and using new varieties.

Studies are now underway to prepare farmers for the likely impacts of climate change. Such efforts include breeding varieties of fruit trees that can withstand the decreased water chill hours, developing tools to aid the crops in coping with insufficient chill, and researching the temperature responses of orchard crops to better understand potential long-term effects. However, some solutions such as replanting orchards with altered crop varieties or the installation of aiding tools may not be feasible for many irrigators.

2.7.4 Mitigation and Adaptation

Responding to climate change generally takes two forms: mitigation and adaptation. Mitigation is taking steps to reduce the human contribution to the causes of climate change by reducing greenhouse gas (GHG) emissions. Adaptation is the process of responding to the effects of climate change by modifying our systems and behaviors to function in a warmer climate (CADWR, 2013).

In the water sector, climate change mitigation is generally achieved by reducing energy use, becoming more efficient with energy use, and/or substituting renewable energy sources in place of fossil fuel based energy sources. Because water requires energy to move, treat, use, heat, and discharge, water conservation is also energy conservation. As each water supplier implements water conservation measures and determines its water conservation targets, it can also calculate conserved energy and GHGs not-emitted as a side benefit. Once a water supplier has calculated the water conserved by a best management practice (BMP), it is straightforward to convert that volume to conserved energy, and GHGs not-emitted. Additionally, water suppliers may want to

focus on implementing water conservation measures that conserve water but do so at a significant decrease in GHG emissions as compared with other measures (CADWR, 2013).

Climate change means more than hotter days. Continued warming of the climate system has considerable impact on the operation of most water districts. Snow in the Sierra Nevada provides 65 percent of California's water supply. Predictions indicate that by 2050 the Sierra snowpack will be significantly reduced. Much of the lost snow will fall as rain, which flows quickly down the mountains during winter and cannot be stored in our current water system for use during California's hot, dry summers. The climate is also expected to become more variable, bringing more droughts and floods. Water districts will have to adapt to new, more variable conditions (CADWR, 2013).

Principles of climate change adaptation include the following:

- As more mitigation is completed now, the less adaptation we may have to do in the future, because climate impacts could be less severe.
- Mitigation is much less expensive than adaptation.
- Mitigation should happen globally.
- Adaptation must happen locally.
- Adaptation strategies should be implemented according to future conditions, regular assessment, and recalibration.
- Some adaptation strategies have benefits that can be realized today.

2.7.5 Local Strategies

As climate change continues to unfold in the coming decades, water agencies may need to mitigate and adapt to new strategies, which may require reevaluating existing agency missions, policies, regulations, facilities, funding priorities, and other responsibilities. Examples of mitigation and adaptation strategies include, but not limited to, the following:

- Prepare long-term facility and sustainability master plans including specific elements for climate change adaptation.
- Increase ground water recharge using additional surface water and recycled water.
- Increase recycled water demands.
- Promote additional water use efficiency for urban, commercial, and industrial best management practices.
- Increase investments in infrastructure that promotes adaptation strategies (such as ground water recharge, and recycled water) and existing principal facilities susceptible to impacts of climate change.

Notwithstanding the above strategies for dealing with climate change, the reality is that current environmental regulations place a very high priority on releasing additional water for endangered species (i.e., Sacramento River and San Joaquin River) and the environment. The potential for increased water demand for environmental resources and the possibility of reduced water supplies will be one of the biggest challenges confronting water agencies.

The goal of the District is to utilize the available surface water and groundwater supplies as effectively as possible in meeting the requirements of the District's water users. It is worth noting, however, that the District's control over water supplies is limited; thus, management practice changes will need to be adaptive in nature.

SECTION 3
WATER DEMAND

This section defines historic and current water usage and the methodology used to project future demands within the District's service area. Water usage is divided into sectors such as the following: residential, industrial, institutional/governmental, landscape/recreational, agricultural, and other purposes.

3.1 Historic/Current District Water Use

Average District annual water demands (groundwater production and imported water purchases) were 12,970 AF in 1990 and decreased to 10,124 AF in 2015 as shown in **Table 3-1**. These data indicate that water demand within the District has decreased by 22 percent upon a comparison of 1990 demands and 2015 demands, while the local population increased by approximately 40 percent. Significant changes in total demands (such as the decrease observed in 1995) were likely due to changes in local precipitation which affect residential landscape watering and agricultural irrigation. The decrease in water demands in 2015, compared to the period 2000 to 2010, is likely due to District water conservation programs and State-mandated demand reduction requirements.

TABLE 3-1
DISTRICT HISTORICAL TOTAL WATER DEMANDS 1990-2015

Calendar Year	Total Water Demands (AFY) (a)
1990	12,970
1995	9,694
2000	11,570
2005	11,872
2010 (b)	11,774
2015 (b)	10,124

Notes:
All data rounded.

(b) Includes recycled water.

3.2 Factors Affecting Water Usage

Water demand is a function of several factors. Geographic location, topography, land use, demography, and water system characteristics (i.e., system pressures, water quality and metering of connections) all influence water usage. Water demand characteristics within the District will differ from water demands of other areas in California according to one or more of these factors.

Two major factors that affect water usage are weather and water conservation. Historically, when the weather is hot and dry, water usage within the District increases. The amount of increase varies according to the number of consecutive months and years of hot dry weather and the conservation activities imposed. During cool-wet years, historical water usage within the District has decreased mainly due to less water usage for external

landscaping. In recent years, water conservation has become an increasingly important factor in water supply planning in California. In 2014, the State Water Resources Control Board mandated significant water demand reductions for all urban water agencies. In addition, the California Plumbing Code has instituted requirements for new construction that mandate the installation of ultra-low-flow toilets and low-flow showerheads. Additional information is available from the District regarding local water conservation programs (District, 2015 UWMP).

3.3 Projected District Water Demands

The District's population projections were presented in **Section 1**. Current population within the District is estimated to be 35,782 (District, 2015 UWMP). Projected District population for the year 2040, is estimated to be 45,000. Residential (single-family and multiple-family) accounted for 93 percent of the total water connections in 2015. **Table 3-2** summarizes the projected water demand by water use sector. Projected demands increase to 13,893 AFY by 2040. Residential demands within the District are currently the largest water use sector, and projected to be the highest water use sectors through 2040. **Table 3-2** includes the water demands for the Hitch Ranch Project.

TABLE 3-2
DISTRICT CURRENT AND PROJECTED WATER DEMANDS BY SECTOR 2015-2040

Water Use Sector	Current 2015	2020	2025	2030	2035	2040
Potable Water Demand						
Residential (single-fam. + multiple-fam.)	5,869	6,777	7,076	7,212	7,316	7,429
Commercial	533	617	631	640	647	654
Industrial	135	156	160	162	164	166
Institutional	341	395	404	410	414	419
Agricultural	2,384	2,615	2,615	2,615	2,615	2,615
Loss	263	386	395	400	405	409
Recycled Water Demand	599	1,400	1,600	1,800	2,000	2,200
Total Water Demand	**10,124**	**12,345**	**12,880**	**13,240**	**13,560**	**13,893**

Notes:
All data in AFY and rounded.
Source: District, 2015 UWMP.

Agricultural water demands in the District's service area are met with interruptible supplies from CMWD. This designation means that potable water supplied to these users is at a reduced water rate, however the supplies can be curtailed at any time at the discretion of the supplier.

3.4 Estimated Water Demands for Hitch Ranch Project

It is anticipated that residential units within the Hitch Ranch Project will maximize the use of water conservation measures both inside and outside the dwellings. Residential homes will be built to current California Plumbing Code including indoor water conservation fixtures. Residential lots will meet the California Model Water Efficient Landscape Ordinance. Use of these measures throughout the Hitch Ranch Project will reduce the water demand as compared to residential units that do not implement water conservation measures. The Hitch Ranch

Project will include use of recycled water for all non-residential landscape irrigation demands, including parks, medians, slopes, and other irrigated areas.

Table 3-3 indicates that the current average District residential water demand is 0.53 acre-feet per connection (146.4 gallons per capita per day, gpcd), for all types and ages of housing in the District. This value is 18 percent less than the average in 2005 (District, 2015 UWMP; Table 4-1B, page 4-3). The District indicated that customers in newer housing units use less water per person than older housing units, and future housing is anticipated to use even less. The District indicated that for new housing projects, such as the Hitch Ranch Project, the estimated residential water rate is 135 gpcd for single-family homes and 60 gpcd for multiple-family homes (District, 2018).

TABLE 3-3
DISTRICT ANNUAL CONSUMPTION RATES BY SERVICE TYPE

Service Type	Estimated Annual Consumption Rate
Residential (a)	0.53 acre-feet per connection
Commercial (b)	3.69 acre-feet per connection
Institutional (b)	7.25 acre-feet per connection
Industrial (b)	3.89 acre-feet per connection
Agricultural (b)	17.67 acre-feet per connection
Construction (b)	0.53 acre-feet per connection
Others (Fire and Hydrant) (b)	1.30 acre-feet per connection

Notes:
(a) District, 2015 UWMP; 146 gallons per person per existing dwelling unit per day for total indoor and outdoor demands; includes 3.33 persons per dwelling unit. However, the District approved a residential water rate of 135 gpcd for new single-family homes and 60 gpcd for new multiple-family homes (District, 2018).
(b) District, 2005 UWMP.

The 755 Project includes construction of approximately 755 residential units, with 328 single-family units, 427 multiple-family units, and a variety of open space areas. Estimated specific water demands for the 755 Project are provided in **Table 3-4**. Total potable water demand for the 755 Project will be approximately 261.2 AFY, while recycled water demand will be approximately 103.4 AFY. Total potable and nonpotable demand will be approximately 364.6 AFY. As indicated previously, water demands for the Hitch Ranch Project were included in the total water demand projections in the District's 2015 UWMP (District, 2015 UWMP, Section 3.4.2).

TABLE 3-4
ESTIMATED WATER DEMANDS FOR THE HITCH RANCH PROJECT - 755

Sector	Quantity	Factor	Water Demand Rate	Estimated Water Demand (AFY)
POTABLE WATER DEMAND (a)				
Single Family Residence (b)	328 du	3.33 ppdu	135 gpcd	165.2
Multi-Family Residence (b)	427 du	3.33 ppdu	60 gpcd	95.6
City Park (b)		200 people	2 gpcd	0.4
Total Potable Water Demand				**261.2**
RECYCLED WATER DEMAND (a)				
Landscape Irrigation - Residential	0 ac		0 AFY/ac	0
Landscape Irrigation – Slopes/fire suppression	41.01 ac		1.886 AFY/ac	77.3
Landscape Irrigation – Parks (c)	10 ac		1.886 AFY/ac	18.9
Landscape Irrigation – Road medians/strips	3.8 ac		1.886 AFY/ac	7.2
Natural open space	61.75 ac		0 AFY/ac	0
Total Recycled Water Demand				**103.4**
TOTAL WATER DEMAND				**364.6**

Notes:
All values rounded.
Abbreviations: du = dwelling units; ac = acre; ppdu = persons per dwelling unit; gpcd = gallons per capita per day; gpacpd = gallons per acre per day; AFY/ac = acre feet per year per acre
(a) Land use estimates based on Hitch Ranch development details (Development Planning Services, 2020).
(b) Potable water demands based on single-family total residential demand of 135 gallons per capita per day, and multiple-family residential demand of 60 gallons per capita per day (District, 2018).
(c) Approximately 4.59 acres total at 2 sites; 100% potable demand for drinking fountains and restrooms; estimate of 200 visitors per day that use water x 2 gallons per visitor that use water.

3.5 Estimated Water Demands for Moorpark Housing Project

As noted in Section 1.3, the development of the Moorpark Housing Project is anticipated to include a maximum of 200 residential units on approximately 6.7 acres. Construction and occupation of the residential component of the proposed project would result in a theoretical population increase of approximately 367 persons. It is anticipated that all residential units within the Moorpark Housing Project will maximize use of water conservation measures both inside and outside the dwellings. Use of these measures throughout the Moorpark Housing Project will reduce the water demand as compared to residential units that do not implement water conservation measures. The Moorpark Housing Project will include use of recycled water for all non-residential landscape irrigation demands, including parks, medians, and other irrigated areas.

Table 3-3 indicates that the current average District residential water demand is 0.53 acre-feet per connection (146.4 gallons per capita per day, gpcd), for all types and ages of housing in the District. This value is 18 percent less than the average in 2005 (District 2015 UWMP; Table 4-1B, page 4-3). The District indicated that customers in newer housing units use less water per person than older housing units, and future housing is anticipated to use even less. The District indicated that for new housing projects, such as the Moorpark Housing

Project, the estimated residential water rate is 135 gpcd for single-family homes and 60 gpcd for multiple-family homes (District, 2018).

Estimated specific water demands for the Moorpark Housing Project are provided in **Table 3-5**. Total potable water demand for the Moorpark Housing Project will be approximately 44.8 AFY, while recycled water demand will be approximately 1.0 AFY. Total potable and nonpotable demand will be approximately 45.8 AFY.

TABLE 3-5
ESTIMATED WATER DEMANDS FOR THE MOORPARK HOUSING PROJECT

Sector	Quantity	Factor	Water Demand Rate	Estimated Water Demand (AFY)
POTABLE WATER DEMAND (a)				
Single Family Residence	0 du	3.33 ppdu	135 gpcd	0
Multi-Family Residence	200 du	3.33 ppdu	60 gpcd	44.8
Institutional		0 people	20 gpcd	0
City Park		0 people	2 gpcd	0
Total Potable Water Demand				**44.8**
RECYCLED WATER DEMAND				
Landscape Irrigation - Residential	0.5 ac		2 AFY/ac	1.0
Landscape Irrigation – Slopes/fire suppression	0 ac		1.886 AFY/ac	0
Landscape Irrigation – Park/institutional	0 ac		1.886 AFY/ac	0
Landscape Irrigation – Road medians/strips	0 ac		1.886 AFY/ac	0
Natural open space	0 ac		0 AFY/ac	0
Total Recycled Water Demand				**1.0**
TOTAL WATER DEMAND				**45.8**

Notes:
All values rounded.
Abbreviations: du = dwelling units; ac = acre; ppdu = persons per dwelling unit; gpcd = gallons per capita per day; gpacpd = gallons per acre per day; AFY/ac = acre feet per year per acre
(a) Potable water demands based on single-family total residential demand of 135 gallons per capita per day, and multiple-family residential demand of 60 gallons per capita per day (District, 2018).

SECTION 4:
WATER SUPPLY RELIABILITY

This Section provides a discussion of the reliability of the water supply within the District's service area. A comparison between the water supply and demand for an average water year, single-dry water year, and multi-dry water years is also provided.

4.1 Reliability

Reliability is "how much one can count on a certain amount of water being delivered to a specific place at a specific time" and depends on the availability of water from the source, availability of the means of conveyance and level and pattern of water demand at the place of delivery.

4.1.1 Plan to Assure Reliable Water Supply

Recognizing its dependence on imported water supplies and the need to improve water supply reliability during drought events, the District anticipates use of the following sources of supply for the period 2020 to 2040:

- Groundwater from the District's wells
- CMWD imported surface water
- Recycled water from the District
- Desalted Groundwater (after the project is complete).

4.2 Reliability Comparison

The Urban Water Management Planning Act requires an assessment of water supply reliability and vulnerability to seasonal or climatic shortage. Reliability is a measure of a water service system's anticipated success in managing water shortages. This assessment must include a comparison of the total projected water demand with the total water supply available for the following conditions: (1) average/normal water-year, (2) single dry water-year, and (3) three consecutive dry water-years. Additional details are provided in the District's 2015 UWMP.

4.2.1 Normal Water-Year Supply and Demand Comparison

A summary of the District's projected 20-year water supplies and demands for normal water-year conditions is provided in Table 4-1. As noted in Table 4-1, the District's total projected normal water-year water supplies available through 2040 are projected to exceed water demands associated with existing and planned uses within the District's service area, including the Hitch Ranch Project, by 1,007 to 1,345 AFY. The District anticipates meeting its normal water-year demands from 2020 to 2040 via the use of existing supplies (local ground water and imported surface water), implementation of the Moorpark Desalter, and increased use of recycled water to meet future water demands in normal water-years (District, 2015 UWMP).

TABLE 4-1
DISTRICT NORMAL WATER-YEAR SUPPLY AND DEMAND COMPARISON 2020-2040

	2020	2025	2030	2035	2040
Total Supply	13,360	14,226	14,467	14,636	14,899
Total Demand	12,345	12,881	13,239	13,561	13,892
Difference	**1,015**	**1,345**	**1,228**	**1,075**	**1,007**

Notes:
All data in AFY and rounded.
Source: District, 2015 UWMP.

4.2.2 Single Dry Water-Year Supply and Demand Comparison

A summary of the District's projected 20-year water supplies for a single dry-year condition is provided in Table 4-2. The District anticipates supplies to exceed demands from 2020 to 2035 in a single dry water-year by 31 to 314 AFY via the use of existing supplies, implementation of the Moorpark Desalter, and increased use of recycled water (District, 2015 UWMP). However, for the year 2040, the District anticipates a deficit of approximately 66 AFY. The District may need to consider additional water supplies (purchase additional imported surface water, future potable and recycled water programs administered by the District, CMWD, and MWD) and implementation of additional conservation measures to meet future water demands in single dry water-years.

TABLE 4-2
DISTRICT SINGLE DRY WATER-YEAR SUPPLY AND DEMAND COMPARISON 2020-2040

	2020	2025	2030	2035	2040
Total Supply	12,932	13,687	13,950	14,115	14,365
Total Demand	12,890	13,373	13,750	14,084	14,431
Difference	**42**	**314**	**200**	**31**	**(66)**

Notes:
All data in AFY and rounded.
Source: District, 2015 UWMP.

4.2.3 Multiple Dry Water-Years Supply and Demand Comparison

A summary of the District's projected 20-year water supplies and demands for multiple dry water-year conditions is provided in Table 4-3. Water supplies available through 2040, during multiple dry water-year conditions, are projected to exceed water demands associated with existing and planned uses within the District's service area, including the Hitch Ranch Project, by 513 to 1,039 AFY. The District anticipates the use of existing supplies, implementation of the Moorpark Desalter, increased use of recycled water, and implementation of additional conservation measures to meet future water demands in multiple dry water-years (District, 2015 UWMP).

TABLE 4-3
DISTRICT MULTIPLE DRY WATER-YEARS SUPPLY AND DEMAND COMPARISON 2020-2040

		2020	2025	2030	2035	2040
First Year	Total Supply	13,149	14,143	14,442	14,606	14,918
	Total Demand	12,636	13,104	13,472	13,798	14,138
	Difference	**513**	**1,039**	**970**	**808**	**780**
		2020	**2025**	**2030**	**2035**	**2040**
Second Year	Total Supply	13,149	14,143	14,442	14,606	14,918

SECTION 5
WATER SHORTAGE CONTINGENCY PLAN

5.1 Introduction

Water shortages arise not only from drought, but shortages resulting from earthquakes, fires, system failures, and water quality contamination as well. California's extensive system of water supply infrastructure, its reservoirs, groundwater basins, and inter-regional conveyance facilities, mitigates the effect of short-term dry periods. Defining when a drought begins is a function of understanding drought impacts on water users. Drought is a gradual phenomenon. Although droughts are sometimes characterized as emergencies, they differ from typical emergency events. Droughts occur slowly, over a multiyear period. Drought impacts increase with the length of a drought, as carry-over supplies in reservoirs are depleted and water levels in groundwater basins decline.

Section 2 of this WSA summarizes the District supplies. Section 3 defines the water demands. Section 4 defines the water supply reliability. In addition, the District's water demand management measures will play an essential role in limiting water use during drought times. Additional details available in the District's 2015 UWMP.

5.2 District Water Shortage Response

To meet short-term water demand deficiencies, and short-term or long-term drought requirements, the District has included a Water Shortage Contingency Plan (WSCP), which is included as Part 1, Section K of the Ventura County Waterworks Districts Rules and Regulations (copy of Part 1 provided in **Appendix D**). The District has also adopted permanent water conservation measures included in Section L of their Rules and Regulations. In the event of a water shortage, the Director of the County of Ventura Public Works Agency (Agency Director) is authorized and directed to implement provisions of the District's WSCP, subject to ratification by the District Board at its first regularly scheduled meeting (District, 2015 UWMP). The Agency Director determines the extent of conservation or water use efficiency required through the implementation and/or termination of conservation stages or levels consisting of three levels for the District to prudently plan for and supply water to its customers. However, in the case of local emergencies, the Director of the Water and Sanitation Department has the authority to order the implementation of the appropriate stage of water conservation. Stages of the District's WSCP are summarized in **Section 5.3**.

Provisions of the District's WSCP will be implemented in congruence with the policy of the MWD and CMWD water shortage/drought activities. The CMWD policy will be based on one or more of MWD's adopted planning documents including, but not limited to, the following:

- Water Surplus and Drought Management Plan (WSDMP)
- Water Supply Allocation Plan (WSAP)
- Regional Integrated Water Resources Plan
- Urban Water Management Plan
- Long Term Conservation Plan.

The MWD's WSDMP is designed to guide the management of regional water supplies to achieve reliability goals for southern California. The Water Supply Allocation Plan is designed to provide a framework for administering an allocation should a water shortage be declared.

The City of Moorpark, which encompasses much of the District, has adopted the CADWR's Model Water Efficient Landscape Ordinance that set forth standards for landscape irrigation during drought and non-drought times, and acknowledges the constant need to establish long-term water efficiency (City Ordinance 10-383,

Chapter 15.23). This ordinance covers all landscaping within new developments as well as rehabilitated landscape (District, 2015 UWMP).

5.3 Rationing Stages and Reduction Goals

To meet short-term water demand deficiencies and short-term or long-term drought requirements, the District will implement its water shortage policy in accordance with the District's Water Conservation Program. In addition, the District will consider the policy of CMWD, which is anticipated to be based on MWD's policies and planning documents. It is important to note that agricultural water service is interruptible at all times. Mandatory allocations are avoided to the extent practicable, however, in the event of an extreme shortage, an allocation plan will be adopted in accordance with the principles of the MWD's WSDMP and WSAP. The three stages of the District's WSCP are shown in **Table 5-1** and described below.

5.3.1 Level 1 Water Supply Shortage

A Level 1 water supply shortage is declared when the Agency Director determines in his or her sole discretion that due to drought or other water supply conditions, a water supply shortage or threatened shortage exists, and a consumer demand reduction is necessary to make more efficient use of water and appropriately respond to existing water conditions.

TABLE 5-1
STAGES OF DISTRICT WATER SHORTAGE CONTINGENCY PLAN

Level	Percent Supply Reduction (a)	Water Supply Condition
1	NA	A water supply shortage or threatened shortage exists, and a consumer demand reduction is necessary to make more efficient use of water
2	NA	A water supply shortage or threatened shortage exists, and a consumer demand reduction is necessary to make more efficient use of water. Additional prohibited water uses are identified relative to Level 1 prohibitions
3	NA	A significant reduction in consumer demand is necessary to maintain sufficient water supplies for public health and safety

Notes:
(a) Percent supply reduction is not used by the District to signal a level of the WSCP; rather, it is up to the discretion of the Agency Director or other authorized person to determine the severity of the water shortage and the appropriate level of the WSCP.

5.3.2 Level 2 Water Supply Shortage

A Level 2 water supply shortage is declared when the Agency Director determines in his or her sole discretion that due to drought or other water supply conditions, a water supply shortage or threatened shortage exists, and a consumer demand reduction is necessary to make more efficient use of water and appropriately respond to existing water conditions. Additional prohibited water uses are identified relative to Level 1 prohibitions.

5.3.3 Level 3 Water Supply Shortage

A Level 3 water supply shortage condition is also referred to as an "Emergency" condition. A Level 3 condition is declared when the Agency Director determines that a significant reduction in consumer demand is necessary to maintain sufficient water supplies for public health and safety. The Agency Director declares a water shortage emergency and notifies District residents and businesses of the emergency.

Additional details regarding the District's WSCP are available in the District's 2015 UWMP and the County Rules and Regulations (see copy of Part 1, Section K included in **Appendix D**).

5.4 CATASTROPHIC SUPPLY INTERRUPTION

A water shortage emergency could be the result of a catastrophic event such as a result of drought, failures of transmission facilities, a regional power outage, earthquake, flooding, supply contamination from chemical spills, or other adverse conditions. These emergencies and the District's method for handling them are described below. County Rules and Regulations regarding water shortages (see copy of Part 1, Section K included in **Appendix D**) includes actions for any event which results in loss of supply.

In addition, the District prepared an Emergency Procedures Manual (EPM, Ventura County, 2010). The County's EPM (Section VII) describes responses to emergency situations resulting from natural disasters, system failures, and other unforeseen circumstances. The EPM provides guidelines for evaluating an emergency situation and procedures for activating an emergency response. The EPM identifies various levels of emergencies (Level 1, Level 2, and Level 3), and provides examples of response to several emergencies, including but not limited to local flooding, power failures, earthquakes, and hazardous material releases.

Examples of the District's response procedures to an emergency are summarized below.

5.4.1 Earthquakes or Other Natural Disasters

The District is located in an earthquake zone. In the event of an earthquake or natural disaster, the District has the potential of losing its imported water supply and or ground water supply. If such a loss occurs, the District could temporarily increase its ground water production (if available) to meet water demand until repairs to the imported water supply facilities were completed and the supply restored. In addition, the District would follow the procedures outlined in their EPM and or County of Ventura Multi-Hazard Mitigation Plan (Ventura County, 2010; Ventura County, 2015). In the event of a prolonged loss of imported water and or groundwater, the District could implement their established Water Shortage Plan from the County Rules and Regulations (**Appendix D**) to substantially reduce demands until supply is restored.

5.4.2 Contamination of Water Supply

Contamination of water supply can result from several different events including a water main break, cross-connection condition, water source pollution, or covert action. Water supplies for the District are generally of good quality and no foreseeable permanent contamination issues are anticipated. In the event of a toxic spill or major contamination, the District would follow the procedures outlined in their EPM (Ventura County, 2010). The District would isolate the problem and reduce the impact on the water supply. Once the problem has been isolated, the contamination would be cleaned up using chlorination or other necessary procedures and the water supply returned to service as soon as possible. The EPM also includes an Emergency Disinfection Plan. In the meantime, alternative supply would be utilized to meet demand. Implementation of additional demand management measures could also be utilized if the outage is anticipated to be of a longer duration. If necessary, the District would implement the procedures outlined in the County Rules and Regulations regarding water shortages (see copy of Part 1, Section K included in **Appendix D**).

5.4.3 Power Failure

In the event of a regional power failure, the District would follow the procedures outlined in their EPM (Ventura County, 2010). Standby generators are available at each of the District's well and pump station sites to maintain operation should an interruption of power occur. The EPM lists all of the stationary and mobile generators located at the various District facilities, with model numbers, kilowatt rating, and fuel tank capacity. If necessary, the District would implement the procedures outlined in the County Rules and Regulations regarding water shortages (see copy of Part 1, Section K included in **Appendix D**).

SECTION 6
CONCLUSIONS

The purpose of this Water Supply Assessment is to demonstrate that future water supplies are sufficient to meet the District's projected water demands, inclusive of the Hitch Ranch Development Plan.

The Hitch Ranch Project is located in southeastern Ventura County, within the boundaries of the City of Moorpark. As proposed, the 755 Project as planned will include a maximum of 755 residential units (approximately 328 single-family dwellings and 427 multiple-family dwellings) on approximately 270.7 acres. Construction and occupation of the residential component of the proposed project would result in a theoretical population increase of approximately 2,515 persons (based on 3.33 persons per dwelling unit; District, 2015 UWMP). Also included in this development are approximately 4.59 acres of active recreational space, 102.8 acres of open space/slopes, and 66.37 acres of public facilities and roads.

It is anticipated that residential units within the Hitch Ranch Project will maximize the use of water conservation measures both inside and outside the dwellings. Residential homes will be built to current California Plumbing Code including indoor water conservation fixtures. Residential lots will meet the California Model Water Efficient Landscape Ordinance. The use of these measures throughout the Hitch Ranch Project will reduce the water demand as compared to existing residential units that do not implement water conservation measures. The Hitch Ranch Project will include infrastructure for use of recycled water for all non-residential landscape irrigation demands, including water for parks, medians, and open spaces.

The District will be the retail water purveyor for the Project including potable (drinking) water and nonpotable (recycled) water. The District distributes potable water via a combination of imported surface water purchased from the CMWD and groundwater from the District's local wells. The District also distributes recycled water for nonpotable demands. The District, CMWD, and its wholesaler, MWD, have taken significant steps to diversify their existing and future water supply resources to enhance service reliability to the District's water customers. The District's plans to enhance water supply reliability include expanding the recycled water distribution system, constructing a Moorpark Groundwater Desalter to create additional local potable water, and expanding the District's MWRF tertiary facilities to increase the volume of available recycled water supplies. In addition, the District continues to support extensive water conservation programs for customers in the service area.

The 755 Project total potable water demand will be approximately 261.2 AFY, while recycled water demand will be approximately 103.4 AFY. Total potable and nonpotable demand will be approximately 364.6 AFY. Water demands for the Hitch Ranch Project were included in the total water demand projections in the District's 2015 UWMP (District, 2015 UWMP, Section 3.4.2).

The Moorpark Housing Project includes the construction of a maximum of approximately 200 multiple-family residential units on approximately 6.7 acres. The Moorpark Housing Project will not be part of the Hitch Ranch Project and will be built by a separate entity. For purposes of this WSA, water demands for the Moorpark Housing Project will be evaluated separately. Total potable water demand for the Moorpark Housing Project will be approximately 44.8 AFY, while recycled water demand will be approximately 1.0 AFY. Total potable and nonpotable demand will be approximately 45.8 AFY.

Based on the analysis summarized in this Water Supply Assessment (and supported by the District's 2015 UWMP), the District's total projected normal water-year water supplies available through 2040 are projected to exceed water demands associated with existing and planned uses within the District's service area, including the Hitch Ranch Project, by 1,007 to 1,345 AFY. Under single dry water-year conditions, the District's water supplies available through 2040 are projected to exceed the projected water demands associated with existing and planned uses within the District's service area, including the Hitch Ranch Project, by 31 to 314 AFY (with one exception). This potential exception is the year 2040 when demands may exceed supplies by 66 AFY. Water

supplies available through 2040, during multiple dry water-years conditions, are projected to exceed water demands associated with existing and planned uses within the District's service area, including the Hitch Ranch Project, by 513 to 1,039 AFY.

As previously noted, the District, CMWD, and its wholesaler, MWD, have taken significant steps to diversify their existing and future water supply resources to enhance service reliability to the District's water customers during normal and drought conditions. On the supply side, the District plans to enhance local potable water supplies and recycled water supplies (District, 2015 UWMP). On the demand side, the District will continue to support extensive water conservation programs for customers in the service area. These conservation measures will continue to reduce the average residential water use per household for existing and new customers. The District noted that the amount of imported water purchased will increase to meet the growth in water demand for years with insufficient supplies from groundwater extractions and recycled water (Pan, July 2018).

California Water Code – Water Supply Assessment

CALIFORNIA WATER CODE
SECTION 10910-10915
October 14, 2016

10910. (a) Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) under Section 21080 of the Public Resources Code shall comply with this part.

(b) The city or county, at the time that it determines whether an environmental impact report, a negative declaration, or a mitigated negative declaration is required for any project subject to the California Environmental Quality Act pursuant to Section 21080.1 of the Public Resources Code, shall identify any water system that is, or may become as a result of supplying water to the project identified pursuant to this subdivision, a public water system, as defined in Section 10912, that may supply water for the project. If the city or county is not able to identify any public water system that may supply water for the project, the city or county shall prepare the water assessment required by this part after consulting with any entity serving domestic water supplies whose service area includes the project site, the local agency formation commission, and any public water system adjacent to the project site.

(c) (1) The city or county, at the time it makes the determination required under Section 21080.1 of the Public Resources Code, shall request each public water system identified pursuant to subdivision (b) to determine whether the projected water demand associated with a proposed project was included as part of the most recently adopted urban water management plan adopted pursuant to Part 2.6 (commencing with Section 10610).

(2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).

(3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

(4) If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.

(d) (1) The assessment required by this section shall include an identification of any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, and a description of the quantities of water received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts.

(2) An identification of existing water supply entitlements, water rights, or water service contracts held by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), shall be demonstrated by providing information related to all of the following:

(A) Written contracts or other proof of entitlement to an identified water supply.

(B) Copies of a capital outlay program for financing the delivery of a water supply that has been adopted by the public water system.

(C) Federal, state, and local permits for construction of necessary infrastructure associated with delivering the water supply.

(D) Any necessary regulatory approvals that are required in order to be able to convey or deliver the water supply.

(e) If no water has been received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts, the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), shall also include in its water supply assessment pursuant to subdivision (c), an identification of the other public water systems or water service contractholders that receive a water supply or have existing water supply entitlements, water rights, or water service contracts, to the same source of water as the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has identified as a source of water supply within its water supply assessments.

(f) If a water supply for a proposed project includes groundwater, the following additional information shall be included in the water supply assessment:

(1) A review of any information contained in the urban water management plan relevant to the identified water supply for the proposed project.

(2) A description of any groundwater basin or basins from which the proposed project will be supplied. For those basins for which a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has the legal right to pump under the order or decree. For basins that have not been adjudicated, information as to whether the department has identified the basin or basins as overdrafted or has projected that the basin will become overdrafted if present management conditions continue, in the most current bulletin of the department that characterizes the condition of the groundwater basin, and a detailed description by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), of the efforts being undertaken in the basin or basins to eliminate the long-term overdraft condition.

(3) A detailed description and analysis of the amount and location of groundwater pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), for the past five years from any groundwater basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(4) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), from any basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(5) An analysis of the sufficiency of the groundwater from the basin or basins from which the proposed project will be supplied to meet the projected water demand associated with the proposed project. A water supply assessment shall not be required to include the information required by this paragraph if the public water system determines, as part of the review required by paragraph (1), that the sufficiency of groundwater necessary to meet the initial and projected water demand associated with the project was addressed in the description and analysis required by paragraph (4) of subdivision (b) of Section 10631.

(g) (1) Subject to paragraph (2), the governing body of each public water system shall submit the assessment to the city or county not later than 90 days from the date on which the request was

received. The governing body of each public water system, or the city or county if either is required to comply with this act pursuant to subdivision (b), shall approve the assessment prepared pursuant to this section at a regular or special meeting.

(2) Prior to the expiration of the 90-day period, if the public water system intends to request an extension of time to prepare and adopt the assessment, the public water system shall meet with the city or county to request an extension of time, which shall not exceed 30 days, to prepare and adopt the assessment.

(3) If the public water system fails to request an extension of time, or fails to submit the assessment notwithstanding the extension of time granted pursuant to paragraph (2), the city or county may seek a writ of mandamus to compel the governing body of the public water system to comply with the requirements of this part relating to the submission of the water supply assessment.

(h) Notwithstanding any other provision of this part, if a project has been the subject of a water supply assessment that complies with the requirements of this part, no additional water supply assessment shall be required for subsequent projects that were part of a larger project for which a water supply assessment was completed and that has complied with the requirements of this part and for which the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has concluded that its water supplies are sufficient to meet the projected water demand associated with the proposed project, in addition to the existing and planned future uses, including, but not limited to, agricultural and industrial uses, unless one or more of the following changes occurs:

(1) Changes in the project that result in a substantial increase in water demand for the project.

(2) Changes in the circumstances or conditions substantially affecting the ability of the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), to provide a sufficient supply of water for the project.

(3) Significant new information becomes available which was not known and could not have been known at the time when the assessment was prepared.

10911. (a) If, as a result of its assessment, the public water system concludes that its water supplies are, or will be, insufficient, the public water system shall provide to the city or county its plans for acquiring additional water supplies, setting forth the measures that are being undertaken to acquire and develop those water supplies. If the city or county, if either is required to comply with this part pursuant to subdivision (b), concludes as a result of its assessment, that water supplies are, or will be,

insufficient, the city or county shall include in its water supply assessment its plans for acquiring additional water supplies, setting forth the measures that are being undertaken to acquire and develop those water supplies. Those plans may include, but are not limited to, information concerning all of the following:

(1) The estimated total costs, and the proposed method of financing the costs, associated with acquiring the additional water supplies.

(2) All federal, state, and local permits, approvals, or entitlements that are anticipated to be required in order to acquire and develop the additional water supplies.

(3) Based on the considerations set forth in paragraphs (1) and (2), the estimated timeframes within which the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), expects to be able to acquire additional water supplies.

(b) The city or county shall include the water supply assessment provided pursuant to Section 10910, and any information provided pursuant to subdivision (a), in any environmental document prepared for the project pursuant to Division 13 (commencing with Section 21000) of the Public Resources Code.

(c) The city or county may include in any environmental document an evaluation of any information included in that environmental document provided pursuant to subdivision (b). The city or county shall determine, based on the entire record, whether projected water supplies will be sufficient to satisfy the demands of the project, in addition to existing and planned future uses. If the city or county determines that water supplies will not be sufficient, the city or county shall include that determination in its findings for the project.

10912. For the purposes of this part, the following terms have the following meanings:

(a) "Project" means any of the following:

(1) A proposed residential development of more than 500 dwelling units.

(2) A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space.

(3) A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.

(4) A proposed hotel or motel, or both, having more than 500 rooms.

(5) (A) Except as otherwise provided in subparagraph (B), a proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet

of floor area.

(B) A proposed photovoltaic or wind energy generation facility approved on or after October 8, 2011, is not a project if the facility would demand no more than 75 acre-feet of water annually.

(6) A mixed-use project that includes one or more of the projects specified in this subdivision.

(7) A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.

(b) If a public water system has fewer than 5,000 service connections, then "project" means any proposed residential, business, commercial, hotel or motel, or industrial development that would account for an increase of 10 percent or more in the number of the public water system's existing service connections, or a mixed-use project that would demand an amount of water equivalent to, or greater than, the amount of water required by residential development that would represent an increase of 10 percent or more in the number of the public water system's existing service connections.

(c) "Public water system" means a system for the provision of piped water to the public for human consumption that has 3,000 or more service connections. A public water system includes all of the following:

(1) Any collection, treatment, storage, and distribution facility under control of the operator of the system that is used primarily in connection with the system.

(2) Any collection or pretreatment storage facility not under the control of the operator that is used primarily in connection with the system.

(3) Any person who treats water on behalf of one or more public water systems for the purpose of rendering it safe for human consumption.

(d) This section shall remain in effect only until January 1, 2018, and as of that date is repealed, unless a later enacted statute, that is enacted before January 1, 2018, deletes or extends that date.

10914. (a) Nothing in this part is intended to create a right or entitlement to water service or any specific level of water service.

(b) Nothing in this part is intended to either impose, expand, or limit any duty concerning the obligation of a public water system to provide certain service to its existing customers or to any future potential customers.

(c) Nothing in this part is intended to modify or otherwise change existing law with respect to projects which are not subject to this part.

(d) This part applies only to a project for which a notice of preparation is submitted on or after January 1, 1996.

10915. The County of San Diego is deemed to comply with this part if the Office of Planning and Research determines that all of the following conditions have been met:

(a) Proposition C, as approved by the voters of the County of San Diego in November 1988, requires the development of a regional growth management plan and directs the establishment of a regional planning and growth management review board.

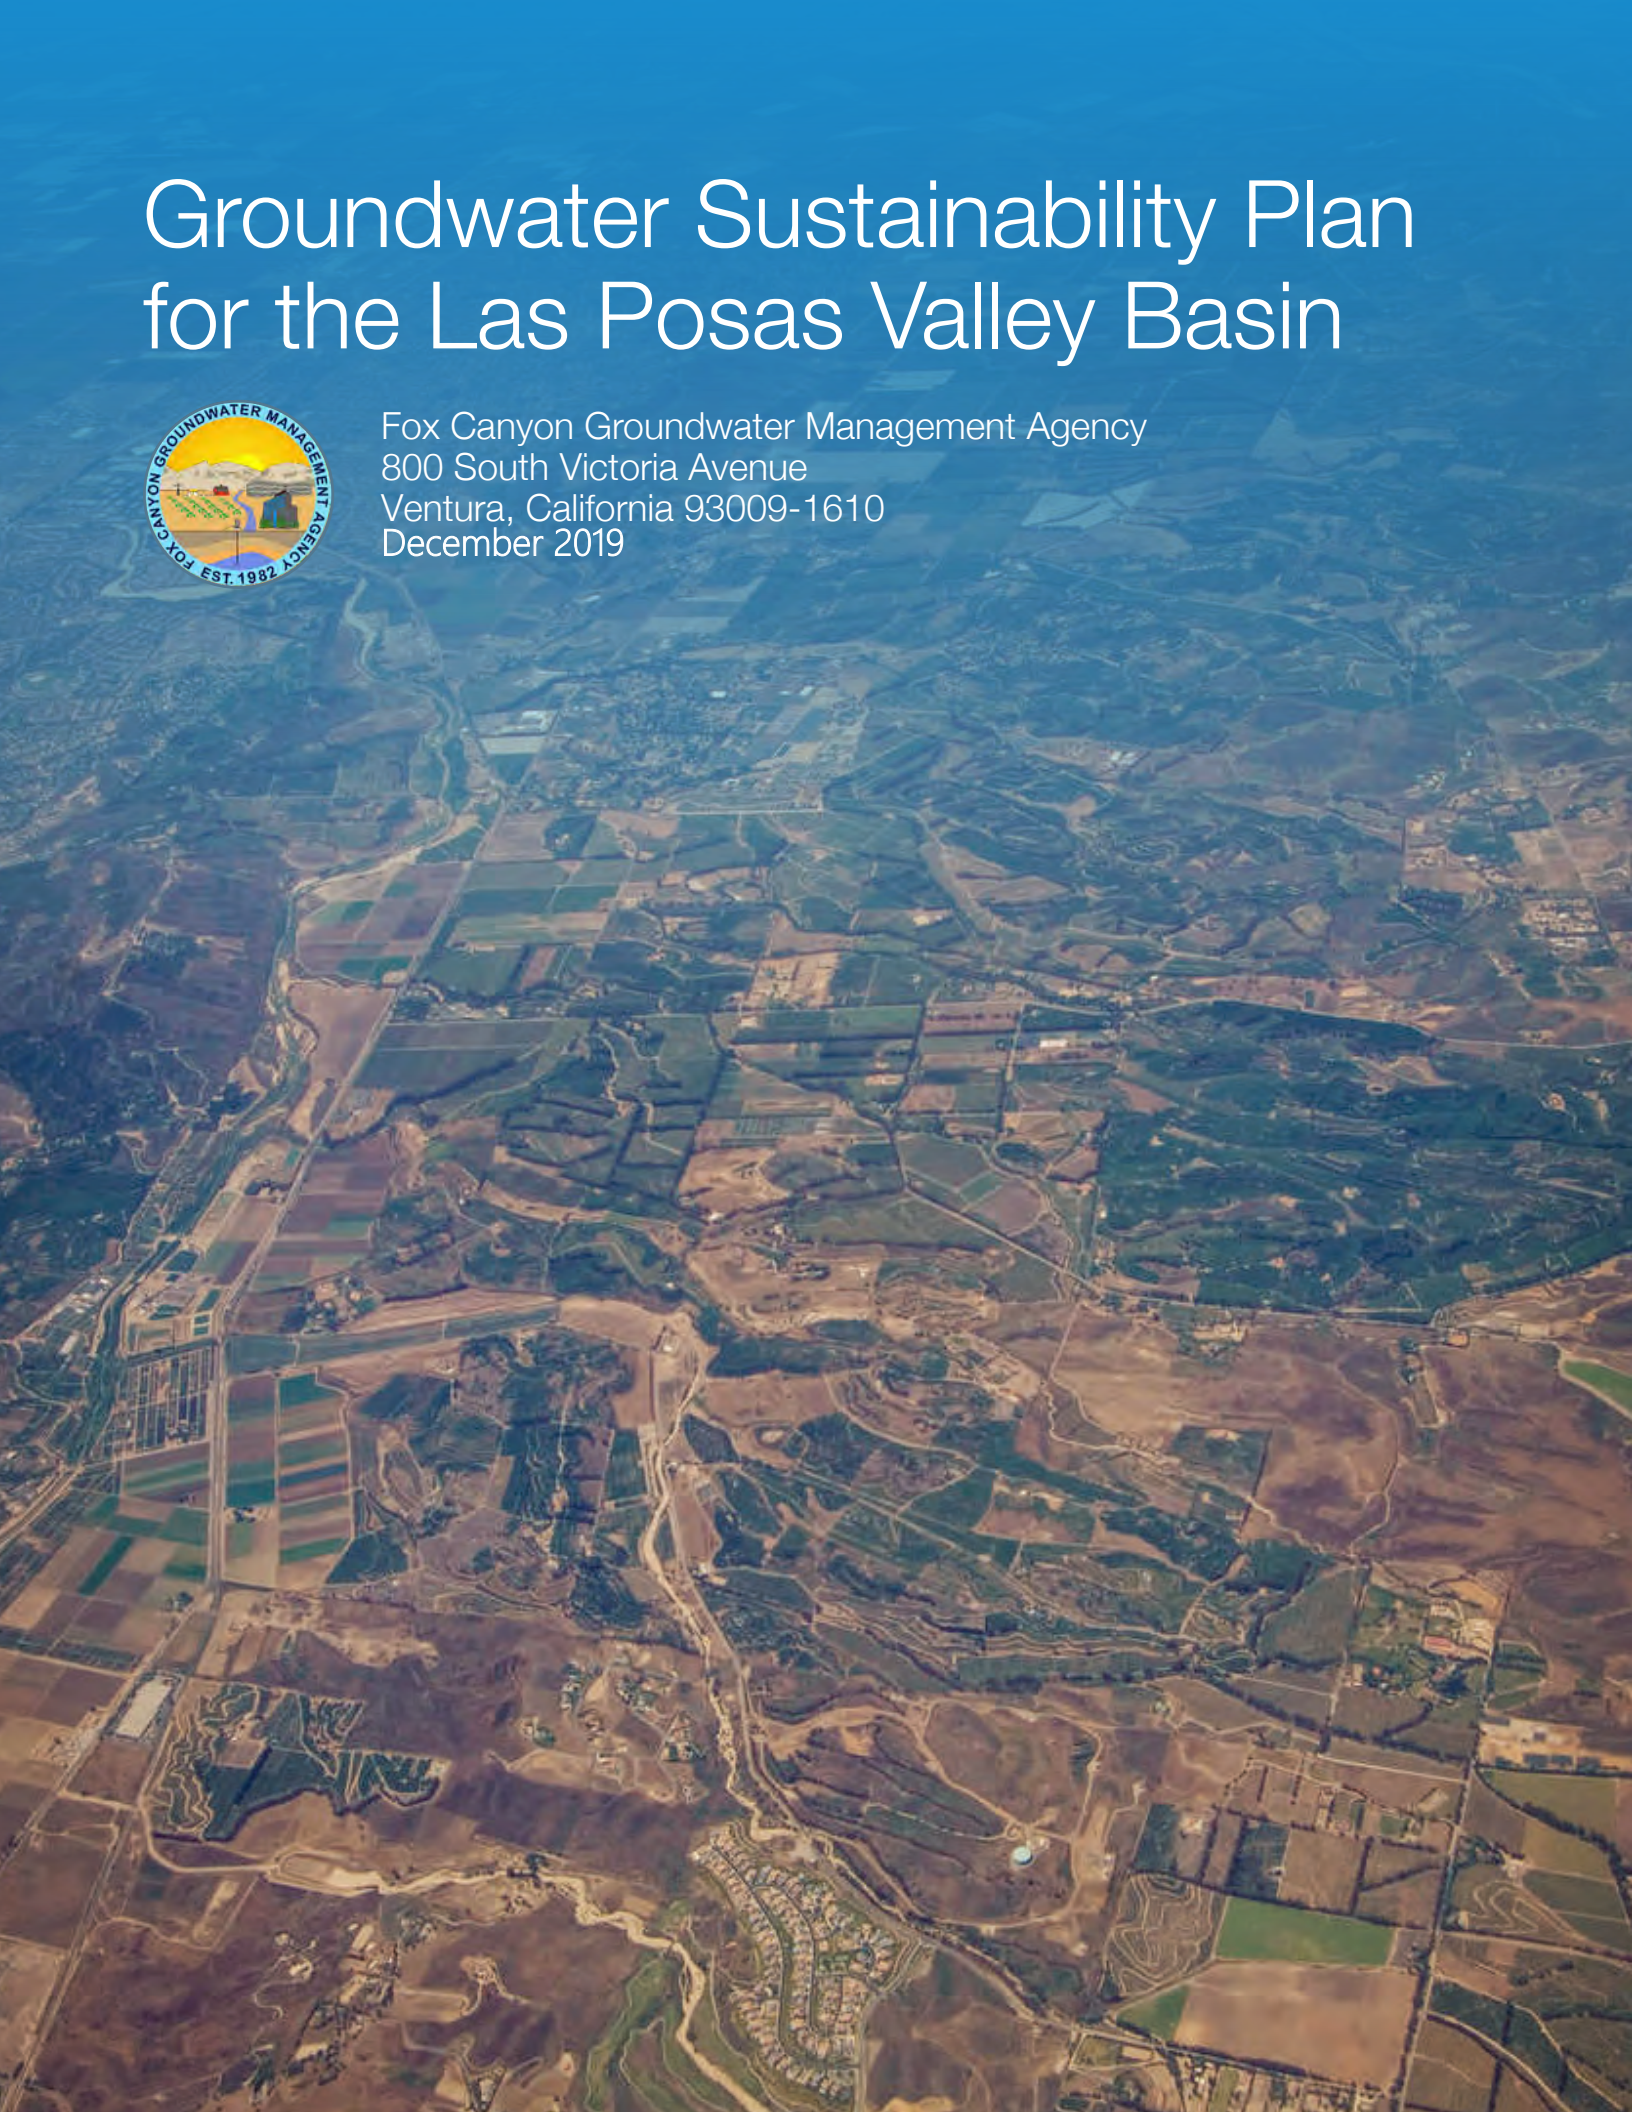
(b) The County of San Diego and the cities in the county, by agreement, designate the San Diego Association of Governments as that review board.

(c) A regional growth management strategy that provides for a comprehensive regional strategy and a coordinated economic development and growth management program has been developed pursuant to Proposition C.

(d) The regional growth management strategy includes a water element to coordinate planning for water that is consistent with the requirements of this part.

(e) The San Diego County Water Authority, by agreement with the San Diego Association of Governments in its capacity as the review board, uses the association's most recent regional growth forecasts for planning purposes and to implement the water element of the strategy.

(f) The procedures established by the review board for the development and approval of the regional growth management strategy, including the water element and any certification process established to ensure that a project is consistent with that element, comply with the requirements of this part.



(g) The environmental documents for a project located in the County of San Diego include information that accomplishes the same purposes as a water supply assessment that is prepared pursuant to Section 10910.

Ventura, CA 93009

Subject: Groundwater Sustainability Plan for the Las Posas Valley Basin

Dear Board of Directors:

Dudek is pleased to submit this Groundwater Sustainability Plan (GSP) for the Las Posas Valley Basin to the Fox Canyon Groundwater Management Agency. This GSP was prepared this in accordance with California Code of Regulations, Title 23. Water, Division 2. Department of Water Resources, Chapter 1.5. Groundwater Management, Subchapter 2. Groundwater Sustainability Plans.

Respectfully Submitted,

Ronald Schnabel, PG #7836, CHG #867
Senior Hydrogeologist

EXECUTIVE SUMMARY

The Fox Canyon Groundwater Management Agency (FCGMA, or the Agency), has developed this Groundwater Sustainability Plan (GSP) for the Las Posas Valley Basin (LPVB; DWR Basin 4-008) in compliance with the 2014 Sustainable Groundwater Management Act (SGMA) (California Water Code, Section 10720 et seq.). FCGMA is one of three Groundwater Sustainability Agencies (GSAs) in the LPVB. The other two GSAs are the Camrosa Water District GSA–Las Posas Valley and the Las Posas Valley Outlying Areas GSA. This GSP is the sole GSP prepared for the LPVB, and covers the entire LPVB, including all areas of the LPVB outside of FCGMA's jurisdiction. The purpose of this GSP is to define the conditions under which the groundwater resources of the entire LPVB, which support agricultural, municipal and industrial, and environmental uses, will be managed sustainably in the future.

Although the California Department of Water Resources (DWR) has defined the LPVB as a single groundwater basin, the western and eastern parts of the basin are hydraulically separated from each other by the Somis Fault, a geologic feature that inhibits groundwater flow across it. As a result, groundwater conditions on the west side of the fault in the Fox Canyon Aquifer and Grimes Canyon Aquifer, two primary aquifers in the LPVB, differ from conditions on the east side of the fault. Furthermore, the Epworth Gravels Aquifer, located on the east side of the fault is hydrologically separated from the Fox Canyon Aquifer and Grimes Canyon Aquifer. Hydrologic differences in the controls on, and responses to, both recharge and groundwater production necessitate the definition of three separate management areas in the LPVB. These three management areas are the West Las Posas Management Area (WLPMA), the East Las Posas Management Area (ELPMA), and the Epworth Gravels Management Area. The hydrologic conditions, sustainable yield, and sustainability criteria are discussed and defined by management area throughout this GSP.

Historical groundwater production in the LPVB has resulted in chronic declines in groundwater levels and loss of groundwater in storage in parts of each of the three management areas. In the WLPMA, the average rate of groundwater production between 2015 and 2017 was approximately 14,000 acre-feet per year (AFY). In the ELPMA and the Epworth Gravels Management Area, the average rate of groundwater production between 2015 and 2017 was approximately 20,500 AFY and 1,500 AFY, respectively. Numerical groundwater simulations indicate that if these production rates were carried into the future, groundwater elevations in each of the management areas of the LPVB would not recover during multi-year cycles of drought and recovery.

In order to determine the sustainable yield of each management area, combinations of projects and management actions were explored to estimate the rate of groundwater production that would prevent chronic declines in groundwater elevation and ongoing loss of groundwater storage in the future. Additionally, in the WLPMA, the numerical groundwater model simulations were used to

assess the influence of groundwater conditions on the adjacent Oxnard Subbasin. In the ELPMA, numerical groundwater simulations were also used to assess zones of the Fox Canyon Aquifer that are most prone to conversion from confined to unconfined conditions.[1] The rate of groundwater production that avoids chronic water level declines, loss of storage, potential land subsidence, and impacts to adjacent basins is referred to as the sustainable yield for each management area.

With the currently available projects and management actions, the sustainable yield of the WLPMA is approximately 12,500 AFY, with an uncertainty estimate of ±1,200 AFY (Table ES-1). In the ELPMA, the total sustainable yield (including the Epworth Gravels Management Area) is estimated to be 17,800 AFY ±2,300 AFY. For the Epworth Gravels Management Area only, the sustainable yield is estimated to be approximately 1,300 AFY. Except for the Epworth Gravels Management Area, both the historical (1985–2015) and recent (2015–2017) groundwater production rates exceeded the upper end of the future sustainable yield estimates (Table ES-1).

Table ES-1
Sustainable Yield Estimates

Period	Management Area	Sustainable Yield (AFY)	Approximate Average Pumping During the Period (AFY)
Historical 1985 to 2015 (based on GSP Regulation Section 354.18[b][5])	WLPMA	10,000 to 11,000	15,400
	ELPMA	17,000 to 19,000	19,800
	Epworth Gravels	About 1,300	1,300
Average groundwater pumping during the 2015–2017 period using a simulated 1930 to 1969 climate period and the 2070 DWR climate change data (based on preventing significant and unreasonable affects for one or more of the six sustainability indicators)	WLPMA	11,300 to 13,700	14,000
	Total ELPMA	15,500 to 20,100	20,500
	Epworth Gravels	1,300 to 1,340	1,500

Notes: AFY = acre-feet per year; DWR = California Department of Water Resources; ELPMA = East Las Posas Management Area; GSP = Groundwater Sustainability Plan; WLPMA = West Las Posas Management Area.

Adoption of this GSP represents the first step in achieving groundwater sustainability within the LPVB, as required by SGMA. SGMA requires that groundwater in each of the management areas of the LPVB be managed sustainably within 20 years of adoption of the GSP. SGMA also requires that this GSP be evaluated at a minimum of every 5 years after adoption. As part of the 5-year evaluation process, the sustainable yield will be refined and adjusted. These refinements will be based on new data, additional studies undertaken to fill data gaps, and groundwater modeling. Refinements and adjustments will also be made to the minimum threshold groundwater levels developed to avoid undesirable results, the measurable objective groundwater levels that account

[1] A confined aquifer is saturated with water that is under pressure, so that when it is penetrated by a well, the water level in the well rises above the top of the aquifer. An unconfined aquifer is an aquifer whose upper water surface is at atmospheric pressure and below the top of the aquifer.

for the need to continue groundwater production during drought cycles and the associated interim milestones to help gauge progress toward sustainability over the next 20 years.

The required 5-year evaluations will also examine both new water supply projects, and the potential impacts of extractions rates on groundwater elevations and sustainability in the LPVB. Additional modeling is recommended during the 5-year update process to understand how changes in pumping and additional new water supply projects can increase the overall sustainable yield of the different management areas of the LPVB. As this understanding improves, projects to support increases in the overall sustainable yield can be developed.

ES.1 INTRODUCTION

The LPVB is an alluvial groundwater basin located in Ventura County, California. The climate is typical of coastal Southern California, with average daily temperatures ranging generally from 54°F to 84°F in summer and from 40°F to 74°F in winter. The Las Posas Valley ranges in elevation from approximately 100 feet above mean sea level in the southwest to more than 1,500 feet above mean sea level in the northeast. The primary surface water drainage in the Las Posas Valley is Arroyo Las Posas, which is named Arroyo Simi in the easternmost portion of the Las Posas Valley.[2] Land use overlying the LPVB is divided between agricultural and urban uses, with agricultural use covering approximately 51% of the land within the Las Posas Valley, and residential and urban use covering approximately 23% of the land. The remaining 26% is open space. DWR has designated the LPVB as a high-priority groundwater basin.

The majority of the LPVB is within the jurisdiction of the FCGMA, an independent special district, formed by the California Legislature in 1982, to manage and protect the aquifers within its jurisdiction for the common benefit of the public and all groundwater users. Extractors within FCGMA jurisdiction are subject to the Agency's GSPs, ordinances, and policies created for the sustainable management of groundwater management actions.

FCGMA is one of three groundwater sustainability agencies (GSAs) that have jurisdiction over portions of the LPVB. FCGMA is the GSA for the area of the LPVB that falls within its jurisdiction. The Camrosa Water District GSA–Las Posas Valley is the GSA for the portion of the Camrosa Water District Service area in the Las Posas Valley, and the Las Posas Outlying Areas GSA is the GSA for portions of the LPVB not within FCGMA or Camrosa Water District jurisdiction. This FCGMA GSP is the sole GSP prepared for the LPVB, and covers the entire LPVB, including all areas of the LPVB outside of FCGMA's jurisdiction.

[2] For simplicity, the name *Arroyo Simi–Las Posas* is used in this GSP to denote the entire reach of the two arroyos in the ELPMA.

Public participation and stakeholder feedback have played a critical role in the development of this GSP. FCGMA maintains a list of stakeholders interested in the GSP process, known as the *List of Interested Parties*. A monthly newsletter, meeting notices, and notices of GSP documents available for review were sent electronically to those on the List of Interested Parties. Public workshops were held to inform stakeholders and the general public on the contents of the GSP and to solicit feedback on that content. To further facilitate stakeholder understanding, the FCGMA Board of Directors (Board) approved release of a preliminary draft GSP for public comment in November 2017. Additionally, the FCGMA Board formed a Technical Advisory Group, which held public meetings throughout the GSP development process, beginning in July 2015, and updates on the development of the GSP were given at meetings of the FCGMA Board, beginning in April 2015. All FCGMA Board meetings, Technical Advisory Group meetings, Board-appointed committee meetings, and Board special workshops were noticed in accordance with the Brown Act, and opportunities for public comment were provided at all FCGMA Board meetings, Technical Advisory Group meetings, Board-appointed committee meetings, and workshops.

ES.2 SUMMARY OF BASIN SETTING AND CONDITIONS

Hydrogeologic Background

DWR defines three water-bearing formations in the LPVB: alluvium, the San Pedro Formation, and the Santa Barbara Formation. Geologic differences between the WLPMA and the ELPMA have resulted in different names being assigned to the hydrostratigraphic units associated with these three water-bearing formations in each management area. In the WLPMA, the alluvium is referred to as the shallow alluvial system to reflect the hydrologic connection between the WLPMA and the Upper Aquifer System of the Oxnard Subbasin to the west. Underlying the shallow alluvial system in the WLPMA, the San Pedro Formation has been divided into two hydrostratigraphic units: the upper San Pedro Formation and, underlying that, the Fox Canyon Aquifer. The Fox Canyon Aquifer is a principal aquifer in the WLPMA. The Grimes Canyon Aquifer in the upper Santa Barbara Formation, which underlies the Fox Canyon Aquifer, is the deepest aquifer in the WLPMA.

In the ELPMA, the alluvium is referred to as the Shallow Alluvial Aquifer, and is constrained to an area adjacent to Arroyo Simi–Las Posas. The San Pedro Formation is divided into three hydrostratigraphic units in the ELPMA: the Epworth Gravels Aquifer, the upper San Pedro Formation, and the Fox Canyon Aquifer. The extent of the Epworth Gravels Aquifer is approximately 1,600 acres (2.5 square miles) located 2 to 3 miles north-northwest of Moorpark in the ELPMA. Because the Epworth Gravels Aquifer is limited in extent and is hydrologically disconnected from the Fox Canyon Aquifer, the Epworth Gravels Aquifer has been designated as a separate management area in this GSP. The upper San Pedro Formation underlies the Shallow Alluvial Aquifer where it is present, and underlies the Epworth Gravels Aquifer, where it is present in the ELPMA. The upper San Pedro Formation is not a primary aquifer, but rather serves as a reservoir of stored water that through time

has been slowly leaking into the Fox Canyon Aquifer below. The Fox Canyon Aquifer is a primary aquifer in the ELPMA. Underlying the Fox Canyon Aquifer is the Grimes Canyon Aquifer in the upper Santa Barbara Formation, which is the deepest aquifer in the ELPMA.

Extensive geologic folding and faulting in the LPVB have resulted in large differences in the thickness, elevation, and exposure of the subsurface aquifers. In general, the Fox Canyon Aquifer is confined, except where it crops out on the northern and southern margins of the basin, and in the vicinity of Moorpark, where a subsurface fold has thinned and lifted the Fox Canyon Aquifer. This fold is known as the Moorpark anticline. In these areas, declining groundwater elevations would result in larger portions of the Fox Canyon Aquifer becoming unconfined.

Historical Groundwater Conditions

Groundwater elevations and flow directions have varied historically in the different management areas of the LPVB. In the WLPMA, groundwater elevations in wells adjacent to the Oxnard Subbasin are influenced by surface water diversions of the Santa Clara River, which are directed to spreading basins in the Forebay area of the Oxnard Subbasin by the United Water Conservation District (UWCD). When UWCD has been able to divert river water to its recharge basins, groundwater elevations have risen in wells in the western parts of the WLPMA. The influence of UWCD recharge operations is not clear in historical water level records from wells farther east in the WLPMA. In this area, chronic declines in groundwater levels caused by groundwater production have been observed historically. These chronic declines were offset by in-lieu surface water deliveries between 1995 and 2008.

In the Epworth Gravels Management Area, chronic groundwater level declines were observed between 1930 and 1990. Water level declines in this management area caused property owners to drill deeper wells, which penetrated the Fox Canyon Aquifer. As groundwater production shifted from the Epworth Gravels Aquifer to the Fox Canyon Aquifer in this area, groundwater elevations began to recover in the Epworth Gravels Aquifer. With the onset of the drought that began in 2011, groundwater elevations in the Epworth Gravels Aquifer began to decline again.

In the ELPMA chronic groundwater level declines were observed prior to 1970. In 1970, upstream wastewater treatment plant and shallow dewatering well discharges began reaching the ELPMA and converted Arroyo Simi–Las Posas from an ephemeral stream to a perennial stream. The perennial flow in the Arroyo provided recharge to the underlying groundwater aquifers. This recharge caused water levels to recover in areas of the ELPMA adjacent to Arroyo Simi–Las Posas, while groundwater levels have continuously declined throughout the northern ELPMA, which does not receive recharge from Arroyo Simi–Las Posas. The volume of perennial surface water flows that reach the ELPMA has declined over the past decade, and water levels adjacent to Arroyo Simi–Las Posas have stabilized or declined in recent years in response to the combined effects of the diminished recharge and the drought that began in 2011.

As the ELPMA began to receive additional recharge from perennial flows in Arroyo Simi–Las Posas, groundwater concentrations of total dissolved solids (TDS) began to increase. Increased concentrations of TDS have been observed in both the Shallow Alluvial Aquifer and the Fox Canyon Aquifer.

Increased surface water flow and infiltration along Arroyo Simi–Las Posas also resulted in the establishment of riparian vegetation, along the banks of the arroyo. This riparian vegetation, which is dominated by non-native Arundo (*Arundo donax*), has been identified as a potential groundwater-dependent ecosystem. Within the boundaries of the ELPMA, water from Arroyo Simi–Las Posas percolates into the underlying sediments to recharge the groundwater. This indicates that the riparian habitat along Arroyo Simi–Las Posas may rely on soil moisture from percolating surface water, rather than groundwater. As surface flows and recharge decrease in Arroyo Simi–Las Posas, groundwater elevations and soil moisture content in the vicinity of the potential groundwater-dependent ecosystem are anticipated to decline. These declines may impact the health of the riparian vegetation.

Water Budget

The water budget for the management areas of the LPVB provides an accounting and assessment of the annual volume of groundwater and surface water entering (i.e., inflow) and leaving (i.e., outflow) each management area. This enables an accounting of the cumulative change in groundwater in storage over time. Two numerical groundwater models were developed to calculate the water budget for the different management areas in the LPVB. Calleguas Municipal Water District (CMWD) developed the "Groundwater Flow Model of the East and South Las Posas Sub-Basins," a MODFLOW numerical groundwater flow model, for the ELPMA and the Epworth Gravels Management Area. UWCD developed the "Ventura Regional Groundwater Flow Model," a MODFLOW numerical groundwater flow model, for the WLPMA, the Oxnard Subbasin, the Mound Basin, and the Pleasant Valley Basin, which are in hydraulic communication with each other. A peer review study of each groundwater model was conducted for this GSP.

The historical groundwater budget for the WLPMA is based on the UWCD model, which had a historical base period from 1985 through 2015. During average conditions, which are defined as water years in which the precipitation was between 75% and 150% of the average annual precipitation, the net change in groundwater storage for the Shallow Aquifer System was an increase of 292 AFY. In the upper San Pedro Formation, Fox Canyon Aquifer, and Grimes Canyon Aquifer, the net change in groundwater storage was a decrease of approximately 263 AFY. Groundwater pumping during these years averaged 1,346 AFY in the Shallow Aquifer System, and 13,274 AFY in the upper San Pedro Formation, Fox Canyon Aquifer, and Grimes Canyon Aquifer, combined. Between 1995 and 2007, CMWD delivered in-lieu water to the WLPMA, which has kept groundwater levels and storage from declining further. As of 2015, CMWD had stored 25,192 AF of water in the WLPMA through in-lieu deliveries. Groundwater levels and storage would be lower if CMWD cumulative storage had not occurred.

During average conditions, the net change in groundwater storage for the Epworth Gravels Aquifer was an increase of 184 AFY. Groundwater pumping during these years averaged 1,203 AFY. The increase in storage during average years reflects the rising water levels in the aquifer that occurred after property owners drilled wells into the Fox Canyon Aquifer, and reduced production from the Epworth Gravels Aquifer.

During average conditions, the net change in groundwater storage for the ELPMA was an increase of 4,638 AFY. Groundwater pumping averaged 17,283 AFY during average conditions. The increase in storage primarily reflects the rising water levels in the management area that occurred since 1970, as perennial flow in Arroyo Simi–Las Posas began to recharge the management area. It also reflects CMWD in-lieu water deliveries, and Aquifer Storage and Recovery Project injections, which have kept groundwater levels and storage from declining. As of 2015, CMWD had stored 11,398 AF of water in the ELPMA through in-lieu deliveries and Aquifer Storage and Recovery Project injections. Groundwater levels and storage would be lower if CMWD cumulative storage had not occurred.

Projected Water Budget and Sustainable Yield

Several numerical groundwater model scenarios were developed for this GSP to assess the future sustainable yield of the management areas of the LPVB. Each future scenario covered a 50-year timeframe, from 2020 to 2069. The UWCD model was used to assess the future sustainable yield of the WLPMA, and the CMWD model was used to assess the future sustainable yield of the ELPMA and the Epworth Gravels Management Area.

Two scenarios in the WLPMA continued the 2015–2017 average groundwater extraction rate throughout the 50-year model period. The results of each of these scenarios indicated that continuing the 2015–2017 extraction rate would contribute to net seawater intrusion in the Oxnard Subbasin, which is hydrologically connected to the WLPMA. In three additional scenarios, the groundwater production rate was decreased gradually over the first 20 years in the WLPMA, Oxnard Subbasin, and Pleasant Valley Basin. These model scenarios indicated that reduced groundwater production can eliminate net seawater intrusion in the Oxnard Subbasin over periods of drought and recovery and may result in higher groundwater elevations in the WLPMA. Increasing groundwater elevations across the management area in the three scenarios indicate that the modeled groundwater production rates in the WLPMA during these scenarios were likely lower than the sustainable groundwater production rate. Based on the suite of model scenarios, the sustainable yield of the WLPMA was calculated to be approximately 12,500 AFY, with an uncertainty of ±1,200 AFY.

In two numerical groundwater model scenarios for the ELPMA and the Epworth Gravels Management Area, the 2015–2017 average groundwater extraction rate was continued throughout the 50-year model period. The results of each of these scenarios indicated that there would be chronic declines in groundwater levels and associated loss of storage in the Epworth Gravels Management Area at the 2015–2017 average groundwater production rate. In the ELPMA, chronic declines in groundwater level and loss of storage were also predicted at the 2015–2017 average production rate. However, a smaller loss of storage was predicted for the scenario in which surface water flow was maintained in Arroyo Simi–Las Posas than for the scenario in which surface water flow was decreased.

Three additional scenarios were developed for the ELPMA and the Epworth Gravels Management Area. In one scenario, groundwater production was reduced and flow in Arroyo Simi–Las Posas was maintained. In the other two scenarios, groundwater production was reduced and flow in Arroyo Simi–Las Posas was also reduced. Based on the suite of model scenarios, the sustainable yield of the ELPMA was estimated to be 17,800 AFY ± 2,300 AFY. In the Epworth Gravels Management Area, the sustainable yield is estimated to be approximately 1,300 AFY.

It is anticipated that the analysis for the 5-year update to the GSP will focus on developing new water supply projects, as well as examining the potential impacts of differential extractions on the water levels in the management areas of the LPVB. In the WLPMA, additional groundwater modeling will be needed to better constrain the sustainable yield over the next 5 years. In the ELPMA, additional modeling is recommended to understand how changes in pumping patterns and the addition of new water supply projects may influence the area of Fox Canyon Aquifer that would convert from confined to unconfined conditions and increase the overall sustainable yield of the management area. As this understanding improves, targeted projects and management actions can be developed to support increases in the overall sustainable yield in each management area.

ES.3 OVERVIEW OF SUSTAINABILITY CRITERIA

The primary sustainability goal in the LPVB is to maintain a sufficient volume of groundwater in storage in each management area so that there is no significant and unreasonable decline in groundwater elevation or storage over wet and dry climatic cycles. Further, groundwater levels in the WLPMA should be maintained at elevations that are high enough to not inhibit the ability of the Oxnard Subbasin to prevent net landward migration of the saline water impact front after 2040.[3]

[3] Sources of water high in chloride in the Oxnard Subbasin include modern seawater as well as non-marine brines and connate water in fine-grained sediments. Therefore, the area of the Subbasin impacted by concentrations of chloride greater than 500 milligrams per liter is referred to as the "saline water impact area," rather than the "seawater intrusion impact area," to reflect all the potential sources of chloride to the aquifers in this area.

Under SGMA, undesirable results occur when the effects caused by groundwater conditions occurring throughout the management area cause significant and unreasonable impacts to any of the six sustainability indicators:

- Chronic lowering of groundwater levels
- Reduction of groundwater storage
- Seawater intrusion
- Degraded water quality
- Land subsidence
- Depletions of interconnected surface water

Of the six sustainability indicators, chronic lowering of groundwater levels, reduction of groundwater storage, degraded water quality, and land subsidence are applicable to the LPVB when groundwater production exceeds the sustainable yield. The LPVB does not experience direct seawater intrusion, although groundwater elevations in the WLPMA can influence the ability of the Oxnard Subbasin to prevent seawater intrusion. Depletion of interconnected surface water is not occurring within the LPVB. Minimum thresholds and measurable objectives, which are quantitative metrics of groundwater conditions in the LPVB, were established for the sustainability indicators determined to be a current and/or potential future undesirable result. Separate minimum thresholds and measurable objectives were developed for each management area in the LPVB. Groundwater elevations were used as a proxy for other sustainability indicators in establishing the minimum thresholds and measurable objectives.

West Las Posas Management Area

The measurable objective groundwater levels for the WLPMA differ geographically, based on the extent of influence of surface water spreading on observed groundwater levels in the management area. In the western part of the WLPMA, where UWCD surface water spreading influences groundwater elevations, the measurable objective water level is the groundwater level to which the Fox Canyon Aquifer has recovered historically. In the eastern WLPMA, the measurable objective groundwater elevation is the elevation that represents half of the total recovery in the historical record. The measurable objective groundwater levels in the WLPMA are at least 20 feet higher than the minimum threshold groundwater levels, thereby allowing for operational flexibility in the management area. To allow for operational flexibility during drought periods, groundwater levels in the WLPMA are allowed to fall below the measurable objective as long as the periods during which groundwater elevations are below the measurable objective are offset by periods when the groundwater elevations are higher than the measurable objective.

The minimum threshold groundwater levels for the WLPMA also differ geographically, based on proximity to the Oxnard Subbasin. In the western part of the WLPMA, the minimum threshold is based on the lowest simulated groundwater elevation after 2040 for the model scenario in which the 2015–2017 average production rate was continued throughout the 50-year model simulation, and projects were implemented. For the eastern part of the WLPMA, the minimum threshold is based on the average low historical groundwater elevations in the early 1990s, before in-lieu surface water deliveries to the WLPMA began. These elevations were selected because the groundwater levels in the eastern part of the WLPMA recovered, with the aid of in-lieu surface water deliveries, from the historical low levels in the early 1990s. These minimum thresholds are anticipated to maintain or improve the beneficial uses of the WLPMA by preventing chronic lowering of groundwater levels. This allows for long-term use of groundwater supplies in the WLPMA without ongoing loss of storage.

Although exceedance of a minimum threshold at any given well in the WLPMA may indicate an undesirable result is occurring, a single exceedance is not necessarily sufficient to indicate management-area-wide conditions are causing undesirable results. To define the conditions under which undesirable results will occur in the WLPMA, two criteria were developed. The WLPMA would be determined to be experiencing an undesirable result if:

- In any single monitoring event, groundwater levels in three of five identified representative monitoring wells, referred to as *key wells*, are below their respective minimum thresholds.
- The groundwater level in any individual key well is below the minimum threshold for either three consecutive monitoring events or three of five consecutive monitoring events, which occur in the spring and fall of each year.

East Las Posas Management Area

In the ELPMA, the measurable objective groundwater elevations were selected based on the historical groundwater level record and the groundwater model simulations that result in stable groundwater elevations after 2040. The measurable objective is the groundwater level at which observed declines in groundwater elevation would cease if gradual reductions in groundwater production are implemented between 2020 and 2040. The measurable objective groundwater elevation is lower than the 2015 groundwater elevation in each of the representative monitoring wells (key wells), in the ELPMA. These measurable objectives reflect the anticipated future declines in groundwater elevation that will result from a gradual reduction in groundwater production to the sustainable groundwater production rate over the next 20 years and the potential for further reductions in recharge to the ELPMA from Arroyo Simi–Las Posas.

The minimum threshold groundwater levels in the ELPMA, which vary geographically, are based on a review of the historical groundwater elevation data, incorporation of potential projects, and

an analysis of the projected future declines in groundwater elevation and storage under multiple future groundwater production scenarios. For wells that are adjacent to Arroyo Simi–Las Posas and are, generally, south and west of the Moorpark Anticline, the minimum thresholds are based on the historical low groundwater elevation. For the remaining wells, the minimum threshold is based on the groundwater level that limits reduction in storage to less than 20% relative to the estimated 2015 groundwater storage volume in areas of the ELPMA where the Fox Canyon Aquifer may convert from being confined to unconfined. Conversion of the Fox Canyon Aquifer from confined to unconfined conditions is most likely to occur on the flanks of the Moorpark and Long Canyon anticlines, and on the northern and southern margins of the ELPMA where the Fox Canyon Aquifer crops out. Continued production at the 2015–2017 rates has the potential to cause these areas of the ELPMA to lose more than 30% of the available groundwater storage. Limiting the long-term loss of storage to no more than 20% in these areas of the ELPMA was determined to be a reasonable approach by the FCGMA Board to avoid significant and unreasonable loss of supply. The selected minimum thresholds are anticipated to maintain the future beneficial uses of the ELPMA by preventing chronic lowering of groundwater levels, ongoing loss of storage, and increased areas of unconfined conditions in the Fox Canyon Aquifer after 2040.

Although exceedance of a minimum threshold at any given well in the ELPMA may indicate an undesirable result is occurring, a single exceedance is not necessarily sufficient to indicate management-area-wide conditions are causing undesirable results. To define the conditions under which undesirable results will occur in the ELPMA, two criteria were developed. The ELPMA would be determined to be experiencing an undesirable result if:

- In any single monitoring event, groundwater levels in 5 of 15 identified key wells are below their respective minimum thresholds.
- The groundwater level in any individual key well is below the minimum threshold for either three consecutive monitoring events or three of five consecutive monitoring events, which occur in the spring and fall of each year.

Epworth Gravels Management Area

In the Epworth Gravels Management Area, the measurable objective groundwater elevation was selected based on the historical groundwater level record and the groundwater model simulations that result in stable groundwater elevations after 2040. Groundwater elevations have been below the measurable objective groundwater elevation historically, but have been above the measurable objective since 2005.

The minimum threshold groundwater level in the Epworth Gravels Management Area was selected as the groundwater level that limits reduction in storage to less than 20% relative to the estimated 2015 groundwater storage volume. Limiting the long-term loss of storage to no more than 20% in

in this management area was determined to be a reasonable approach by the FCGMA Board to avoid significant and unreasonable loss of supply. The selected minimum threshold is anticipated to maintain the future beneficial uses of the Epworth Gravels Management Area by preventing chronic lowering of groundwater levels and ongoing loss of storage after 2040.

One well was selected as a key well in the Epworth Gravels Management Area. The definition of undesirable results for the Epworth Gravels Management Area is based on the time over which this well may exceed the minimum threshold. Under this definition, the Epworth Gravels Management Area would be determined to be experiencing an undesirable result if the groundwater level in the key well were below the minimum threshold for either three consecutive monitoring events or in three of five consecutive monitoring events. Monitoring events are scheduled to occur in the spring and fall of each year.

ES.4 OVERVIEW OF THE BASIN MONITORING NETWORK

The overall objective of the monitoring network in the LPVB is to track and monitor parameters that demonstrate progress toward meeting the sustainability goals. In order to accomplish this objective, the monitoring network in the LPVB must be capable of the following:

- Monitoring changes in groundwater conditions (in six sustainability indicator categories)
- Monitoring progress toward minimum thresholds and measurable objectives
- Quantifying annual changes in groundwater budget components

The existing network of groundwater wells includes both monitoring wells and production wells. This network is capable of delineating the groundwater conditions in the different management areas of the LPVB and has been used for this purpose in the past. The current groundwater well network will be used to monitor groundwater conditions moving forward, in order to continue to assess long term trends in groundwater elevation and groundwater quality in the LPVB.

In both the WLPMA and the ELPMA, monitoring can be improved in the future by coordination of monitoring schedules to ensure that groundwater monitoring activities occur over a 2-week window during the key reporting periods and mid-March and mid-October. Additionally, as funding becomes available, pressure transducers should be added to wells in the groundwater monitoring network. Pressure transducer records provide the high-temporal-resolution data that allows for a better understanding of water level dynamics in the wells related to groundwater production, groundwater management activities, and climatic influence.

In the ELPMA, the monitoring network can also be improved by adding a monitoring well screened in the Grimes Canyon Aquifer, and a well screened in the Shallow Alluvial Aquifer. The monitoring well screened in the Shallow Alluvial Aquifer should be placed within the boundaries

of the potential groundwater-dependent ecosystem to assist with understanding the potential connectivity between groundwater and the potential groundwater-dependent ecosystem.

In the future, to the extent possible, additional dedicated monitoring wells will be incorporated into the existing monitoring network. These wells will provide information on groundwater conditions in geographic locations where data gaps have been identified, or where a dedicated monitoring well would better represent conditions in the aquifers than a production well currently used for monitoring.

ES.5 PROJECTS AND MANAGEMENT ACTIONS

Future projects and management actions have been identified to address potential impacts to beneficial uses and users of groundwater in the management areas of the LPVB resulting from groundwater production in excess of the current sustainable yield. Three projects were included in this GSP. One project applies to the WLPMA and two projects apply to the ELPMA. No projects were proposed for the Epworth Gravels Management Area. The projects that are included in this GSP were suggested by stakeholders and reviewed by the FCGMA Board. The inclusion of these projects does not constitute a commitment by the FCGMA Board to construct or fund them, but rather signals that the projects were sufficiently detailed to be included in groundwater modeling efforts that examined the quantitative impacts of the projects on groundwater elevations and the sustainable yield of the LPVB. Projects included in the GSP or any amendment thereof that increase the available supply of groundwater are necessary to meet the sustainability goal for the basin in a manner that avoids adverse impacts to beneficial uses and users of groundwater within the basin.

Project No. 1 – Purchase of Imported Water from CMWD

The Purchase of Imported Water from CMWD for Basin Replenishment Project would supply imported water to the eastern part of the WLPMA in lieu of groundwater production. This project would reduce production from discrete wells in the WLPMA by 1,762 AFY. Numerical groundwater model scenarios suggest that this project will assist with water level recovery in the WLPMA. Furthermore, historical deliveries of imported water in lieu of groundwater production have resulted in groundwater elevation recoveries in the eastern WLPMA. Therefore, this project is anticipated to have a direct impact on groundwater elevations and could be used to help maintain elevations above the minimum thresholds.

Project No. 2 – Arroyo Simi–Las Posas Arundo Removal

The Arroyo Simi–Las Posas Arundo Removal Project consists of removing the invasive plant species Arundo from approximately 324 acres of land along the Arroyo Simi–Las Posas corridor. Arundo would be replaced with native riparian plant species, which are estimated to consume

approximately 6 to 25 AFY per acre less water than Arundo. If all of the Arundo is removed, this project could result in up to an additional 2,680 AFY of recharge to the ELPMA. This project is anticipated to have a positive impact on groundwater recharge, as well as a positive impact on the health of riparian habitat along Arroyo Simi–Las Posas.

By increasing surface water flow in Arroyo Simi–Las Posas and decreasing evapotranspiration losses from invasive species that currently line the Arroyo Simi–Las Posas, the ELPMA is anticipated to receive more recharge along Arroyo Simi–Las Posas. Although this recharge alone is insufficient to maintain groundwater elevations at or above the measurable objectives throughout the ELPMA at the 2015–2017 average groundwater production rate, it will lessen groundwater pumping reductions necessary to maintain groundwater elevations close to the measurable objectives groundwater levels. This project is anticipated to have a positive impact on groundwater recharge, as well as a positive impact on the health of riparian habitat along Arroyo Simi–Las Posas.

Project No. 3 – Arroyo Simi–Las Posas Water Acquisition

The Arroyo Simi–Las Posas Water Acquisition Project would involve the purchase of recycled water and discharged groundwater from the City of Simi Valley. In return, Simi Valley would commit to continuing to discharge the purchased water from its shallow dewatering wells or the Simi Valley Water Quality Control Plant to Arroyo Simi–Las Posas for downstream recharge to the LPVB. Simi Valley has indicated that 3,000 AFY of recycled water would be available from the Simi Valley Water Quality Control Plant and 1,700 AFY would be available from the dewatering wells. However, due to the riparian use of the water along the Arroyo Simi–Las Posas, an estimated 1,000 to 2,500 AFY of the water may be lost due to plant uptake and evaporation, leaving 2,200 to 3,700 AFY available as surface flow and recharge to the ELPMA.

This project is anticipated to have a direct impact on groundwater elevations and could be used to help maintain elevations above the minimum thresholds throughout much, but not all, of the ELPMA. Although perennial surface water flow has provided recharge to the ELPMA, this flow is also thought to be the primary source of rising TDS concentrations observed in the groundwater adjacent to Arroyo Simi–Las Posas since the 1990s. Consequently, if this project is pursued further, the water quality of the surface water flows will have to be investigated further and addressed in the feasibility study.

Management Action No. 1 – Reduction in Groundwater Production

The primary management action proposed under this GSP is Reduction in Groundwater Production from the LPVB. FCGMA has had the authority to monitor and regulate groundwater production in the LPVB since 1983. The FCGMA Board has established extraction allocations for each extraction facility and has used its authority to reduce groundwater production from the LPVB in the past, and will continue to control groundwater production as a GSA for the LPVB.

In the WLPMA, the estimated long-term rate of groundwater production that will prevent chronic declines in groundwater levels, loss of storage, and subsidence due to groundwater withdrawal and will also allow the prevention of seawater intrusion in the Oxnard Subbasin is approximately 12,500 AFY, with an estimated uncertainty of approximately ±1,200 AFY. The difference between the estimated sustainable yield and the average 2015–2017 production rate is 1,500 AFY. In the ELPMA, the sustainable yield is estimated to be 17,800 AFY ± 2,300 AFY. The average 2015–2017 groundwater production rate was approximately 20,500 AFY. In the Epworth Gravels Management Area, the sustainable yield is estimated to be approximately 1,300 AFY. The average 2015–2017 groundwater production rate was approximately 1,500 AFY.

Appendix C

District's 2018 Annual Water Quality Report

Annual

WATER QUALITY Report

Reporting Year 2018

Presented by:

Ventura County Waterworks District No. 1

General Information About Water Sources

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the U.S. Environmental Protection Agency (USEPA) and the State Water Resources Control Board (State Board) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

What Makes Water Hard?

If substantial amounts of either calcium or magnesium, both nontoxic minerals, are present in drinking water, the water is said to be hard. “Hard” water does not dissolve soap readily, so making lather for washing and cleaning is difficult. Conversely, water containing little calcium or magnesium is called “soft” water.

Maintaining High Standards

Once again we are proud to present our annual water quality report. This report covers the testing performed between January 1 and December 31, 2018. We continue to maintain high standards in an effort to deliver a reliable water supply that meets Title 22 requirements. Please know that we will always work diligently to provide you with quality water at a reasonable cost. We will also remain vigilant in meeting the challenges of new regulations, new local source water production, water conservation, community outreach and education while continuing to serve all your water needs.

We take our responsibility seriously for providing you and your family with quality drinking water. We encourage you to share your thoughts with us on the information contained in this report. Should you ever have any questions or concerns, we are always available to assist you.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Water Hotline (1-800-426-4791).

Community Participation

You are invited to attend our public meeting to voice concerns about your drinking water. The Citizens' Advisory Committee meets monthly at the District office located at 6767 Spring Road in Moorpark. If you wish to attend, please call (805) 378-3000 for the specific date and time.

For more information about this report, or for any other questions relating to the quality of your drinking water, please contact Shane Dass, Water and Wastewater Laboratory Manager, at (805) 378-3089.

Information for Customers with Special Water Needs

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. USEPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Where Does the District's Water Come From?

The District's water supply comes from both imported and local sources. In 2018, 81% of our total water supply came from the State Water Project. The State water originates in Northern California where it is captured in reservoirs north of Sacramento and released into the Delta of the Sacramento and San Joaquin rivers. It is transported via the 444-mile California Aqueduct to State Water Project contractors such as the Metropolitan Water District of Southern California (MWD). The District water is filtered and disinfected by MWD at its Jensen Filtration Facility in Granada Hills. MWD then delivers the water to its 26-member public agencies, including Calleguas Municipal Water District (CMWD), Ventura County's regional wholesale purveyor and the District's direct supplier.

Local water is pumped from the Las Posas Basin by five (5) groundwater wells owned and operated by the District. The wells produced approximately 19% of our total supply in 2018. The District treats the water that is pumped from these wells, and then delivers it to our customers. Local and imported water is delivered to our customers through our distribution system, which consists of 19 reservoirs, 11 booster pump stations, and approximately 177 miles of water lines. Water service is provided through approximately 10,941 service connections.

In 2018, the District supplied approximately 9,263 acre-feet of water to over 38,700 people in the city of Moorpark and the contiguous unincorporated areas to the north and west. The water supplied by the District was used for residential, industrial, commercial, agricultural, institutional and fire protection purposes.

Lead in Household Plumbing

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The District is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

Water Main Flushing

Distribution mains (pipes) convey water to homes, businesses, and hydrants in your neighborhood. The water entering distribution mains is of very high quality; however, water quality can deteriorate in areas of the distribution mains over time. Water main flushing is the process of cleaning the interior of water distribution mains by sending a rapid flow of water through the mains.

Flushing maintains water quality in several ways. For example, flushing removes sediments like iron and manganese. Although iron and manganese do not pose health concerns, they can affect the taste, clarity, and color of the water. Additionally, sediments can shield microorganisms from the disinfecting power of chlorine, contributing to the growth of microorganisms within distribution mains. Flushing helps remove stale water and ensures the presence of fresh water with sufficient dissolved oxygen, disinfectant levels, and an acceptable taste and smell.

During flushing operations in your neighborhood, some short-term deterioration of water quality, though uncommon, is possible. You should avoid tap water for household uses at that time. If you do use the tap, allow your cold water to run for a few minutes at full velocity before use and avoid using hot water, to prevent sediment accumulation in your hot water tank.

Please contact us if you have any questions or if you would like more information on our water main flushing schedule.

Information on Radon

Radon is a radioactive gas that you cannot see, taste, or smell. It is found throughout the U.S. Radon can move up through the ground and into a home through cracks and holes in the foundation. Radon can build up to high levels in all types of homes. Radon can also get into indoor air when released from tap water from showering, washing dishes, and other household activities. Compared to radon entering the home through soil, radon entering the home through tap water will in most cases be a small source of radon in indoor air. Radon is a known human carcinogen. Breathing air containing radon can lead to lung cancer. Drinking water containing radon may also cause increased risk of stomach cancer. If you are concerned about radon in your home, test the air in your home. Testing is inexpensive and easy. You should pursue radon removal for your home if the level of radon in your air is 4 picocuries per liter of air (pCi/L) or higher. There are simple ways to fix a radon problem that are not too costly. For additional information, call your State radon program (1-800-745-7236), the USEPA Safe Drinking Water Act Hotline (1-800-426-4791), or the National Safety Council Radon Hotline (1-800-767-7236).

Summary of Water Quality Results For 2018

During the past year, we have taken hundreds of drinking water samples in order to determine the presence of any radioactive, biological, inorganic, volatile organic, or synthetic organic contaminants. The tables below list all the drinking water contaminants that were detected in 2018. The State requires that we monitor for certain contaminants less than once per year because the concentrations of these contaminants do not vary significantly from year to year. Some of this data, though representative of water quality, are more than one year old.

			Local Water Supplied by: Waterworks District No. 1		Imported Water Supplied by: Calleguas Municipal Water District			
			Percent of Supply		*81%*			
Parameter (Unit of Measure)	**MCL [MRDL]**	**PHG (MCLG) [MRDLG]**	Average	Range	Average	Range	Violation	**Major Sources in Drinking Water**
PRIMARY DRINKING WATER STANDARDS--Mandatory Health-Related Standards								
CLARITY (a)								
Turbidity (NTU) (TT)	Highest Single Value		n/a		0.06		No	Soil runoff
	% of samples <0.3		n/a		100%		No	
DISINFECTION BY-PRODUCTS AND DISINFECTANT RESIDUALS								
Bromate (ppb) (b)	10	0.1	n/a	n/a	5.0	ND - 6.4	No	By-product of drinking water disinfection
Haloacetic Acids (ppb) (c)	60	n/a	7.5	0 - 9	11.3	5 - 22	No	By-product of drinking water disinfection
Total Chlorine Residual (ppm)	[4]	[4]	1.57	1.06 - 1.86	2.3	1.5 - 2.5	No	Drinking water disinfectant added for treatment
Total Trihalomethanes (ppb) (c)	80	n/a	20.8	6 - 30	27.3	10 - 57	No	By-product of drinking water disinfection
INORGANIC CHEMICALS								
Aluminum (ppb)	1,000	600	ND	n/a	ND	ND - 75	No	Erosion of natural deposits, residual from water treatment process
Arsenic (ppb)	10	0.004	ND	n/a	0.1	ND - 4	No	Erosion of natural deposits, runoff from orchards
Barium (ppm)	1	2	ND	n/a	ND	n/a	No	Erosion of natural deposits, discharge from oil & metal refineries
Fluoride - Distribution System (ppm) (d)	2.0	1	0.2	0.2 - 0.2	0.7	0.6 - 1.0	No	Errosion of natural deposits, water additive that promotes strong teeth
Nitrate (as N) (ppm)	10	10	ND	n/a	0.5	ND - 0.5	No	Runoff and leaching from fertilizer use, erosion of natural deposits
Selenium (ppb)	50	30	ND	n/a	0.34	ND - 15	No	Runoff and leaching from fertilizer use, erosion of natural deposits
RADIOLOGICALS								
Gross Alpha Particle Activity (pCi/L)	15	(0)	4.58	0.83-8.94	ND	ND - 3	No	Erosion of natural deposits
Gross Beta Particle Activity (pCi/L)	50	(0)	n/a	n/a	ND	n/a	No	Decay of natural and man-made deposits
Uranium (pCi/L)	20	0.43	1.2	0 - 3	ND	ND - 1.4	No	Erosion of natural deposits

Home Tap Water Samples Collected for Lead and Copper Analyses

Parameter (Unit of Measure)	Year Sampled	RAL	PHG (MCLG)	Amount Detected (90th %)	# Sites Above AL / Total Sites	Violation	**Major Sources in Drinking Water**
Lead (ppb)	2018	15	0.2	ND	0 / 33	No	Corrosion of household plumbing systems; erosion of natural deposits
Copper (ppm)	2018	1.3	0.3	0.24	0 / 33	No	Corrosion of household plumbing systems; erosion of natural deposits

SECONDARY DRINKING WATER STANDARDS--Aesthetic Standards

Parameter	**Secondary Notificatio MCL**	**Level**	Average	Range	Average	Range	Violation	**Major Sources in Drinking Water**
Aluminum (ppb) (e)	200		ND	n/a	ND	ND - 75	No	Erosion of natural deposits, residual from water treatment process
Chloride (ppm)	500		22	13 - 31	58	54 - 109	No	Runoff and leaching from natural deposits, seawater influence
Color (Units)	15		ND	n/a	ND	n/a	No	Naturally-occurring organic materials
Odor Threshold (Units)	3		3	0 - 12	ND	n/a	No	Naturally-occurring organic materials
Iron (ppb)	300		37	0 - 235	ND	n/a	No	Leaching from natural deposits
Manganese (ppb)	50		20	0 - 64	ND	n/a	No	Leaching from natural deposits
Specific Conductance (µS/cm)	1,600		721	477 - 1040	446	428 - 792	No	Substances that form ions when in water, seawater influence
Sulfate (ppm)	500		183	80 - 314	46	43 - 100	No	Runoff and leaching from natural deposits
Total Dissolved Solids (ppm)	1,000		496	320 - 780	249	236 - 440	No	Runoff and leaching from natural deposits
Turbidity (NTU) (f)	5		1.3	0.6 - 2.6	0.32	0.06 - 0.52	No	Soil runoff

Lead Sampling in Schools

Signing of Assembly Bill (AB 746) requires community water systems to test all public school sites constructed before January 1, 2010 for lead. The District is pleased to inform you that all K-12 public schools have been tested for lead and no schools were above the regulatory level of 15ppb.

PPCPs and How to Dispose of Them

When cleaning out your medicine cabinet, what do you do with your expired pills? Many people flush them down the toilet or toss them into the trash. Although this seems convenient, these actions could threaten our water supply.

Recent studies are generating a growing concern over pharmaceuticals and personal care products (PPCPs) entering water supplies. PPCPs include human and veterinary drugs (prescription or over-the-counter) and consumer products, such as cosmetics, fragrances, lotions, sunscreens, and house cleaning products. Many of these drugs and personal care products do not biodegrade and may persist in the environment for years.

The best and most cost-effective way to ensure safe water at the tap is to keep our source waters clean. Never flush unused medications down the toilet or sink. Instead, check to see if the pharmacy where you made your purchase accepts medications for disposal, or contact your local health department for information on proper disposal methods and drop-off locations. You can also go to www.Earth911.com to find more information about disposal locations in your area.

ABBREVIATIONS, DEFINITIONS, and NOTES

n/a = not applicable
ND = None Detected
gpg = Grains per Gallon
NTU = Nephelometric Turbidity Units
ppm = parts per million, or milligrams per liter (mg/L)
µS/cm = microSiemen per centimeter
ppb = parts per billion, or micrograms per liter (µg/L) ppt = parts per trillion, or nanograms per liter (ng/L)
pCi/L = PicoCuries per Liter NS = No Standard
ppt = parts per trillion, or nanograms per liter (ng/L)
RAL = Federal Regulatory Action Level
NS = No Standard

Maximum Contaminant Level (MCL) = The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible.
Maximum Contaminant Level Goal (MCLG) = The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. Environmental Protection Agency.
Maximum Residual Disinfectant Level (MRDL) = The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial pathogens.
Maximum Residual Disinfectant Level Goal (MRDLG) = The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminant
Public Health Goal (PHG) = The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.
Primary Drinking Water Standard = MCLs and MRDLs for contaminants that affect health along with their monitoring and reporting requirements, and water treatment requirements.
Regulatory Action Level (RAL) = The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.
Treatment Technique (TT) = A required process intended to reduce the level of a contaminant in drinking water.
Notification Level = The level at which notification of the public water system s governing body is required.

(a) The turbidity level of filtered water shall be less than or equal to 0.3 NTU in 95% of the measurements taken each month and shall not exceed 1.0 NTU at any time
(b) Compliance for treatment plants that use ozone is based on a running annual average of monthly samples.
(c) Compliance is based on a running annual average of quarterly distribution system samples. Values reported reflect the highest and lowest single value in the distribution system (range) and the highest running annual average
(d) MWD treats their water by adding fluoride to the naturally occurring level in order to help prevent dental caries in consumers. The fluoride levels in the treated water are maintained within a range of 0.7 - 1.3 ppm, as required by State Water Resources Control Board (SWRCB), Division of Drinking Water (DDW). Formally known as the Department of Public Health, the DDW was created in 2014 when the drinking water program moved under the SWRCB.
(e) Aluminum has both Primary and Secondary standards.
(f) The monthly averages and ranges of turbidity shown in the Secondary Standards section are based on source effluents

PART 1 - GENERAL CONDITIONS AND RULES

PART 1 - SECTION A - DEFINITION OF TERMS

The following terms shall have meanings as herein defined whenever references are made thereto.

RULE

1-A-1 **DISTRICT**: Any one of Ventura County Waterworks Districts Nos. 1, 16, 17, 19 and 38.

1-A-2 **BOARD**: The Board of Directors of the District, the members of which are the members of the Board of Supervisors of the County of Ventura.

1-A-3 **APPLICANT**: The person applying for water service.

1-A-4 **CUSTOMER**: The person of record receiving water service from the District.

1-A-5 **BILLING DATE:** The date upon which charges for services rendered by the District become effective and upon which a bill is generated.

1-A-5a **MAILING DATE**: The date upon which a water bill or notice is mailed to the customer, not to exceed three business days following the billing date.

1-A-6 **WATER SERVICES**: The services performed by the District including the following:

1-A-6a **DOMESTIC WATER SERVICE**: The service performed by the District in supplying water for domestic use, including use of water for household residential purposes, sprinkling lawns, irrigating small gardens and shrubbery, watering livestock, washing vehicles, and the ordinary use of water at residences and business or commercial establishments.

1-A-6b **AGRICULTURAL WATER SERVICE**: The water service provided for agricultural purposes only.

1-A-6c **PUBLIC WATER SERVICE**: The class of domestic service supplying water to any tax-exempt property.

1-A-6d **CONSTRUCTION WATER SERVICE**: The service supplying water for backfilling trenches, compaction, and other construction services.

1-A-6e **FIRE PROTECTION SERVICE**: The service performed by the District in supplying water for automatic fire sprinkling systems and maintaining water service at fire hydrant locations.

1-A-6f **METERED WATER SERVICE**: The service of supplying water through a meter which measures the quantity of water used.

1-A-6g **FLAT RATE WATER SERVICE**: The service of supplying unmetered water.

1-A-6h **ENGINEERING AND CONSTRUCTION SERVICES**: Those services performed by employees of the District or the County of Ventura in preparation of plans and specifications, checking the plans submitted by privately employed engineers for water systems proposed to be installed within the

District, inspecting the construction of water systems installed by private contractors, and installing water systems in the District paid for from fees or deposits paid for such purposes by private contractors, developers, customers or any other person.

1-A-7 **SCHEDULE OF RATES**: The schedule of rates, charges, and fees established and authorized by the Board of the District for the various types of services performed by the District. The Schedule of Rates shall be publicly posted and available by, at a minimum, posting on the website of the Water and Sanitation Department.

1-A-8 **PREMISES**: Property occupied or used by a customer to which water is being supplied by the District or for which water service has been requested.

1-A-9 **SERVICE CONNECTION or SERVICE LATERAL**: The pipe, valves, and other equipment installed in place, necessary for conducting water from the District's distribution mains to the meter or meter location, but does not include the meter or meter box.

1-A-10 **METERED SERVICE CONNECTION**: The service connection or service lateral including meter and meter box.

1-A-11 **WATER AND SANITATION DEPARTMENT**: The department of the Public Works Agency of the County of Ventura responsible for the operations, construction, repair, maintenance, budgets, and business of the District, under the direction of the following employees:

1-A-11a **MANAGER**: The employee of the Public Works Agency assigned to the Water and Sanitation Department to be in charge of the operations, repair, and maintenance of the District's facilities, or billing and administration, under the direction of the Director.

1-A-11b **DIRECTOR**: The employee of the Public Works Agency assigned to the Water and Sanitation Department to be in charge of the operations, budgets, construction, repair, maintenance, and business of the District.

1-A-12 **ENGINEER**: The Director of the Public Works Agency or his or her authorized representative.

1-A-13 **PUBLIC WAY**: Any street, alley, highway, or walk dedicated to public use.

1-A-14 **EASEMENT**: Public way or right-of-way which the District is authorized to use for pipeline or other purposes.

1-A-15 **PRIVATE EASEMENT**: An easement in which a customer or other person may have installed a water main for transportation of water furnished by the District, in which easement or pipeline the District has no interest or responsibility, or an easement in which the District may have installed a water line or distribution main, for the transportation or distribution of water to the public by the District, within which easement, the District is to have access at all time for reasons of repairs or maintenance.

1-A-16 **MAIN EXTENSIONS**: The extension of distribution pipelines beyond existing facilities, exclusive of service connections.

1-A-17 **INTERCONNECTION**: An authorized connection of the distribution system to the distribution system of another water service agency or water system.

1-A-18 **CROSS-CONNECTION**: An illegal piping connection or any connection which may cause contamination or backflow or back-siphonage.

1-A-19 **PERMANENT SERVICE CONNECTION**: A service connection intended to remain in use two years or more.

1-A-20 **TEMPORARY SERVICE CONNECTION**: A service connection requested for use for a period of less than two years.

1-A-21 **PRIVATE CONTRACT WORK**: Construction of water mains and related facilities by subdividers or other persons other than the District, within the District.

1-A-22 **AUTHORIZED PRIVATE CONTRACT WORK**: Private contract work authorized by the District.

1-A-23 **UNAUTHORIZED PRIVATE CONTRACT WORK**: Private contract work undertaken without authorization by the District.

1-A-24 **PRIVATE CONTRACTORS**: A person, not employed by the District or County of Ventura, engaged in the installation of water facilities within the service area of the District or within territory being considered for annexation thereto.

1-A-25 **PERSON**: Any natural person, firm, corporation, association, organization, partnership, business trust, limited liability company, company or other legal entity, or any district, city or other government unit.

1-A-26 **STRUCTURAL IMPROVEMENTS**: Both Capital Improvements and Local System Improvements, including, but not limited to, land, real estate, all classes of water mains, service connections, meter valves, hydrants, pumping plants, electrical systems, water treatment plants, and appurtenances.

1-A-27 **CAPITAL IMPROVEMENTS**: Those portions of the structural improvements of a District, the use of which is necessary to the services to, and shared in common by, all customers of the District and shall specifically include:

(a) Real estate and rights-of-way.

(b) Wells.

(c) Reservoirs.

(d) Pumping plants and all piping thereon.

(e) Water treatment plants.

(f) Water mains which are oversized at the request of the District.

(g) Local water system improvements undertaken by the District for the benefit of the existing customers.

(h) Pressure reducing stations and all piping thereon.

1-A-28 **LOCAL SYSTEM IMPROVEMENTS**: The following structural improvements are considered to be local system improvements:

(a) Service connections, fire hydrants, valves, fittings, blow-offs, air and vacuum release valves.

(b) All water mains used for distribution and transmission of water within the boundaries of the proposed development.

(c) In water mains used both for the transmission and distribution of water, that portion of the cost of a water main in commercial, industrial, and residential areas. The cost of the water main in areas other than commercial, industrial, and residential areas shall be classified as a Capital Improvement.

1-A-29 **CAPITAL IMPROVEMENT CHARGE**: The charge for equitable participation in the Capital Improvements of a District as a condition precedent to the supply of water to any residence, building, or parcel of land which has not theretofore been supplied with water by the District.

1-A-30 **RESIDENTIAL AREA**: Those land areas zoned R-1 and R-2 with the permitted use confined to family dwelling.

1-A-31 **COMMERCIAL AND MANUFACTURING AREA**: All zone classifications and permitted uses, except those within the definition of residential area.

1-A-32 **DISTRICT DIVISION DESIGNATION**: Specific areas of Ventura County Waterworks District No. 1 are designated divisions and zones as follows:

a) The former District No. 1 shall be designated as Division 1 of Ventura County Waterworks District No. 1.
b) The Improvement Zone No. 1 of former District No. 1 shall be designated as Improvement Zone No. 1 of Division 1 of Ventura County Waterworks District No. 1.
c) The Improvement Zone No. 2 of former District No. 1 shall be designated as Improvement Zone No. 2 of Division 1 of Ventura County Waterworks District No. 1.
d) The former District No. 11 shall be designated as Division 2 of Ventura County Waterworks District No. 1.

PART 1 - SECTION B - SERVICE AREA MAPS AND LEGAL DESCRIPTIONS

RULE

1-B-1 Maps and legal descriptions of service areas and special zones of the District shall be maintained in the office of the County Surveyor.

Although the boundaries of Ventura County Waterworks District No. 38 do not presently include the service area of the Lake Sherwood Mutual Water Company, District No. 38 and its predecessor water provider, Lake Sherwood Community Services District, have served this area since prior to January 1, 2001, and shall continue to serve this area pursuant to Government Code Section 56133, subdivision (e)(4), and Section E of this part shall not apply to

that portion of the Lake Sherwood Mutual Water Company service area outside the District's boundaries.

PART 1 - SECTION C - DESCRIPTION OF SERVICE

RULE

1-C-1 **WATER SUPPLY**:

The District will exercise reasonable diligence and care to:

(a) Deliver a continuous supply of water to the customer at reasonable pressure, and

(b) Avoid unnecessary shortages or interruption in the service.

The District shall not be liable for:

(a) Interruptions of service, shortage, or inadequacy of supply, or

(b) Any loss or damage caused thereby.

The District shall have the right to temporarily suspend service to any customer, whenever the District deems it necessary to do so, and the District shall not be liable for any loss or damage caused thereby. The causes for temporary suspension of service will be removed by the District without unnecessary delay and with the least inconvenience to the customer.

1-C-2 **WATER QUALITY**: Whenever domestic service is furnished, the District will endeavor to furnish at all times a safe and potable water supply.

1-C-3 **CUSTOMER AND WATER SERVICE CLASSIFICATIONS**: Water service provided by the District may be separated into the following customer and water service classifications for the purpose of establishing water rates:

(a) "Single Family Residential" – individually-metered single family homes, single unit condominiums, townhomes, or other similar dwellings, service to which may include water for household domestic purposes, sprinkling lawns, irrigating small gardens and shrubbery, washing vehicles, and the ordinary use of water at residences.

(b) "Agricultural" – a customer that receives water service to a parcel of land that uses water exclusively for the: (a) growing of crops for human consumption or commercial purposes; (b) raising of fowl or livestock for human consumption or commercial purposes; or (c) commercial breeding and training of horses for sale, including training for racing. Agricultural use excludes water used for commercial or non-commercial boarding or riding facilities, stables, equestrian centers, show arenas or event centers, or other similar facilities or operations.

For Ventura County Waterworks District No. 1, the serviced parcel of land must be at least five (5) acres. For Ventura County Waterworks District No. 19, the serviced parcel of land must be at least one (1) acre.

(c) "Non-Tiered Residential" or "Residential Association/Irrigation" – homeowner association common areas, pool areas, and other separately-metered residential irrigation areas.

(d) "Multi-Family Residential" – multiple residential dwellings through one meter, such as multiple single family residences on one parcel, apartment and condominium complexes, duplexes, and trailer parks.

(e) "Commercial" – an entity engaged in the selling of goods and services, such as retail establishments, restaurants, business offices, gas stations, etc.

(f) "Industrial" – an entity that is engaged in manufacturing, warehousing, or distributing products.

(g) "Temporary Construction" – service of a temporary, or non-permanent, nature to a person engaged in construction or similar building, landscaping, development, or improvement activities, including service through fire hydrant meters and truck load count accounts (the rate is converted to a "per 1,000 gallon rate"), or any other service being used for construction on a temporary basis.

(h) "Non-Residential" – refers to service to a customer in any of the following customer/service classifications: commercial, industrial, or institutional.

(i) "Private Fireline Service" – water service rendered for privately owned fire protection systems, including fire hydrants on private property.

(j) "Pump Charge" or "'Lift' Charge" – a charge, in an amount per 100 cubic feet of water usage based on the District's actual pumping costs to customers in service zones requiring water to be pumped up to a higher zone. If applicable, these pump or "lift" charges will be published in the District's Schedule of Rates.

PART 1 - SECTION D - APPLICATION FOR SERVICE

RULE

1-D-1 **APPLICATION FOR SERVICE**: Each applicant for water service will be required to sign a form provided by the District. The application will be regarded as merely a written request for service, and not binding upon the applicant to take service for a period of time longer than that upon which the rates and minimum charge of the selected rate schedule are based.

The application shall show the following information:

(a) **Name(s)** of applicant(s) responsible for the water bill payment. Two or more persons who join in one application for service shall be jointly and

severally liable for payment and shall be billed by means of a single periodic bill.

(b) **Service address** of the property where water is connected.

(c) **Billing/mailing address** if different than the service address.

(d) **Location** of proposed service, address, and brief property description.

(e) **Date** applicant desires service to begin.

(f) **Account** and service type.

(g) **Signature(s)** of applicant(s) acknowledging agreement to abide by all Rules and Regulations of the District and pay all bills when due.

(h) **Other** information the District may reasonably require.

1-D-2 **LARGE INCREASE IN USE OF WATER**: Customers making any change in operations on the customer's premises requiring substantial increases in the rates of water flow through the District's facilities shall immediately give the District written notice of the nature of the change.

PART 1 - SECTION E – OUTSIDE–OF-BOUNDARY SERVICE CONTRACTS

RULE

1-E-1 The District, at its discretion, may provide new or extended services by contract or agreement outside its jurisdictional boundaries as permitted by Government Code Section 56133 and other applicable law. Unless the contract or agreement expressly states otherwise, the District may, with or without cause, with or without advance notice, terminate any such contract or agreement and interrupt or cease any such new or extended services. Although not required to do so, to the extent circumstances reasonably allow, the District will provide advance notice before terminating any such contract or agreement or interrupting or ceasing any such new or extended services. The District's provision of any such new or extended services shall not, and shall not be deemed to, create any rights to continuing services. Water provided pursuant to any such contract or agreement shall be charged at the rates set forth in the District's Schedule of Rates.

PART 1 - SECTION F - BILLING NOTICES

RULE

1-F-1 **NOTICES TO CUSTOMERS**: Notices regarding discontinuance and restoration of water services shall be hand delivered to the customer at the customer's last known address. If the customer is not available, the notice may be placed on the customer's front door.

The substance of the Rules and Regulations addressing discontinuance and restoration of water service shall be printed on each bill.

PART 1 - SECTION G - NOTICES

RULE

1-G-1 **NOTICES TO CUSTOMERS**: Notice from the District to a customer normally will be given in writing delivered via the United States Postal Service to the customer's last known address. Where conditions warrant, and in emergencies, verbal notice or notice by telephone or electronic mail will be deemed adequate.

1-G-2 **NOTICES FROM CUSTOMERS**: Notice from the customer to the District may be given, by the customer or the customer's authorized representative, verbally or in writing, at the District's operating offices.

PART 1 - SECTION H - SERVICE RULES

RULE

1-H-1 **DOMESTIC SERVICE**: Each house or building under separate ownership must be provided with a separate service connection or connections. Two or more houses or buildings under one ownership and on the same lot or parcel of land may be supplied through one service connection, or a separate service connection may be installed for each building.

1-H-1a The District reserves the right to limit the number of houses or buildings, or the area of the land under one ownership, to be supplied by one service connection.

1-H-1b When property provided with a service connection is partitioned, the existing service connection, if any, shall be considered as being assigned to the lot or parcel of land nearest to the meter or service connection.

1-H-1c A service connection shall not be used to supply water to adjoining property of a different owner or property of the same owner on opposite sides of a public street or alley.

1-H-2 **AGRICULTURAL SERVICE CONNECTIONS**: In a District having agricultural water rates, the purposes of the water requirements of the parcel to be served shall guide the District in its determination of the proper sized meter to be installed. Water used for agricultural purposes shall be separately metered. Agricultural water service may be discontinued, with 30 days' notice, at the option of the District. An agricultural service connection shall not be used to supply adjoining properties.

1-H-2a The regulation by the customer of the flow of water from an agricultural meter must be effected by means of a valve installed on the outlet side of the meter, and the installation and maintenance of such a valve shall be at the customer's expense.

1-H-3 **AUTOMATIC FIRE SPRINKLER SERVICE CONNECTIONS**: When an automatic fire sprinkler service connection is installed, the control valve thereon will be left closed and sealed until a written order to turn on the water is received from the customer. After the water is turned on, the District shall not be liable for damages of any kind that may occur on or to the premises or property therein served due to the installation, maintenance, or use of such service connection, or because of fluctuation of pressure or interruption of water supply.

1-H-3a If water is used through an automatic fire sprinkler service connection for any purpose other than the extinguishing of fires, or a purpose related thereto, the District shall have the right either to place a meter on the automatic fire sprinkler service connection at the customer's expense, and to charge at metered rates for all water used, or to shut off the entire supply of water to the premises through such service connection.

1-H-3b The District shall have the right to install and connect with the automatic fire sprinkler service connection at the curb, a service connection for rendering any other type of water service to the same premises served by the automatic fire sprinkler service connection.

1-H-3c All automatic fire sprinkler service connections shall be equipped with a District-approved check valve detector device, all at the expense of the customer.

1-H-4 **TEMPORARY WATER SUPPLY**: Temporary water supply may be provided through:

(a) Temporary service connections or

(b) Fire hydrants.

Temporary water supply may be disconnected and/or terminated upon notification by the District.

Water obtained on a temporary basis shall be for use only within the service boundaries of the District. Any use of the water obtained on a temporary basis for use outside the boundaries of the District is subject to Government Code Section 56133.

1-H-5 **TEMPORARY SERVICE CONNECTIONS**: Temporary service connections will be disconnected and terminated within two years after installation unless an extension of time is granted by the District.

1-H-5a Where a regular service connection of adequate size is available, it may be used for temporary service so long as such connection is not required to supply the property which it enters, provided a temporary service connection number is assigned to it for identification during such usage. A charge, as shown in the District's Schedule of Rates, will be made for arranging temporary service. If such connection is at any time required to permanently serve the property which it enters, said temporary service there must be discontinued.

1-H-5b A charge for the installation of a temporary service connection shall be the same as for a regular service connection, as shown in the District's Schedule of Rates. The applicant shall deposit in cash the amount specified in the District's Schedule of Rates and shall be subject to an additional charge, or entitled to a credit, as provided herein.

1-H-5c After a temporary service connection is installed, and the District is requested by the applicant to terminate and remove the service, the cost of disconnecting and terminating the temporary service will then be estimated and added to the installation cost. From this total, the estimated salvage value of the material to be recovered will be deducted, leaving the final net estimated cost of the temporary service connection. If such net estimated cost is greater than the amount of the applicant's original charge, upon demand the applicant shall pay the District such additional sum as is required to make the applicant's aggregate payment equal to the final net estimated cost.

1-H-5d When a temporary service connection is disconnected and terminated within two years from the date of installation, the estimated cost of the disconnection and the present value of the material recovered shall be deducted from the deposit charge and the balance (if any) of such deposit shall be refunded to the customer if requested. If the aggregate deposit is less than the sum of the installation charge, the disconnection charge, and the present value of the material recovered, the amount of such deficiency shall be paid by the customer.

1-H-5e Where the construction of an installed temporary service connection conforms to the standard requirements of a permanent service connection installation, it may be designated as a permanent service connection at any time, provided all charges for permanent service at its location are paid; and the District will refund to the customer the difference in charges between the temporary service connection and permanent service connection, if the former charge was less than the latter. If the temporary service connection is not metered when it is converted into a regular permanent service connection, and the kind of permanent service to be rendered requires metering, the regular meter charge for the appropriate size of meter shall be paid by the customer.

1-H-5f The District reserves the right at any time to set a meter on any temporary service connection and to collect the required meter deposit, and thereafter to charge the regular metered rate for the kind of service to be rendered.

1-H-5g **METER CHARGE CREDITS**: If a metered temporary service connection is disconnected and terminated and the meter is recovered within one month after its installation, upon application, 95 percent of the meter charge, less $5.00, will be refunded; if within two months, 90 percent less $5.00; if within three months, 85 percent less $5.00; if within four months, 80 percent less $5.00; if within five months, 75 percent less $5.00; and if after five months and within two years, 70 percent less $5.00. All refunds of meter deposits shall be made to the customer, and no refund of a meter deposit shall be made if the temporary service connection is not terminated and the meter recovered within two years from its date of setting.

1-H-6 **TEMPORARY WATER SUPPLY FROM FIRE HYDRANTS**: Water may, on application, be obtained at rates determined by the Director from fire hydrants, for purposes other than extinguishing fires, in the manner prescribed as follows: When water is to be so procured from a fire hydrant, the applicant shall sign an application for a fire hydrant permit, wherein the applicant shall specify the location of the fire hydrant to be used and shall agree to pay the required cash deposit or charge therefor to the District. The applicant must at the same time deposit with the District a sum of money to secure payment of its charges for furnishing, installing, removing, inspecting, and renting of the equipment required to be installed on a fire hydrant for such procuring of water.

Water obtained on a temporary basis from a fire hydrant shall be for use only with the service boundaries of the District. Any use of water obtained on a temporary basis from a fire hydrant for use outside district boundaries is subject to Government Code Section 56133.

1-H-6a A minimum charge for the furnishing, installation, removal, inspection, and rental of such equipment on each fire hydrant shall be imposed pursuant to the District's Schedule of Rates.

1-H-6b If the equipment so furnished is damaged through carelessness or abuse, the cost of repairing the same shall constitute a charge against the customer. If any such equipment is removed from the fire hydrant other than by the District's employee and is not recovered by the District, the value thereof shall constitute a charge against the customer.

1-H-6c The fact that some fire hydrants are already equipped with auxiliary valves, or that some customers may desire to furnish their own equipment for installation on fire hydrants, shall not affect or vary this rule or in any way prevent or modify its application.

1-H-7 **SERVICE CONNECTION AND METER INSTALLATION CHARGES**: Where a charge is fixed herein for the installation of the service connection and/or meter, such charge shall be paid in advance by the applicant. Where no such charge is fixed, the District reserves the right to require the applicant to pay an amount as a fixed charge equal to the estimated cost of installation of such service connection and/or meter.

1-H-8 **SERVICE CONNECTION, SIZE, AND LOCATION**: The District reserves the right to determine the size of the service connection and its location in relation to boundaries of the premises to be served. Where possible, the customer's pipe to the curb should not be laid until the service connection is installed. In the event the customer's pipe is laid to the curb prior to the time the service connection is installed, and its location at the curb does not correspond with that of the service connection at the curb, then the customer must bear the additional cost of connecting the service connection pipe with the customer's pipe.

1-H-9 **EXTENSION OF SERVICE PIPE THROUGH BASEMENT WALL**: Where the applicant requires the service connection pipe to be extended through a

basement wall, the applicant shall, at the applicant's own expense, provide and seal the entrance way for such pipe and shall assume all responsibility for damage caused by leakage through such entrance way and/or by leaking pipes, fittings, or meters.

1-H-10 **SERVICE CONNECTION CURB STOP OR VALVE**: Every service connection installed by the District will be equipped with a curb stop or valve on the inlet side of the meter. Such valve or curb stop is intended for the exclusive use of the District in controlling the use of water through the service connection and/or meter. If such curb stop or valve is damaged by the customer to an extent requiring its replacement, the customer shall bear the cost for such replacement. The customer's pipe shall have a wheel valve placed at some known and accessible location between the meter and the building, to control the supply to the building.

1-H-11 **ENLARGING SERVICE CONNECTION AT TIME OF RENEWAL**: When the District replaces a service connection for any reason, such service connection may be enlarged, upon the customer's request and at the customer's expense, the District's estimated cost of which shall constitute a fixed charge.

1-H-12 **MAINTENANCE OF SERVICE CONNECTIONS, METERS, DETECTOR CHECK VALVES, AND HOUSINGS**: All service connections, water meters, detector check valves, and housings installed by the District shall be maintained at its expense, except as may be otherwise provided herein.

1-H-12a Where a two-inch, or larger, stub pipe is laid to the curb to replace one or more old service connections, such old service connection will be disconnected, and the District will lay, connect, and maintain the necessary piping from such new stub pipe to the old location of the meter or to the customer's supply pipe.

1-H-13 **CUTTING, REFITTING, RAISING, LOWERING, OR RELOCATING WATER SERVICE CONNECTIONS, MAINS, ETC.**: Any person making improvements or changes, including road repairs, resulting in the cutting, refitting, raising, lowering, relocating, or damaging in any way of service connections, water mains, fire hydrants, stub pipes, meters, valves, or other parts of the water system shall be liable to the District for all costs incurred by it in making such changes.

1-H-14 **INCREASING SIZE OF DETECTOR CHECK VALVE FOR AUTOMATIC FIRE SPRINKLER SERVICE**: In all cases in which a detector check valve on an installed service connection for automatic fire sprinkler service is recovered by the District because of the substitution of a larger detector check valve, the charge to the customer for furnishing and installing such larger detector check valve shall be the estimated cost of replacement, which estimate shall include a credit for the replaced equipment; and such credit shall be the present value.

1-H-14a **REFUND OF CHARGES FOR DETECTOR CHECK VALVE AND BY-PASS METER UPON DISCONNECTION AND ABANDONMENT OF AUTOMATIC FIRE SPRINKLER SERVICE CONNECTION**: When an automatic fire sprinkler service connection is disconnected and abandoned and the detector check valve and by-pass meter on such service connection are recovered by

the District, upon written application, a refund of the charge paid by the customer for such detector check valve and by-pass meter will be made in an amount equal to the present value as determined in Part 3 of these Rules and Regulations, less the estimated costs of removing the equipment.

1-H-15 **SETTING OF METERS**: The District may install all meters unless installation by another person is authorized by the District.

1-H-15a **OWNERSHIP OF METERS**: The District is the owner of all meters and appurtenances incidental thereto within the District.

1-H-15b **REMOVAL OF METERS FROM INACTIVE SERVICE CONNECTIONS**: The District may at its option remove the meter from any service connection determined to be inactive for more than two billing cycles, for maintenance or for use in another location. The District will reinstall the meter upon the customer's request. In the case of an inactive agricultural meter, if the customer requests discontinuation of service to avoid service charges, the District will remove the meter. However, reinstatement of service shall be at the discretion of the District.

1-H-16 **CHARGE FOR SUBSTITUTION OF LARGER METER FOR DOMESTIC SERVICE OR FOR COMBINED AGRICULTURAL AND DOMESTIC SERVICE**: When a meter for domestic service, or for combined agricultural and domestic service, of larger size than the existing meter is to be installed on an existing service connection, or when the existing service connection is disconnected and abandoned and the meter thereon is recovered by the District and a larger service connection and a larger meter are to be installed in the place thereof, the charge required for furnishing and setting such larger meter installation shall be the same as for a new service and meter, less the present value of the recoverable meter and fittings.

1-H-17 **SUBSTITUTION OF SMALLER METER TO REDUCE MONTHLY MINIMUM CHARGE**: When substitution of a smaller meter is requested by the customer in order to reduce the monthly minimum charge, and when the minimum charge is related to the meter size, such substitution will be made without charge, provided the delivery of water required through such smaller meter shall not exceed its rated capacity, and provided also that such capacity conforms with the requirements of the Plumbing Code. No credit for a large meter so removed will be allowed.

The allowable change in meter size shall not be less than one size smaller than the customer's piping, except that in no case shall the meter size be reduced below the size determined by application of rules in the Plumbing Code.

1-H-18 **DAMAGE TO METERS BY HOT WATER OR STEAM**: The District will furnish, set and maintain all meters.

1-H-18a When a customer becomes responsible for the payment of water bills for any premises served, the meter at that date installed or continued on the service connection is in this rule designated as the "first meter" and any other meter installed on the same service connection, to serve the same premises in

substitution for a meter damaged in service, is herein designated as "any substituted meter."

1-H-18b The District assumes the liability for the cost of changing and repairing any meter that shall have been damaged by hot water or steam emanating from the premises served in only the following cases:

1. When such damage occurs to the first meter;
2. When such damage occurs to any substituted meter more than three years after the same shall have been installed;
3. When such damage occurs to any substituted meter within three years after the same shall have been installed, and the customer as of the date such damage occurs has not been continuously so responsible for the same at all times since the date of the last previous occurrence of damage to a meter, for which the District assumes liability hereunder.

1-H-18c When the first meter is found to have been damaged by hot water or steam emanating from the premises served, notice of such damage will be mailed to the customer responsible for the payment of the water bills, but the customer will not be charged with the cost of changing or repairing the first meter.

1-H-18d If any substituted meter be similarly damaged (whether through the fault of such customer or otherwise) and such damage occurs within three years after the last previous meter installed on the same service connection and supplying the same premises was damaged, the cost of changing and repairing such substituted meter will be charged to the customer, provided such customer shall have been continuously so responsible at all times since the date of the last previous occurrence of damage to a meter, for which the District assumes liability hereunder.

1-H-18e When a meter is to be replaced, a notice will be left on the premises notifying the customer that the water will be or is being shut off for work on the water meter.

1-H-18f In the case of damage to a meter due to excessive flow onto the customer's premises, the customer shall supply the District, within five (5) working days of the District's request, the customer's maximum flow demand. If that demand is in excess of the meter's rating, the customer shall do one of the following at the District's system:

1. Install a larger meter or meter and service line, in accordance with charges established in the District's Schedule of Rates.
2. Approve the installation, by the District, of a device to limit the flow through the meter to its maximum amount.

1-H-19 **CHANGE OF METER LOCATION**: When the location of a meter and/or service is changed at the customer's request, the cost of making such change will be charged to the customer, in accordance with the District's Schedule of Rates.

NOTE: *When the customer requests such change of the location of a meter because of constructing a driveway that is to be paved, instead of moving the meter, a concrete box equipped with a steel cover plate to house the meter may be installed, provided the slope of such driveway is not such as to cause the face of the steel plate to be dangerous to pedestrians walking thereon.*

1-H-20 **APPLICATION FOR WATER SERVICE**: No charge will be made for the mere turning on of the water supply upon the opening of a new account for any kind of service. An application provided by the District must be signed by the applicant. Such application shall contain the following provisions:

1. The applicant shall agree to accept the services applied for subject to these Rules and Regulations and to pay for the services at regular rates. Should the applicant subsequently cancel one or more items of service, such cancellation shall not change or affect the terms of the applicant's application in respect to the remaining item or items of service.

2. The applicant shall also agree to give at least twenty-four hours' notice to the District before service is to be discontinued. The provisions of the application, obligating the applicant to accept and pay for service, shall remain in force until said notice is given and all bills shall be paid in full to date of receipt of said notice by the District.

3. The applicant shall further agree to assume all liability for any damage occurring on the premises served, by reason of open faucets, faulty fixtures, or broken pipes on such premises at or after the time when service is turned on, whether or not at that time there is any responsible person on the premises.

1-H-21 **USE OF WATER WITHOUT REGULAR APPLICATION FOR SERVICE**: Any person taking possession of premises where the water supply has been shut off and the curb cock or valve sealed must make proper application to the District to have the water supply turned on. In the event the person turns on the water supply or suffers or causes it to be turned on, without first having made such application, the person will be held liable for all charges for the water service rendered, the amount thereof to be determined, at the election of the District, either by the meter reading or on the basis of the estimated consumption for the length of time service was received without proper application.

1-H-21a **TAMPERING OR TURNING ON WATER**: Tampering with a water meter or the turning on of water at a water meter without District consent is a violation of these Rules and Regulations and Penal Code Section 498 and constitutes a misdemeanor. Any person who tampers with a District meter or water supply is subject to a fine, plus costs of all repairs, labor and damages to District property. When the District finds that water is being used without proper application, the customer or other person will be notified, and if application for such service is not made promptly thereafter and the District immediately compensated for water already used, the supply will be shut off without further notice.

1-H-22 **DISCONTINUANCE OF WATER SERVICE**: No charge will be made for shutting off water supply or for reading the meter upon closing the account.

1-H-22a When a customer makes application for water service for specified premises, the customer will be charged for water service on such premises until the customer requests the service to such premises be discontinued.

1-H-23 **READING OF METER AND BILLING**: Under ordinary conditions, each continuous service meter will be read monthly on approximately 28 to 35 days for one billing cycle to the next and a bill thereupon rendered, showing the period covered by the meter reading, or the amount of water used, and the total charge for the service rendered. Fire service meters may, at the option of the District, be read semi-annually or annually. However, monthly bills shall be rendered for the monthly fire service charge. Notice may be given by the District if large or unusual meter registration. The customer is responsible for paying all water that passes through the meter.

1-H-23a Where the meter is found to be out of order, or when a meter reading cannot be obtained, the charge for water will be based, at the option of the District, on an estimated meter reading. Such estimates may be computer generated based on previous usage for the property or on the consumption as registered by a substituted new meter. Consideration may also be given to the average monthly consumption adjusted to seasonal demand for the current billing period. Consideration may also be given to volume of business, seasonal demand, and other factors that may assist in determining an equitable charge.

1-H-23b When the meter is temporarily covered by building or other material, or when a mobile construction meter has been moved to a new location without the District's knowledge, so that it cannot be read, the charge for water will be based, at the option of the District, on estimated water usage. Such estimates may be computer generated based on previous usage for the property, and a bill or series of bills for the billing period, will be rendered. Estimated water usage may be adjusted if necessary when the meter is first thereafter read. The District may notify the customer of the inaccessibility of the meter and may charge the applicable fee for the notice as specified in the District's Schedule of Rates.

1-H-23c When the water meter or water lines within a private easement are not accessible to the District due to locked gates, fences, livestock, dogs, or any other condition for more than 60 days, the District will, at its option:

1. Remove the meter and/or terminate service until the inaccessibility is eliminated. Notice of the District's intent to do so will be given to the customer after the first incident of inaccessibility.
2. If the water meter and/or the water lines within a private easement remain inaccessible or their location inhibits or excludes District access, the water meter and/or water lines may be relocated at the determination of the District, and all relocation costs, including, but not limited to, materials and labor, will be billed to the customer.

1-H-24 **PAYMENT OF WATER BILLS**: All bills for service and other charges for which payment is not otherwise provided in these Rules and Regulations shall be due and payable in cash, by check, or by automatic payment, upon presentation, and shall become delinquent 22 days from the bill date but no less than nineteen (19) days after mailing.

The District may, at its option, accept alternative payment methods for water bills, including credit card payments, electronic fund transfers, or other methods.

The Director or the Director's authorized representative, in his or her sole discretion, may make adjustments, extend due dates, or waive charges resulting from meter read errors or other discrepancies, delinquent or shut-off notices, or other miscellaneous services.

1-H-24a All bills for fire hydrant service, for sewer flushing service, for water for street washing and/or sprinkling, or for water for flushing storm drains, culverts, etc., shall be rendered either monthly or bi-monthly and shall become delinquent nineteen (19) days after mailing.

1-H-24b If any bill becomes delinquent, the water service may be discontinued with notice.

1-H-24c Water bills may be addressed in the name of the property owner or other person in possession of the property served or in the name of the applicant for water service.

1-H-24d If more than one tenant on a parcel of property is served through a single meter, the District will render a single bill to the property owner or applicant, and include a minimum charge for water service based upon the number of billing units, the number of which may be determined by any of the following methods:

1. The number of tenant units: Each house, apartment, store, trailer space, hotel room, or motel unit with water piping shall be considered a separate tenant unit for the purpose of computing a minimum charge as specified in Part 2 of these Rules and Regulations.
2. Meter size as specified in Part 2 of these Rules and Regulations.

1-H-24e The form of the bill shall be prescribed by the District.

1-H-24f Payments made to the customer's account will be applied to the customer's account balance, which may include a deposit due, water charges, sewer charges, lift charges, penalty/late fees, and other miscellaneous charges. If the balance is not paid within 22 days from the bill date (the "due date"), the account will be charged with a penalty/late fee, and a past due bill and a "Delinquent Notice" will be issued.

At the option of the Director, the District may allow a grace period of one to six days past the delinquent date prior to charging a penalty/late fee. The amount of such penalty/late fee shall be as specified in the District's

Schedule of Rates. At the option of the District the Delinquent Notice may be incorporated into the next regular bill for service, provided current and past due charges are so specified.

Fifteen days from the date of the Delinquent Notice, if payment still has not been received, water service may be discontinued upon notification to the customer. At least 48 hours prior to termination of service, the District shall attempt to notify the customer by telephone, mail, or delivery of a door hanger notice to the service location. At the option of the District, telephone notification may be made through the use of an interactive voice response (IVR) system. A "48-Hour Notice of Pending Shut-Off" charge in the amount specified in the District's Schedule of Rates will be added to the customer's account to process the notice. The customer shall be subject to the 48-Hour Notice of Pending Shut-Off charge upon preparation of the door hanger notice by the District.

If payment is not made by the end of the period stated in the 48-Hour Notice of Pending Shut-Off, a shut-off notice will be printed for delivery and a charge will be added to the delinquent account in the amount specified in the District's Schedule of Rates. If resumption of service is requested for other than regular working days or hours, payment of an additional "Service Turn-on After Business Hours" fee will be charged in the amount specified in the District's Schedule of Rates.

1-H-24g In the event of underpayment of any water bill, where alternate payment arrangements have not been approved in accordance with this rule, such underpayment may be treated as non-payment. Where the amount of such underpayment exceeds fifty percent of the total amount of the bill, the remaining balance of said bill may become a charge upon the next ensuing water bill issued to the same customer, at the option of the District.

1-H-24h An adjustment shall be made to water billing charges when subsequent meter readings show that the meter was previously read in error. Also, upon the customer-verified statement, a correction may be made as to previous opening or closing billing dates.

1-H-24i In the event of payment in excess of the billed amount, the District shall credit the amount of over-payment thereof upon the next ensuing water bill issued to the same property.

1-H-24j In the event a customer is unable to pay a water bill, the customer may contact the District's billing office and request an alternate payment plan subject to approval by the Director or his or her authorized representative. Such arrangements for payment must be made before the shut-off date to avoid the shut-off notice charge. If a customer fails to pay a subsequent bill by the shut-off date, service may be discontinued upon notification to the customer. At the option of the District, the District may limit the number of approved payment extensions to no more than one per customer per year.

1-H-24k At the option of the Director, the District may apply a penalty/late fee to closing bill balances not paid within 22 days from the closing bill date.

1-H-25 **SHUTTING OFF WATER SUPPLY FOR EMERGENCY REPAIRS OR FOR CHANGES, ETC., IN OR AFFECTING THE DISTRIBUTION SYSTEM**: The District reserves the right at any and all times to shut off the water for the repairing, extending, or altering of water mains, the repairing and placing of fire hydrants, the repairing and renewing of water service connections, or the changing and testing of water meters or detector check valves.

1-H-26 When the water supply is to be shut off for any of the above reasons, the District will make a reasonable effort to deliver a notice of the shut-off to the customer or to some responsible person on the premises, but it does not assume any liability for the failure of the customer to receive or to understand such notice.

1-H-26a The District will not be responsible for the maintenance of pressure, nor for the continuity of water supply, and customers dependent upon a continuous water supply should provide adequate storage for emergencies. Customers having water heaters or other devices requiring a continuous water supply should take all necessary steps to prevent damage to, or the causing of injury by, such devices as a result of the shutting off of the water supply.

1-H-26b The District shall not be responsible for water pressures for any customers located at high elevation beyond normal District water pressures. Nor is the District obligated to extend water services to those areas beyond existing District water mains and/or off the public rights-of-way.

1-H-26c Credit forward balances for water service normally due to a former customer shall not be credited to the account of the new customer at the same service address. Said credit balances shall be refunded to the former customer when a forwarding address is available. When there is not a forwarding address available, said credit balances shall be deposited in the District's applicable water sales trust fund and shall be refunded to the former customer upon written request to the District. If no such request is submitted within one year, the credit forward balance shall be credited to the District's General Fund.

1-H-27 **LEAKING PIPES OR FIXTURES ON THE PREMISES SERVED:** The District's control and responsibility ends at the curb shut-off or meter, and the District will in no case be liable for damage caused by, or in any way arising out of, the running or escape of water from open faucets, burst pipes, or faulty fixtures on the premises.

1-H-27a **CUSTOMER RESPONSIBILITIES**: All piping and appurtenances installed by the customer on the customer's premises shall remain the property of the customer and the maintenance thereof shall be the customer's sole responsibility. Water provided to the property, on the customer's side of the meter, including water from leaks, must be paid for by the customer. The District's control and responsibility shall end at the customer's side of the meter. The District shall in no case be liable for damages caused by, or in any way arising out of, the running or escape of water from open faucets, burst pipes, or faulty fixtures on the premises.

1-H-27b When it becomes necessary to shut off the water supply to the entire premises, the customer may use the customer hand valve within the meter box on the customer side of the meter, if one has been installed. Upon request, for emergency purposes, the District may, without charge, shut off its control valve on the inlet side of the meter with the understanding that the District will turn on the water after repairs have been made.

1-H-27c Every service connection is equipped with a control valve on the inlet side of the meter which may be used by the customer when necessary to shut off the water supply from the entire premises. Upon request, day or night, the District will, without charge, shut off such control valve for emergency purposes, upon the understanding that the customer will turn on the water after repairs shall have been made.

NOTE: *For convenience and safety, the water pipe on the customer's premises shall be equipped with a wheel valve, placed at some known accessible location between the meter and the building.*

1-H-28 **TAMPERING WITH DISTRICT PROPERTY**: Except as provided elsewhere in this rule, no person, other than an authorized District employee, shall at any time or in any manner operate, or cause to be operated, any valve in or connected with a water main, service connection, or fire hydrant, or tamper or otherwise interfere with any water meter, detector check valve, or other part of the water system. No person shall deposit, or cause to be deposited, any substance or liquid in any water main or pipe of the District, or do anything which might cause any water supplied or furnished by, or belonging to, the District to become polluted, or take water from any service without first securing permission from the District.

1-H-28a In the event a person for any reason damages an angle meter valve or valve controlling a water supply, or damages a meter cover or its center piece, or causes any such act to be done, such person will be held liable for such damage.

1-H-28b The District may impose a fine of up to $250.00, plus the cost of labor and materials to repair any damages, against any person found to be tampering with District property or engaged in the unauthorized operation of any part of the water system.

1-H-29 **RIGHT OF INSPECTION OF AND ACCESS TO CUSTOMER'S PREMISES**:

By accepting service from the District, the customer agrees that authorized agents and employees of the District shall have the right of entry and access, at all reasonable times, in, to and upon the customer's buildings, grounds or premises, or any part thereof (including any and all plumbing, water piping, fixtures, or connections located, used, maintained or operated therein or thereon), for the purposes of:

1) Reading of meters and/or repairs and maintenance to the meter or water system.
2) Determining the existence, operation, and/or use in, on, or about such buildings, grounds, or premises for:
   a. Any plumbing or water piping which may now or hereafter cause, create, or permit backflow, back-siphonage, or any other condition affecting or likely to affect the purity and/or potability of the water supply furnished by the District.
   b. Any source such as hot water which could damage District equipment such as meters.
   c. Any source of water supply which may now or hereafter be connected with the water supply system of the District.
   d. Any source of pressure, vacuum, contamination or pollution (including any and all equipment, fixtures or appliances connected or used therewith or therefor) affecting or likely to affect the purity and/or potability of the water supply of the District.
3) Facilitating the enforcement, from time to time, of any and all applicable laws and Rules and Regulations of the District.

1-H-29a Such authorized representatives of the District shall be furnished with and upon the request of any customer shall display, appropriate identification.

1-H-29b If the District shall ascertain that a condition affecting the purity and potability of the water supply in any District exists in, on, or about any building, grounds, or premises in violation of any law, rule or regulation of this State, or any ordinance of the County of Ventura, or any of these Rules and Regulations, the District shall:

1. Immediately notify the person owning and/or controlling such building, grounds, or premises of the existence of such condition; and

2. Require of such person compliance within a reasonable time (to be stated in said notice) with any such law, ordinance, rule or regulation so violated; and

3. Further notify the person that, for the failure to so comply within said described period, the District will take, or cause to be taken, by the appropriate authority, such steps to enforce such compliance, to remedy such condition, and/or to protect the interests of the District, as shall be provided by law or by these Rules and Regulations.

1-H-30 **EASEMENTS**: The customer shall be responsible for maintaining public utility easements within the customer's property such that the District has access at all times to the public utility systems within the easements. No permanent improvements such as buildings, block walls, iron fences, large trees and shrubs and the like shall be placed over the easement without prior written approval from the District. Where the District must perform maintenance and/or construction activity within the easement, it shall not be responsible for replacing said permanent improvements or other prohibited structures. The District must have access to the public utility systems within any easement at all times.

1-H-31 **PROHIBITION OF CROSS-CONNECTIONS**: No physical connection shall hereafter exist or be installed, located, maintained, or operated between the water supply system of any District (including its appurtenant mains, pipes, fixtures, equipment, or appliances), and any other supply system or any sewer or grading system, or any steam, gas, or chemical line, pipe, or conduit, or any device, boiler, tank, or container whereby any contamination or pollution or any dangerous, impure, unsanitary, or unpotable substance (solid, liquid, or gaseous, or any combination thereof) may now or hereafter be introduced to any portion of the water supply system of the District by backflow, back-siphonage, or any other method, means, or cause whatsoever.

1-H-31a Wherever a mechanical or other method or device (approved by the District) may be used for protecting the District's water supply system from any such source of contamination or pollution, any customer shall at the customer's own expense and subject to the final inspection and approval thereof by a person certified for such inspection and repair by the County of Ventura Health Officer, install, maintain, operate, and use the same. Maintenance shall include inspections and operational tests once a year, or more often as required by the Engineer and/or County of Ventura Health Officer.

1-H-31b The District shall promulgate and shall, upon request, furnish copies to the customer of lists of approved mechanical devices and information concerning the installation of said devices.

1-H-31c The District shall have the right to discontinue the supply of water to, and to seal or disconnect the services to, the premises of the customer for the customer's failure to comply with, or the violation or infraction of, any of these Rules and Regulations relative to the inspection of the customer's premises for, to the prohibition of, or to the protection of the District's water supply against cross-connections, backflow, or back-siphonage. A customer shall be entitled to reasonable notice of the intent of the District to discontinue the service for the customer's noncompliance with, or violation of, any of such Rules and Regulations, and to a reasonable opportunity to comply with and/or to cease the violation thereof. However, no such notice or opportunity to comply with, or to cease a violation of, any of such Rules and Regulations need be given in those instances in which non-compliance or violation by the customer has created, is creating or is likely to create in the water supply

system conditions dangerous and detrimental to public health, safety, and welfare.

1-H-32 In the event that the customer is unable to obtain qualified private inspection services, the District will furnish competent inspection and/or repair service at the rates set forth in the District's Schedule of Rates.

PART 1 - SECTION I – CROSS-CONNECTION CONTROL AND BACKFLOW PREVENTION

RULE

1-I-1 **GENERAL POLICY**: The regulations of the Department of Public Health of the State, contained in Title 17 of the California Code of Regulations, the standards of the Uniform Plumbing Code, American Water Works Association Standard M14, and the University of Southern California Foundation for Cross-Connection Control and Hydraulic Research Manual of Cross-Connection Control (10th ed.) are applicable for cross-connection control and backflow prevention in the District.

1-I-2 **DISTRICT REGULATIONS FOR CROSS-CONNECTION CONTROL AND BACKFLOW PREVENTION**

1-I-2a **GENERAL**: No water service connection to any premises will be installed or maintained by the District unless the water supply is protected as required by State laws and these Rules and Regulations. Service of water to any premises shall be discontinued by the District if a backflow prevention assembly required by these Rules and Regulations is not installed, tested and maintained, or if it is found that a backflow prevention assembly has been removed or bypassed, or if an unprotected cross-connection exists on the premises. Service will not be restored until such conditions or defects are corrected. The customer's system should be open for inspection at all reasonable times to authorized representatives of the District to determine whether cross-connections or other structural or sanitary hazards, including violations of these Rules and Regulations, exist. When such a condition becomes known, the District shall deny or immediately discontinue service to the premises by providing for a physical break in the service line until the customer has corrected the condition(s) in conformance with the State laws relating to plumbing and water supplies and the regulations adopted pursuant thereto and these Rules and Regulations.

1-I-2b All existing backflow prevention assemblies that do not meet the requirements in these Rules and Regulations but were approved devices for the purposes described in these Rules and Regulations this section, be excluded from the requirements of these Rules and Regulations so long as the District is assured that they will satisfactorily protect the utility system. Whenever the existing device is moved from the present location or requires more than minimum maintenance (e.g., no replacement parts required) or when the District finds that the maintenance constitutes a hazard to health, the unit shall be replaced by an approved backflow prevention assembly meeting the requirements of these Rules and Regulations.

1-I-2c **WHEN BACKFLOW PREVENTION IS REQUIRED**:

1. In the case of premises having an auxiliary water supply which is not or may not be of safe bacteriological or chemical quality and which is not acceptable as an additional source by the District, the public water system shall be protected against backflow from the premises (i.e., irrigation services).

2 In the case of premises on which any industrial fluid or any other objectionable substance is handled in such a fashion as to create an actual or potential hazard to the public water system, the public system shall be protected against backflow from the premises. This shall include the handling of process waters and waters originating from the utility system which have been subject to deterioration in quality.

3. In the case of premises having (1) a cross-connection that cannot be permanently corrected or controlled or (2) intricate plumbing and piping arrangements or where entry to all portions of the premises is not readily accessible for inspection purposes, making it impracticable or impossible to ascertain whether or not dangerous cross-connections exist, the public water system shall be protected against backflow from the premises.

4. In the case of premises having industrial or commercial facilities, the public water system shall be protected against backflow from the premises.

1-I-3 **ACCEPTABLE BACKFLOW PREVENTION ASSEMBLIES**: The District will not accept any backflow prevention assembly for cross-connection protection other than an approved air gap separation or a reduced pressure principle backflow prevention assembly unless otherwise approved by the District. An exception will be the installation of an approved double detector check valve assembly on fire lines for sprinklered buildings or on private fire hydrant lines.

1-I-4 **REDUCED PRESSURE PRINCIPLE DEVICE (RP)**: Commonly referred to as an RP or RPP, this device consists of two independently acting check valves, together with an automatically operating pressure differential relief valve located between the two check valves. The first check valve reduces the supply pressure at a predetermined amount so that during normal flow, and at cessation of normal flow, the pressure between the two check valves shall be lower than the supply pressure. If either check valve leaks, the relief valve will discharge to the atmosphere. This will maintain the pressure in the zone between the two check valves lower than the supply pressure. The unit also has two shut-off valves (one upstream and one downstream of the checks) and properly located test cocks for field testing.

1-I-4a **INSTALLATION**: An approved RP assembly, the same size as the water meter, shall be installed on the customer water line as close as practical to the meter (not to exceed 10 feet unless otherwise approved by the District). Unprotected outlets shall not be installed between the meter and the RP device. This unit shall be installed a minimum of 18 inches and not more than 36 inches above finish grade with a minimum of 12 inches of side clearance. The unit shall not be installed in an enclosed structure.

1-I-4b **APPROVED RP DEVICES**: Any backflow prevention assembly required herein shall be a model approved by the District. The term "Approved Backflow Prevention Assembly" shall mean an assembly that has been manufactured in full conformance with the standards established by the American Water Works Association (AWWA) entitled AWWA C506-84 Standards for Reduced Pressure Principle and Double Check Valve Backflow Prevention Devices and has met completely the laboratory and field performance specifications as set forth in Chapter 10, Specifications of Backflow Prevention Assemblies, of the Manual of Cross-Connection Control (10th ed.) of the University of Southern California Foundation for Cross-Connection Control and Hydraulic Research (FCCCHR).

Final approval shall be evidenced by a "Certificate of Approval" issued by an approved testing laboratory certifying full compliance with the said AWWA standards and FCCCHR specifications.

The following testing laboratory has been qualified by the District to test and certify backflow preventers:

Foundation for Cross-Connection Control and Hydraulic Research
University of Southern California
University Park
Los Angeles, California 90089-0231

Testing laboratories other than the laboratory listed above will be added to an approved list as they are qualified by the District.

The list of approved RP assemblies is issued and maintained by the Ventura County Environmental Health Division. The District should be consulted for the currently approved list.

1-I-4c **TESTING**: It shall be the duty of the customer at any premises where the backflow prevention assemblies are installed to have certified inspections and operational tests made at least once per year. Where the District deems the potential hazard of backflow to be significant, certified inspections at more frequent intervals may be required. These inspections and tests shall be performed by a certified tester approved by the District. It shall be the duty of the District to see that these tests are made in a timely manner. The customer shall notify the District in advance when the tests are to be undertaken so that an official representative of the District may witness the tests. These assemblies shall be repaired, overhauled or replaced at the expense of the customer whenever said assemblies are found to be defective. Records of such tests, repairs and overhaul shall be kept by the customer and made available to the District upon request.

1-I-5 **AIR GAP**: An air gap is a physical separation between the free flowing discharge end of a potable pipe line and an open or non-pressure receiving vessel. To have an acceptable air gap, the end of the discharge pipe has to be at least twice the diameter of the pipe above the topmost rim of the receiving vessel, but in no case can this distance be less than one inch.

PART 1 – SECTION J - CAPITAL IMPROVEMENT CHARGES AND LOCAL SYSTEM IMPROVEMENT CHARGES

RULE

1-J-1 **CHARGES**: As a condition precedent to receiving water service for any residence or building or parcel of land which has not theretofore been supplied with water by the District, there shall be paid to the District a Capital Improvement Charge in accord with the District's Schedule of Rates, except as defined in this section. The Capital Improvement Charge shall not include charges for service and meter connections, which charges shall be paid separately as required elsewhere in these Rules and Regulations.

1-J-2 **AGRICULTURAL SERVICE**: In the case where water service is requested for any land and/or parcel for agricultural purposes only and the District has facilities available or no expenditure of District funds is required to provide such service, the District may, at its option, waive payment of the Capital Improvement Charge. However, the Capital Improvement Charge shall be paid prior to development of the property for a use other than agricultural.

1-J-3 **SERVICE TO USERS OUTSIDE DISTRICT**: The furnishing of water to any residence, building or parcel of land outside the District's jurisdictional boundaries pursuant to Section E of this part shall not excuse such residence, building or parcel of land from the requirements of this section in the event such parcel of land, or any land on which any such residence or building is located, is annexed to the District. In such event, the payment of a Capital Improvement Charge shall be a condition precedent to the continuation of water service to such residence, building or parcel of land.

1-J-4 **TIME OF PAYMENT**: The Capital Improvement Charge shall be paid in full prior to issuance of a water will serve letter, and/or prior to the commencement of any work necessary to furnish water to any residence, building or parcel.

However, in a case where a person owns a parcel of land larger than ten acres in size but desires water service for only a small portion thereof, and if the District is financially able to do so, it may, at its option, collect the Capital Improvement Charge for only that portion of the parcel that is to be developed. At such time as further development of the parcel occurs, the then applicable Capital Improvement Charge shall be paid for the remainder.

1-J-5 **CONTRIBUTIONS AND GRANTS OF CAPITAL IMPROVEMENTS**: In an amount agreed upon by the grantor and the District all or any part of one or more Capital Improvement Charges may be reduced by deducting therefrom the actual cost of any Capital Improvement, or the fair market value of any real property, contributed or given to the District and expressly accepted by the District in lieu of all or part of the Capital Improvement Charge due upon any residence or building.

1-J-6 **IMPROVEMENT ZONE**: Capital Improvement Charges shall not be collected by the District for ministerial development on existing parcels whenever an improvement zone has been established and local and Capital Improvements have been or are to be financed by the proceeds of bonds issued as special obligations of said zone. The term improvement zone shall refer to any area within a District which has been set up pursuant to Water Code Section 55650 to provide for financing of facilities and improvements of benefit to such zone that are not of District-wide benefit.

All parcels requesting discretionary land use entitlements shall be assessed Capital Improvement Charges according to these Rules and Regulations.

Whenever the ownership of any property within such improvement zone is held or acquired by a non-taxable entity, such entity shall be subject to meter and Capital Improvement Charges. The amount of such Capital Improvement Charge shall be determined by the Director and shall be calculated in such a manner as to include only those costs of Capital Improvements which are required to provide adequate service for such non-taxable entity. In no event shall said Capital Improvement Charge exceed that charged non-taxable entities for lands located within the District but not within an improvement zone.

1-J-6a **EXCEPTION TO CAPITAL IMPROVEMENT CHARGES**: Capital Improvement Charges shall not be collected by the District for the lots developed by LSR, the developer of Lake Sherwood Community or the customers served by the Lake Sherwood Mutual Water Company, at the time of adoption of these Rules and Regulations.

If in the event a special assessment district is formed in any District for the purpose of paying for the cost of constructing water system improvements, including improvements to existing vacant lots, Capital Improvement Charges will not apply.

1-J-7 **MAIN EXTENSIONS**: Upon payment of Capital Improvement Charges, the District will extend water lines from its facilities which exist in a publicly dedicated and accepted road nearest the lot, parcel or building to be served to a point along such publicly dedicated and accepted road nearest the lot, parcel or building to be served. However, the District shall not be required to provide water service where the cost of providing such service would cause an undue financial hardship on the District as determined by the District Board.

1-J-8 **OFF-SITE CONSTRUCTION**: The developer of any lot, parcel or building shall extend pipelines to the District's facilities to provide the necessary service. Said improvements shall be as required by the District in accord with the District's specifications and subject to the approval and acceptance of the District. Upon completion, said improvements shall be conveyed to the District together with an adequate easement for their installation, operation and maintenance.

1-J-9 **LOCAL SYSTEM IMPROVEMENTS AND CHARGES**: As a condition precedent to receiving water service for any residence, or building or parcel of land which has not theretofore been supplied with water by the District, all necessary Local System Improvements shall be furnished and installed by the applicant at the applicant's expense or the applicant shall be charged for said improvements and pay the District the cost thereof computed at the rates described in the District's Schedule of Rates or as computed by the Director. Said improvements shall be as required by the District, in accord with the District's specifications and subject to the approval and acceptance of the District. Upon completion, said improvements shall be conveyed to the District together with an adequate easement for their installation, operation and maintenance.

1-J-10 **LOCAL SYSTEM IMPROVEMENTS WITHIN IMPROVEMENT ZONE**: Local System Improvements within an improvement zone shall be financed as provided for in the petition or resolution to form the improvement zone as approved pursuant to applicable law.

PART 1 - SECTION K - WATER SHORTAGES

RULE

1-K-1 **EMERGENCY RESTRICTIONS ON WATER USE**

1-K-1a **EMERGENCY RESTRICTIONS ON WATER USE DUE TO SYSTEM EMERGENCIES**: If the Director determines that over-consumption of water, loss of pressure in a system, breakdown, or any similar occurrence requires emergency restrictions upon the use of water from any system, the Director shall order such restrictions as the Director in his or her sole discretion deems appropriate under the circumstances.

Such order may restrict the use of water for sprinkling, manufacturing, or nonessential uses. The use of water for particular purposes may be limited to specified days or hours of a day or altogether prohibited, except that the use of water for drinking, cooking, and sanitary purposes shall not be prohibited.

Notice of any such order shall be given, either in writing or orally when possible, to customers served by the affected system. Water supply to any premises upon which the use of water is being made in violation of such order may be summarily shut off.

When the Director determines that the emergency no longer exists, the Director shall, by further order, rescind the restrictions previously ordered. Notice of such order shall be given to customers in the same manner in which the order imposing the restrictions was given.

1-K-1b **EMERGENCY RESTRICTIONS ON WATER USE DUE TO OTHER THAN SYSTEM EMERGENCIES**: If the Engineer determines that circumstances other than those specified elsewhere in this section (such as natural disaster, epidemic, accident, war, other violent activity, labor dispute, civil disturbance or state or federal statute or executive or judicial order) require emergency restrictions upon the use of water from any system, the Engineer shall order such restrictions as the Engineer in his or her sole discretion deems appropriate under the circumstances, and then shall obtain ratification of the order from the District's Board at its first meeting following such restriction order.

Such order may restrict the use of water for sprinkling, manufacturing, or nonessential uses. The use of water for particular purposes may be limited to specified days or hours of a day or altogether prohibited, except that the use of water for drinking, cooking, and sanitary purposes shall not be prohibited.

Notice of any such order shall be given, either in writing or orally when possible, to customers served by the affected system. Water supply to any premises upon which the use of water is being made in violation of such order may be summarily shut off.

When the Engineer determines that the emergency no longer exists, the Engineer shall, by further order, rescind the restrictions previously ordered. Notice of such order shall be given to customers in the same manner in which the order imposing the restrictions was given.

1-K-2 **LEVEL 1 WATER SUPPLY SHORTAGE**:

1-K-2a A Level 1 Water Supply Shortage exists when the Engineer determines in his or her sole discretion that due to drought or other water supply conditions, a water supply shortage or threatened shortage exists, and a consumer demand reduction is necessary to make more efficient use of water and appropriately respond to existing water conditions. Upon the declaration by the Engineer of a Level 1 Water Supply Shortage condition, the Director shall implement the mandatory Level 1 conservation measures identified in this section, effective on the date determined by the Director.

1-K-2b In addition to the prohibited uses of water identified in Section L of this part, the following water conservation measures apply during a declared Level 1 Water Supply Shortage:

(i) Exterior Water Use: The District will establish allocations and water rates to achieve the desired reduction in exterior water use.

1-K-3 **LEVEL 2 WATER SUPPLY SHORTAGE**:

1-K-3a A Level 2 Water Supply Shortage exists when the Engineer determines in his or her sole discretion that due to drought or other water supply conditions, a water supply shortage or threatened shortage exists, and a consumer demand reduction is necessary to make more efficient use of water and appropriately respond to existing water conditions. Upon the declaration by the Engineer of a Level 2 Water Supply Shortage condition, the Director shall implement the mandatory Level 2 conservation measures identified in this section, effective on the date determined by the Director.

1-K-3b In addition to the prohibited uses of water identified in Rule 1-K-2 of Section K of this part and Section L of this part, the following water conservation measures apply during a declared Level 2 Water Supply Shortage:

(i) Limits on Filling Ornamental Lakes or Ponds: Filling or re-filling ornamental lakes or ponds is prohibited, except to the extent needed to sustain aquatic life, provided that such animals are of significant value and have been actively managed within the water feature prior to the declaration of a supply shortage level under these Rules and Regulations.

(ii) Limits on Washing Vehicles: Using water to wash or clean a vehicle is prohibited, except by use of a hand-held bucket or similar container, a hand-held hose equipped with a positive self-closing water shut-off nozzle or device, by high pressure/low volume wash systems, or at a commercial car washing facility that utilizes a re-circulating water system to capture or reuse water.

(iii) Limits on Filling Residential Swimming Pools and Spas: Re-filling of more than one foot and initial filling of residential swimming pools or outdoor spas with potable water is prohibited.

1-K-4 **LEVEL 3 WATER SUPPLY SHORTAGE – EMERGENCY CONDITION**:

1-K-4a A Level 3 Water Supply Shortage is also referred to as an "Emergency" condition. A Level 3 Water Supply Shortage exists when the Engineer determines that a significant reduction in consumer demand is necessary to maintain sufficient water supplies for public health and safety, declares a water shortage emergency and notifies District residents and businesses of the emergency. Upon the declaration by the Engineer of a Level 3 Water Supply Shortage, the Director shall implement the mandatory Level 3 emergency conservation measures identified in this section, effective on the date determined by the Director.

1-K-4b In addition to the prohibited uses of water identified in Rules 1-K-2 and 1-K-3 of Section K of this part and Section L of this part, the following water conservation measures apply during a declared Level 3 Water Supply Shortage:

(i) **No Watering or Irrigating**: Watering or irrigating of lawn, landscape or other vegetated area with potable water is prohibited. This restriction does not apply to the following categories of use, unless it is determined by the Director that recycled water is available and may be applied to the use:

a. Maintenance of vegetation, including trees and shrubs, that are watered using a hand-held bucket or similar container or hand-held hose equipped with a positive self-closing water shutoff nozzle or device.

b. Maintenance of existing landscape necessary for fire protection.

c. Maintenance of existing landscape for soil erosion control.

d. Maintenance of plant materials identified to be rare or essential to the well-being of protected species.

e. Maintenance of landscape within active public parks and playing fields, day-care centers, golf course greens, and school grounds, provided that such irrigation does not exceed two (2) days per week according to the schedule established to achieve the desired reduction in exterior water use and does not occur between 9:00 a.m. and 4:00 p.m. except for a short duration, not to exceed 3 minutes per station, for the limited purpose of testing or making repairs to the irrigation system.

f. Actively irrigated environmental mitigation projects.

(ii) **Obligations to Fix Leaks, Breaks or Malfunctions**: All leaks, breaks or other malfunctions in the water user's plumbing or distribution system must be repaired within a reasonable time of notification or discovery of the malfunction unless other arrangements are made with the District. A period of forty-eight hours after the water user discovers such malfunction, or receives notice from the District of such malfunction, whichever occurs first, shall be deemed a reasonable time within which to repair such malfunction.

(iii) **No New Potable Water Service**: Upon declaration of a Level 3 Water Supply Shortage, no new potable water service will be provided, no new temporary meters or permanent meters will be provided, and no statements of immediate ability to serve or provide potable water service (such as will-serve letters, certificates, or letters of availability) will be issued, except under the following circumstances:

a. A valid, unexpired building permit has been issued for the project; or

b. The project is necessary to protect the public health, safety, and welfare; or

c. The applicant provides substantial evidence of an enforceable commitment that water demands for the project will be offset prior to the provision of a new water meter(s) to the satisfaction of the District.

This provision does not preclude the resetting or turn-on of meters to provide continuation of water service or the restoration of service that has been interrupted for a period of one year or less.

1-K-5 **NO NEW ANNEXATIONS**: Upon the declaration of a Level 3 Water Supply Shortage, the District will suspend consideration of annexations to its service area. This subdivision does not apply to boundary corrections and annexations that will not result in any increased use of water.

1-K-6 **DISCONTINUED SERVICE**: The Director, in his or her sole discretion, may discontinue service to consumers who willfully violate the Level 3 Water Supply Shortage provisions.

1-K-7 **PROCEDURES FOR DETERMINATION/NOTIFICATION OF WATER SUPPLY SHORTAGE**

1-K-7a **DECLARATION AND NOTIFICATION OF WATER SUPPLY SHORTAGE**: The existence of a Level 1, Level 2 or Level 3 Water Supply Shortage shall be declared by the District Board or Engineer. If the declaration is made by the Engineer, the Engineer shall seek ratification of the declaration from the District Board at its first meeting following the declaration. Upon such declaration, all District customers shall be notified in writing of the applicable mandatory conservation measures, the date the measures are to take effect and, by reference to the applicable rule within these Rules and Regulations, the penalties that may be imposed for failing to comply with the measures.

1-K-8 **HARDSHIP WAIVER**

1-K-8a **UNDUE AND DISPROPORTIONATE HARDSHIP**: If, due to unique circumstances, a specific requirement of this section would result in undue hardship to a person using water or to property upon which water is used that is disproportionate to the impacts to water users generally or to similar property or classes of water users, then the person may apply for a waiver to the requirements as provided in this section.

1-K-8b **WRITTEN FINDING**: The waiver may be granted or conditionally granted only upon a written finding of the existence of facts demonstrating an undue hardship to a person using water or to a property upon which water is used that is disproportionate to the impacts to water users generally or to similar property or classes of water use due to specific and unique circumstances of the user or the user's property.

(i) Application: Application for a waiver shall be on a form prescribed by the District and shall be accompanied by a non-refundable processing fee in an amount set by the District.

(ii) Supporting Documentation: The application shall be accompanied by photographs, maps, drawings, and other information, including a written statement of the applicant

(iii) Required Findings for Waiver: An application for a waiver shall be denied unless the Approval Authority (defined elsewhere in this rule) finds, based upon the information provided in the application, supporting documents, or such additional information as may be requested, and on water use information for the property as shown by the records of the District, all of the following:

a. That the waiver does not constitute a grant of special privilege inconsistent with the limitations upon other residents and businesses;

b. That because of special circumstances applicable to the property or its use, the strict application of this section would have a disproportionate impact on the property or use that exceeds the impacts to residents and businesses generally;

c. That the authorizing of such waiver will not be of substantial detriment to adjacent properties, and will not materially affect the ability of the District to effectuate the purpose of this section and will not be detrimental to the public interest; and

d. That the condition or situation of the subject property or the intended use of the property for which the waiver is sought is not common, recurrent or general in nature.

1-K-8c **APPROVAL AUTHORITY**: The Director shall have approval authority and act upon any completed application no later than twenty (20) days after submittal and may approve, conditionally approve, or deny the waiver. The applicant requesting the waiver shall be promptly notified in writing of any action taken. Unless specified otherwise at the time a waiver is approved, the waiver will apply to the subject property during the term of the applicable Level 1, Level 2 or Level 3 Water Supply Shortage.

1-K-8d **APPEALS TO THE DISTRICT**: An applicant may appeal a decision by the Director to deny or conditionally approve a waiver application by filing a written request for hearing with the Engineer within ten (10) days of the Director's decision. The request for hearing shall state the grounds for the appeal. At a

public hearing, the Engineer shall act as the Approval Authority and review the appeal in accordance with the standards established in this rule. The decision of the Engineer is final.

PART 1 - SECTION L - PERMANENT WATER CONSERVATION MEASURES

RULE

1-L-1 **WATER SAVING DEVICES**: All new customers shall install and use the following water efficient plumbing fixtures:

(i) Ultra low volume toilets (1.6 gallons per flush or less).

(ii) Low flow shower heads (2.0 gallons per minute or less).

1-L-2 **WATER WASTE PROHIBITED:** No person shall use or permit the use of District water as follows:

1-L-2a Watering of turf, ornamental landscape, open ground crops and trees, in a manner or to an extent which allows water to run to waste.

1-L-2b In any manner such that the escape of water through leaks, breaks, or malfunctions within the water user's plumbing or distribution system occurs for any period of time beyond which such break or leak should reasonably have been discovered and corrected. It shall be presumed that a period of forty-eight hours after the water user discovers such leak, break, or malfunction, or receives notice from the District of such condition, whichever occurs first, is a reasonable time within which to correct such condition.

1-L-2c Using water to wash or clean a vehicle, including but not limited to washing automobiles, trucks, trailers, boats, or other types of mobile equipment, without the use of a hand-held bucket or similar container or a hand-held hose equipped with a positive self-closing water shut-off nozzle or device. This subdivision does not apply to any commercial car washing facility.

1-L-2d Operating any ornamental fountain, or similar structures, unless water for such is recycled for lawful reuse without substantial loss.

1-L-2e Washing down hard or paved surfaces, including but not limited to washing of sidewalks, walkways, driveways, parking lots or any other hard-surfaced areas by hose or flooding, except as otherwise necessary to prevent or eliminate conditions dangerous to the public health and safety or for other legitimate uses approved by the District, and then only by use of a hand-held bucket or similar container, a hand-held hose equipped with a positive self-closing water shut-off nozzle or device, a low-volume high-press cleaning machine equipped to recycle any water used, or a low-volume high-pressure water broom.

1-L-2f Serving water in eating or drinking establishments, including but not limited to restaurants, hotels, cafés, bars or other public places where food or drinks are sold or served, to customers without first being expressly requested by the customer.

1-L-2g Running of water or washing with water not otherwise prohibited above which is wasteful and without reasonable purpose.

1-L-2h Watering of residential, commercial, industrial, and governmental outdoor irrigation from 9:00 a.m. to 4:00 p.m. except for a short duration, not to exceed 3 minutes per station, for the limited purpose of testing or making repairs to the irrigation system. Agricultural customers are exempt from this irrigation schedule, but must comply with agricultural irrigation schedules determined by the District.

1-L-2i Running of water or spraying of water onto other properties.

1-L-2j Watering or irrigating of lawn, landscape or other vegetated area with potable water using a landscape irrigation system or a watering device that is not continuously attended for more than ten (10) minutes watering per day per station. This rule does not apply during the establishment period, as determined by the District, for new landscaping.

1-L-2k Laundering by hotels, motels and other commercial lodging establishments, except where customers are given the option of not having towels and linens laundered daily through the prominent display of written notice of such option in each bathroom using clear and easily understood language.

1-L-2l Through the installation of single pass cooling systems in buildings requesting new water service.

1-L-2m Through the installation of non-recirculating water systems in new commercial conveyor car wash and new commercial laundry systems.

1-L-2n Through the use of non-water conserving dish wash spray valves by food preparation establishments, such as restaurants and cafes.

1-L-2o Through a commercial conveyor car wash operating without a recirculating water system, or without first securing a waiver of this requirement from the Director.

1-L-3 **IRRIGATION SCHEDULES**: The district may impose irrigation schedules for outdoor use, including agricultural use, to address water conservation and limited water supply.

1-L-4 **FAILURE TO COMPLY**

1-L-4a **CIVIL PENALTIES**: In addition to any other penalties or sanctions provided by law, the following civil penalties shall be imposed for violation of any of the provisions of these Rules and Regulations, to be paid by the customer at the premises at which the violation occurred:

(i) For the first violation of any of the provisions of these Rules and Regulations, a written notice will be given to the customer.

(ii) For the second violation of any of the provisions of these Rules and Regulations within the preceding (12) twelve calendar months, a penalty of one hundred dollars ($100.00) shall be imposed by written

notice to the customer. This penalty is payable as part of the water bill, by the customer at the premises at which the violation occurred.

(iii) For the third violation of any of the provisions of these Rules and Regulations within the preceding (12) twelve calendar months, a penalty of two hundred and fifty dollars ($250.00) shall be imposed by written notice to the customer. This penalty is payable as part of the water bill, by the customer at the premises at which the violation occurred.

(iv) For the fourth violation of any of the provisions of these Rules and Regulations within the preceding twelve (12) calendar months, a penalty of five hundred dollars ($500.00) shall be imposed by written notice to the customer. This penalty is payable as part of the water bill, by the customer at the premises at which the violation occurred.

The District may also give written notice to the customer indicating that it will install a flow restricting device of 1 GPM capacity for services up to one and one half inch meter size, and comparatively sized restrictors for larger services, on the service of the customer at the premises at which the violation occurred for a period of not less than forty-eight (48) hours. The charge for installing such a flow restricting device will be based upon the size of the meter and the actual cost of installation. The charge for removal of the flow restricting device and restoration of normal service shall be based on the actual cost involved. Said charges shall be payable by the customer as part of the water bill. Restoration of normal service will be performed during the hours of 8:00 a.m. to 4:00 p.m. on regular working days. In addition, a surcharge penalty of $100.00 shall be imposed for restoration of normal service, payable by said customer as part of the water bill.

(v) If there are five violations of any of the provisions of these Rules and Regulations within twelve (12) consecutive calendar months, the District may, following notice to the customer as described herein, discontinue water service to the customer at the premises at which the violation occurred.

1-L-4b **NOTICE**: The District will give notice of each violation to the customer at the premises at which the violation occurred, as follows:

(i) For a first, second, or third violation, the District may give written notice of such violation to the customer personally or by regular mail.

(ii) If the penalty assessed is, or includes, the installation of a flow restrictor or the discontinuance of water service to the customer for any period of time whatever, notice of the violation will be given in the following manner:

a. By giving written notice thereof to the customer personally; or
b. If the customer is absent from or unavailable at the customer's billing address, place of residence, or place of business, by leaving a copy with an adult at such places, and by sending a

copy through the United States mail addressed to the customer at such places, via registered mail return receipts requested.

c. If service of the notice as provided in a & b above cannot be accomplished, notice can be given by affixing a copy in a conspicuous place on the property where the failure to comply has occurred and also by delivering a copy to a person residing at the property, if such person can be found.

d. All notices will contain, in addition to the facts of the violation, a statement of the possible penalties for each violation, a statement informing the customer of the customer's right to a hearing on the violation, a brief summary of the appeal process specified in this rule, and the date and time installation of the restrictor or discontinuance of the service will occur.

1-L-4c **HEARING**: Any customer against whom a penalty is to be levied pursuant to this section shall have a right to a hearing, in the first instance by the Director, with the right of appeal to the Engineer or his or her designee, on the merits of the alleged violation, upon the written request of that customer to the Director within fifteen (15) days of the date of giving notice of the violation. Penalties, including termination of water service, will be stayed until any such hearing is conducted and a written decision is made by the Director or his or her designee and given to the customer.

1-L-4d **APPEAL OF DECISION OF DIRECTOR**: A request for an appeal must be in writing and filed with the Engineer or his or her designee. The filing by a customer of a request for an appeal for any form of relief must be made within fifteen (15) days of the giving of the decision of the Director to the customer. Filing of such a request will automatically stay the implementation of the proposed course of action, pending the decision of the Engineer or his or her designee. No other or further stay will be granted. The appeal hearing will be scheduled to occur within a reasonable period of time following the written notice of appeal. The customer may present any evidence that would tend to show that the alleged violation has not occurred. Formal rules of evidence will not apply and all relevant evidence customarily relied upon by reasonable persons in the conduct of serious business affairs will be admissible, unless a sound objection warrants its exclusion as determined by the Engineer or his or her designee. The decision of the Engineer or his or her designee shall be final.

1-L-4e **RECONNECTION**: Where water service is disconnected, as authorized above, it will be reconnected upon correction of the condition or activity and the payment of the estimated reconnection charge and other applicable charges.

1-L-4f **PUBLIC HEALTH AND SAFETY**: Nothing contained in these Rules and Regulations shall be construed to require the District to curtail the supply of water to any customer when, in the discretion of the Engineer or his or her designee, such water is required by that customer to maintain an adequate level of public health and safety.

SECTION 1 INTRODUCTION

This report details the sanitary sewer study investigation for the Tentative Tract 5708 Hitch Ranch development in Moorpark, CA. The development is on a 273-acre± property north of Poindexter Avenue between Gabbert Road and Walnut Canyon Road within the Hitch Ranch SP1 Specific Plan area. The proposed project is located within the sanitary sewer service area of Ventura County Waterworks (VCWW) District No. 1.

The proposed development will consist of an in-tract gravity collection system that will flow generally north-to-south toward the southeastern corner of the project. The in-tract sewer system will have a 12-inch diameter main line on Street "A" which will serve all onsite Planning Areas and will be sized to accommodate any future flows from the north. After crossing beneath the existing Walnut Canyon Channel and Union Pacific Railroad tracks, the mainline will outfall to an existing manhole at the intersection of Poindexter Avenue and Sierra Avenue. From this point, an existing 18" gravity sewer line proceeds south on Sierra Avenue ultimately joining the main VCWW trunk line that parallels the Arroyo Simi waterway.

Specifically addressed herein are: 1) the proposed sewer generation loads for the Hitch Ranch project; and 2) the impacts of those proposed Hitch Ranch sewer loads on the existing VCWW sewer system.

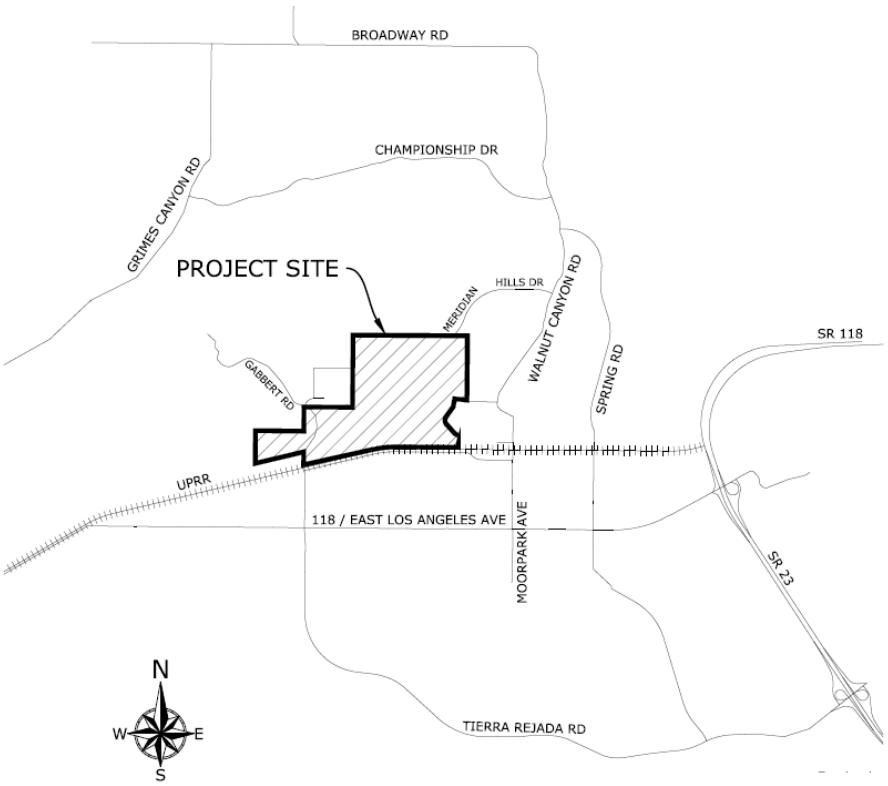

Figure 1: Project Location Map

SECTION 2 BASIS AND METHODOLOGY

The existing conditions of the VCWW sewer system were determined by performing wastewater flow monitoring at two locations identified in Exhibit 1. Results of the flow monitoring are included in Attachment 2. Additional anticipated future flows from planned (but not-yet-constructed) upstream developments were estimated based on the number of dwelling units approved by the City of Moorpark Community Development Department or (if the project is not yet approved as of the date of this report) based on the zoning density tables within the *County of Ventura Public Works Agency Sewerage Manual*. Refer to Exhibit 2 for an overview of the sewer service area that is tributary to the Hitch Ranch project. The *Sewer Master Plan (SMP) for Tentative Tract Nos. 4928 and 5187* and the S*anitary Sewer Study for Country Club Estates West and East (Tracts 5463 and 5464)* (both prepared by Hunsaker & Associates) were also referenced for pertinent information.

The average day sewer generation loads for the proposed development were calculated using the following VCWW duty factors:

- Dwelling density of 3.5 persons per SFD
- Dwelling density of 2.2 persons per MFD for buildings w/ 5 for more residential units
- Per capita average sewer generation of 0.00012 ft^3/s, or 78 gallons/day
- Q_{adw} = average dry-weather flow in ft^3/s
- Q_{pdw} = peak dry-weather flow = 2.65 $(Q_{adw})^{0.9}$ in ft^3/s (for avg flows ≤1.0 ft^3/s)
- Q_{pdw} = peak dry-weather flow = 2.65 $(Q_{adw})^{-0.1}$ in ft^3/s (for avg flows > 1.0 ft^3/s)
- Q_{pww} = peak wet-weather flow = 2.50 (Q_{pdw}) in ft^3/s
    - An I&I of 2.5 was assigned by VCWW District No. 1 staff on the basis that average flow at the Moorpark Treatment plant is 2 MGD, but flows have reached up to 5 MGD during significant storm events
- d/D = maximum depth/diameter = ⅔ for pipes < 12”
- d/D = maximum depth/diameter = ¾ for pipes ≥ 12”

SECTION 3 DEVELOPMENT SEWER LOADS

The Hitch Ranch development will be comprised of of 4 residential planning areas consisting of 755 dwelling units, of which 261 are single-family detached dwellings (SFDs), 253 are medium-density multi-family dwellings (MFDs), and 241 are high-density MFDs. An additional 110 MFDs are anticipated at a future apartment development on Lot 264 of Tentative Tract 5708. While this apartment development is considered ‘Not a Part’ of the Tentative Tract 5708 Hitch Ranch development improvements, the sewer flows generated from this future development will be factored into the design calculations to ensure adequate capacity of the sewer infrastructure in a fully developed condition. Table 1 below details the proposed average day sewer generation loads anticipated for the Hitch Ranch development.

Table 1: Proposed In-Tract Average Sewer Generation Loads

Dwelling Type	VCWW Sewer Criteria		Proposed Average Sewer Load		
	Dwelling Density	Per Capita Sewer Load (gallons/day)	Dwelling Units	Sewer Load (Gallons per Day)	Sewer Load (cfs)
SFD	3.5	78	261	71,253	0.110
MFD	2.2	78	494	84,771	0.131
		SUBTOTAL	**755**	**156,024**	**0.241**
Future MFD (Lot 264)	2.2	78	110	18,876	0.029
		TOTAL	**865**	**174,900**	**0.271**

Following the determination of the average day sewer loads from the Hitch Ranch development, the proposed 15-inch sewer main line on High Street was analyzed to confirm sizing and capacity. Table 2 (below) summarizes the sewer flow analysis results.

Table 2: In-Tract Peak Sewer Analysis

Point ID	Description	Sewer Diam. (in)	Min. Pipe Slope (ft/ft)	SFD	MFD	Q_{adw} (ft^3/s)	Q_{pdw} (ft^3/s)	Q_{pww} (ft^3/s)	V_{pww} (ft/s)	d/D (% full)
A	High Street	15	0.0030	-	-	0.271	0.817	2.043	2.94	55 ✓
	Street A at Street D	-	-	*27*	-	*0.011*	-	-	-	-
	Street A at Casey Rd	-	-	-	*253*	*0.067*	-	-	-	-
	Street A at Street H	-	-	*20*	-	*0.009*	-	-	-	-
	Street A at Street I	-	-	*23*	-	*0.010*	-	-	-	-
	Street A at Lot 263	-	-	-	*351*	*0.093*	-	-	-	-
	Street A at Street J	-	-	*93*	-	*0.039*	-	-	-	-
	Street A South of Street J	-	-	*98*	-	*0.042*	-	-	-	-

The remainder of the in-tract wastewater conveyance system will consist of 8-inch diameter gravity sewer lines that will convey wastewater to the aforementioned 12-inch diameter mainline beneath Street "A". At a minimum anticipated slope of 0.0100 ft/ft, an 8-inch diameter pipe can convey 0.973 ft^3/s before exceeding the maximum allowable d/D of ⅔. The highest anticipated

peak flow from the proposed 8-inch lines can be found in the line servicing the MFDs on Lots 263 and 264. This line will convey a Q_{adw} of 0.093 ft^3/s, a Q_{pdw} of 0.312 ft^3/s, and a Q_{pww} of 0.780 ft^3/s, which is 20% less than the maximum allowable flow rate of 0.973 ft^3/s.

Following the determination of the proposed in-tract sewer loads from the Hitch Ranch development, the existing downstream sewer system was analyzed to confirm capacity. Table 3 (below) summarizes the sewer flow analysis results.

Table 3: Off-Tract Peak Sewer Analysis

* Existing flows were obtained from flow monitoring results. Refer to Attachment 2.
** Dwelling unit count is based on Sewerage Manual Section 2.122, Building Density for Undeveloped Areas.
*** Avg. flow rate is based on Sewerage Manual Section 2.13, Commercial and Manufacturing.
****Dwelling unit count is assumed to be 1.5 persons/unit for the planned 390 senior assisted-living units

At the request of VCWW, this study also presents an analysis with an alternate point of connection from the Hitch Ranch development to the existing sewer line on Gabbert Road at the intersection of Poindexter Avenue. The northerly 1,100 feet of the existing Gabbert Road main line is an 8-inch diameter pipe at 0.0075 ft/ft slope. At the intersection of Gabbert Road and Commerce Avenue, the line increases to a 12-inch diameter pipe and proceeds 1,300 feet south and west to Mira Sol Drive (via Los Angeles Avenue) at 0.0020 ft/ft slope. Based on the aforementioned flow data and the information presented in Table 4 below, both the existing 8-inch and existing 12-inch segments described above are undersized to effectively convey the anticipated flows from Tentative Tract 5708 and would require upsizing to larger diameter lines in order to accommodate the anticipated flows. At minimum 0.0020 ft/ft slope, a 15-inch dimeter pipe would be required from the intersection of Gabbert Road and Poindexter Avenue to the intersection of Los Angeles Avenue and Mira Sol Drive in order to convey the anticipated flows.

Table 4: Off-Tract Peak Sewer Analysis (Alternate Route)

* Existing flows were obtained from flow monitoring results. Refer to Attachment 2.

** Dwelling unit count is based on VCWW Sewerage Manual Section 2.122, Building Density for Undeveloped Areas.

SECTION 4 CONCLUSIONS AND RECOMMENDATIONS

The preceding analysis of the proposed Tract 5708 Hitch Ranch sewer flow rates indicates that at peak flow all proposed sewer pipes less than 12-inches in diameter will remain within the VCWW design constraint of two-thirds full at peak flow, and proposed (and existing pipes immediately downstream of the Hitch Ranch development) which are 12-inches in diameter and larger will remain within the VCWW design constraint of three-quarters full at peak. With the exception of the 1,500 feet of existing 8-inch and 12-inch diameter sewer pipe on Gabbert Road north of Los Angeles Avenue in the alternate route option, it is determined that no deficiency is observed in the existing wastewater collection system at the studied level of build-out conditions.

1.1 Overview

The sewer system in the City of Moorpark is controlled by the County of Ventura Water and Sanitation Department, which is managed by the County of Ventura Department of Public Works. The sewer lines monitored as part of this report are all within the Ventura County system. The Utility Services Division of the County of Ventura Water and Sanitation Department is responsible for the operation, maintenance, design, inspection, and construction of the Special Districts and County Service Areas.

Formed on November 22, 1921, Ventura County Waterworks (VCW) District 1 encompasses approximately 20,000 acres. Providing potable water and sanitation services to over 10,000 customers, District 1's boundaries encompass the City of Moorpark as well as contiguous, unincorporated areas to the north and west of the city. VCW District 1 owns, operates, and maintains the Moorpark Water Reclamation Facility (MWRF). The current rated design capacity of the plant is 5.0 million gallons per day (mgd). Approximately 1.5 mgd of effluent is treated to tertiary standards to comply with Title 22 water quality standards. The Moorpark Country Club Estate's 27-hole golf course uses recycled water from the MWRF for irrigation.

Since the County of Ventura is responsible for all portions of this wastewater collection system, sewer flow monitoring is required as a condition of development. This requirement not only helps to ensure adequate capacity, but continually updates their database with the most current information, allowing the County to improve the condition and performance of its wastewater collection system, reducing the occurrences of SSOs, and ensuring the health and safety of the communities they serve.

1.2 Project Description

Utility Systems Science & Software, Inc. (US^3) was contracted by the Encompass Consultant Group to perform sewer flow monitoring at two sewer manholes downstream from the point of connection with the proposed Hitch Ranch development project. The sewer lines and monitoring sites are shown on map in Section 1.3. This sewer system assessment was developed for the current conditions to analyze for potential capacity limitations in the monitored lines.

US^3 assessed permitting and traffic control requirements for the selected monitoring sites. Traffic control for the two sites followed standards used during construction, maintenance, and utility activities in accordance with the California Manual of Uniform Traffic

Control Devices. An encroachment permit was approved by the City prior to flow monitoring.

US^3 performed an initial site inspection to evaluate the site hydraulics at the selected monitoring sites. **Note:** Each wastewater collection system is different, and some of the differences that affect flow monitoring include: slope of sewer line; age, condition and material of sewer line; number and type of connections; and sewer design, specifically the proximity of baffles, drop structures, pumps, siphons, and weirs. None of these structures were found within the selected manholes. Since the hydraulics within the selected manholes were acceptable for flow monitoring during the inspection, it was determined that the sites should provide an accurate representation of the flow patterns during the study. Therefore, installation at the sites occurred on 4/10/2019.

The manholes were equipped with Hach Marsh-McBirney Flo-Dar® AV Sensors and Loggers. With the installation and removal of the equipment, the manholes were opened and confined space entry was limited to crossing the plane with hands and arms, but not actually entering the manholes. Even though US^3 personnel did not enter the manholes during equipment installation or removal, they were fully trained and certified in Confined Space Entry and CPR, and in accordance with safety standards, gas readings were taken and recorded throughout the duration of the installation and removal process.

In summary, US^3 performed the following services as part of this project:

- Sewer Flow Monitoring
    - Detailed preliminary investigation
        - Assessment of permitting and traffic control requirements
        - Inspection and evaluation of the selected sites
    - Installation of Marsh-McBirney Flo-Dar® AV Sensors and Loggers
        - Validation of hydraulic suitability
        - Calibration of flow monitoring equipment
        - Documentation of installation and calibration

- Flow monitoring between 4/10/2019 and 4/18/2019
- Removal of flow monitoring equipment
- Validation of flow monitoring data

- Development of a report to discuss the flow monitoring data, including system statistics and graphs

1.3 Site Map

Figures: The vicinity map (above) shows the temporary wastewater flow monitoring locations and their sewer lines. The Gabbert Rd manhole is at latitude 34.280152 and longitude -118.900978, and the Poindexter Av manhole is located at latitude 34.284676 and longitude -118.889169.

1.4 Summary of Sites

Figures below: The photos show the Gabbert Rd MH in the southbound lane of Gabbert Rd, at its intersection with Commerce Av. This is a commercial area, and the field team used cones and signs for traffic control during installation and removal of the monitoring equipment. Surface conditions were dry. No issues were encountered.

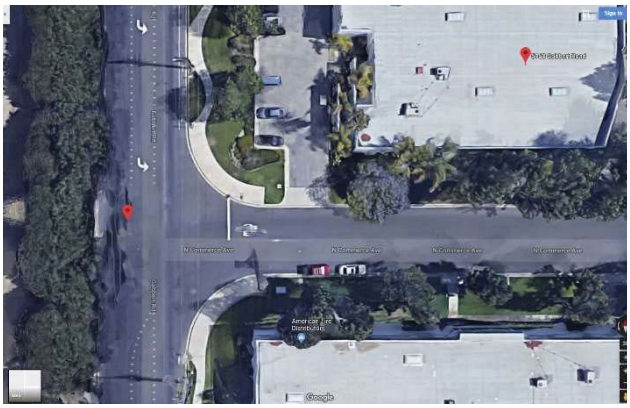

Figure above: The manhole provided access to a 12-inch sewer line, which entered from the east and discharged to the south. An 8-inch lateral entered the manhole from the north. Gas levels were good (well within OSHA acceptable limits: O_2=20.9%; LEL, H_2S & CO=0). The flow monitoring equipment was set to monitor the downstream pipe to get the total flow. Follow up on this installation confirmed equipment calibration.

Figures below: The photos show the Poindexter Av MH in the eastbound lane of the road. This is north of a residential area, and the field team used cones and signs for traffic control during installation and removal of the monitoring equipment. Surface conditions were dry. No issues were encountered.

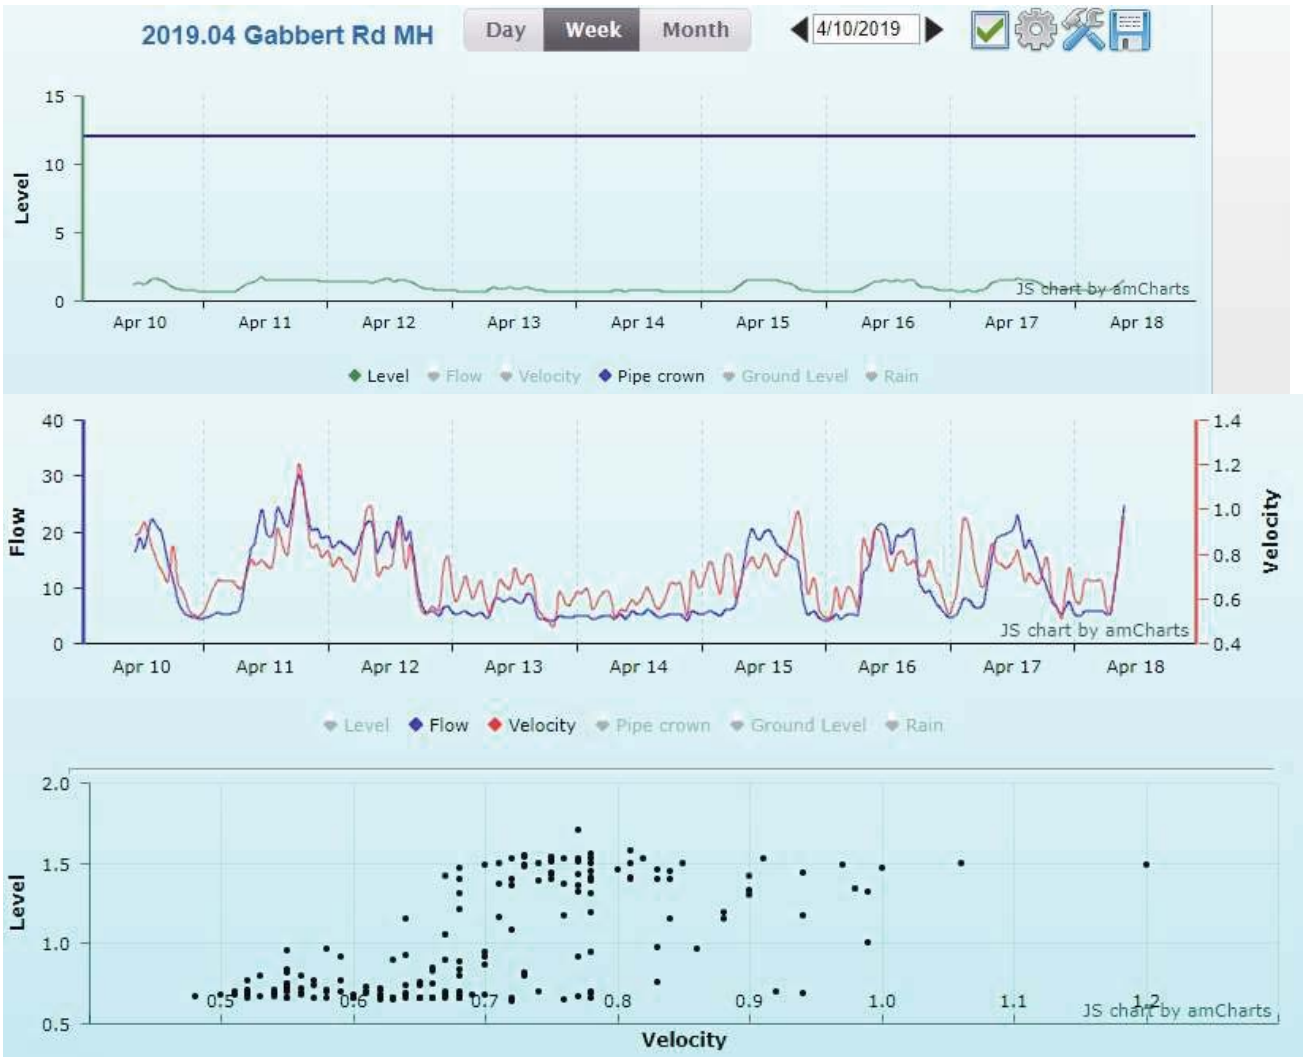

Figure above: The manhole provided access to an 18-inch sewer line, which entered from the east and discharged to the west. Gas levels were good. The flow monitoring equipment was set to monitor the upstream pipe as it provided the best hydraulics. Follow up on this installation confirmed equipment calibration.

1.5 Existing Capacity Analysis

The capacity evaluation method conformed to the following process:

1. Collect 15-minute interval depth and velocity data points at each site over the entire monitoring period and determine the depth vs. velocity relationship or pipe curve based on Manning's equation.
2. Determine statistically the minimum, maximum and average depths and flow rates at each site during the monitoring period.
3. Calculate the maximum theoretical unobstructed flow rate at each site.
4. Determine remaining capacity under peak flow conditions at each site, using the ratios of actual daily flow depths to pipe diameter.

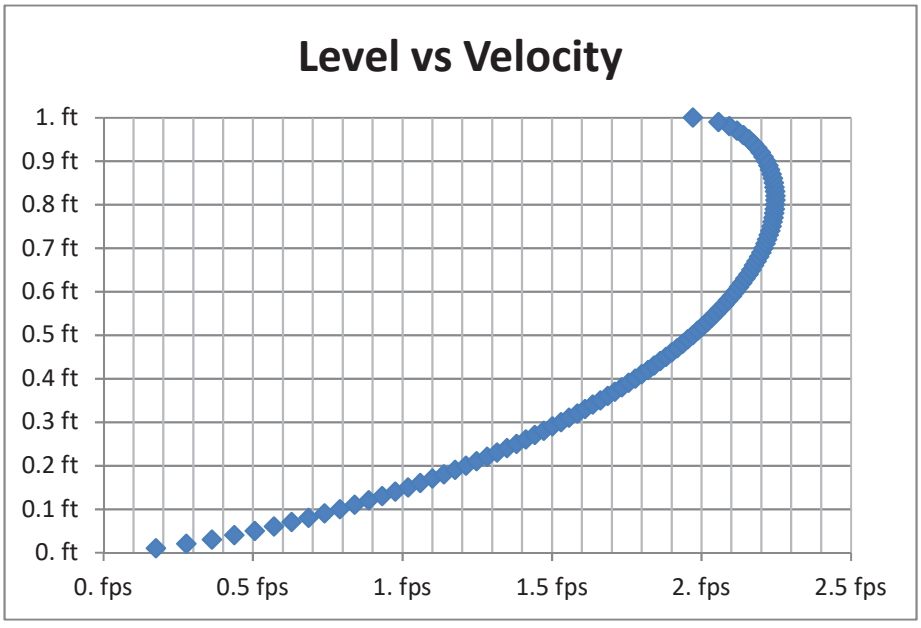
Figures below: 2019.04 Gabbert Rd MH graphs of level, flow & velocity, and scatter plot of level in relation to velocity from US[3] Flow Monitoring Website (http://us3.uscubed.com/)

The scatter plot on the previous page shows the depth vs. velocity data points for the monitored pipe. The pattern of velocity and depth data points for a sewer operating in free-flow conditions over an extended period of time should conform to the depth-velocity relationship of Manning's Equation, which is the basis for evaluating flow monitoring data. This equation (shown below) defines a commonly used theoretical relationship between depth and velocity in pipes operating under free flow conditions:

$$v = 1.486/n \times R^{2/3} \times S^{1/2}$$

Where,

v = velocity (fps)



n = pipe roughness, defined as the Manning's Roughness Coefficient

R = hydraulic radius,
defined as wetted area (ft^2) divided by wetted perimeter (ft)

S = hydraulic slope

The scatter plot from the Gabbert Rd MH shows the depth vs. velocity data points for the 12-inch downstream pipe, which should resemble a theoretical hydraulic operating curve based on the site-specific characteristics of the pipe. Using velocities from this study in conjunction with the associated cross-sectional areas depicted by the monitored levels, the flow was calculated using the Continuity Equation, and then the slope was derived using Manning's Equation. Therefore, the calculated slope is based on the average flow data observed during the study. Velocity and level readings were compared to theoretical hydraulic operating curves at different slopes, correlating with an operating curve with a slope of ~0.42% (S=0.0041687).

Figure at right: This theoretical pipe curve was generated for a 12-inch (1.0-ft) pipe with a slope of ~0.42%.

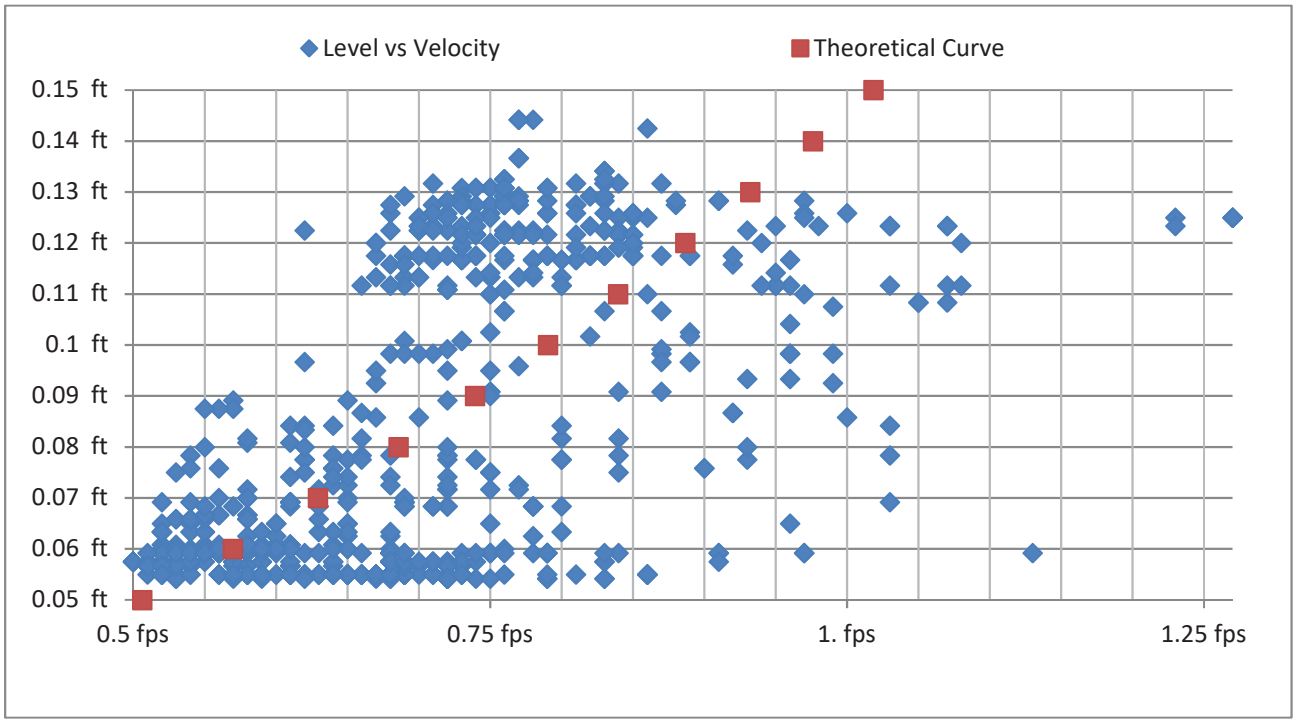


Figure above: Since the flows at the Gabbert Rd MH utilized ~5% to ~14% of the pipe depth during the study, that portion of its theoretical curve has been overlaid onto its scatter plot.

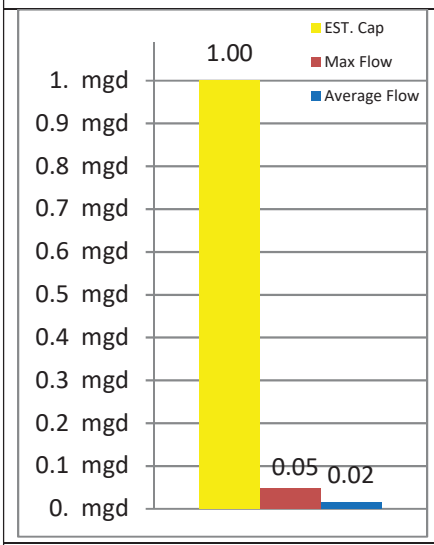
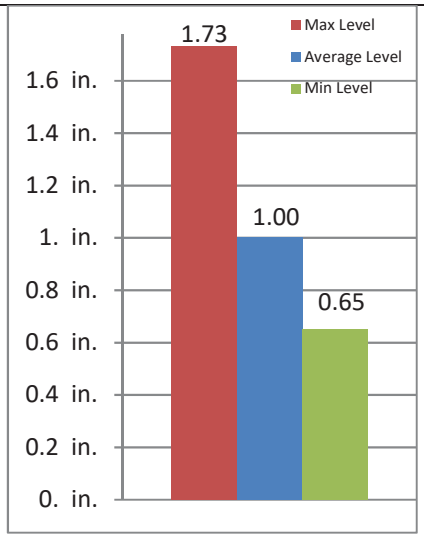


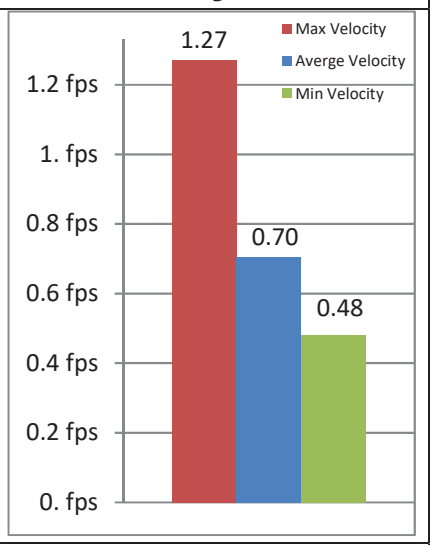
As shown in the scatter plot above, the expected relationship between level and velocity is not prevalent, probably due to the low velocities and potential blockages within the line. There could be multiple flow patterns present, but this data set is more of a cloud formation, which is indicative of processed flow.

To summarize the site statistics from the data analysis at the Gabbert Rd MH:



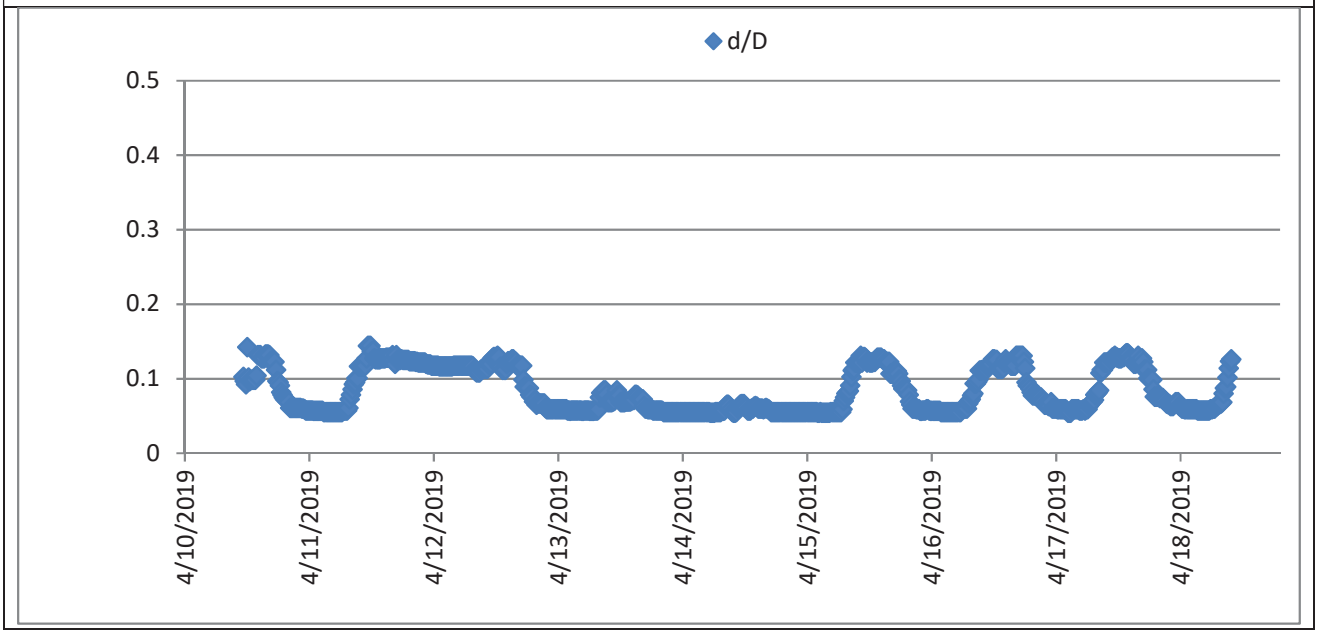
- During peak flows, ~5% of the pipe's capacity was utilized at ~32 gpm.
- During average flows, ~2% of the pipe's capacity was utilized at ~11 gpm.
- According to common sewer design, velocity shall not be less than 2.0 fps a minimum of once per day to provide sufficient scouring action for self-cleaning. The maximum velocity at this site was 1.27 fps with an average velocity of 0.70 fps. Since the minimum requirements for self-cleaning were not met during this 9-day study, this site is likely to have issues due to settlement of normal system solids.
- According to common sewer design, the depth versus diameter (d/D) ratio for gravity drains of 15 inches in diameter or less should be no greater than 0.50 for the ultimate peak flow condition. The average d/D ratio for the site during this study was ~0.08 and the maximum was ~0.14. Therefore, this 12-inch pipe has capacity available at peak flow.

The following is a graphical representation of the site statistics from the data analysis:

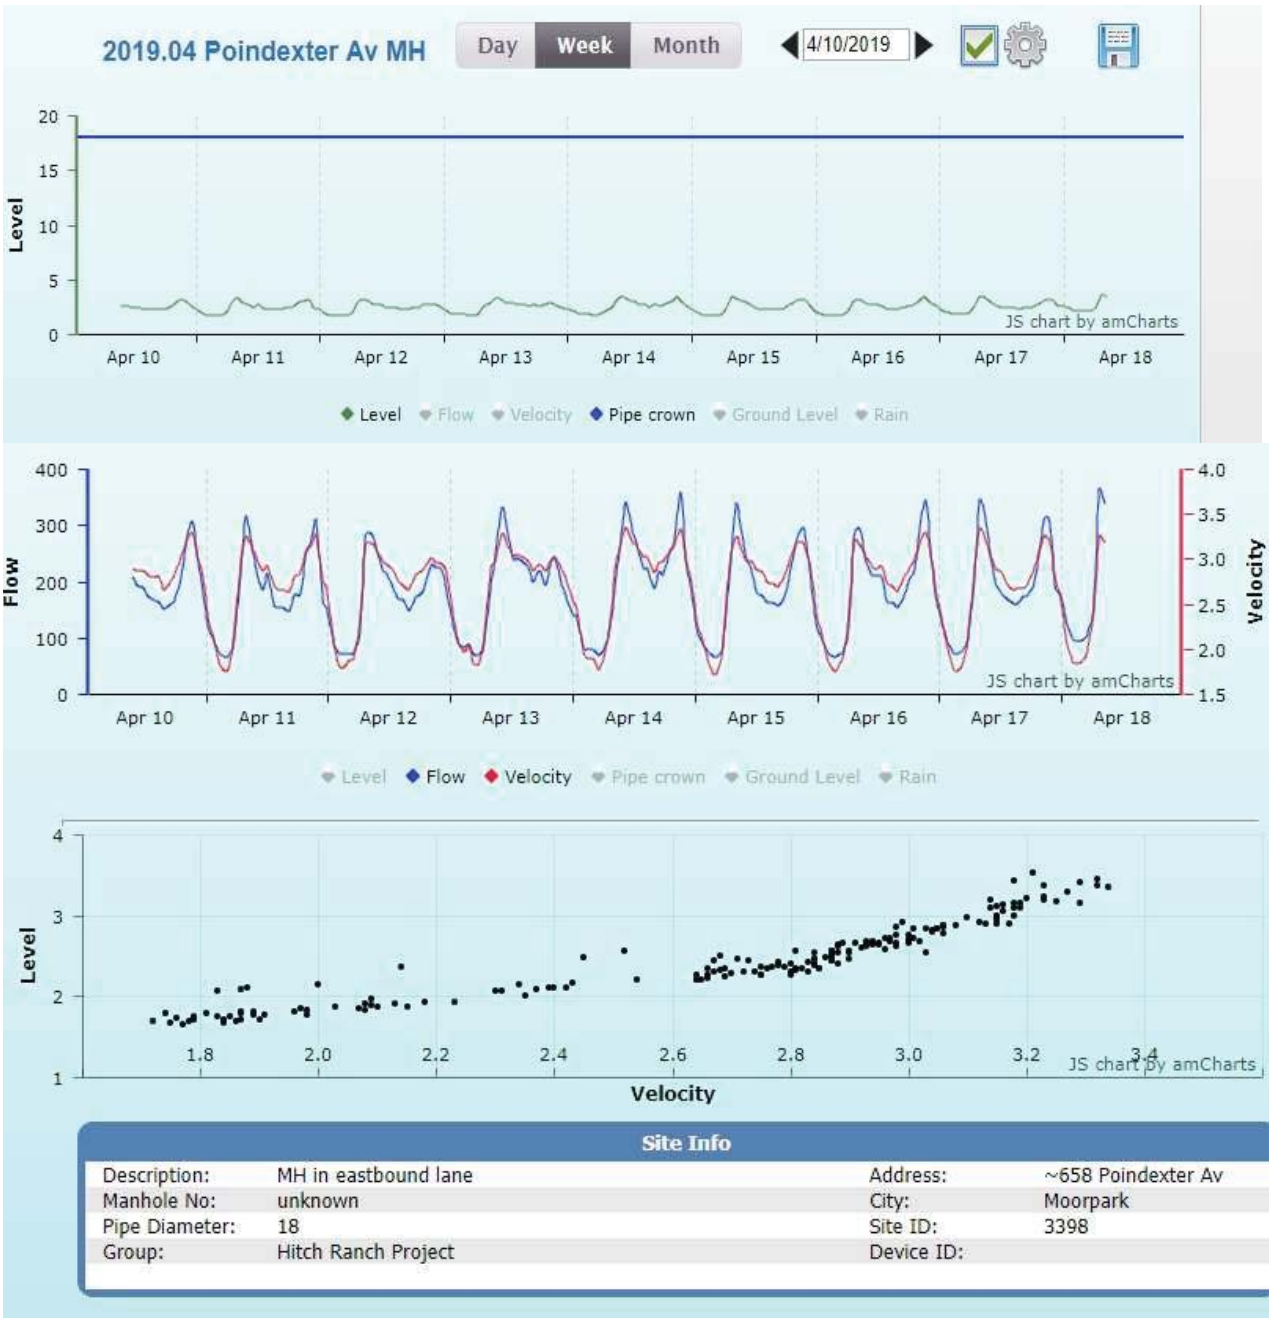


Flow Stats

Level Stats



Velocity Stats



The pipe capacity was estimated using a Manning's Circular Pipe Flow Capacity chart, where n=0.013 (in accordance with the minimum value for a vitrified clay sewer pipe (VCP) with manholes, inlets, etc., Chow 1959). From the theoretical hydraulic operating curve for a 12-inch pipe with a slope of ~0.42% (S=0.0041687), with the pipe completely full, the velocity is expected to be ~1.9710 fps. When this velocity is input into the Flo-Ware program from the Gabbert Rd MH, a maximum capacity of ~1.0005 mgd is produced. This is a reasonable assumption based on the levels and velocities observed during this study.

2019.04 Gabbert Rd MH Level (depth) vs Pipe Diameter

Figures below: 2019.04 Poindexter Av MH graphs of level, flow & velocity, and scatter plot of level in relation to velocity from US^3 Flow Monitoring Website (http://us3.uscubed.com/)

The scatter plot above shows the depth vs. velocity data points for the 18-inch upstream pipe, which should resemble a theoretical hydraulic operating curve based on the site-specific characteristics of the pipe. Actual velocities and levels were compared to theoretical hydraulic operating curves at different slopes, which led to the conclusion that the data best resembles a curve with the slope of ~1.89% (S=0.01893813) at the Poindexter Av MH.

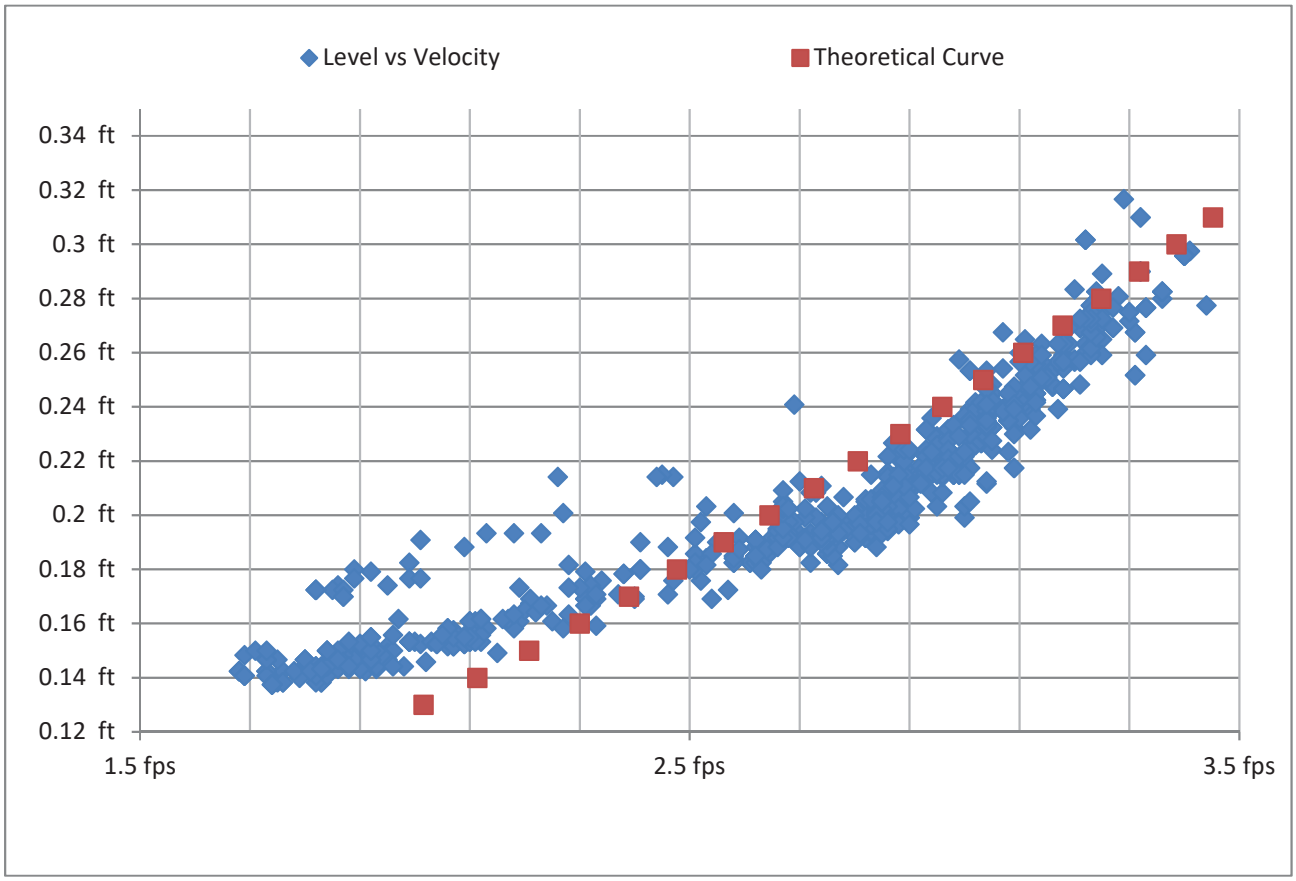


Figure above: Since the flows at Poindexter Av MH utilized ~9% to ~21% of the pipe depth during the study, that portion of its theoretical curve has been overlaid onto its scatter plot.

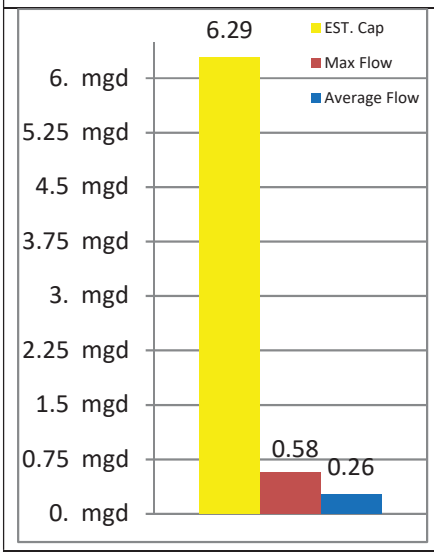
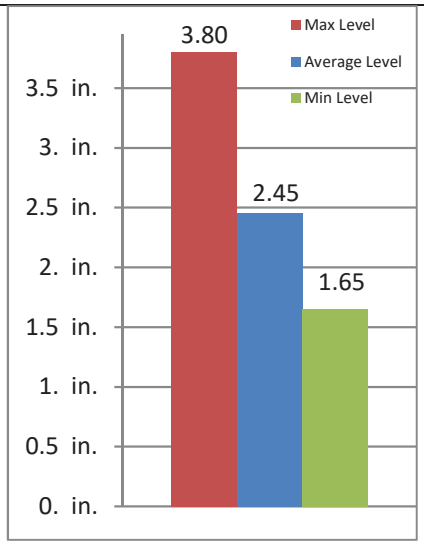


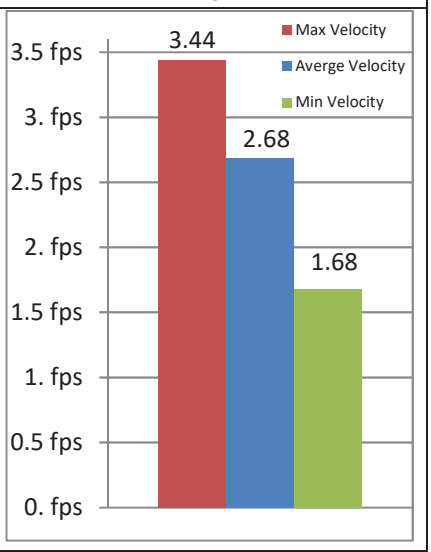
As shown in the scatter plot above, while a majority of the data follows the expected level to velocity relationship, there is a secondary flow pattern that is slightly off.

To summarize the site statistics from the data analysis at the Poindexter Av MH:



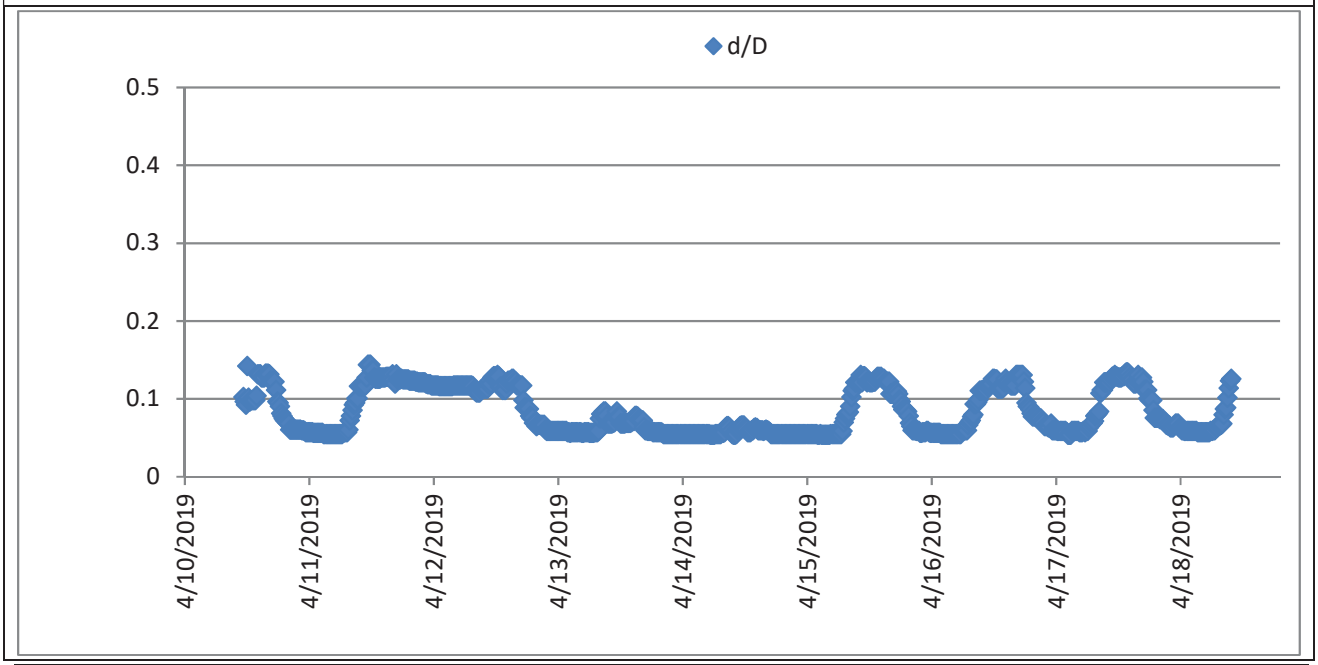
- During peak flows, ~9% of the pipe's capacity was utilized at ~402 gpm.
- Average flows utilized ~4% of the pipe's capacity at ~184 gpm.
- The maximum velocity at this site was 3.44 fps with an average velocity of 2.68 fps. Since velocities exceeded 2.0 fps every day during this study, this site should have no issues with regard to blockage due to settlement of normal system solids.
- According to common sewer design, the depth versus diameter (d/D) ratio for gravity drains of greater than 15 inches in diameter should be no greater than 0.67 for the ultimate peak flow condition. During the study, the average d/D ratio for this 18-inch line was ~0.14 and the maximum was ~0.21. Therefore, this site has capacity available at peak flow.

The following is a graphical representation of the site statistics from the data analysis:



Flow Stats

Level Stats



Velocity Stats

The pipe capacity was estimated using a Manning's Circular Pipe Flow Capacity chart, where n=0.013 (in accordance with the minimum value for a VCP with manholes, inlets, etc., Chow 1959). From the theoretical hydraulic operating curve for an 18-inch pipe with a slope of ~1.89% (S=0.01893813), with the pipe completely full, the velocity should be ~5.5049 fps, which when input into the Flo-Ware program from the Poindexter Av MH produced a maximum capacity of ~6.2873 mgd. This is a reasonable assumption based on the levels and velocities observed during this study.

2019.04 Poindexter Av MH Level (depth) vs Pipe Diameter

1.6 Conclusions

Calculations in this report are based on steady uniform flow with steady flow defined as the discharge being constant with time, and uniform flow defined as the slope of the water surface and cross-sectional flow area being constant in the length of pipe analyzed. Using velocities from this study in conjunction with the associated cross-sectional areas depicted by the monitored levels, the flow was calculated using the Continuity Equation, and the slope was derived using Manning's Equation.

The flow monitoring equipment at each site was calibrated with regard to location and flow, using site-specific characteristics and manual level and velocity readings for adjustment and verification.

2019.04 Gabbert Rd MH: The graphs for this site showed a fairly consistent daily flow pattern with a poor level to velocity relationship. In addition, velocities did not meet the minimum requirements to provide sufficient scouring action for self-cleaning and flows were extremely low on the weekend.

In order to determine the maximum allowable flow within this monitored pipe segment, the calculated slope based on the average flow data observed during the study (~0.42%) was used to generate a theoretical hydraulic operating curve for a 12-inch pipe. At half pipe (6 inches), the velocity from the theoretical curve was ~1.9710 fps, which when input into the Flo-Ware program from the Gabbert Rd MH produced an expected capacity of ~0.5003 mgd. Since peak flow was 0.0465 mgd, there should be capacity available for an additional 0.4538 mgd before the pipe exceeds its d/D limit of 0.50 at peak flow. This is a reasonable assumption since the average maximum velocity from the study (1.00 fps) coincided with an average level of ~1.2206 inches, and according to the theoretical curve, the velocity at 1.22 inches should be ~0.7992 fps.

2019.04 Poindexter Av MH: The graphs for this site showed a fairly consistent daily flow pattern with a good level to velocity relationship. In addition, velocities met the minimum requirements to provide sufficient scouring action for self-cleaning daily.

In order to determine the maximum allowable flow within this monitored pipe segment, the calculated slope based on the average flow data observed during the study (~1.89%) was used to generate a theoretical hydraulic operating curve for an 18-inch pipe. For a pipe size greater than 15-inches, the d/D limit is 0.67. At this flow depth (12 inches), the velocity from the theoretical curve was ~6.0931 fps, which when input into the Flo-Ware program from the Gabbert Rd MH produced an expected capacity of ~4.9285 mgd. Since peak flow was 0.5788 mgd, there should be capacity available for an additional 4.3497 mgd before the pipe exceeds its d/D limit of 0.67 at peak flow. This is a reasonable assumption since

the average maximum velocity from the study (3.32 fps) coincided with an average level of ~3.3275 inches, and according to the theoretical curve, the velocity at 3.33 inches should be ~3.2491 fps.

Whether or not the available capacity is sufficient is dependent upon the proposed land use for the proposed project. Since the capacity of a system is contingent upon its most limited segment, the Gabbert Rd MH is the limiting factor. However, the data supports the conclusion that there is capacity available in these lines.

Tab 3: Methods & Procedures & Equipment

3.1 Methods and Procedures

Utility Systems Science & Software provided the Encompass Consultant Group with an off the shelf, non-proprietary flow monitoring solution that included two state of the art Hach Flo-Dar® AV Sensor systems. The project course of action is listed below. The US^3 team:

- Assessed permitting and traffic control at the monitoring sites on Gabbert Rd and Poindexter Av in Moorpark, CA.
- Validated the sites for suitability for sewer flow monitoring for the Hitch Ranch Development Project.
- Prepared a submittal packet and obtained an Encroachment Permit with the City of Moorpark.
- Coordinated with the Ventura County Water and Sanitation Department Engineer and the Wastewater Superintendent for installation and removal of flow monitoring equipment.
- Installed and removed traffic control in accord with approved site-specific WATCH requirements for both the installation and removal of equipment.
- Installed and calibrated the flow monitoring equipment per manufacturer recommendations.
- Removed the equipment, validated the data and prepared the reports.
  - The data supports the conclusion that there is capacity available in the monitored lines since the depth of the peak flows observed during this study did not exceed the d/D limit at either of the sites.

3.2 Equipment

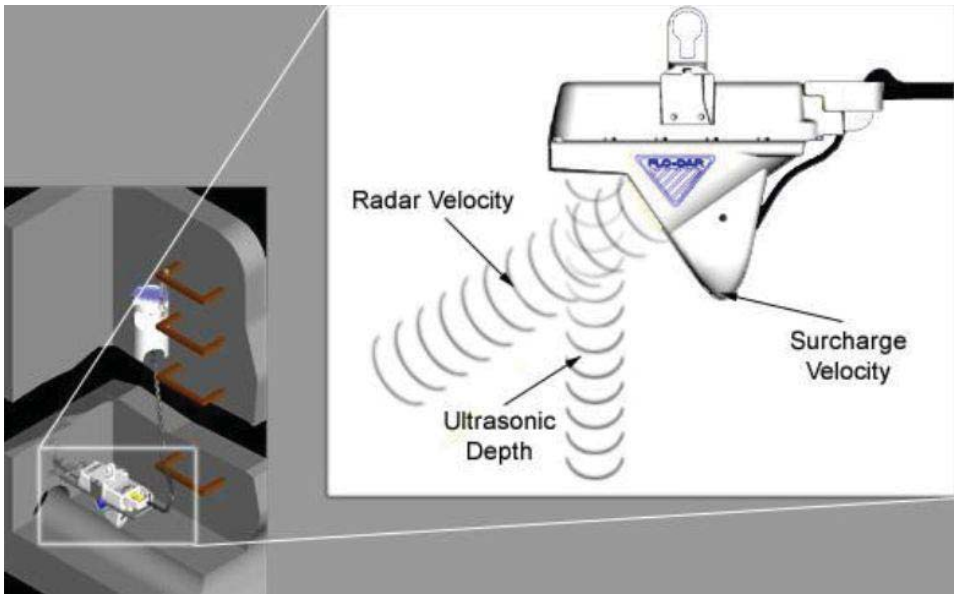

Figure: Equipment installed as part of this Sewer Flow Monitoring Study

Figure: Web-Enabled Flo-Dar® AV Sensor, Radar-Based Velocity/Area Flow Meter

3.2.1 SPECIFICATIONS

- **Enclosure**
  - IP68 Waterproof rating, Polystyrene
- **Dimensions**
  - 160.5 W x 432.2 L x 297 D mm (6.32 x 16.66 x 11.7 in.),
  - With SVS, D = 387 mm (15.2 in.)
- **Weight**
  - 4.8 kg (10.5 lbs.)
- **Operating Temperature**
  - -10 to 50°C (14 to 122°F)
- **Storage Temperature**
  - -40 to 60°C (-40 to 140°F)
- **Power Requirements**
  - Supplied by FL900 Flow Logger, Flo-Logger, or Flo-Station

- **Interconnecting Cable**
  - Disconnect available at both sensor and logger or Flo-Station
  - Polyurethane, 0.400 (±0.015) in. diameter; IP68
  - Standard length 9 m (30 ft), maximum 305 m (1000 ft)
- **Cables – available in two styles:**
  - Connectors at both ends
  - Connector from sensor with open leads to desiccant hub, desiccant hub with connector to logger. A potting/sealant kit will be included. This can be used to run the cable through conduit.
- **Certification**
  - Certified to: FCC Part 15.245: FCC ID: VIC-FLODAR24
  - Industry Canada Spec. RSS210. v7: IC No.: 6149A-FLODAR24

SURCHARGE DEPTH MEASUREMENT

  - Auto zero function maintains zero error below 0.5 cm (0.2 in.)
- **Method**
  - Piezo-resistive pressure transducer with stainless steel diaphragm
- **Range**
  - 3.5 m (138 in.), overpressure rating 2.5 x full scale

VELOCITY MEASUREMENT

- **Method**
  - Radar
- **Range**
  - 0.23 to 6.10 m/s (0.75 to 20 ft/s)
- **Frequency Range**
  - 24.075 to 24.175 GHz, 15.2 mW (max.)
- **Accuracy**
  - ±0.5%; ±0.03 m/s (±0.1 ft/s)

DEPTH MEASUREMENT

- **Method**
  - Ultrasonic
- **Standard Operating Range from Flo-Dar® Housing to Liquid**
  - 0 to 152.4 cm (0 to 60 in.)
- **Optional Extended Level Operating Range from Transducer Face to Liquid**
  - 0 to 6.1 m (0 to 20 ft.) with 43.18 cm (17 in.) dead band, temperature compensated.
- **Accuracy**
  - ±1%; ±0.25 cm (±0.1 in.)

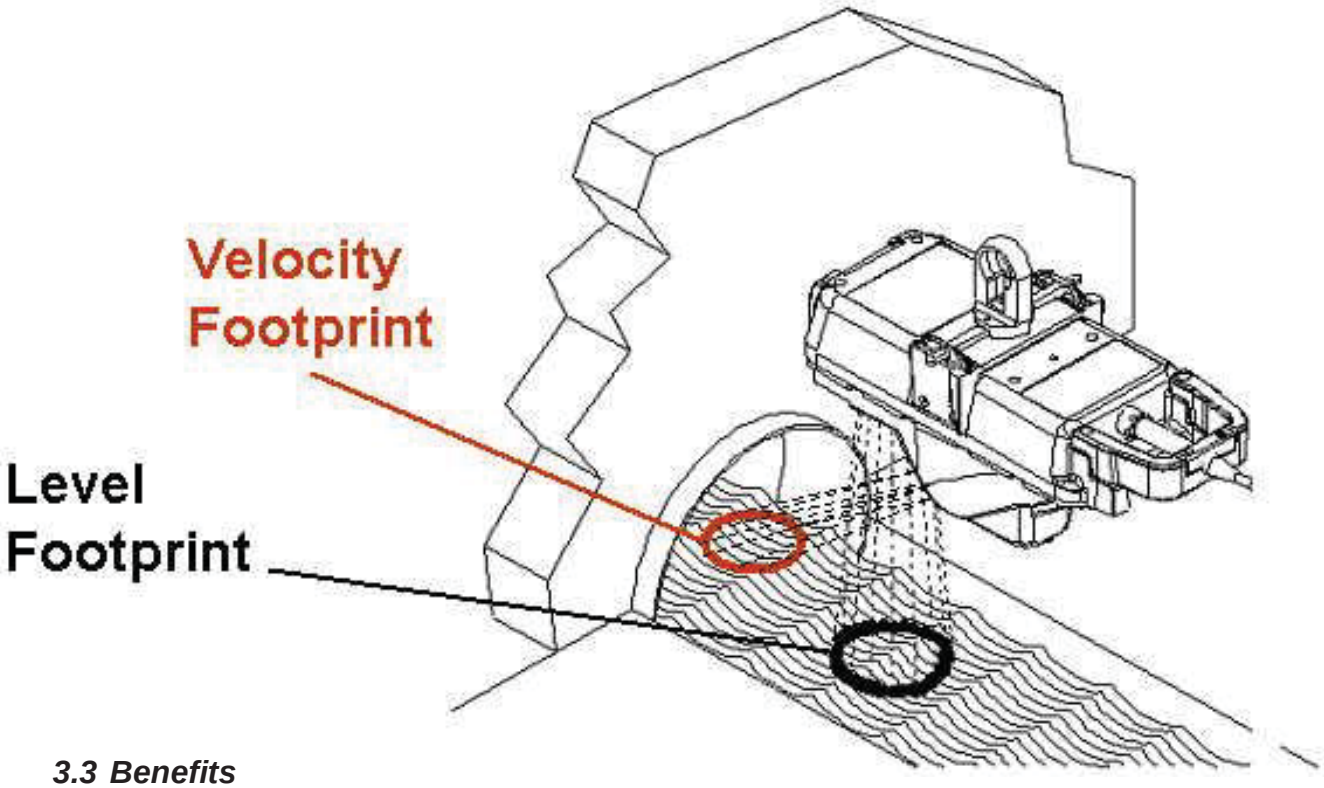
FLOW MEASUREMENT

- **Method**
  - Based on Continuity Equation
- **Accuracy**
  - ±5% of reading typical where flow is in a channel with uniform flow conditions and is not surcharged, ±1% full scale max.

SURCHARGE CONDITIONS DEPTH/VELOCITY DEPTH (Std with Flo-Dar® Sensor)

- **Surcharge depth supplied by Flo-Dar® sensor.**

VELOCITY (Optional Surcharge Velocity Sensor)



- **Method**
  - Electromagnetic
- **Range**
  - ±4.8 m/s (±16 ft/s)
- **Accuracy**
  - ±0.15 ft/s or 4% of reading, whichever is greater.
- **Zero Stability**
  - ±0.05 ft/s

The Flo-Dar® Open Channel Flow Meters provide an innovative approach to open channel flow monitoring. Combining digital Doppler radar velocity sensing with ultrasonic pulse echo level sensing, Flo-Dar® provides accurate open channel flow monitoring without the fouling problems associated with submerged sensors.

3.2.2 Perfect Solution for Difficult Flow Conditions:

- Flows with High Solids Content
- High Temperature Flows
- Caustic Flows
- Large Man-Made Channel
- High Velocities
- Shallow Flows

3.3 Benefits

3.3.1 Personnel have no contact with the flow during installation.
3.3.2 Maintenance caused by sensor fouling is eliminated.
3.3.3 Field Replaceable / Interchangeable Sensors and Monitors

3.4 How It Works

Flo-Dar® transmits a digital Doppler radar beam that interacts with the fluid and reflects back signals at a different frequency than that which was transmitted. These reflected signals are compared with the transmitted frequency. The resulting frequency shift provides an accurate measure of the velocity. Level is detected by ultrasonic pulse echo. Flow is then calculated based on the Continuity Equation:

Q = V x A, Where Q = Flow, V = Average Velocity and A = Area

3.5 Accurate Flow Measurements

Flo-Dar® provides the user with highly accurate flow measurements under a wide range of flows and site conditions. By measuring the velocity of the fluid from above, Flo-Dar® eliminates accuracy problems inherent with submerged sensors including sensor disturbances, high solids content and distribution of reflectors.

Tab 4: DVD with Raw Flow Monitoring Data

Tab 5: US³ Company Information

US³ is a California Corporation **Federal ID No. 33-0729605** and qualifies as a Minority Business Enterprise. US³ has certified as an MBE with the California Public Utility Commission's authorized clearinghouse, **Verification Number: 97ES0008.**

US³ is a specialty service company for the Water & Waste Water industry, providing monitoring and control for Utilities since 1996. US³ is in the forefront of this industry by taking the proven technological approaches developed in other high-tech industries and applying them to protect one of our most precious natural resources - our water.

US³ engineers and technical personnel have applied advanced instrumentation system technology to water/wastewater open channel flow monitoring, pipeline evaluation, engineering, and data analysis, all coupled to the power of the Internet. This unique integrated systems approach allows the company to bring greater insight and intelligence to gathering information about water/wastewater system performance of our clients, and in turn, to support the fulfillment of their commitments to manage and cost effectively design, operate, and maintain these systems.

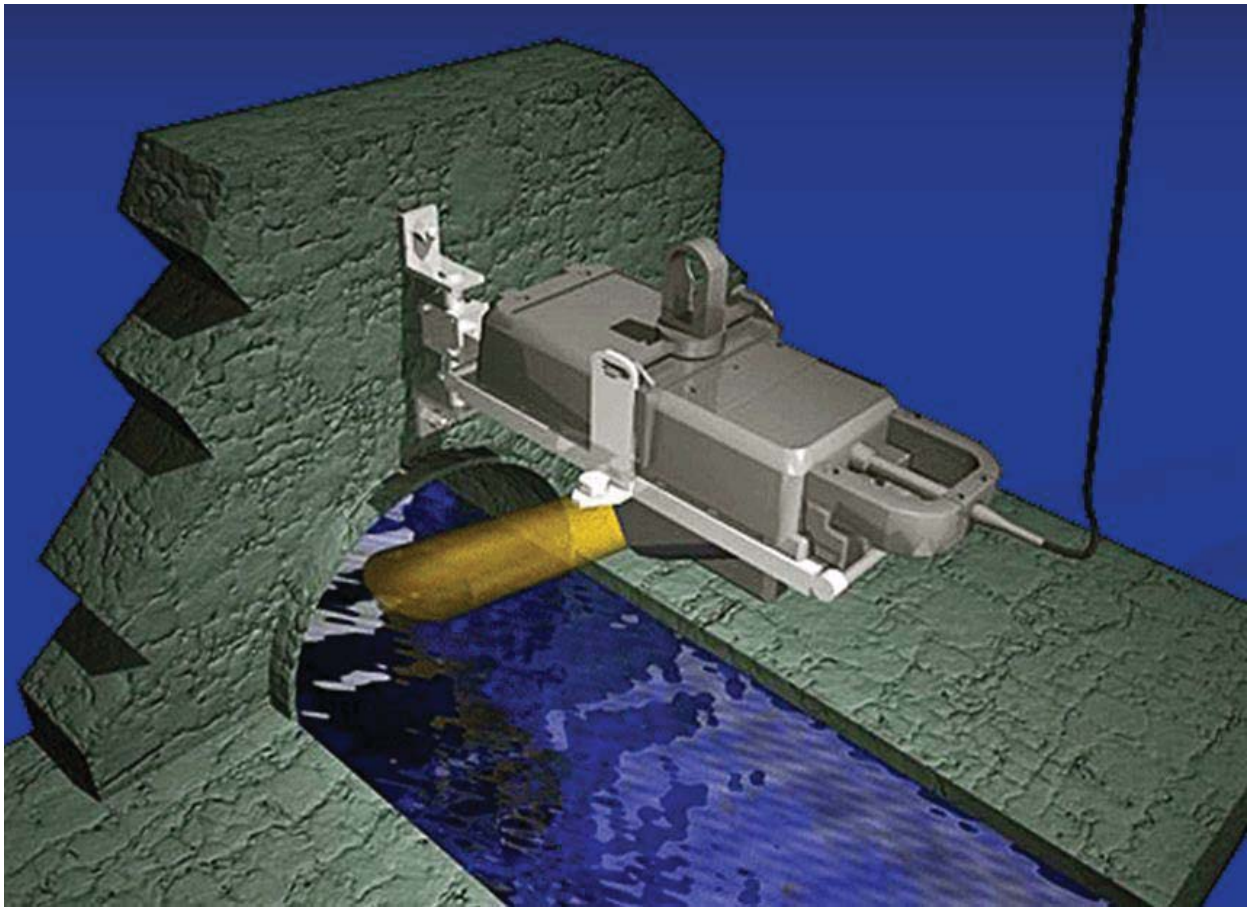


Figure: US³ utilizes exclusively Hach March-McBirney Flo-Dar® Meters

Moreover, ***US³*** supports Municipalities, Consulting Engineering firms and other water/waste water systems integrators by providing temporary technical services for engineering, software programming and technical site maintenance and calibration site support work, primarily in the Water and Waste Water industries.

Figure: All technicians are certified for Confined Space Entry.

Subject: TM 5708 – Hitch Ranch
Sewer Study

Dear Ms. Rapista,

The District has reviewed the sewer study provided by ECG along with previous studies and new studies for concurrently proposed developments. This letter serves as guidance for your development to facilitate potential future improvements.

The ECG study proposed two routes for connecting the development to the sewer system as described below:

- Primary Route – east along the High Street extension to a point of connection on Sierra Avenue, Sierra Avenue to Shasta Avenue to Los Angeles Avenue to Maureen Lane and finally connecting to the sewer trunk line along the Arroyo Las Posas
- Alternative Route- west along the High Street extension to a point of connection on Gabbert Road, Gabbert Road to Los Angeles Avenue to Mira Sol Drive to Pepper Mill Street and finally connecting to the sewer trunk line along the Arroyo Las Posas

The District has reviewed the proposed routing and determined the primary routing may lead to odor issues due to the multiple turns in the sewer and resulting turbulence. There is also significant flow proposed from future developments in northern Moorpark. This flow will be primarily routed through the sewer main in Sierra Avenue. It is in the District's best interest to attempt to spread flow evenly throughout the collection system to retain capacity and minimize impact of emergencies.

The District requires Hitch Ranch to proceed with the alternative routing through Gabbert Road or propose a new alternative with appropriate supporting documents which will minimize impact to existing District customers. This new alternative could include flow splitting using multiple existing sewer mains to route flows. Future requirements may be further defined during plan review of the sewer system. The West Point Homes Development (Tract 5847) has also proposed to have a point of connection on Gabbert Road. Efforts will need to be coordinated for the construction of infrastructure should they pursue that point of connection.

If you have any questions regarding the above, please feel free to contact Ryan Lippincott (805) 378-3018 or Scott Meckstroth at (805) 378-3015.

Sincerely,

Ryan Lippincott

Cording, E.J. and Hansmire, W.H., "Displacement Around Soft Ground Tunnels", Proceedings of the 6th Pan-American Conference on Soil Mechanics and Foundation, Engineering, Buenos Aires, Argentina, pp.571-633.

Dear Ms. Rapista,

At your request, we have prepared this correspondence to summarize our "updated" evaluation of the proposed undercrossing of the Ventura County Watershed Walnut Channel. We previously presented our preliminary evaluation of the proposed Walnut Channel undercrossings of water and sewer lines. However, the proposed sewer line crossing will now be located near the intersection of Gabbert Road and Poindexter Avenue. Based on the information provided by the project civil engineer, the sewer invert at the crossing will be an elevation of 463.8 feet MSL. The channel invert near the sewer has an elevation of approximately 468.1 feet MSL. The sewer will be 12 inches in diameter and likely be installed using a jack and bore approach with a conducting casing that has an OD of about 20 inches. Based on this configuration, the clearance between the conducting casing and the bottom of the channel is estimated to be a minimum of about 2 feet. The Ventura County Watershed District has expressed concern with adverse effects on the channel from vibrations caused by the jack and bore operation. In addition, ground subsidence caused by soil loss during drilling is also a general factor to be considered.

As part of our evaluation, we have reviewed previous site exploration data contained in our referenced report for the Hitch Ranch development. One boring was drilled to a depth of 28 feet in proximity to the proposed sewer crossing and another boring in the generally area with a similar geologic conditions was drilled to a depth of 41.5 feet. The borings indicate the area is underlain by alluvial soils that are generally comprised of silty clay, silty sand, and sand. The materials were described as moist and stiff and loose to dense. The borings were drilled with an 8-inch-diameter hollow stem auger and no caving occurred. Groundwater was encountered at depths of 15 and 23 feet below the existing grade. We

estimate that bedrock is located approximately at an elevation of 440 feet MSL or deeper near the sewer crossing.

With regard to ground vibrations, a jack and bore operation would use a drill bit slightly smaller than the conducting casing. Therefore, the bit would still be about 2 feet from the bottom of the channel. Site soils are anticipated to consist of silty sands or finer-grained soils that are expected to be easily drilled with this equipment. Due to a lack of hard rock, gravel, and cobbles, we anticipated the resulting ground vibrations would not exceed a continuous Peak Particle Velocity (PPV) of about 0.10 inch/sec. Based on criteria established by Caltrans in their Technical Advisory TAV-02-01-R9601, "Transportation Related Earthborne Vibrations, dated February 20, 2002, a PPV of 0.10 represents virtually no risk of architectural damage to normal buildings. We therefore conclude that jack and bore operations required to construct the water and sewer lines would pose little risk of damage due to ground vibrations provided clearance of about 2 feet is maintained between the channel bottom and the conducting casing.

We have also performed analyses to estimate the potential ground subsidence that could be caused by soil loss during jack and bore operations. Our analyses followed the methodology proposed by Cording and Hansmire referenced above. Assuming a 21-inch-diameter casing with a spring line depth of 2.9 feet below the bottom of the channel, we estimate maximum vertical ground settlement of about ¼ to 3/8 inches, depending on the actual soil and groundwater conditions at the pipe depth. This settlement is estimated to occur over a length ranging from 3.5 feet to 9 feet along the line of the channel with corresponding angular distortions of about 1:60 to 1:400, respectfully. An angular distortion as low as 1:60 would generally result in cracking of a concrete structure. However, the channel is expected to behave as a deep beam due to the sides of the channel. Taking this into consideration, we anticipate the channel can readily span this short distance of 3.5 feet without distortion and without exhibiting damage. As the potential span length increases, the total settlement and distortion decrease toward tolerable levels. Therefore, upper range of span should also not impact the channel.

The key to completing the jack and bore operations will be to fully characterize subsurface site conditions and develop detailed construction specifications to minimize risks to the channel. We recommend this firm undertake an investigation of the proposed undercrossing and prepare a detailed geotechnical report pertaining to this work.

Respectfully submitted,

Albus & Associates, Inc.

Executive Summary

This Fire Protection Plan (FPP) has been prepared for the proposed Hitch Ranch mixed-density residential community Project (Proposed Project) that incorporates land uses for housing and recreational purposes. The Proposed Project would consist of the construction of approximately 755 dwelling units on approximately 277.30 acres including approximately 328 single-family dwelling units on approximately 46.91 acres and approximately 427 multi-family dwelling units on approximately 26.47 acres (191 medium density units and 236 high density units), 32 open space lots, two (2) recreation space lots, and one (1) public park lot located within the City of Moorpark in the County of Ventura, California. The Proposed Project site is currently undeveloped and is located in the rolling hills north of Poindexter, east of Gabbert Road and west of Moorpark Avenue/Walnut Canyon Road (State Route 23). The Proposed Project site is located approximately 0.5 miles south of the Moorpark County Club and bordered to the south by the Union Pacific Railroad track ROW, a commercial development park, existing single-family residences, and a middle school; to the west by existing single-family residences; and to the east by single-family residences and an elementary school. The proposed development will be situated on seven parcels comprised of the following Assessor Parcel Numbers (APN's): APN's 511-0-020-170, 511-0-020-110, 511-0-020-130, 511-0-020-160, 511-0-020-180, 511-0-020-195, and 511-0-200-245. As part of the Proposed Project, access to the site will be improved by widening existing Casey Road to the east, extending High Street across the southern boundary of the Project site from Gabbert Road to the easterly boundary of the project, extending proposed North Hills Parkway across the center of the project site from Gabbert Road to the west to State Route 23 to the east, and from existing Meridian Hills Road to the north. As indicated in the Moorpark's General Plan Circulation Element, access will be improved and area circulation and evacuation capabilities will be improved as the project eliminates three existing dead end roads by connecting them with project roads.

The Hitch Ranch Proposed Project site lies within an area considered a Very High Fire Hazard Severity Zone (VHFHSZ), as designated by the Ventura County Fire Department (VCFD) and California Department of Forestry and Fire Protection (CAL FIRE). Fire hazard designations are based on topography, vegetation, and weather, amongst other factors. In summary, the project is located in the western portion of the City of Moorpark, adjacent to open space areas to the north, is currently undeveloped and vacant, and is covered primarily by flashy grass fuels. The terrain on, and within the vicinity of the project, is characterized by relatively flat slopes, with gradients reaching up to roughly 9%. The area, like all of Ventura County, is subject to seasonal weather conditions that can heighten the likelihood of fire ignition and spread, and, considering the site's terrain and vegetation, may result in a moderate to fast moving and moderate-intensity wildfire.

This FPP evaluates and identifies the potential fire risk associated with the Proposed Project's land uses and identifies requirements for water supply, fuel modification and defensible space, access, building ignition and fire resistance, and fire protection systems, among other pertinent fire protection criteria. The purpose of this plan is to generate and memorialize the fire safety requirements and standards of the VCFD along with project-specific measures based on the site, its intended use, and its fire environment.

The Proposed Project site is within the jurisdiction of the VCFD. The VCFD operates two fire stations that would respond to an incident on the site, including Station Nos. 40 and 42. Based on the Hitch Ranch Project site location in relation to existing VCFD stations, travel time to the site for the first responding engine from Station 42 is less than 2 minutes to the proposed project entrance, on Casey Road. Travel within the development may reach up to 2 minutes, based on the longest proposed road stretch of approximately 0.80 miles, resulting in response time of less than 4 minutes for the entire development. Secondary response would arrive in less than 4 minutes. Based on these calculations, emergencies within the project can be responded to by VCFD's first arriving unit

(average maximum initial response of no more than 8.5 minutes for fire apparatus and 5 minutes for ambulance, 90% of calls) in accordance with the County's emergency response standard. In addition, automatic/mutual aid agreements are in place with all surrounding communities and have been recently improved through the implementation of a computer aided dispatch system.

As determined during the analysis of this site and its fire environment, the Proposed Project site, in its current condition, may include characteristics that, under favorable weather conditions, could have the potential to facilitate fire spread. Under extreme conditions, wind-driven wildfires from the east / northeast could cast embers onto the property. Once the Proposed Project community is built, the Hitch Ranch on-site fire potential will be lower than its current condition due to fire safety requirements that will be implemented on this site, including ignition resistant construction standards, requirements for water supply, fire apparatus access, fuel modification and defensible space, interior fire sprinklers and 8.5 minute or less fire response travel times were integrated into the code requirements and internal VCFD guidelines based on the County of Ventura Strategic Plan. When it became clear that specifics of how structures were built, how fire and embers contributed to ignition of structures, what effects fuel modification had on structure ignition, how fast firefighters could respond, and how much (and how reliable) water was available, were critically important to structure survivability, the Fire and Building codes were revised appropriately. Ventura County now boast some of the most restrictive codes for building within Wildland Urban Interface (WUI) areas that focus on preventing structure ignition from heat, flame, and burning embers.

As detailed in this FPP, the Hitch Ranch Project site's fire protection approach will include a redundant layering of protection methods that have proven to reduce overall fire risk. The requirements and recommendations included herein are performance based rather than a prescriptive, one-size-fits-all approach. The fire protection approach is designed to reduce the wildfire hazards on the site, to minimize risks associated with proposed uses, and aid the responding firefighters during an emergency. No singular measure is intended to be relied upon for the site's fire protection, but rather, a system of fire protection measures, methods, and features combine to result in enhanced fire safety, reduced fire potential, and a prepared community.

Early evacuation for any type of wildfire emergency at the Hitch Ranch Proposed Project site is the preferred method of providing for safety, consistent with the VCFD's current approach for evacuation. As such, the Hitch Ranch Project residents will be provided information on, encouraged to practice, and implement a "Ready, Set, Go!" (Ventura County Fire Department 2016) approach to site evacuation. The "Ready, Set, Go!" concept is widely known and encouraged by the state of California and most fire agencies, including the VCFD. Pre-planning for emergencies, including wildfire emergencies, focuses on being prepared, having a well-defined plan, minimizing potential for errors, maintaining the site's fire protection systems, and implementing a conservative (evacuate as early as possible) approach to evacuation and site uses during periods of fire weather extremes.

Based on the results of this FPP's analysis and findings, the following FPP implementation measures will be provided by the Hitch Ranch Proposed Project site. These measures are discussed in more detail throughout this FPP.

- Project buildings will be constructed of ignition resistant[1] construction materials and include automatic fire sprinkler systems based on the latest adopted Building and Fire Codes for occupancy types.

[1] A type of building material that resists ignition or sustained flaming combustion sufficiently to reduce losses from wildland-urban interface conflagrations under worst-case weather and fuel conditions with wildfire exposure of burning embers and small flames, as prescribed in CBC, Chapter 7A and State Fire Marshal Standard 12-7A-5, Ignition-Resistant Materials.

- Project will provide up to 200 feet of Zone A, Zone B, and Zone C fuel modification with additional fire protection measures, including dual-tempered dual pane window upgrade for facades facing the natural open space. The project would also hire a qualified Ventura County Fire Department-approved 3rd party fuel modification zone inspector to provide annual inspections.

- Landscape plantings will not utilize prohibited plants that have been found to be highly flammable (see Appendix E).

- Fire apparatus access roads (i.e., public and private streets) will be provided throughout the development and will vary in width and configuration but will all provide at least the minimum required unobstructed travel lanes, lengths, turnouts, turnarounds, and clearances required by applicable codes. Primary access and internal circulation will comply with the requirements of the VCFD.

- Buildings will be equipped with automatic fire sprinkler systems meeting requirements.

- Water capacity and delivery provide for a reliable water source for operations and during emergencies requiring extended fire flow.

- The Hitch Ranch residents will be provided information on, encouraged to practice, and implement a "Ready, Set, Go!" approach to site evacuation

INTENTIONALLY LEFT BLANK

1 Introduction

This Fire Protection Plan (FPP) has been prepared for the proposed Hitch Ranch Project (Proposed Project) in Moorpark, California, an incorporated city in Ventura County. The purpose of the FPP is to assess the potential impacts resulting from wildland fire hazards and identify the measures necessary to adequately mitigate those impacts. Additionally, the purpose of this plan is to generate and memorialize the fire safety requirements of the Fire Authority Having Jurisdiction (FAHJ), namely the VCFD. Requirements are based on site-specific characteristics and incorporate input from the project's developer/applicant (Comstock Homes), project planners, engineers, and architects, as well as the VCFD.

As part of the assessment, the plan has considered the fire risk presented by the site including the property location and its topography, geology, surrounding combustible vegetation (fuel types), climatic conditions, fire history and the proposed land use. This FPP addresses water supply, access, structural ignitability and ignition resistive building features, fire protection systems and equipment, impacts to existing emergency services, defensible space, and vegetation management. The plan identifies fuel modification zones and recommends the types and methods of treatment that will protect this project and its essential infrastructure. The FPP recommends measures that developer/builders will take to reduce the probability of structural ignition throughout the project.

The following tasks were performed toward completion of this plan:

- Gather site specific climate, terrain, and fuel data;
- Collect site photographs;
- Process and analyze Hitch Ranch Project data using the latest GIS technology;
- Predict fire behavior using scientifically based fire behavior models, comparisons with actual wildfires (e.g., 2003 Simi, 2006 Shekell, and 2009 Guiberson Fires) in similar terrain and fuels, and experienced judgment;
- Analyze and guide design of proposed infrastructure;
- Analyze the existing emergency response capabilities;
- Assess the risk associated with the proposed Hitch Ranch Project and the project site; and
- Prepare this FPP detailing how fire risk will be mitigated through a system of fuel modification, structural ignition resistance enhancements, and fire protection delivery system upgrades.

This FPP is consistent with the uniform emergency access and installation standards used throughout the State as described in the 2019 California Building Code (CBC), Chapter 7A (or then current edition), which focuses primarily on preventing ember penetration into homes, a leading cause of structure loss from wildfires; thus, it is an important component of the requirements of this FPP and the California Code of Regulations Titles 14 and 24 and the 2019 California Fire Code (CFC) (or then current edition) as well as the operational procedures and capabilities particular to the VCFD emergency vehicles and suppression personnel. In addition, the Ventura County Fire Code and the Ventura County Fire Protection District (VCFPD) Ordinance No. 31 are even more restrictive. In most instances, this FPP requires inclusion of these local code requirements at the Proposed Project site. The purpose of this plan is to generate and memorialize the fire safety requirements of the FAHJ, namely the VCFD. Requirements are based on site-specific characteristics and incorporate input from project planners, engineers, biologists, architects, and the VCFD.

Field observations were utilized to augment existing digital site data in generating the fire behavior models and formulating the recommendations presented in this FPP. Refer to Appendix A for site photographs of existing site conditions.

1.1 Proposed Project Summary

1.1.1 Location

The Proposed Project site is located within the west-northwest portion of the incorporated City of Moorpark in Ventura County, California. The Proposed Project site is currently undeveloped and is located in the rolling hills north of Poindexter Avenue, east of Gabbert Road and west of Moorpark Avenue/Walnut Canyon Road (State Route 23). More specifically, the Hitch Ranch Project site is situated in Section 5 of Township 2 North, Range 19 West and Section 32 of Township 3 North, Range 19 West on the U.S. Geological Survey (USGS) 7.5-minute Moorpark, California quadrangle map (Figure 1, *Project Site Location Map*). Surrounding land uses include a residential community to the northwest, a Southern California Edison (SCE) Moorpark Substation to the southwest, a commercial and residential development to the south, Walnut Canyon Elementary School and residential developments to the east, a new residential community to the northeast, and naturally vegetated open space land separating the Proposed Project site from the Moorpark County Club approximately 0.5 miles to the north. The proposed development will be situated on seven parcels comprised of the following Assessor Parcel Numbers (APN's): APN's 511-0-020-170, 511-0-020-110, 511-0-020-130, 511-0-020-160, 511-0-020-180, 511-0-020-195, and 511-0-200-245. The entirety of the proposed property lies within the local responsibility area (LRA) Very High Fire Hazard Severity Zone (VHFHSZ), as statutorily designated by CAL FIRE (2007) and the VCFD (Figure 2, Hitch Ranch Fire Hazard Severity Zone Map).

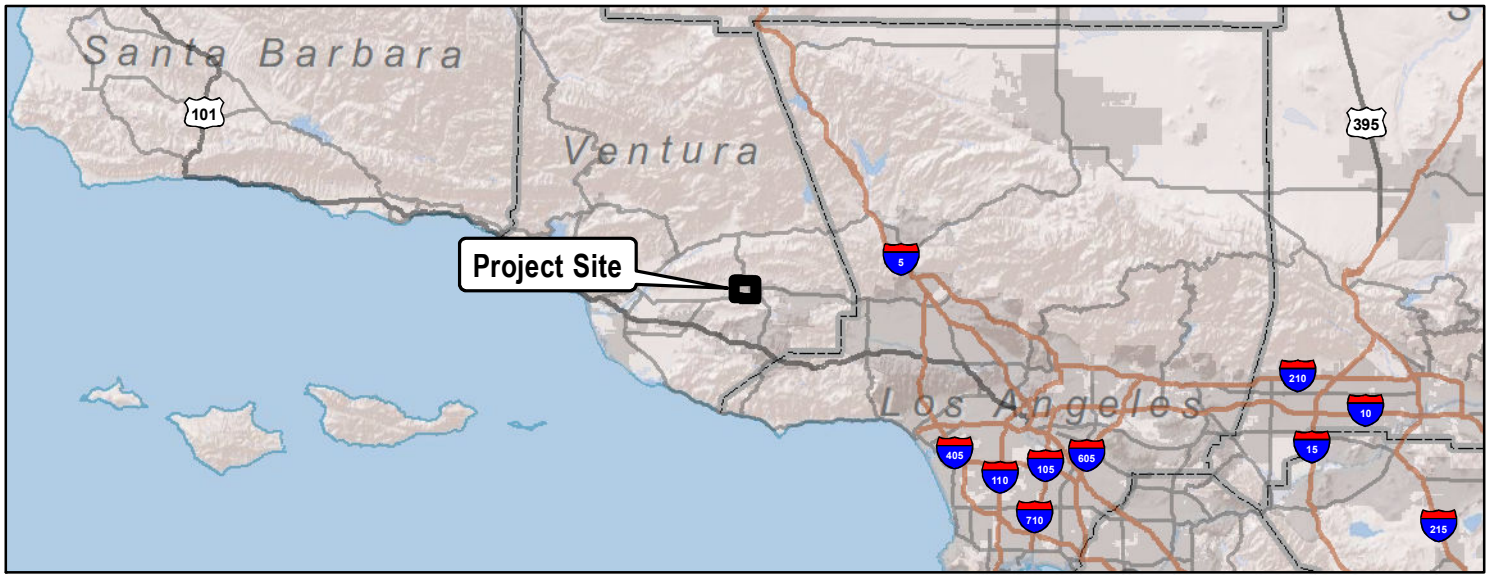
1.1.2 Project Description

The Proposed Project consists of a mixed-density residential community that incorporates land uses for housing and recreational purposes. The Proposed Project would consist of the construction of 755 dwelling units on approximately 277.30 acres including 328 single-family dwelling units on approximately 46.91 acres and 427 multi-family dwelling units on approximately 26.47 acres (191 medium density units and 236 high density units), 32 open space lots, three (3) recreation space lots, and one (1) public park (Figure 3, *Proposed Site Plan*). The single-family residential units are proposed to be one and two stories in height, while the multi-family dwelling units would be two and three stories in height. Single-family dwelling units are proposed for Planning Areas (PA) 1, 2, and 3, and multi-family dwelling units are proposed for PA3 and PA4. Comstock plans to phase the land development of the project over two phases. In addition to the 755 proposed residential dwelling units, the project will include lots dedicated to recreation and fuel modification zones (FMZ) to be managed by the property owners and the Homeowners Association (HOA). Three private recreation areas are proposed, including The Outlook located in PA1 and two additional recreation lots are located in PA3 and PA 4. Landscaped areas may incorporate horticultural plantings. The proposed Hitch Ranch Project would include up to 200 feet of fuel modification, consisting of three zones, a 30-foot Zone A, a 70-foot Zone B, and a 100-foot thinning Zone C. Public access to the site is currently available via Gabbert Road on the west and from Casey Road on the east. Access to the site will be improved by extending existing Casey Road from its terminus east of the project site to provide access to PA2, PA3, and PA4; by extending High Street from its current terminus east of the project site across the southern boundary of the Project site to Gabbert Road; by extending North Hills Parkway across the center of the project site from Gabbert Road to State Route 118; and by extending Meridian Hills Drive from the existing terminus and would connect to Street "A" at North Hills Parkway. As indicated in the Moorpark's General Plan Circulation Element, North

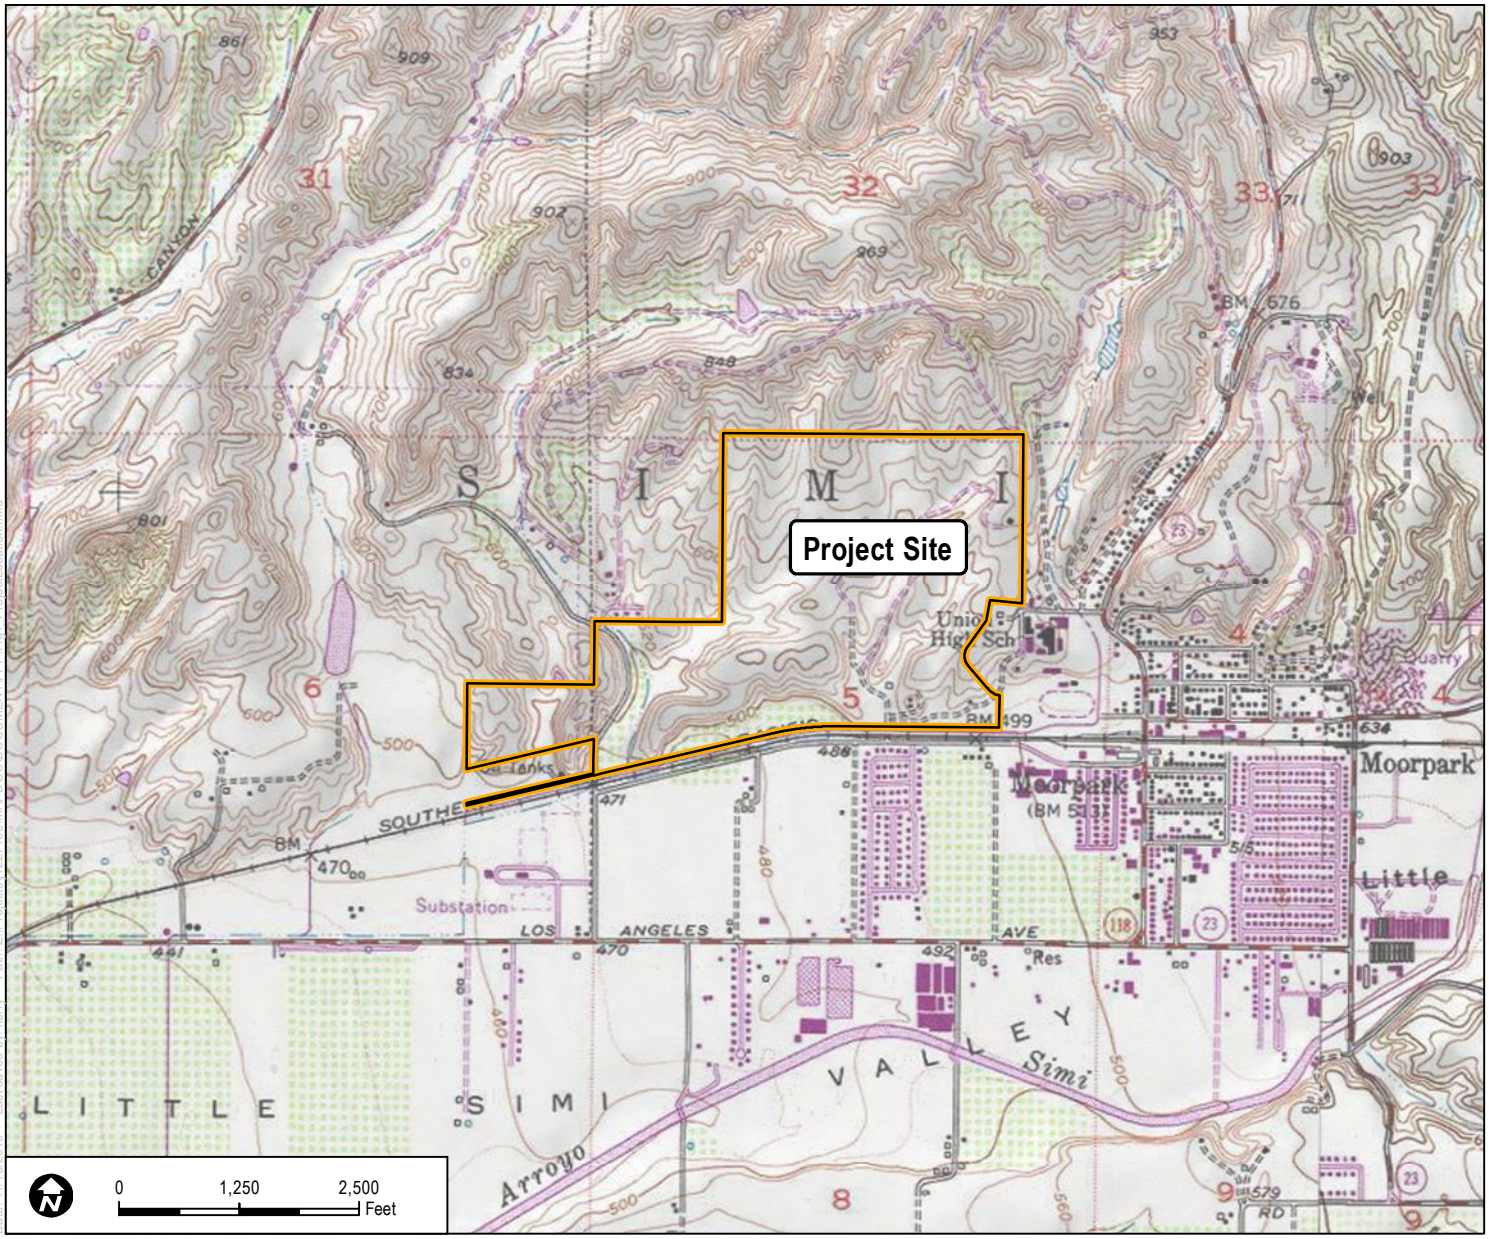
Hills Parkway would ultimately be constructed as a four-lane roadway. Gabbert Road would be improved to a four-lane arterial roadway from the point of connection with Poindexter Avenue, crossing the Union Pacific Railroad tracks, and continuing to North Hills Parkway. North of North Hills Parkway, Gabbert Road would taper back to its existing width. Appendix A provides photographs of the site in its current, undeveloped condition.

1.1.3 Current Land Use

The Hitch Ranch Project site is currently undeveloped and vacant, consisting of naturally vegetated slopes and disturbed land. According to the Hitch Ranch 2019 Biological Update prepared for Impact Sciences, the existing site is comprised mainly of annual brome grassland (approximately 154 acres), California sagebrush-deerwood scrub (approximately 39 acres), and non-native woodlands (approximately 11 acres), and a variety of disturbed habitats on the relatively flat with gently rolling hills Project site. In 2003 and 2006, fires entirely burned these plant communities, but they have since grown back in similar proportions, because these communities are comprised of species largely adapted to periodic fires. Numerous dirt roads were observed throughout the site to accommodate existing land uses. The Project site exhibits signs of prior occupation in the form of foundations, fences, and water production. The existing ranch run cows within the fence line of the property to graze the grassland throughout the property. Overhead electrical transmission lines traverse the western portion of the site which are connected to the Southern California Edison (SCE) Substation located just southwest of the Proposed Project site.



The surrounding land uses include single-family residential developments to the northwest, east, and south, the Moorpark County Club to the north, and a commercial development to the south. Railroad tracks and Poindexter Avenue borders the southern edge of the property.



1.1.4 Proposed Land Use

The Hitch Ranch Project proposes to construct approximately 328 single-family dwelling units on approximately 46.91 acres and approximately 427 multi-family dwelling units on approximately 26.47 acres (191 medium density units and 236 high density units), 32 open space lots, three (3) recreation space lots, and one (1) public park. In addition to the approximately 755 proposed residential dwelling units, the project will include lots dedicated to recreation and open space lands. Three private recreation areas are proposed, including The Outlook located in PA1 and two additional recreation lots are located in PA3 and PA 4. Approximately 104-acres of open space is proposed and would remain in its existing condition and would provide a buffer between existing residential uses west of the Proposed Project site and the single-family residences proposed in PA1 and PA2. Four detention basins are proposed within the project site to protect against flooding from the local drainage basin (i.e, Gabbert and Walnut Canyons). All four basins are designed as soft-bottom facilities, which would ultimately drain to the Ventura County Watershed Protection District (VCWPD) channel located along the southern perimeter of the project site. An approximately 5.56-acre public park is proposed in the southeast portion of the project site that would be dedicated to the City of Moorpark, which tentatively will include athletic fields and an aquatic facility. A 100- to 200-foot fuel modification zone would occur between the open space areas and the on-site dwelling units to be managed by the property owners and the HOA.

As indicated in Figure 3, public and private streets will provide access to the development, including a single entrance off Gabbert Road from the west, a single entrance from the proposed extension of High Street along the southern property boundary, and three proposed entrances from the north and east. In addition to the single and multi-family dwelling units, the project will include fuel modification zones. Access to the site will be improved as indicated in the Moorpark's General Plan Circulation Element and area circulation and evacuation capabilities will be improved as the project eliminates three existing dead end roads by connecting them with project roads. Details are provided in Section 6.1.4.

2 Proposed Project Site Risk Analysis

2.1 Environmental Setting and Field Assessment

Dudek conducted a site evaluation on October 11, 2019, in order to confirm/acquire site information, document existing site conditions, and to determine potential actions for addressing the protection of the project's structures. While on site, Dudek's Fire Planners assessed the area's topography, natural vegetation and fuel loading, surrounding land use and general susceptibility to wildfire. Among the field tasks that were completed included:

- Topography evaluation
- Vegetation/fuel assessments
- Photograph documentation of the existing condition
- Confirmation/verification of hazard assumptions
- Off-site, adjacent property fuel and topography conditions
- Surrounding land use confirmations
- Necessary fire behavior modeling data collection
- Ingress/egress documentation
- Nearby Fire Station reconnaissance.

Field observations were utilized to augment existing site data in generating the fire behavior models and formulating the recommendations detailed in this report.

2.2 Site Characteristics and Fire Environment

Fire environments are dynamic systems and include many types of environmental factors and site characteristics. Fires can occur in any environment where conditions are conducive to ignition and fire movement. Areas of naturally vegetated open space are typically comprised of conditions that may be favorable to wildfire spread. The three major components of fire environment are topography, vegetation (fuels), and climate. The state of each of these components and their interactions with each other determines the potential characteristics and behavior of a fire at any given moment. It is important to note that wildland fire may transition to urban fire if structures are receptive to ignition. Structure ignition depends on a variety of factors and can be prevented through a layered system of protective features including fire resistive landscapes directly adjacent the structure(s), application of known ignition resistive materials and methods, and suitable infrastructure for firefighting purposes. Understanding the existing wildland vegetation and urban fuel conditions on and adjacent to the site is necessary to understand the potential for fire within and around the Hitch Ranch Project site.

2.2.1 Topography

The project site is situated within the Transverse Ranges at the southern limit of the Simi Hills, between the Oak Ridge Mountains to the north and the Las Posas Hills to the south. The site is characterized by gently rolling hills and a series of north-south trending ridges and canyons. The topography ranges from moderately steep to relatively flat, and is highly variable; elevation at the site ranges from approximately 475 to 720 feet above mean sea level

(AMSL). The site has been previously disturbed by agricultural operations and several fires in recent years. Numerous dirt roads, concrete foundations of old farm buildings, and culverts in old agricultural ditches are still present as well as a livestock shed and goats in a fenced pen. Several ephemeral drainages convey storm water down the steep slopes of the site, but no defined beds and banks or well-developed riparian plant communities were observed. Some evidence of erosion was noted in 2018 and 2019 at areas previously disturbed, such as where pipelines were installed and along Gabbert Road (Hitch Ranch Specific Plan EIR, Impact Sciences, Inc., 2019).

2.2.2 Climate

The Proposed Project site, like much of Southern California, is influenced by the Pacific Ocean and a seasonal, migratory subtropical high-pressure cell known as the "Pacific High." Wet winters and dry summers with mild seasonal changes characterize the Southern California climate. This climate pattern is occasionally interrupted by extreme periods of hot weather, winter storms, or dry, easterly Santa Ana winds. The average high temperature for the project area is approximately 74°F, with daily highs in the summer and early fall months (July–October) exceeding 95°F. Precipitation typically occurs between December and March with average rainfall of 18 inches (Western Regional Climate Center, 2019).

The prevailing wind pattern is from the west (on-shore), but the presence of the Pacific Ocean causes a diurnal wind pattern known as the land/sea breeze system. During the day, winds are from the west–southwest (sea) and at night winds are from the northeast (land), averaging 2 miles per hour (mph). During the summer season, the diurnal winds may average slightly higher (approximately 19 mph) than the winds during the winter season due to greater pressure gradient forces. Surface winds can also be influenced locally by topography and slope variations. The highest wind velocities are associated with downslope, canyon, and Santa Ana winds. The Hitch Ranch Project site does not include topography that would create unusual weather conditions. However, the site is subject to periodic extreme fire weather conditions that occur throughout Ventura County.

Typically, the highest fire danger is produced by the high-pressure systems that occur in the Great Basin, which result in the Santa Ana winds of Southern California. Sustained wind speeds recorded during recent major fires in Ventura County exceeded 30 mph and may exceed 50 mph during extreme conditions, as was the case during the most recent wildfire. The Santa Ana wind conditions are a reversal of the prevailing southwesterly winds that usually occur on a region-wide basis during late summer and early fall. Santa Ana winds are warm winds that flow from the higher desert elevations in the north through the mountain passes and canyons. As they converge through the canyons, their velocities increase. Consequently, peak velocities are highest at the mouths of canyons and dissipate as they spread across valley floors. Santa Ana winds generally coincide with the regional drought period and the period of highest fire danger. The Hitch Ranch Project site is affected by strong winds, such as Santa Ana winds.

2.2.3 Vegetation (Fuels)

Vegetation within the project site was identified, characterized, and mapped using geographic information system [GIS] technology (Impact Sciences, Inc., 2021). Vegetation nomenclature used to describe plant communities is

based on the current list of vegetation types, available from the CDFW VCMP.[2] Common plant names of plant taxa are taken from various informal sources. The majority of the site is disturbed by active cattle grazing and covered in non-native brome grasslands, specifically to the east of Gabbert Road. Native plant communities present on site are substantially disturbed by grazing and include California sagebrush-deerweed scrub, California sagebrush scrub, cactus scrub, blue elderberry stands, and chaparral yucca scrub. Also present are disturbed areas that are actively disced, developed areas, and nonnative woodland. The area proposed for development and within the project grading limits will be converted to roads, structures, and landscaped vegetation following project completion. Vegetative fuels within proposed fuel modification zones consist primarily of annual grasslands and California sage scrub, although these fuels will be modified as a result of development, altering their current structure and species composition. Areas outside of proposed development and fuel modification zones can be classified primarily as annual grasslands and sage scrub. Table 1, Project Vegetation Communities and Land Cover Types, and the following discussion provide a description of the botanical characteristics of each of the plant communities found on the project site.

Table 1. Project Vegetation Communities and Land Cover Types

Vegetation Community or Land Cover Type	Acres*	Percent of Site (%)
Annual brome grassland	1.35	0.47
Annual brome grassland (Disturbed/Grazed)	152.45	53.45
Total Annual brome grassland	153.79	54.01
Non-Native woodland	10.65	3.73
Blue Elderberry Stands	1.62	0.56
Blue Elderberry Stands (Disturbed/Grazed)	5.38	1.88
Total Blue Elderberry Stands	7.00	2.46
California sagebrush-deerwood scrub	23.85	9.20
California sagebrush-deerwood scrub (Disturbed/grazed)	12.92	4.53
Total California sagebrush-deerwood scrub	39.13	13.74
Cactus scrub (Disturbed/Grazed)	1.76	0.62
Developed	1.44	0.51
Disturbed/Disced	70.53	24.78
Total	**284.73**	**100.0**

Source: Impact Sciences, Inc. Biological Resources Assessment Report 2021. Refer to Impact Sciences, Inc. Biological Resources Assessment Report for descriptions of the vegetation communities or land cover types.

* Acreages include the 277.3-acre project site and off-site improvement areas associated with the development (e.g., roadway connections) as depicted in Figure 3.3-2 of the Biological Assessment Report.

2.2.4 Vegetation Dynamics (Fuel Loads)

The vegetation described above translates to fuel models used for fire behavior modeling, discussed in Chapter 4 of this FPP. Variations in vegetative cover type and species composition have a direct effect on fire behavior. Some plant communities and their associated plant species have increased flammability based on plant physiology (resin content), biological function (flowering, retention of dead plant material), physical structure (bark thickness, leaf size, branching patterns), and overall fuel loading. For example, non-native grass dominated plant communities become seasonally prone to ignition and produce lower intensity, higher spread rate fires. In comparison, California sagebrush scrub can produce higher heat intensity and higher flame lengths under strong, dry wind patterns, but does not typically ignite or spread as quickly as light, flashy grass fuels. The corresponding fuel models for each of these vegetation types are designed to capture these differences.

As described, vegetation plays a significant role in fire behavior, and is an important component to the fire behavior models discussed in this report. A critical factor to consider is the dynamic nature of vegetation communities. Fire presence and absence at varying cycles or regimes disrupts plant succession, setting plant communities to an earlier state where less fuel is present for a period of time as the plant community begins its succession again. In summary, high-frequency fires tend to convert shrublands to grasslands or maintain grasslands, and fire exclusion tends to convert grasslands to shrublands over time as shrubs sprout back or establish and are not disturbed by repeated fires. In general, biomass and associated fuel loading will increase over time, assuming that disturbance (e.g., fire, grazing, or farming) or fuel reduction efforts are not diligently implemented. It is possible to alter successional pathways for varying plant communities through manual alteration. This concept is a key component in the overall establishment and maintenance of the proposed FMZs for the project site. The FMZs will consist of irrigated and maintained landscapes that will be subject to regular “disturbance” in the form of maintenance and will not be allowed to accumulate excessive biomass over time, which results in reduced fire ignition, spread rates, and intensity.

2.2.5 Fire History

Fire history is an important component of a site-specific FPP. Fire History data provides valuable information regarding fire spread, fire frequency, ignition sources, and vegetation/fuel mosaics across a given landscape. One important use for this information is as a tool for pre-planning. It is advantageous to know which areas may have burned recently and therefore may provide a tactical defense position, what type of fire burned on the site, and how a fire may spread. Fire history represented in this FPP uses the Fire and Resource Assessment Program (FRAP) database. FRAP summarizes fire perimeter data dating to the late 1800s, but which is incomplete due to the fact that it only includes fires over 10 acres in size and has incomplete perimeter data, especially for the first half of the 20th century (Syphard and Keeley 2016). However, the data does provide a summary of recorded fires and can be used to show whether large fires have occurred in the Project area, which indicates whether they may be possible

in the future. According to available data from the CAL FIRE in the FRAP database[3], twenty-nine (29) fires have burned in the vicinity of the project site since the beginning of the historical fire data record, including the most recent Easy Fire which burn approximately 1,700 acres in October 2019. Recorded wildfires within 5 miles range from 11 acres to 107,570 (2003 Fire) acres and the average fire size is 9,075 acres (not including the 2003 Simi Fire or fires smaller than 10 acres). The Easy Fire (approximately 1,700 acres) is the most recent fire, which occurred approximately 1 mile east of the Project Site (not included in FRAP data based because the fire occurred in October 2019). VCFD may have data regarding smaller fires (less than 10 acres) that have occurred on the site that have not been included herein. Two fires have burned on the project site. Table 2 summarizes the fire history for the area within 5 miles of the Hitch Ranch Project site. Fire history for the general vicinity of the project site is illustrated in the map in Appendix B.

Table 2. Fire History within Five Miles of the Hitch Ranch Project Site

Fire Year*	Fire Name	Interval (years)	Total Area Burned (acres)
1940	Camarillo Rifle Range	N/A	1,411
1943	Jones Canyon	3	522
1944	Long Canyon	1	462
1946	Wiley Canyon	2	21,266
1953	Shields Lease	7	11,775
1956	BI Brush	3	1,595
1957	Simi Valley Ranch	1	468
1958	Santa Rosa	1	1,138
1958	Calumet Canyon	0	17,214
1958	Brea Canyon	0	1,244
1967	Sence Ranch	9	18,354
1970	Clampitt Fire	3	115,537
1973	Santa Rosa	3	424
1976	Arroyo	3	206
1980	Hill Canyon	4	11,975
1984	Grimes Fire	4	11,305
1985	Peach Hill	1	1,992
1987	Tierra	2	759
1995	Wildwood 1	8	799
2001	Walnut Incident	6	36
2003	Simi Fire	2	107,570
2006	Shekell	3	13,618
2009	Guiberson	3	17,527
2011	Collins	2	60
2013	Happy Camp	2	45
2015	Princeton	2	44

[3] Based on polygon GIS data from CAL FIRE's FRAP, which includes data from CAL FIRE, USDA Forest Service Region 5, BLM, NPS, Contract Counties and other agencies. The data set is a comprehensive fire perimeter GIS layer for public and private lands throughout the state and covers fires 10 acres and greater between 1878–2018.

Table 2. Fire History within Five Miles of the Hitch Ranch Project Site

Fire Year*	Fire Name	Interval (years)	Total Area Burned (acres)
2018	Collins	3	11
2018	Olsen	0	28
2018	Hill	0	4,310

1 *CAL FIRE FRAP 2019

Based on an analysis of this fire history data set, specifically the years in which the fires burned, the average interval between wildfires in the area was calculated to be 3 years with intervals ranging between 0 to 9 years. Based on this analysis, it is expected that wildland areas in the vicinity of the project site will be subject to wildfire at least every 3 years with the realistic possibility of shorter interval occurrences, as observed in the fire history record. Based on fire history, wildfire risk for the project site is associated primarily with a Santa Ana wind-driven wildfire burning or spotting onto the site from the north or east, although a fire approaching from the south during more typical on-shore weather patterns is possible.

INTENTIONALLY LEFT BLANK

3 Determination of Project Effects

FPPs provide an evaluation of the adverse environmental effects a proposed project may have from wildland fire. The FPP describes the project design features that would ensure that the project would not unnecessarily expose people or structures to a significant loss, injury or death involving wildland fires. Significance is determined by answering the following guidelines:

Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

The wildfire risk in the vicinity of the Hitch Ranch Project site has been analyzed according to a standard used throughout Ventura County (County of Ventura Initial Study Assessment Guidelines – Fire Hazards (2011)). According to the CALFIRE Fire Severity Zone Map, the proposed project is located in an area considered a VHFHSZ, as designated by CALFIRE and the VCFD. The wildland fire risk in the vicinity of the project site has been analyzed and it has been determined that wildfires may occur in wildland or naturally vegetated areas north of the Proposed Project site and in areas off-site to the west, east, and northeast of the project site. However, wildfire occurrence would not be expected to be significantly increased in frequency, or size with the construction of the Hitch Ranch Proposed Project. The closest off-site fuels that form large fuel beds are located to the north of the site.

The site currently includes a variety of potential vegetation that could serve as fuel sources. The types of potential ignition sources that currently exist in the area include vehicle and roadway, the Union Pacific ROW, off-site commercial areas, off-site residential neighborhoods, and arson related ignitions. Although the Proposed Project would introduce more people in the area and would include the development of approximately 328 single-family dwelling units and approximately 427 multi-family dwelling lots, the site would be largely converted from readily ignited fuels to ignition resistant structures and landscaped areas. The Proposed Project would be developed to meet all existing development building codes and fire codes, including landscaping and vegetation requirements as indicated in *Ventura County Fire Protection District Ordinance Number 30* adopted California Fire Code. The project would include conversion of fuels to maintained urban development with designated landscaping and fuel modification areas. Fuel modification zones will be designed according to all applicable development codes and the Ventura County Fire Code, and indicated on the project site plan. The Project Developer will perform fuel modification work throughout the project site prior to construction and the Hitch Ranch HOA will conduct annual fuel modification (or more often as needed) to reduce the potential for fire ignition and spread.

The Proposed Project would introduce potential ignition sources, but would include a variety of fire protection features that form a redundant system of protection to minimize the likelihood of wildfire exposing residents and visitors, as well as structures to a significant risk of loss, injury, or death involving wildland fires. The Project will provide a fire hardened landscape, highly ignition resistant residential dwelling units, and conversion of flashy fuels (non-native grasslands) to maintained developed areas with designated review of all landscaping and maintenance of fuel modification areas. Fires from off-site would not have continuous fuels across this site and would therefore be expected to burn around and/or over the site via spotting. Burning vegetation embers may land on project structures, but are not likely to result in ignition based on ember decay rates and the types of non-combustible and ignition resistant materials that will be used on site. The site further provides multiple ingress/egress routes for evacuation for better access throughout the site and there will be more fire aware individuals on the ground to reduce the likelihood of arson, off-road vehicles, or other recreational based activity fires. If evacuation is not considered the preferred approach, such as during a short-notice evacuation, the Hitch Ranch Project offers a contingency option of temporarily sheltering on site to residents,

visitors, firefighters and law enforcement, as well as to neighboring property owners. These concepts are discussed further in the following sections.

The project would comply with applicable ignition resistant fire and building codes and would include a layered fire protection approach which is designed to current codes and inclusive of site-specific measures that will result in a project that is less susceptible to wildfire than surrounding landscapes. Additionally, residential dwelling units are constructed to very high levels of ignition resistance and may be used as safe sites or temporary shelter if necessary. The Project's single- and multi-family residential units will include residential fire protection systems. This same fire protection system will provide protections from on-site fire spreading to off-site vegetation. As such, accidental fires within the maintained landscape or structures in the Hitch Ranch Project would have limited ability to spread.

Therefore, the Proposed Project would not expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

Would the project result in inadequate emergency access?

The Proposed Project would result in the development of a currently undeveloped area, including the development of site access. The project would involve the construction of new structures, roadways, and would generate new trips to and from the project site. The project site would be accessible from public roadways and access into the site would be provided via four entrances for vehicles and pedestrians. The project would be required to comply with the County's development review process, including review for compliance with the Ventura County Fire Apparatus Access Code - Ordinance 29 as well as compliance with applicable emergency access standards that would facilitate emergency vehicle access during project construction and operation. Additionally, an adequate water supply and an approved paved access roadway shall be installed prior to any combustibles on site.

The project applicant would be required to design, construct, and maintain structures, roadways, and facilities to comply with applicable local, regional, state, and federal requirements related to emergency access. Drive aisles, turning radii, and all access points would be designed with adequate emergency access. The project would be required to provide fire apparatus turnarounds on all dead-end fire apparatus access roadways over 150 feet in length, although the Fire Code Official is authorized to increase the length of a dead-end fire apparatus access roadway to a length of 250 feet, and provide a 40-foot horizontal turning radius of a fire apparatus access road, measured at the center line of the access road. All access roadways designed for one-way traffic shall have an unobstructed width of not less than 20 feet; all access roadways designed for two-way traffic shall have an unobstructed width of not less than 24 feet. Fire access roadways designed to allow parking shall provide a minimum clear width of not less than 32 feet for parking on one side and a clear width of not less than 36 feet for parking on both sides. All fire access roadways would have a vertical clearance of not less than 13 feet 6-inches for the full road width to allow access for fire apparatus. The proposed site plan is subject to approval by the County and the VCFD. Further, the project would be required to provide walking access to the rear of buildings, and ladder access for any windows facing the rear of the buildings.

The County and the VCFD will need to review proposed modifications to existing roadways to ensure that adequate emergency access or emergency response would be maintained. Additionally, emergency response procedures would be coordinated through the County in coordination with the police and fire departments. Adherence to these requirements would ensure that that the project would not result in inadequate emergency access.

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance service ratios, response times or other performance objectives for fire protection?

Fire protection would be provided to the proposed project via the VCFD. The VCFD consists of a staff of 395 full-time safety (including safety Chief Officers) and 158 full-time non-safety employees that provides fire protection and emergency medical services to more than 480,000 people in the unincorporated areas of Ventura County. The VCFD response area covers 848 square miles including seven of its incorporated cities, including Ojai, Port Hueneme, Moorpark, Camarillo, Santa Paula, Simi Valley, and Thousand Oaks (VCFD 2017 Annual Report). The Hitch Ranch Project includes approximately 328 single-family dwelling units and approximately 427 multi-family dwelling lots (191 medium density units and 236 high density units). Service level requirements can cause a decline in the response times and capabilities for existing residents. The Proposed Project estimated call volume generation is based on 2,333 maximum persons living on site (based on 3.09 persons per household) during any given time period during the week and on weekends. The entire population would be new to the VCFD's response area. The Proposed Project is projected by call volume analysis (using VCFD per capita call generation factor of 0.09/year or 90 calls per 1,000 persons per year) to add approximately 210 calls per year to the VCFD's existing call load. This call volume (approximately 4 calls per week) is not considered enough of an increase to require additional resources.

The primary response (first due in) would be provided by Station 42, located at 295 E. High Street, Moorpark, California, approximately 1 mile east of the project site. The station is staffed daily by three firefighters and houses one engine (Engine 42), one reserve engine, and one brush engine. The Project is projected to add an estimated 210 calls per year (0.58 calls per day) for a Station that currently responds to an existing call load of approximately 3.1 calls per day (1,129 calls per year in 2017). The addition of approximately 4 calls per week is considered absorbable and the station's capacity to respond to the additional calls is available. This level of impact is not expected to require the construction of additional Fire Station facilities based on that increase alone. The anticipated 3.68 calls per day (3.1 daily calls + 0.58 additional calls per day) is below what would be considered a busy station. For perspective, urban fire stations that respond to five calls per day are considered average and 10 calls per day would be considered a busy station. Further, Station 42 can respond to the entire project within Ventura County's target response time standard (8.5 minutes) for first arriving for all urban areas within Ventura County. Therefore, although there would be an incremental increase in call volume, it would not, according to California Environmental Quality Act (CEQA), be considered to exceed significance thresholds.

Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

The Proposed Project will be served by the Ventura County Waterworks District (VCWWD) No. 1 and sufficient water supplies will be available to serve the Proposed Project from the existing entitlements and resources, which will be consistent with VCFD requirements. The County of Ventura, and the VCWWD No. 1 require new developments to meet a minimum 2,500 gallons per minute (gpm) fire flow. The water distribution system is designed to yield a minimum residual pressure of 40 pounds per square inch (psi) during peak hour demands and a minimum residual pressure of 20 psi during maximum day demands plus fire flow. Each fire hydrant shall be capable of 1,500 gpm fire flow for minimum duration of three hours at 20 psi residual pressure.

The measures described in the responses to these significance questions are provided more detail in the following sections.

INTENTIONALLY LEFT BLANK

4 Anticipated Fire Behavior

4.1 Fire Behavior Modeling

Following field data collection efforts and available data analysis, fire behavior modeling was conducted to document the type and intensity of fire that would be expected on and adjacent to the project site given characteristic site features such as topography, vegetation, and weather. Dudek utilized BehavePlus software package (Andrews, Bevins, and Seli 2004) to analyze potential fire behavior for the Hitch Ranch Project site. As is customary for this type of analysis, three fire scenarios were evaluated, including one summer, onshore weather condition (west from the project site) and two extreme fall, offshore weather condition (north and east/northeast of the project site), with assumptions made for the pre- and post-project slope and fuel conditions. Results are provided below and a more detailed presentation of the modeling inputs and results is provided in Appendix C.

4.1.1 Fuel Model Output Results

The results from the BehavePlus fire behavior modeling analysis for pre- and post-project conditions are presented in Tables 3 and 4, respectively, and in Figure 4, BehavePlus Fire Behavior Analysis Map. As presented, wildfire behavior on the Hitch Ranch Project site is expected to be primarily of moderate to high intensity throughout the non-maintained grass dominated fuels north and northeast of the Proposed Project site.

Table 3. BehavePlus Fire Behavior Modeling Results, Existing Conditions

Fire Scenario	Flame Length (feet)	Spread Rate (mph)[1]	Fireline Intensity (Btu/ft./s)	Spotting Distance[2] (Miles)
Scenario 1: 5% slope, Summer, Onshore, Summer Winds (Pre-Development)				
High Load Grass (Gr7)	29.1’	3.5	8,616	1.1
Scenario 2: 9% slope, Fall, Offshore Extreme Winds (Pre-Development)				
High Load Grass (Gr7)	42.9’ (74.6’ & 87.1’)	6.0 (20.0 & 28.0)	20,054 (66,781 & 93,536)	1.2 (3.5 and 4.9)[3]
Scenario 3: 5% slope, Fall, Offshore, Extreme Winds (Pre-Development)				
High Load Grass (Gr7)	43.0’ (74.6’ & 87.1’)	6.0 (20.0 & 28.0)	20,168 (66,846 & 93,591)	1.2 (3.5 & 4.9)

Note:
1 mph = miles per hour
2 Spotting distance from a wind driven surface fire.
3 It should be noted that the wind mph in parenthesis represent peak gusts of 50 mph and 70 mph, respectively.

Table 4. BehavePlus Fire Behavior Modeling Results, Post-Project Conditions

Fire Scenario	Flame Length (feet)	Spread Rate (mph)[1]	Fireline Intensity (Btu/ft./s)	Spotting Distance[2] (Miles)
Scenario 1: 5% slope, Summer, Onshore, Summer Winds (Post-Development)				
FMZ Zones A and B (FM8)	1.8'	0.1	20	0.2
FMZ Zone C (Gr2)	7.2'	1.1	420	0.4
Scenario 2: 9% slope, Fall, Offshore Extreme Winds (Post-Development)				
FMZ Zones A and B (FM8)	2.1' (3.0' & 3.0')	0.1 (0.2 & 0.2)	29 (63 & 63)	0.2 (0.4 & 0.5)
FMZ Zone C (Gr2)	10.9' (18.0' & 18.0')	2.1 (6.2 & 6.2)	1,012 (3,037 & 3,037)	0.5 (1.3 & 1.6)
Scenario 3: 5% slope, Fall, Offshore, Extreme Winds (Post-Development)				
FMZ Zones A and B (FM8)	2.1' (3.0' & 3.0')	0.1 (0.2 & 0.2)	29 (63 & 63)	0.2 (0.4 & 0.5)
FMZ Zone C (Gr2)	10.9' (18.0' & 18.0)	2.1 (6.2 & 6.2)	1,018 (3,037 & 3,037)	0.5 (1.3 & 1.5)

Note:
1 mph = miles per hour
2 Spotting distance from a wind driven surface fire.
3 It should be noted that the wind mph in parenthesis represent peak gusts of 50 mph and 70 mph, respectively.

The results presented in Tables 3 and 4 depict values based on inputs to the BehavePlus software and are not intended to capture changing fire behavior as it moves across a landscape. Changes in slope, weather, or pockets of different fuel types are not accounted for in this analysis. For planning purposes, the averaged worst-case fire behavior is the most useful information for conservative fuel modification design. Model results should be used as a basis for planning only, as actual fire behavior for a given location will be affected by many factors, including unique weather patterns, small-scale topographic variations, or changing vegetation patterns.

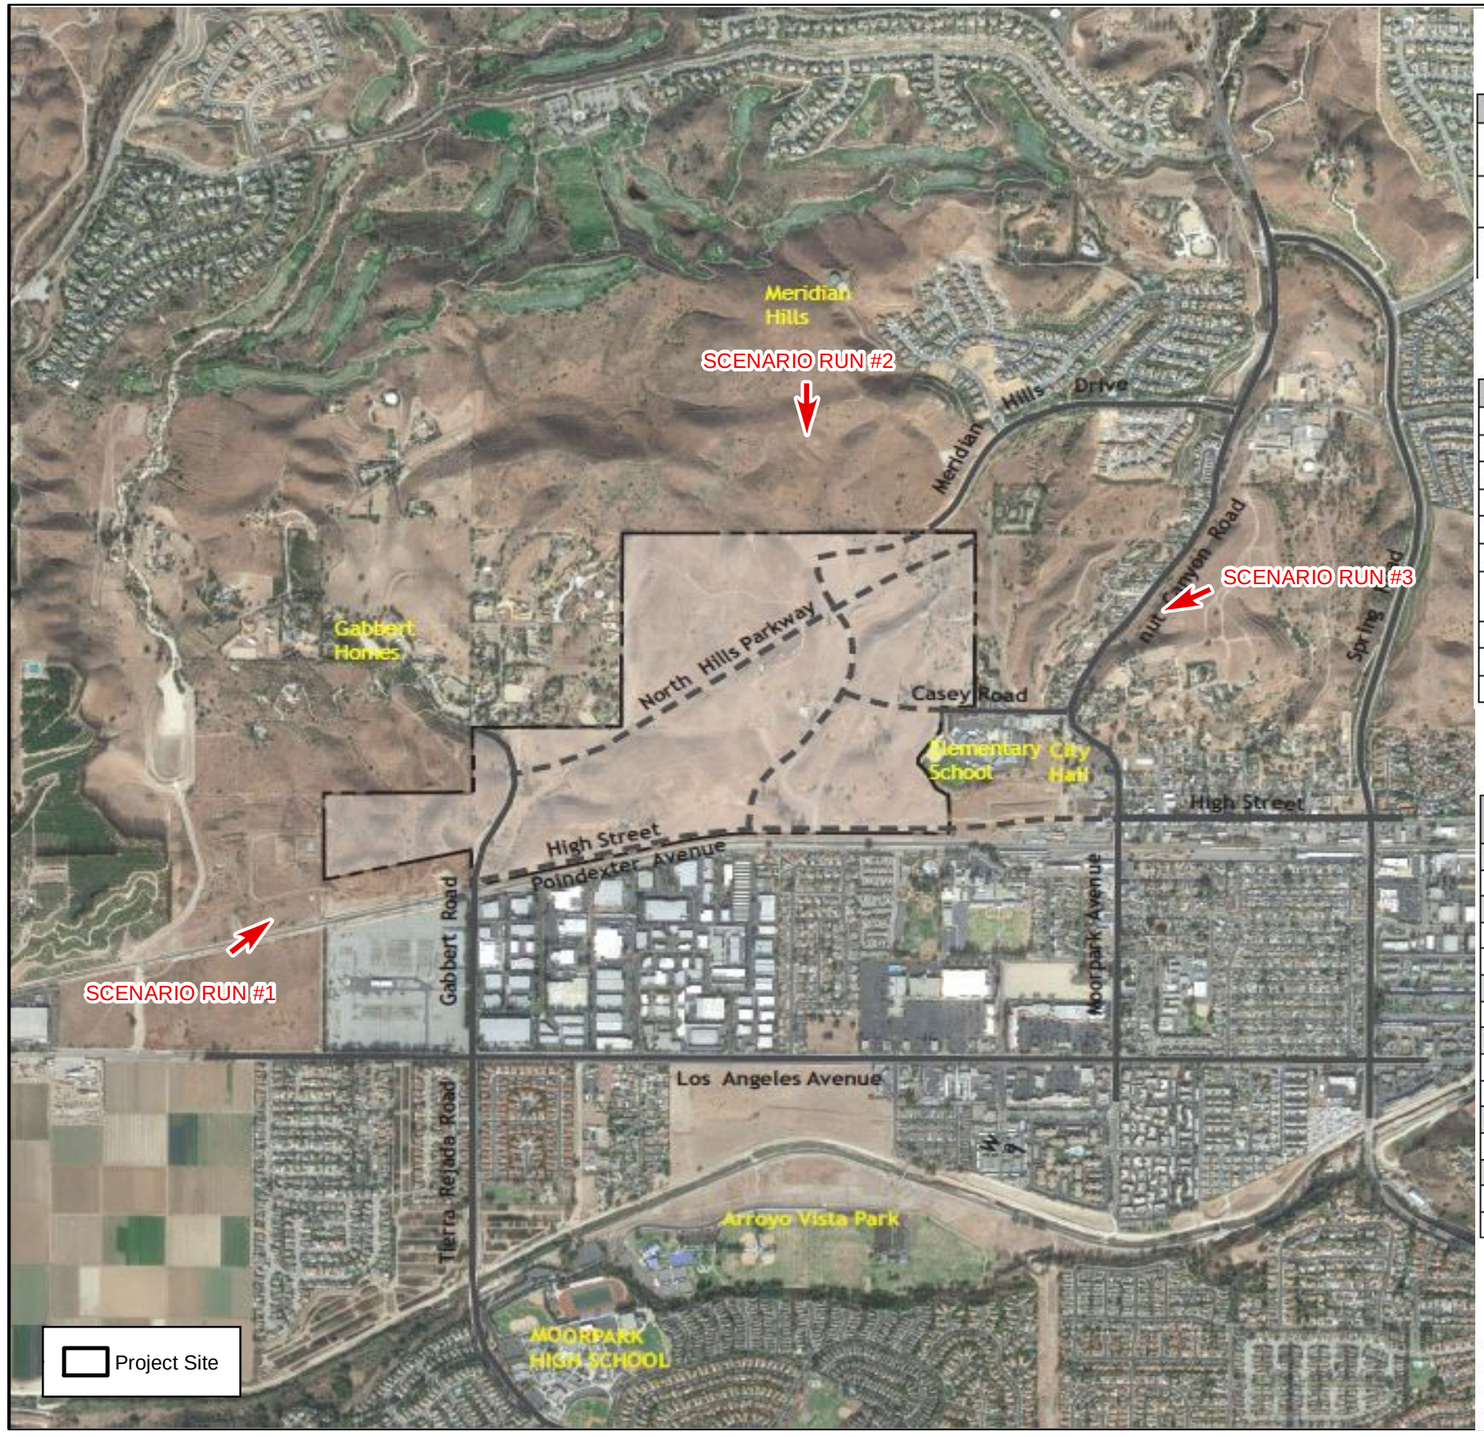
Based on the BehavePlus analysis, worst-case fire behavior is expected in non-maintained grass north and northeast of the proposed Project site under Peak weather conditions (represented by Fall Weather, Scenario 3). The fire is anticipated to be a wind-driven fire from the north/northeast during the fall. Under such conditions, expected surface flame lengths reach 74 feet with wind speeds of 50+ mph. Under this scenario, fireline intensities reach 66,781 BTU/feet/second with fast spread rates of 20 mph and could have a spotting distance up to 3.5 miles away. Fires burning into brush thinning zones of the proposed FMZs are expected to be less intense and generate lower flame lengths.

As previously mentioned, Dudek conducted modeling of the site for post-fuel modification zones. Typical fuel modification includes establishment of minimum 100-foot wide irrigated zone (Zones A and B) and up to a 100-foot wide thinning zone (Zone C) on the periphery of the project site, beginning at the structure. For modeling the post-FMZ treatment condition, the fuel model assignment for non-native grasslands was re-classified according to the specific fuels management (e.g., irrigated, fire resistive landscaping and 50% thinning) treatment.

Based on the BeahvePlus analysis, post development fire behavior is expected in irrigated and replanted with plants that are acceptable with VCFD (Zones A and B - FM8), as well in an area with 50% thinning of the existing shrubs (Gr2) under peak weather conditions (represented by Fall Weather, Scenario 3b). Under such conditions, expected surface flame length is expected to be significantly lower, with flames lengths reaching approximately 18 feet with wind speeds of 50+ mph. Under this scenario, fireline intensities reach 3,037 BTU/feet/second with relatively slow spread rates of 2.1 mph and could have a spotting distance up to 1.3 miles away.

As depicted in Table 4, the FMZ areas experience a significant reduction in flame length and intensity. The 74-foot flame lengths predicted for non-native grassland fuels during pre-treatment modeling for fire scenarios 2 and 3 are reduced to approximately 18 feet by the time FMZ (Zone C) is reached and to approximately three-feet by the time FMZ (Zones A and B) are reached. These reduction of flame lengths and intensities are assumed to occur within the 200 feet of fuel modification (an irrigated Zone A and B and 50% thinning Zone C).

4.2 On-Site Fire Risk Assessment



Given the climatic, vegetative, topographic characteristics, and local fire history of the area, the project site, once developed, is determined to be subject to periodic wildfires that may start on, burn onto, or spot into the site. The most common type of fire anticipated in the vicinity of the Project Area is a wind-driven fire from the north/northeast during the fall. Potential for off-site wildfire encroaching on, or showering embers on the site is considered moderate, but risk of ignition from such encroachments or ember showers is considered low based on the type of construction and fire protection features that will be provided for the structures.

Therefore, it will be critical that the latest fire protection technologies, developed through intensive research and real world wildfire observations and findings by fire professionals, for both ignition resistant construction and for creating defensible space in the ever-expanding WUI areas, are implemented and enforced. The Proposed Project will implement the latest fire protection measures, including fuel modification along the perimeter edges of the development.

Wildland fires are a common natural hazard in most of southern California with a long and extensive history. Southern California landscapes include a diverse range of plant communities, including vast tracts of tracts of grasslands and shrublands, like those found adjacent to Hitch Ranch site. Wildfire in this Mediterranean-type ecosystem ultimately affects the structure and functions of vegetation communities (Keeley 1984) and will continue to have a substantial and recurring role (Keeley and Fotheringham 2003). Supporting this are the facts that 1) native landscapes, from forest to grasslands, become highly flammable each fall and 2) the climate of southern California has been characterized by fire climatologists as the worst fire climate in the United States (Keeley 2004) with high winds (Santa Ana) occurring during autumn after a six-month drought period each year. Based on this research, the anticipated growing population of Ventura County wildland urban interface (WUI) areas, including in the City of Moorpark, and the regions fire history, it can be anticipated that periodic wildfires will occur in the open space areas of Ventura County, with the natural open spaces north and northeast of the Hitch Ranch Project site being no exception.

Two large wildfires have burned on to and several more have burned within a close proximity to the project site, including the 2003 Simi Fire which burnt approximately 107,500 acres and the most recent Easy Fire which burned approximately 1,700 acres 1 mile east of the Project site in October 2019. Both of these fires burned very similarly to the results found in the modeled fire behavior for non-native grasslands under extreme weather conditions. As such, wildlands near the Proposed Project site are expected to be exposed to periodic wildfire ignition and spread and may be subject to nearby wildfire. However, the Hitch Ranch Proposed Project site, once developed, would not facilitate wildfire spread and would reduce projected flame lengths to levels that would be manageable by firefighting resources for protecting the site's structures, especially given the ignition resistance of the structures and the planned ongoing maintenance of the entire site landscape.

BehavePlus Analysis Map
Hitch Ranch Proposed Project Fire Protection Plan

INTENTIONALLY LEFT BLANK

5 Emergency Response and Service

5.1 Emergency Response

The Proposed project is located within the jurisdiction of the VCFD, and consequently, VCFD provides initial response. The VCFD jurisdictional response area encompasses approximately 848 square miles including seven of its cities, including Ojai, Port Hueneme, Moorpark, Camarillo, Santa Paula, Simi Valley, and Thousand Oaks with a population of more than 480,000 people in the unincorporated areas of Ventura County (VCFD 2017 Annual Report)[4]. The VCFD consists of a staff of 395 full-time safety (including safety Chief Officers) and 158 full-time non-safety employees that provides fire protection and emergency medical services. The Hitch Ranch Project includes approximately 328 single-family dwelling units and approximately 427 multi-family dwelling lots (191 medium density units and 236 high density units). Service level requirements can cause a decline in the response times and capabilities for existing residents. The Proposed Project estimated call volume generation is based on 2,333 maximum persons living on site (based on 3.09 persons per household) during any given time period during the week and on weekends. The entire population would be new to the VCFD's response area. The Proposed Project is projected by call volume analysis (using VCFD per capita call generation factor of 0.09/year or 90 calls per 1,000 persons per year) to add approximately 210 calls per year to the VCFD's existing call load. This call volume (approximately 4 calls per week) is not considered enough of an increase to require additional resources.

The VCFD currently operates 33 Fire Stations, two of which are analyzed herein due to their proximity to the proposed project site and could respond to an incident at the Hitch Ranch Project site (Stations 40 and 42), although primary response would be from Station 42, with Station 40 responding shortly thereafter. Station 42 is located at 295 E. High Street, Moorpark, California, approximately 1 mile east of the project site. The station is staffed daily by three full-time firefighters and houses one engine (Engine 42), one reserve engine, and one brush engine. Table 5 presents a summary of the location, fire apparatus equipment, staffing levels, maximum travel distance, and estimated time travel for the two closest VCFD stations that would respond to a fire or medical emergency within the Hitch Ranch Project site. Travel distances are derived from Google road data while travel times are calculated applying the nationally recognized RAND Corporation formula used by the Insurance Services Office (ISO) Public Protection Classification Program's Response Time Standard: (T=0.65 + 1.7D), where T=time and D=distance). The ISO response travel time formula discounts speed for intersections, vehicle deceleration and acceleration, and does not include turnout donning time.

[4] https://vcfd.org/about-vcfd/overview

Table 5. Ventura County Fire Department Responding Stations Summary

Station	Location	Equipment	Staffing	Maximum Travel Distance	Travel Time***
Station 40	4185 Cedar Springs Street, Moorpark, California, 93201	- Medic/Engine (Medic/Engine 40); - Reserve Engine (Engine 140); - Utility Pickup Truck (Utility 40); - USAR Tractor/Trailer (USAR 40).	On duty: 3	0. 70 mi.**	1 minute 48 secs.**
Station 42	295 E. High Street, Moorpark, California, 93021	- Engine (Engine 42); - Reserve Engine (Engine 142); - Brush Engine (Engine 342).	On-duty: 3	1.50 mi.*	3 minutes 10 secs.*

* Distance measured to the proposed western entrance of the proposed development area off Gabbert Road.
** Distance measured to the proposed eastern entrance of the proposed development area off Casey Road.
*** Assumes travel to the project entrance, and application of the ISO formula, T=0.65+1.7(Distance), a 35-mph travel speed, and does not include turnout time.

Based on the Proposed Project site location in relation to existing VCFD stations, travel time to the site for the first responding engine from Station 42 is less than 2 minutes to the proposed project entrance, on Casey Road. Travel within the development may reach up to 2 minutes, based on the longest proposed road stretch of approximately 0.80 miles, resulting in response time of less than 4 minutes for the entire development. Secondary response would arrive in less than 4 minutes. Based on these calculations, emergencies within the project can be responded to by VCFD's first arriving unit (average maximum initial response of no more than 8.5 minutes for fire apparatus and 5 minutes for ambulance, 90% of calls) in accordance with the County's standard.

In addition, there are automatic aid agreements and dropped boundary agreements on first alarm or greater emergency calls with surrounding communities, ensuring that the closest unit will be dispatched, regardless of jurisdictional boundaries. The VCFD is also part of the State of California Master Mutual Aid Agreements.

5.2 Emergency Service Level

The VCFD estimates approximately 44,742 total annual calls (VCFD's 2017 Annual Report) and Ventura County's population of approximately 480,000 (VCFD 2019). The per capita call volume is roughly 0.09 for the County of Ventura. Based on the proposed development plans, the project's estimated 2,333 residents (assumes an average of 3.09 occupants per residence for this type of community (SANDAG 2019) would generate roughly 210 calls per year, most of which are expected to be medical-related calls, consistent with typical emergency call statistics.

Service level requirements are not expected to be significantly impacted with the increase of approximately 210 calls per year or 0.58 calls per day for a station (VCFD Station 42) that currently responds to roughly 3 calls per day (1,130 calls[5] in 2017) in its primary service area. Therefore, the project is not expected to cause a decline in VCFD's emergency response times. Additional response, rounding out the effective firefighting force (the manpower needed to effectively fight a structure fire and/or respond to serious medical emergency) would be provided by Stations 40 and 57.

[5] Data derived from VCFD's 2017 annual report which states that there were 2,259 calls within the Moorpark service area. There are two stations within the Moorpark service area, so a rough estimate of 1,130 calls in 2017 was used for Station 42.

5.2.1 Cumulative Impacts on Fire Response

Cumulative impacts from multiple projects can cause fire response service decline and must be analyzed for each project. The Hitch Ranch Project and its proposed usage by up to 2,333 residents is an increase in potential service demand of approximately 210 calls per year, well within the capacity of the existing Fire Stations that will service the Hitch Ranch Project. Other future projects in the vicinity of Stations 40 and 42 are not known at the time of this FPPs preparation, but when considered cumulatively, the potential impact of multiple projects is considered less than significant, mitigated by increased funding available from each project to the VCFD through property taxes and other fees associated with each project, including the Hitch Ranch Project. This funding would be utilized to maintain or enhance fire response capabilities.

INTENTIONALLY LEFT BLANK

6 Buildings, Infrastructure and Defensible Space

The Ventura County Fire Protection District's Fire Ordinance Number 31 (2018 International Fire Code and 2019 California Fire and Building Codes adopted by reference with several modifications) governs the building, infrastructure, and defensible space requirements detailed in this FPP. The project will meet or exceed applicable codes or will provide alternative materials and/or methods. While these standards will provide a high level of protection to structures for the Proposed Project, there is no guarantee that compliance with these standards will prevent damage or destruction of structures by fire in all cases. A response map update, including roads and fire hydrant locations, in a format compatible with current department mapping shall be provided to the VCFD.

The following summaries highlight important fire protection features. All underground utilities, hydrants, water mains, curbs, gutters, and sidewalks will be installed, and the drive surface shall be approved prior to combustibles being brought on site.

6.1 Fire Access

6.1.1 Primary

The Proposed Project would result in the development of a currently undeveloped area, including the development of site access. The project would involve the construction of new structures, roadways, and would generate new trips to and from the project site. Site access, including road widths and connectivity, will comply with the County's development review process, including review for compliance with the Ventura County Fire Apparatus Access Code - Ordinance 29 as well as compliance with applicable emergency access standards that would facilitate emergency vehicle access during project construction and operation. Additionally, an adequate water supply and approved paved access roadways shall be installed prior to any combustibles on site and will include:

- The project site would be accessible from public roadways and access into the site would be provided via four entrances, one northbound on Gabbert Road, another northbound on Moorpark Avenue/Walnut Canyon Road, one westbound or eastbound on High Street, and one westbound or southbound on Meridian Hills Drive for vehicles and pedestrians. Primary access to the Project site via Gabbert Road will connect to the proposed extension of High Street (runs west to east) and North Hills Parkway (runs west to east/northeast). High Street will provide access to the southern portion of the Project site and will connect to Moorpark/Walnut Canyon (SR-23), while proposed North Hills Parkway is designed as an interior road and will facilitate access throughout the site. Primary access via Moorpark Avenue/Walnut Canyon Road will connect to Casey Road, which will be extended from its current terminus and provide access to the eastern portion of the site. Moorpark Avenue/Walnut Canyon Road also connects to Meridian Hills Drive, which will be extended from its current terminus and provide access to the northern portion of the site.
- All perimeter roads comply with all fire apparatus access road standards; all fire access roadways designed for one-way traffic shall have an unobstructed width of not less than 20 feet; all access roadways designed for

two-way traffic shall have an unobstructed width of not less than 24 feet. Fire access roadways designed to allow parking shall provide a minimum clear width of not less than 32 feet for parking on one side and a clear width of not less than 36 feet for parking on both sides. The access roads shall be capable of supporting an imposed load of at least 20-tons or 80,000 pounds (lbs.) after a 10-year storm.

- Interior circulation streets include all roadways that are considered common or primary roadways for traffic flow through the site and for fire department access serving all proposed structure. The project would be required to provide approved fire apparatus turnarounds on all dead-end fire apparatus access roadways over 150 feet in length, although the Fire Code Official is authorized to increase the length of a dead-end fire apparatus access roadway to a length of 250 feet.
- Typical, interior Project roads, including collector and local roads, will be constructed to minimum 36-foot, unobstructed widths and shall be improved with aggregate cement or asphalt paving materials. Private or public streets that provide fire apparatus access to buildings three stories or more in height shall be improved to a minimum 24 feet unobstructed width. All interior residential streets will be designed to accommodate a minimum of at least 20-tons or 80,000-lb. fire apparatus load after a 10-year storm.
- Private and public streets for each phase shall meet all project approved fire code requirements and/or mitigated exceptions for maximum allowable dead-end distance, paving, and fuel management prior to combustibles being brought to the site.
- Vertical clearance of vegetation (lowest-hanging tree limbs), along roadways will be maintained at clearances of 13 feet, 6 inches to allow fire engines passage. Unobstructed vertical clearance must be clear to the sky to allow aerial ladder truck operation.
- Roads with a median or center divider will have a minimum 20 feet unobstructed width on both sides of the center median or divider. Maximum road grade will not exceed 16%.
- Cul-de-sacs and fire apparatus turnarounds will meet requirements and VCFD Standards.
- Roadways and/or driveways will provide fire department access to within 150 feet of all portions of the exterior walls of the first floor of each structure.
- Access roads shall be completed and paved prior to issuance of building permits and prior to the occurrence of combustible construction.

6.1.2 Secondary Access Roads and Gates

Two secondary emergency vehicle access entry/exit roads are proposed within PA1 and PA2, to provide additional access to North Hills Parkway from PA1 and "A" Street from PA1. The secondary access roads will include a secondary access gate with knox box switches allowing emergency vehicles access into and out of PA 1 and PA2, as well as an automatic exit loop system allowing the residents of PA1 and PA2 to exit the communities. I

Any access gates will comply with Ventura County Fire Department 501 Apparatus Access Code Standard – Ordinance Number 29. Gates across fire apparatus access roads shall not be limited to emergency exit only and shall provide for egress for all persons at all times without the use of keys, codes, remote controls, or special knowledge. Gates

on private roads and secondary access roads will comply with VCFD standard for electric gates and will include a Knox box switch and automatic exit loops.

6.1.3 Maximum Dead-End Road Length

Each planning area varies in the number of ingress/egress roads or streets. All areas shall include at least two ingress/egress streets. Dead end streets no longer than 150 feet shall have approved provisions for fire apparatus turnaround or cul-de-sac. The Fire Code Official is authorized to increase the length of a dead-end fire apparatus access roadway to a length of 250 feet. When only one (1) access point is provided, the maximum length of access roads shall not exceed 800 feet from the point of two (2) separate means of ingress/egress.

Fire apparatus turnarounds to provide a 40-foot horizontal turning radius of a fire apparatus access road, measured at the center line of the access road (VCFD Fire Apparatus Access Code).

6.1.4 Road Width and Circulation

On-site roads will be constructed to current Ventura County Fire Apparatus Access Code standards (Ordinance Number 29) and 2019 CFC (or then current edition), including all fire access roadways designed for one-way traffic shall have an unobstructed width of not less than 20 feet; all access roadways designed for two-way traffic shall have an unobstructed width of not less than 24 feet. Fire access roadways designed to allow parking shall provide a minimum clear width of not less than 32 feet for parking on one side and a clear width of not less than 36 feet for parking on both sides and shall be improved with asphalt paving materials that support the imposed loads of fire apparatus (not less than 20-tons or 80,000 lbs. after a 10-year storm). Turning radius for fire apparatus access roads will be 40 feet as measured at the center line of the access road.

Access to the site will be improved as indicated in the Moorpark's General Plan Circulation Element, North Hills Parkway would ultimately be constructed as a four-lane roadway. Gabbert Road would be improved to a four-lane arterial roadway from the point of connection with Poindexter Avenue, crossing the Union Pacific Railroad tracks, and continuing to North Hills Parkway. North of North Hills Parkway, Gabbert Road would taper back to its existing width.

The circulation upgrades not only benefit the Proposed Hitch Ranch Project, they also provide a public benefit to the surrounding communities and elementary school by providing additional access to these existing one-way in and out communities. Access to the Gabbert Canyon neighborhood to the northwest will be improved by expanding Gabbert Road to be a four-lane arterial roadway and by providing a new easterly evacuation route by extending High Street from its current terminus east of the project site across the southern boundary of the Project site north to the railroad track to Gabbert Road. The Meridian Hills neighborhood to the northeast will be improved by providing a southerly evacuation route through Hitch Ranch by extending Meridian Hills Drive from the existing terminus and connecting it to Street "A" at North Hills Parkway. Finally, Walnut Canyon Elementary school to the east is currently accessed by a dead end, two-lane road off Moorpark Avenue. There presently are no evacuation routes or secondary vehicle access roads to the school. However, the Proposed Project would provide an additional evacuation route through the Hitch Ranch community by extending Casey Road from its terminus east of the project site west into PA2, PA3, and PA4.

6.1.5 Grade

There are no roads or driveways in the Hitch Ranch Project that exceed the 16% maximum grade for new roads and driveways. There are no roads or driveways that will require mitigation.

6.1.6 Surface

All fire apparatus access and vehicle roadways shall be asphalt or concrete and designed and constructed in accordance with County Public Works standards

6.1.7 Vertical Clearance

Minimum unobstructed vertical clearance of 13 feet 6 inches will be maintained for the entire required width for all streets, including driveways that require emergency vehicle access.

6.1.8 Premise Identification

Identification of roads and structures will comply with CFC, Section 505.1, as follows:

- Each Building shall have a minimum 12-inch address number, with 1-1/2 inch stroke. Number shall be mounted in visible locations and contrast in color to background. Each individual living unit shall have minimum 4-inch high address or unit numbers, ½-inch stroke, and 6 to 8 feet above grade.
- Streets and roads shall be identified with approved signs. Temporary signs shall be installed at each street intersection when construction of new roadways allows passage by vehicles. Signs shall be of an approved size, weather resistant and be maintained until replacement by permanent signs.

6.2 Ignition Resistant Construction and Fire Protection Systems

All new structures within the Proposed Project will be constructed to Ventura County Fire Code, Ventura County Fire Protection District's Fire Ordinance 31, and 2019 CFC standards (or then current edition). Each of the proposed dwelling units will comply with the enhanced ignition-resistant construction standards of the 2019 California Building Code (Chapter 7A) (or then current edition). These requirements address roofs, eaves, exterior walls, vents, appendages, windows, and doors and result in hardened structures that have been proven to perform at high levels (resist ignition) during the typically short duration of exposure to burning vegetation from wildfires. While these standards will provide a high level of protection to structures in this development, there is no guarantee that compliance with these standards will prevent damage or destruction of structures by fire in all cases.

There are two primary concerns for structure ignition: 1) radiant and/or convective heat and 2) burning embers (NFPA 1144 2008, Ventura County Fire Protection District 2011, IBHS 2008, and others). Burning embers have been a focus

of building code updates for at least the last decade, and new structures in the Wildland Urban Interface[6] (WUI) built to these codes have proven to be very ignition resistant. Likewise, radiant and convective heat impacts on structures have been minimized through the Chapter 7A exterior fire ratings for walls, windows and doors. Additionally, provisions for modified fuel areas separating wildland fuels from structures have reduced the number of fuel-related structure losses. As such, most of the primary components of the layered fire protection system provided the project are required by the VCFD (Ventura County Fire Protection District Ordinance Number 30 and state codes, but are worth listing because they have been proven effective for minimizing structural vulnerability to wildfire and, with the inclusion of required interior sprinklers (required in the 2019 Building/Fire Code update), of extinguishing interior fires, should embers succeed in entering a structure. Even though these measures are now required by the latest Building and Fire Codes, at one time, they were used as mitigation measures for buildings in WUI areas, because they were known to reduce structure vulnerability to wildfire. These measures performed so well, they were adopted into the code. The following project features are required for new development in WUI areas and form the basis of the system of protection necessary to minimize structural ignitions as well as providing adequate access by emergency responders:

1. Application of Chapter 7A, ignition resistant building requirements
2. New class-A fire rated roof and associated assembly. With the proposed class-A fire rated roof, there will be attic or void spaces above the third level living spaces requiring ventilation to the outside environment. The attic spaces will require either ember-resistant roof vents or a minimum 1/16-inch mesh and shall not exceed 1/8-inch mesh for side ventilation (recommend BrandGuard, O'Hagin or similar vents). All vents used for this project will be approved by SMFD.
3. Multi- pane glazing with a minimum of one tempered pane, fire-resistance rating of not less than 20 minutes when tested according to NFPA 257 (such as SaftiFirst, SuperLite 20-minute rated glass product), or be tested to meet the performance requirements of State Fire Marshal Standard 12-7A-2
4. Automatic, Interior Fire Sprinkler System to code by occupancy type for all habitable, multi-family residential dwellings.
5. Modern infrastructure, access roads, and water delivery system.

6.3 Infrastructure and Fire Protection Systems Requirements

The following infrastructure components are made in order to comply with the Ventura County requirements, the 2019 California Fire Code (or then current edition), VCFPD's Fire Ordinance Standards (VCFD Ordinance Number 31), and nationally accepted fire protection standards, as well as additional requirements to assist in providing reasonable on-site fire protection.

6.3.1 Water

Water service for the Proposed Project site will be provided by the VCWWD No. 1 and will be consistent with VCFD requirements. The public water system will be through connections to existing water mains running along Gabbert Road, Meridian Hills Drive, and Casey Road. There is an additional connection to the existing waterline

[6] The Wildland-Urban interface is the area where urban and suburban development meets the undeveloped areas containing natural vegetation

on Poindecter Ave. The water distribution system is designed to yield a minimum residual pressure of 40 pounds per square inch (psi) during peak hour demands and a minimum residual pressure of 20 psi during maximum day demands plus fire flow. Each fire hydrant shall be capable of 1,500 gallons per minute (gpm) fire flow for minimum duration of two hours at 20 psi residual pressure.

6.3.2 Fire Hydrants

Hydrants shall be located along fire access roadways as determined by the VCFD Fire Marshal to meet operational needs, at the beginning radius of cul-de-sac streets, regardless of parcel size, pursuant to Sections 507.5.1 through 507.5.7 of the VCFPD Ordinance Number 31 and Appendix C of the 2019 CFC (or then current edition) for single- and multi-family residential units. Fire Hydrants will be consistent with applicable Design Standards.

6.3.3 Automatic Fire Sprinkler Systems

All structures, of any occupancy type, will be protected by an automatic, interior fire sprinkler system. All structures Automatic internal fire sprinklers would be in accordance with NFPA 13, 13-D, or 13-R and VCFD installation requirements as appropriate. Actual system design is subject to final building design and the occupancy types in the structure.

6.3.4 Residential Hazard Detectors

All residences will be equipped with residential smoke detectors and carbon monoxide detectors and comply with current CBC, CFC, and California Residential Code standards.

6.4 Ongoing Building and Infrastructure Maintenance

The project HOA shall be responsible for long term funding and maintenance of private roads and fire protection systems, including fire sprinklers and private fire hydrants.

6.5 Pre-Construction Requirements

Prior to bringing lumber or combustible materials onto the site, site improvements within the active development area shall be in place, including utilities, operable fire hydrants, an approved, temporary roadway surface, and fuel modification zones established. These features will be approved by prior to combustibles being brought on site.

6.6 Defensible Space and Vegetation Management

6.6.1 Fuel Modification Zones

An important component of a fire protection system for this Project is the provision for ignition resistant landscapes and modified vegetation buffers. FMZs are designed to provide vegetation buffers that gradually reduce fire intensity and flame lengths from advancing fire by strategically placing thinning zones, restricted vegetation zones, and irrigated zones adjacent to each other on the perimeter of the WUI exposed structures. FMZs are arguably more

important when situated adjacent to older structures that were built prior to the latest ignition resistant codes and interior sprinkler requirements. All dwelling units within the Proposed Project site will be highly ignition resistant based on required construction design, materials, and methods.

The Proposed Project will be exposed to naturally-vegetated open space areas to the northern, eastern, and western portions of the site. The rest of the proposed development is adjacent to residential communities to the northwest, south, and east, the Moorpark County Club Course approximately half a mile to the north, and commercial buildings to the south. FMZs will be provided for those portions of the proposed development that are adjacent to open space areas in accordance with the VCFD's Ordinance 31 Appendix W, VCFD Standard 515 – Defensible Space and Fuel Modification Zones and Standard 517 – Application of Mulch and Chips in Defensible Space, including all manufactured and maintained slopes. FMZs will include a minimum 200-foot fuel modification zones between the natural open space area to the north and on-site structures of PA1. Additionally, 100 feet of fuel modification (Zones A and B only) along the western portions of the site. The eastern edge of the Proposed Project will receive 68 to 121 feet of FMZs to the top of the grading limits. FMZs less than 100 feet will be augmented with mitigations that meet or exceed the level of protection 100 feet of fuel modification provides. These mitigations include window upgrades that are code-exceeding, dual pane, both panes tempered and a six-foot noncombustible fire wall, while some of the east side FMZs tie into existing development and will not require additional fire protection measures. The fuel modification zones will be constructed from the structure outwards towards undeveloped areas. Figure 5 illustrates the FMZ Plan proposed for the Proposed Project Site, including a minimum 30-foot wide limited planting area Zone A, and a minimum 70-foot wide limited planting area Zone B extending from the structures towards the undeveloped areas. If provided, either by the conditions of the development, voluntarily by the property owner, or required by the VCFD, a minimum 100-foot wide more progressive 50% thinning zone (Zone C) would lessen the spread of fire as it approaches the primary FMZ adjacent to structures. A 10-foot wide roadside FMZ along each side of the roads adjacent to the open space shall be required as well.

Based on the predicted fire intensity and duration along with flame lengths for this project site and the provided FMZs, the highest concern is considered to be from firebrands or embers as a principal ignition factor. To that end, this site, based on its location and ember potential, is required to include the latest ignition and ember resistant construction materials and methods for roof assemblies, walls, vents, windows, and appendages, as mandated by the VCFD and County's Fire and Building Codes (e.g., Chapter 7A).

6.6.1.1 VCFD Fuel Modification Zone Standards

A fuel modification zone (FMZ) is a strip of land where combustible vegetation has been removed and/or modified and partially or totally replaced with more adequately spaced, drought-tolerant, fire resistant plants in order to provide a reasonable level of protection to structures from wildland fire. The purpose of this section is to document VCFD's standards and make them available for reference. However, we are proposing a site-specific fuel modification zone program with additional measures that are consistent with the intent of the standards. VCFD is consistent with the 2019 California Fire Code (Section 4907 — Defensible Space) (or then current edition), Government Code 51175 – 51189, and Public Resources Code 4291, which require that fuel modification zones be provided around every building that is designed primarily for human habitation or use within a VHFHSZ. Fuel modification consists of at least 100 feet, measured in a horizontal plane, from the exterior façade of all structures towards the undeveloped areas. A typical landscape/fuel modification installation per the County's Fire Code consists of a 30-foot-wide Zone A and a 70-foot wide Zone B for a total of 100 feet in width. An additional 100-foot

wide thinning zone (Zone C) is required for the areas adjacent to natural-vegetated, open space areas (north of PA1).

To ensure long-term identification and maintenance, a fuel modification area shall be identified by a permanent zone marker meeting the approval of VCFD. All markers will be located along the perimeter of the fuel modification area at a minimum of 500 feet apart or at any direction change of the fuel modification zone boundary. FMZs will be maintained on at least an annual basis or more often as needed to maintain the fuel modification buffer function.

Zone A – from structure outward to minimum 30 feet)

Zone A is applicable site wide and is a limited planting area measured from the structure outward to 30 feet (horizontal), or to the property line in all directions.

a. 0 to 5 feet from structure includes very low growing (three-inch high), high water content ground cover and few small shrubs (two-foot high). No landscape mulch or wood chips. Use clear soils, rocks, gravel, or concrete. No trees. This is a recommended no planting zone.

b. 5 to 30 feet from structure includes minimal plantings including ground cover and shrubs. Limited trees of a very fire resistive type and additional spacing. Trees should be spaced to allow a minimum 10-foot clearance to structure at full maturity. See Table 6, *VCFD FMZ Spacing Requirements.*

c. Plants and trees identified as "Target" (undesirable plants) by VCFD shall not be planted within Zone A. See Appendix D – VCFD Suggested Plant Reference Guide and Appendix E – VCFD Prohibited Plant List.

Zone B – from outer edge of Zone A to 100 feet from structure

Zone B is applicable site wide and is the area measured from the outer edge of Zone A to 100 feet from the structure. This zone includes plantings including ground cover and shrubs. Limited trees of a very fire resistive type and additional spacing. Trees should be spaced to allow a minimum 10-foot clearance to structure at full maturity. See Table 6, *VCFD FMZ Spacing Requirements.*

Zone C – Thinning Zone (from outer edge of Zone B to 200 feet from structure)

Zone C is considered a thinning zone and is any FMZ greater than 100 feet from structures. When provided, either by conditions of development, voluntary by the property owner, or required by the VCFD, this zone is more of a progressive thinning zone to lessen spread of fire as it approaches the primary FMZ adjacent to structures. The amount of fuel reduction and removal should take into consideration the type and density of fuels, aspect, topography, weather patterns, and fire history.

Table 6. VCFD Fuel Modification Zone Spacing Requirements

Type of Vegetation	Maximum Height (H)	Maximum Area / Diameter (W)	Slope Percentage / Minimum Spacing (S) [1]
Ground Cover	6-inches Max	N/A	N/A
Mosaic Grouping of Ground Cover (GC)	>6 - 18-inches	Groupings shall not exceed 500 square feet without minimum spacing (S) to next grouping	<20%: 2 x GC height (H) 20%-40%: 4 x GC height (H) >40%: 6 x GC height (H)

Single Shrub	6 feet Max	4 feet diameter	<20%: 2 x shrub height (H) 20%-40%: 4 x shrub height (H) >40%: 6 x shrub height (H)
Grouping of Shrubs	4 feet Max	Groupings shall not exceed 50 square feet without minimum spacing (S) to next grouping	<20%: 20 feet 20%-40%: 40 feet >40%: Not allowed
Single Tree	N/A	N/A	<20%: 10 feet 20%-40%: 20 feet >40%: 30 feet

[1] Spacing (S) Notes:
a. Spacing measured canopy at maturity
b. Ground cover up to 3-inches high, when approved, may be installed within the required clear space (S) between groups. If natural or annual grasses are used, they shall be mowed to a maximum height of 3-inches stubble with chippings removed.
c. Ground cover under tree canopies, when approved, shall have a clear distance above the ground cover a minimum 3 times the height of the ground cover (3H) to the lowest branch of the tree canopy and shall not be within 3 feet of the trunk of the tree.

Additional FMZ requirements:

- Highly flammable trees are not allowed unless approved by the Fire Code Official
- The horizontal distance between crowns of trees and crowns of adjacent trees, overhead electrical facilities, or unmodified fuel is not less than 15 feet.
- The vertical clearance distance above any roof is not less than 3 feet.
- The horizontal and vertical clearance to any chimney or heat producing device is not less than 10 feet.
- Trees exceeding 6 feet in height shall be limbed up from the ground 5 feet or 1/3 the height of the tree, whichever is less.
- All plants and trees shall be maintained free of deadwood, leaves, and limbs that can increase ability to ignite and/or carry fire. This includes dried palm fronds.
- Tree litter shall not exceed 2-inch depth underneath the canopies.
- Where tree canopies touch or extend past the 100-foot defensible space zone, there shall be a clear area from the edge of the tree canopy to the brush of not less than 15 feet; which may require clearance outside the 100-foot zone.
- Roofs and gutters on buildings shall be maintained free of any leaves, needles, or other vegetative materials.
- Mulch and wood chips shall comply with VCFD Standard 517. Not allowed within 5 feet of structures.
- Irrigation is not required for any defensible space or FMZ.

6.6.1.2 Other Vegetation Management

Roadway-Adjacent Defensible Space

As required under the Ventura County Fire Code, an area of 10 feet from each side of fire apparatus access roads and driveways in addition to an unobstructed vertical clearance of 13 feet, 6-inches above the roadways. Roadside fuel modification consists of mowing grasses to six-inches in height and/or maintaining ornamental landscapes, including trees, clear of dead and dying plant materials. Roadside fuel modification shall be maintained by the HOA.

Stormwater Basins

Fire-safe vegetation management will be performed within the basins on a yearly basis in accordance with the following guidelines.

1. Groundcovers or shrubs included in the basin shall be low-growing with a maximum height at maturity of 36 inches. Single tree specimens or groupings of two to three trees per grouping of fire resistive trees or tree form shrubs may exceed this limitation if they are located to reduce the chance of transmitting fire from vegetation to habitable structures and if the vertical distance between the lowest branches of the large, trees or tree form shrubs and the tops of adjacent plants are three times the height of the adjacent plants to reduce the spread of fire through ladder fueling.
2. All trees shall be planted and maintained at a minimum of 10 feet from the tree's mature drip line to any combustible structure.
3. The water detention basin area will be irrigated and maintained to brush management Zone 1 standards.
4. Grasses must be maintained/mowed to 6 inches in height.
5. The water quality basins will not be re-vegetated with plant species that are found on the VCFD's Prohibited Plant List (Appendix E).
6. This area shall be maintained annually free of dying and dead vegetation.
7. Trees adjacent to the basin's access road shall be maintained at a vertical clearance of 13 feet, 6-inches for access into the interior of the basin.

Special Fuel Management Issues

On the Proposed Project site, tree planting in the fuel modification zones and along roadways is acceptable, as long as they meet the following restrictions as described below and in the County's Fire Code and the VCFD's Standard 515 – Defensible Space and Fuel Modification Zones spacing requirements:

- For streetscape plantings, trees should be planted 10 feet from edge of curb to center of tree trunk. Care should be given to the type of tree selected, that it will not encroach into the roadway, or produce a closed canopy effect.
- Crowns of trees located within defensible space shall maintain a minimum horizontal clearance of 15 feet for a single tree. Mature trees shall be pruned to remove limbs one-third the height or 5 feet, whichever is less, above the ground surface adjacent to the trees.
- Dead wood and litter shall be regularly removed from trees.
- Ornamental trees shall be limited to groupings of 2–3 trees with canopies for each grouping separated horizontally as described in Table 6.

Specific Landscaping Requirements

The following requirements are provided for HOA-maintained fuel modification zones. All landscaping shall be maintained by the HOA.

Plants used in the fuel modification areas or landscapes will include drought-tolerant, fire resistive trees, shrubs, and groundcovers. The planting list and spacing will be reviewed and approved by VCFD, included on submitted landscape plans. The plantings will be consistent with VCFD's Suggested Plant Reference Guide (Appendix D). The intent of the suggested plant reference guide is to provide examples of plants that are less prone to ignite or spread flames to other vegetation and combustible structures during a wildfire. Additional Plants can be added to the landscape plant material palette with the approval from VCFD.

Pre-Construction Requirements

- Perimeter fuel modification areas must be implemented and approved by the VCFD prior to combustible materials being brought on site.
- Existing flammable vegetation shall be reduced by 50% on vacant lots upon commencement of construction.
- Dead fuel, ladder fuel (fuel which can spread fire from ground to trees), and downed fuel shall be removed and trees/shrubs shall be properly limbed, pruned, and spaced per this plan.

Undesirable Plants

Certain plants are considered to be undesirable in the landscape due to characteristics that make them highly flammable. These characteristics can be physical or chemical. The plants included in the VCFD Prohibited Plant List (Appendix E) are unacceptable from a fire safety standpoint, and shall not be planted on the site unless otherwise approved by the VCFD.

6.6.2 Fuel Modification Area Vegetation Maintenance

All fuel modification area vegetation management shall be completed annually by May 1 of each year and more often as needed for fire safety, as determined by the VCFD.

The individual homeowners shall be responsible for all fuel modification vegetation management on their lots in compliance with this plan and the VCFD requirements. The Hitch Ranch Community HOA shall be responsible for all fuel modification vegetation management for all common areas, roadsides clearance, fuel modification zones, any retention basins, medians, planters, parks, etc. The HOA will assure private homeowner lots comply with this plan initially and on an ongoing basis. Chapter 7A requirements for ongoing maintenance of fire resistive building materials and fire sprinkler systems will be included in the C, C and R's and Deed encumbrances for each lot. Additionally, the project HOA shall be responsible for ensuring long-term funding and ongoing compliance with fuel modification and maintenance requirements with all provisions of this report.

Maintenance of FMZ's and Defensible Space is an important component for long term fire safety of the Project. Maintenance obligations will be as follows:

Hitch Ranch HOA:

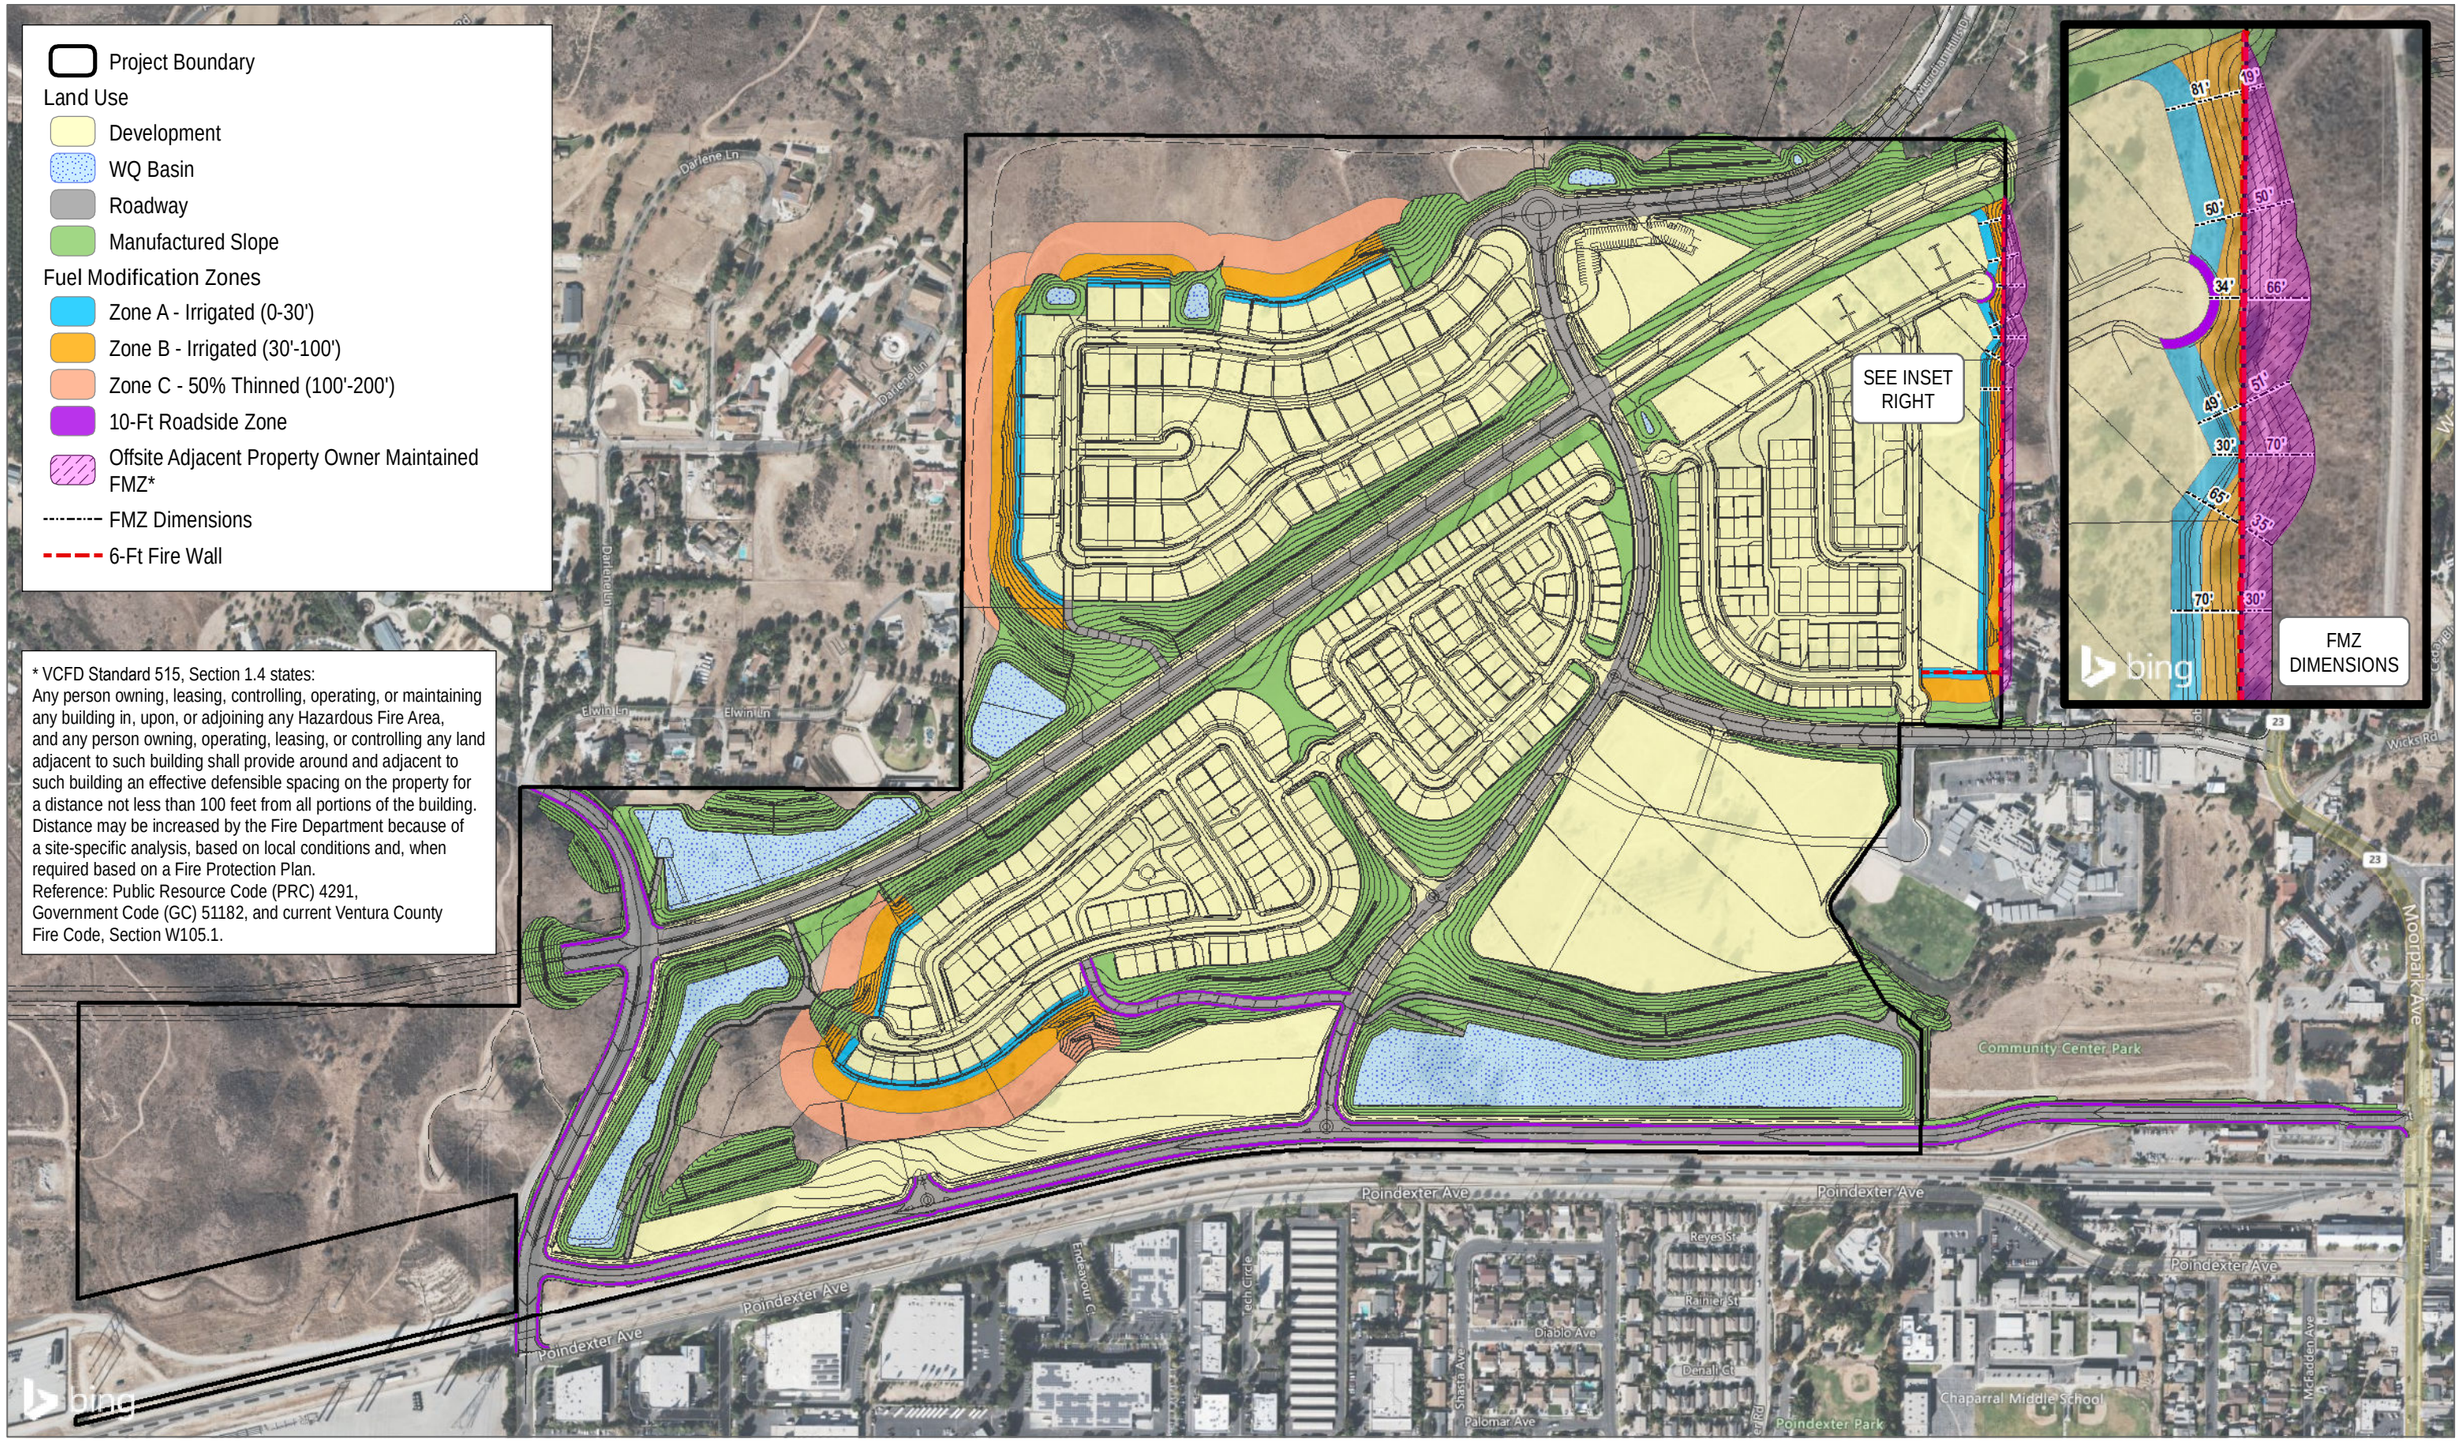
- Maintenance of access roads, includes a minimum of 10 feet clearance on each side of road(s).
- Annual Maintenance of FMZs (or as needed)
- Maintenance of all common areas, including trees planted along roadways and in other areas throughout project.

Resident/Homeowner:

- Maintenance of vegetation on individual property lots.

6.6.3 Annual Fuel Modification Zone Compliance Inspection

To confirm that the Proposed Project's FMZs and landscape areas are being maintained according to this FPPs and the VCFD's requirements, the Project HOA would obtain an FMZ inspection and report from a qualified VCFD-approved 3rd party inspector in May of each year certifying that vegetation management activities throughout the project site have been performed. If the FMZ areas are not compliant, the Hitch Ranch HOA will have a specified period to correct any noted issues so that a re-inspection can occur, and certification can be achieved. Annual inspection fees are subject to the current Fire Department Fee Schedule.



6.6.4 Construction Phase Vegetation Management

Vegetation management requirements shall be implemented at commencement and throughout the construction phase. Vegetation management for the Proposed Project area shall be performed pursuant to this FPP and VCFD requirements on the property site prior to the start of work and prior to any import of combustible construction materials. Adequate firebreaks that are at least 50 feet wide shall be created around all grading, site work, and other construction activities in areas where there is flammable vegetation. Combustible Materials will not be brought on site without prior fire department approval.

In addition to the requirements outlined above, the project will comply with the following important risk-reducing vegetation management guidelines:

- All new power lines shall be underground for fire safety during high wind conditions or during fires on a right-of-way that can expose aboveground power lines. Temporary construction power lines may be allowed in areas that have been cleared of combustible vegetation.
- Caution must be used not to cause erosion or ground (including slope) instability or water runoff due to vegetation removal, vegetation management, maintenance, landscaping, or irrigation.

7 Alternative Materials and Methods for Non-Conforming Fuel Modification

As previously mentioned, due to site constraints, it is not feasible to achieve the standard FMZ width on the entire east side of the development within Planning Area 3. The Project's eastern property line can only provide an area between 68 and 121 feet of structural setback from off-site fuel beds. As such, this FPP describes additional measures that will be implemented to mitigate the non-conforming fire related threats and proposed reduced fuel modification zones. These measures are customized for this site based on the analysis results and focus on providing functional equivalency as a County-defined, full fuel modification zone.

As experienced in numerous wildfires, including the most recent fire storms in Ventura and San Diego Counties, homes in the WUI are potential fuel. The distance between the wildland fire that is consuming wildland fuel and the home ("urban fuel") is the primary factor for structure ignition (not including burning embers). The closer a fire is to a structure, the higher the level of heat exposure (Cohen 2000). However, studies indicate that given certain assumptions (e.g., 10 meters of low fuel landscape, no open windows), wildfire does not spread to homes unless the fuel and heat requirements (of the home) are sufficient for ignition and continued combustion (Cohen 1995, Alexander et al. 1998). Construction materials and methods can prevent or minimize ignitions. Similar case studies indicate that with nonflammable roofs and vegetation modification from 10–18 meters (roughly 32–60 feet) in southern California fires, 85–95% of the homes survived (Howard et al. 1973, Foote and Gilless 1996). Similarly, San Diego County after fire assessments indicate strongly that the building codes are working in preventing home loss: of 15,000 structures within the 2003 fire perimeter, 17% (1,050) were damaged or destroyed. However, of the 400 structures built to the 2001 codes (the most recent at the time), only 4% (16) were damaged or destroyed. Further, of the 8,300 homes that were within the 2007 fire perimeter, 17% were damaged or destroyed. A much smaller percentage (3%) of the 789 homes that were built to 2001 codes were impacted and an even smaller percentage (2%) of the 1,218 structures built to the 2004 Codes were impacted (IBHS 2008). Damage to the structures built to the latest codes is likely from flammable landscape plantings or objects next to structures or open windows or doors (Hunter 2007).

These results support Cohen's (2000) findings that if a community's homes have a sufficiently low home ignitability, the community can survive exposure to wildfire without major fire destruction. This provides the option of mitigating the wildland fire threat to homes/structures at the residential location without extensive wildland fuel reduction. Cohen's (1995) studies suggest, as a rule-of-thumb, larger flame lengths and widths require wider fuel modification zones to reduce structure ignition. For example, valid SIAM results indicate that a 20-foot high flame has minimal radiant heat to ignite a structure (bare wood) beyond 33 feet (horizontal distance). Whereas, a 70-foot-high flame may require about 130 feet of clearance to prevent structure ignitions from radiant heat (Cohen and Butler 1996). This study utilized bare wood, which is more combustible than the ignition resistant exterior walls for structures built today. Fire behavior modeling conducted for this project indicates that fires in the moderate to high load shrub and chaparral north of the Project Site would result in roughly 42- to 87-foot flame lengths under fall, extreme weather conditions. The proposed FMZ is twice the length of the predicted flame length.

As indicated in this report, the FMZs and additional fire protection measures proposed for the eastern portion of the development provide equivalent wildfire buffer but are not standard zones. Rather, they are based on a variety of analysis criteria including predicted flame length, fire intensity (Btu), site topography and vegetation, extreme and typical weather, position of structures on pads, position of roadways, adjacent fuels, fire history, current vs. proposed land use,

neighboring communities relative to the proposed project, and type of construction. The fire intensity research conducted by Cohen (1995) and Cohen and Butler (1996) supports the fuel modification alternatives proposed for this project.

7.1 Additional Structure Protection Measures

The following additional measures will be implemented to "mitigate" potential structure fire exposure related to the provided reduced FMZs for the eastern edge of the development. These measures are customized for this site, its unique topographical and vegetative conditions, and focus on providing functional equivalency as a full fuel modification zone. It should be noted that a fully developed Senior Living Project is proposed for development along the eastern edge of the Hitch Ranch development, from the existing homes off Casey Road up to the proposed North Hills Parkway. If that project site is under development prior to Hitch Ranch beginning construction in this area, then additional mitigations would not be necessary. If Hitch Ranch begins construction prior to the neighboring Senior Living Project development, then compensating measures are proposed. In order to provide compensating structural protection in the absence of a 100-foot wide FMZ, and in addition to the residences being built to the latest ignition resistant codes, these structures will also include the following features for additional fire prevention, protection, and suppression:

1. The proposed Triplex structures along the eastern edge of the development within PA3 that are adjacent to existing homes off Casey Road, shall be constructed with multi- pane glazing with a minimum of one tempered pane windows (see Figure 5);
2. The remaining Triplex structures along the eastern edge of the development within PA3 are exposed to natural vegetation. Depending on the timing of development of the proposed Senior Living project which currently is not developed, the remaining Triplex structures within the Hitch Ranch development along the eastern edge of the development shall implement either; a.) if the proposed Senior Living development begins construction prior to the Hitch Ranch Project development begins construction, then dual pane single tempered windows will be acceptable, or b.) if the Senior Living development has not begun construction prior to Hitch Ranch Project construction at this site, then dual pane, dual tempered windows will be required for the Hitch Ranch developments that are north of the existing homes off Casey Road up to proposed North Hills Parkway, exceeding the CBC Chapter 7A code requirement (see Figure 5).
3. Provide a noncombustible, 6-foot high concrete masonry unit (CMU) wall at the top of the manufactured slopes behind the units within PA3 along the eastern property boundary. These walls will be installed to function as heat-deflecting walls.

The information provided herein supports the ability of the proposed structures and FMZs to withstand the predicted short duration, low to moderate intensity wildfire and ember shower that would be expected from wildfire burning in the vicinity of the site or within the site's landscape.

INTENTIONALLY LEFT BLANK

8 Homeowner's Association Wildfire Education Program

The residents and visitors of the Proposed Project will be provided a proactive educational component disclosing the potential wildfire risk and this report's requirements. This educational information must include maintaining the landscape and structural components according to the appropriate standards and embracing a "Ready! Set! Go!"[7] stance on evacuation. The "Ready! Set! Go!" informational packet and other VCFD standards and ordinances can be found on the VCFD's website at vcfd.org. VCFD will review and approve all wildfire educational material/programs before printing and distributing.

9 Conclusion

This FPP is submitted in support of an application for project entitlement of the Hitch Ranch mixed-density residential development project. It is submitted in compliance with requirements of the VCFPD Ordinance's and the Ventura County Fire Code. The requirements in this document meet fire safety, building design elements, fuel management/modification, and landscaping recommendations of the VCFD. Fire and Building Codes and other local, county, and state regulations in effect at the time of each building permit application supersede these recommendations unless the FPP recommendation is more restrictive. Where the project does not strictly comply with the Code, alternative materials and methods have been proposed that provide functional equivalency as the code intent.

The recommendations provided in this FPP have been designed specifically for the proposed construction of residential dwelling units within the vicinity of a very high fire hazard severity zone on the Proposed Project site. The project site's fire protection system includes a redundant layering of code compliant fire-resistant construction materials and methods that have been shown through post-fire damage assessments to reduce risk of structural ignition.

Ignition resistant landscaping would occur throughout the site. Fuel modification will be installed on the Proposed Project's perimeter which abuts open space located north and west of and adjacent to the project. The site's landscaping will be maintained throughout each year and an inspection will be funded by the Hitch Ranch Community HOA to ensure compliance with this FPP and fire safe plant palettes, planting densities and spacing.

The site improvements are designed to facilitate emergency apparatus and personnel access to all portions of the site. Three existing dead end roads that are adjacent to the site would be eliminated through interconnections, improving overall circulation and evacuation options. Roads and driveways meeting the code width standards and including fire engine turnarounds provide access to within 150 feet of all sides of every building.

Water availability and flow via the VCWWD No. 1 will be consistent with VCFD requirements including fire flow, residual pressure and hydrant distribution. These features along with the ignition resistance of all dwelling units, the interior sprinklers, and the pre-planning, training and awareness will assist responding firefighters through prevention, protection and suppression capabilities.

Ultimately, it is the intent of this FPP to guide, through code and other project specific requirements, the construction of structures that are defensible from wildfire and, in turn, do not represent significant threat of ignition source for the adjacent communities. It must be noted that during extreme fire conditions in a VHFHSZ, there are no guarantees that a given structure will not burn. Precautions and mitigating actions identified in this report are designed to reduce the likelihood that fire would impinge upon the proposed structures. There are no guarantees that fire will not occur in the area or that fire will not damage property or cause harm to persons or their property. Implementation of the required enhanced construction features provided by the applicable codes and the mitigating fuel modification requirements provided in this FPP will accomplish the goal of this FPP to assist firefighters in their efforts to defend these structures and reduce the risk associated with this project's WUI location. For maximum benefit, the developer, contractors, engineers, and architects are responsible for proper implementation of the concepts and requirements set forth in this report. Homeowners and HOA are responsible to maintain their structures and landscaping as required by this report, the applicable Fire Code, and the VCFD. While wildfires under extreme wind conditions can be unpredictable, the project has been designed with a layered system of

protections and would include the necessary features to perform well during wildfires. With these features, the project would be considered a "Fire Safe" project."

This FPP does not provide a guarantee that all residents or visitors will be safe at all times because of the advanced fire protection features it requires. There are many variables that may influence overall safety. This FPP provides requirements and recommendations for implementation of the latest fire protection features that have proven to result in reduced wildfire related hazard, resulting in reduced risk. Even then, fire can compromise the fire protection features through various, unpredictable ways. The goal is to reduce the likelihood that the system is compromised through implementation of the elements of this FPP and a regular occurring maintenance program

It is recommended that the homeowners or other occupants who may reside within the Hitch Ranch development adopt a conservative approach to fire safety. This approach must include maintaining the landscape and structural components according to the appropriate standards and embracing a "Ready, Set, Go" stance on evacuation. This project is not to be considered a shelter-in-place development. However, the fire agencies and/or law enforcement officials may, during an emergency, as they would for any new development providing the layers of fire protection as Hitch Ranch development, determine that it is safer to temporarily refuge clients or visitors on the site. When an evacuation is ordered, it will occur according to pre-established evacuation decision points or as soon as notice to evacuate is received, which may vary depending on many environmental and other factors. Fire is a dynamic and somewhat unpredictable occurrence and it is important for anyone living at the WUI to educate themselves on practices that will improve safety.

The goal of the fire protection features, both required and those offered above and beyond the Codes, provided for the Hitch Ranch Project is to provide the structures with the ability to survive a wildland fire with little intervention of firefighting forces. Preventing ignition to structures results in reduction of the exposure of firefighters and residents to hazards that threaten personal safety. It will also reduce property damage and losses. Mitigating ignition hazards and fire spread potential reduces the threat to structures and can help the fire department optimize the deployment of personnel and apparatus during a wildfire. The analysis in this FPP provides support and justifications for acceptance of the proposed fuel modification zones for Hitch Ranch development based on the site specific fire environment.

BehavePlus Fire Behavior Analysis

APPENDIX C
Fire Behavior Modeling Summary
Hitch Ranch FPP, Moorpark, California

BEHAVEPLUS FIRE BEHAVIOR MODELING

Fire behavior modeling has been used by researchers for approximately 50+ years to predict how a fire will move through a given landscape (Linn 2003). The models have had varied complexities and applications throughout the years. One model has become the most widely used as the industry standard for predicting fire behavior on a given landscape. That model, known as "BEHAVE", was developed by the U. S. Government (USDA Forest Service, Rocky Mountain Research Station) and has been in use since 1984. Since that time, it has undergone continued research, improvements, and refinement. The current version, BehavePlus 6.0, includes the latest updates incorporating years of research and testing. Numerous studies have been completed testing the validity of the fire behavior models' ability to predict fire behavior given site specific inputs. One of the most successful ways the model has been improved has been through post-wildfire modeling (Brown 1972, Lawson 1972, Sneeuwjagt and Frandsen 1977, Andrews 1980, Brown 1982, Rothermel and Rinehart 1983, Bushey 1985, McAlpine and Xanthopoulos 1989, Grabner, et. al. 1994, Marsden-Smedley and Catchpole 1995, Grabner 1996, Alexander 1998, Grabner et al. 2001, Arca et al. 2005). In this type of study, Behave is used to model fire behavior based on pre-fire conditions in an area that recently burned. Real-world fire behavior, documented during the wildfire, can then be compared to the prediction results of Behave and refinements to the fuel models incorporated, retested, and so on.

Fire behavior modeling conducted on this site includes a relatively high-level of detail and analysis which results in reasonably accurate representations of how wildfire may move through available fuels on and adjacent the property. Fire behavior calculations are based on site-specific fuel characteristics supported by fire science research that analyzes heat transfer related to specific fire behavior. To objectively predict flame lengths, spread rates, and fireline intensities, this analysis incorporated predominant fuel characteristics, slope percentages, and representative fuel models observed on site. The BehavePlus fire behavior modeling system was used to analyze anticipated fire behavior within and adjacent to key areas just outside of the proposed lots.

Predicting wildland fire behavior is not an exact science. As such, the movement of a fire will likely never be fully predictable, especially considering the variations in weather and the limits of weather forecasting. Nevertheless, practiced and experienced judgment, coupled with a validated fire behavior modeling system, results in useful and accurate fire prevention planning information.

To be used effectively, the basic assumptions and limitations of BehavePlus must be understood.

- First, it must be realized that the fire model describes fire behavior only in the flaming front. The primary driving force in the predictive calculations is dead fuels less than one-quarter inch in diameter. These are the fine fuels that carry fire. Fuels greater than one inch have little effect while fuels greater than three inches have no effect on fire behavior.
- Second, the model bases calculations and descriptions on a wildfire spreading through surface fuels that are within six feet of the ground and contiguous to the ground. Surface fuels are often classified as grass, brush, litter, or slash.
- Third, the software assumes that weather and topography are uniform. However, because wildfires almost always burn under non-uniform conditions, length of projection period and choice of fuel model must be carefully considered to obtain useful predictions.
- Fourth, the BehavePlus fire behavior computer modeling system was not intended for determining sufficient fuel modification zone widths. However, it does provide the average length of the flames, which is a key element for determining "defensible space" distances for minimizing structure ignition.

Although BehavePlus has some limitations, it can still provide valuable fire behavior predictions which can be used as a tool in the decision-making process. In order to make reliable estimates of fire behavior, one must understand the relationship of fuels to the fire environment and be able to recognize the variations in these fuels. Natural fuels are made up of the various components of vegetation, both live and dead, that occur on a site. The type and quantity will depend upon the soil, climate, geographic features, and the fire history of the site. The major fuel groups of grass, shrub, trees, and slash are defined by their constituent types and quantities of litter and duff layers, dead woody material, grasses and forbs, shrubs, regeneration, and trees. Fire behavior can be predicted largely by analyzing the characteristics of these fuels. Fire behavior is affected by seven principal fuel characteristics: fuel loading, size and shape, compactness, horizontal continuity, vertical arrangement, moisture content, and chemical properties.

The seven fuel characteristics help define the 13 standard fire behavior fuel models[1] and the five custom fuel models developed for Southern California[2]. According to the model classifications, fuel models used in BehavePlus have been classified into four groups, based upon fuel loading (tons/acre), fuel height, and surface to volume ratio. Observation of the fuels in the field (on site) determines which fuel models should be applied in BehavePlus. The following describes the distribution of fuel models among general vegetation types for the standard 13 fuel models and the custom Southern California fuel models:

[1] Anderson, Hal E. 1982. Aids to Determining Fuel Models for Estimating Fire Behavior. USDA Forest Service Gen. Tech. Report INT-122. Intermountain Forest and Range Experiment Station, Ogden, UT.

[2] Weise, D.R. and J. Regelbrugge. 1997. Recent chaparral fuel modeling efforts. Prescribed Fire and Effects Research Unit, Riverside Fire Laboratory, Pacific Southwest Research Station. 5p.

- Grasses Fuel Models 1 through 3
- Brush Fuel Models 4 through 7, SCAL 14 through 18
- Timber Fuel Models 8 through 10
- Logging Slash Fuel Models 11 through 13

In addition, the aforementioned fuel characteristics were utilized in the recent development of 40 new fire behavior fuel models[3] developed for use in BehavePlus modeling efforts. These new models attempt to improve the accuracy of the standard 13 fuel models outside of severe fire season conditions, and to allow for the simulation of fuel treatment prescriptions. The following describes the distribution of fuel models among general vegetation types for the new 40 fuel models:

- Non-Burnable Models NB1, NB2, NB3, NB8, NB9
- Grass Models GR1 through GR9
- Grass-shrub Models GS1 through GS4
- Shrub Models SH1 through SH9
- Timber-understory Models TU1 through TU5
- Timber litter Models TL1 through TL9
- Slash blowdown Models SB1 through SB4

BehavePlus software was used in the development of this Hitch Ranch Project (Proposed Project) Fire Protection Plan (FPP) in order to evaluate potential fire behavior for the Project site. Existing site conditions were evaluated, and local weather data was incorporated into the BehavePlus modeling runs.

FUEL MODELS

Dudek utilized the BehavePlus software package to analyze fire behavior potential for the Hitch Ranch Project site in Moorpark, California. As is customary for this type of analysis, three fire scenarios were evaluated, including one summer, onshore weather condition (west from the Project Site) and two extreme fall, offshore weather condition (northt and northeast of the Project Site). Fuels and terrain at and beyond this distance can produce flying embers that may affect the project, but defenses have been built into the structures to prevent ember penetration and to extinguish fires that may result from ember penetration. It is the fuels adjacent to and within fuel modification zones that would have the potential to affect the project's structures from a radiant

[3] Scott, Joe H. and Robert E. Burgan. 2005. Standard fire behavior fuel models: a comprehensive set for use with Rothermel's surface fire spread model. Gen. Tech. Rep. RMRS-GTR-153. Fort Collins, CO: U.S. Department of Agriculture, Forest Service, Rocky Mountain Research Station. 72 p.

and convective heat perspective as well as from direct flame impingement. BehavePlus software requires site-specific variables for surface fire spread analysis, including fuel type, fuel moisture, wind speed, and slope data. The output variables used in this analysis include flame length (feet), rate of spread (feet/minute), fireline intensity (BTU/feet/second), and spotting distance (miles). The following provides a description of the input variables used in processing the BehavePlus models for the Proposed Project site. In addition, data sources are cited and any assumptions made during the modeling process are described. Table 1 provides a description of the fuel model observed in the vicinity of the site that were subsequently used in the analysis for this project. Modeled areas include the high load grass ground fuels (Gr7) that occur throughout the Project site. A total of three fire modeling scenarios were completed for the Project site. These sites were selected based on the strong likelihood of fire approaching from these directions during a Santa Ana wind-driven fire event (fire scenarios 2 and 3) and an on-shore weather pattern (fire scenario 1).

Table 1
Existing Fuel Model Characteristics

Fuel Model	Description	Location	Fuel Bed Depth (Feet)
Gr7	High Load, Dry Climate Grass	Fuel type is concentrated throughout the Project site.	>5.0 ft.
Gr2	Low Load, Dry Climate Grass	Fuel type will occur post development within 50% thinning zone.	1.0 ft.
FM8	Irrigated Landscape	Fuel type will occur post development within irrigated zone.	<1.0 ft.

Topography

Slope is a measure of angle in degrees from horizontal and can be presented in units of degrees or percent. Slope is important in fire behavior analysis as it affects the exposure of fuel beds. Additionally, fire burning uphill spreads faster than those burning on flat terrain or downhill as uphill vegetation is pre-heated and dried in advance of the flaming front, resulting in faster ignition rates. Slope values ranging from 5–9% were measured around the perimeter of the proposed project site from U.S. Geological Survey (USGS) topographic maps.

Weather

Historical weather data for the Moorpark region was utilized in determining appropriate fire behavior modeling inputs for the Project area. 50th and 97th percentile moisture values were derived from Remote Automated Weather Station (RAWS) and utilized in the fire behavior

modeling efforts conducted in support of this report. Weather data sets from the Cheeseboro Station RAWS[4] were utilized in the fire modeling runs.

RAWS fuel moisture and wind speed data were processed utilizing the Fire Family Plus software package to determine atypical (97th percentile) and typical (50th percentile) weather conditions. Data from the RAWS was evaluated from August 1 through November 30 for each year between 1995 and 2018 (extent of available data record) for 97th percentile weather conditions and from June 1 through September 30 for each year between 1995 and 2018 for 50th percentile weather conditions.

Following analysis in Fire Family Plus, fuel moisture information was incorporated into the Initial Fuel Moisture file used as an input in BehavePlus. Wind speed data resulting from the Fire Family Plus analysis was also determined. Initial wind direction and wind speed values for the two BehavePlus runs were manually entered during the data input phase. The input wind speed and direction is roughly an average surface wind at 20 feet above the vegetation over the analysis area. Table 2 summarizes the wind and weather input variables used in the Fire BehavePlus modeling efforts.

Table 2
BehavePlus Fine Dead Fuel Moisture Calculation

Model Variable	Summer Weather (50th Percentile)	Peak Weather (97th Percentile)
Fuel Models	Gr7	Gr7
1 h fuel moisture	5%	1%
10 h fuel moisture	6%	2%
100 h fuel moisture	11%	4%
Live herbaceous moisture	60%	30%
Live woody moisture	90%	60%
20 ft. wind speed	24 mph (sustained winds)	19 mph (sustained winds); 50 and 70 mph (gusty winds)
Wind Directions from upslope (degrees)	60	180, 235
Wind adjustment factor	0.4	0.4
Slope (uphill)	5%	5 and 9%

Fire Behavior Modeling Effort

As mentioned, the BehavePlus fire behavior modeling software package was utilized in evaluating anticipated fire behavior adjacent to the Proposed Project site. Three focused analyses were completed, each assuming worst-case fire weather conditions for a fire approaching the

[4] https://wrcc.dri.edu/cgi-bin/rawMAIN.pl?caCCHB
Latitude: 34.1105 Longitude: -118.4302; Elevation: 1,650 ft.)

project site from the north, northeast, and west. Four fire behavior variables were selected as outputs from the BehavePlus analysis conducted for the project site, and include flame length (feet), rate of spread (mph), fireline intensity (BTU/feet/second), and surface fire spotting distance (miles). The aforementioned fire behavior variables are an important component in understanding fire risk and fire agency response capabilities. Flame length, the length of the flame of a spreading surface fire within the flaming front, is measured from midway in the active flaming combustion zone to the average tip of the flames (Andrews, Bevins, and Seli 2008). Fireline intensity is a measure of heat output from the flaming front, and also affects the potential for a surface fire to transition to a crown fire. Fire spread rate represents the speed at which the fire progresses through surface fuels and is another important variable in initial attack and fire suppression efforts (Rothermel and Rinehart 1983). Spotting distance is the distance a firebrand or ember can travel down wind and ignite receptive fuel beds. The information in Table 3 presents an interpretation of the outputs for two fire behavior variables as related to fire suppression efforts. The results of fire behavior modeling efforts are presented in Table 4. Identification of modeling run locations is presented graphically in Figure 4 of the FPP.

Table 3
Fire Suppression Interpretation

Flame Length (ft)	Fireline Intensity (Btu/ft/s)	Interpretations
Under 4 feet	Under 100 BTU/ft/s	Fires can generally be attacked at the head or flanks by persons using hand tools. Hand line should hold the fire.
4 to 8 feet	100-500 BTU/ft/s	Fires are too intense for direct attack on the head by persons using hand tools. Hand line cannot be relied on to hold the fire. Equipment such as dozers, pumpers, and retardant aircraft can be effective.
8 to 11 feet	500-1000 BTU/ft/s	Fires may present serious control problems -- torching out, crowning, and spotting. Control efforts at the fire head will probably be ineffective.
Over 11 feet	Over 1000 BTU/ft/s	Crowning, spotting, and major fire runs are probable. Control efforts at head of fire are ineffective.

FIRE BEHAVIOR MODELING RESULTS

The results presented in Table 4 depict values based on inputs to the BehavePlus software and are not intended to capture changing fire behavior as it moves across a landscape. Changes in slope, weather, or pockets of different fuel types are not accounted for in this analysis. For planning purposes, the averaged worst-case fire behavior is the most useful information for conservative fuel modification design. Model results should be used as a basis for planning only, as actual fire behavior for a given location will be affected by many factors, including unique weather patterns, small-scale topographic variations, or changing vegetation patterns.

Based on the BehavePlus analysis, worst-case fire behavior is expected in non-maintained grass north and northeast of the proposed Project site under Peak weather conditions (represented by Fall Weather, Scenario 3). The fire is anticipated to be a wind-driven fire from the north/northeast during the fall. Under such conditions, expected surface flame lengths reach 74 feet with wind speeds of 50+ mph. Under this scenario, fireline intensities reach 66,781 BTU/feet/second with fast spread rates of 20 mph and could have a spotting distance up to 3.5 miles away.

Based on the BeahvePlus analysis, post development fire behavior is expected in irrigated and replanted with plants that are acceptable with VCFD (Zones A and B - FM8), as well in an area with 50% thinning of the existing shrubs (Gr2) under peak weather conditions (represented by Fall Weather, Scenario 3b). Under such conditions, expected surface flame length is expected to be significantly lower, with flames lengths reaching approximately 18 feet with wind speeds of 50+ mph. Under this scenario, fireline intensities reach 3,037 BTU/feet/second with relatively slow spread rates of 2.1 mph and could have a spotting distance up to 1.3 miles away.

Table 4
RAWS BehavePlus Fire Behavior Model Results

Fire Scenario	Flame Length (feet)	Spread Rate (mph)[5]	Fireline Intensity (Btu/ft./sec)	Spot Fire (Miles)[6]
Scenario 1a: 5% slope, Summer, On-shore Winds (Pre-Development)				
High load Grass Fuels (Gr7)	29.1'	3.5	8,616	1.1
Scenario 1b: 5% slope, Summer, On-shore Winds (Post Development)				
FMZ Zones A and B (FM8)	1.8'	0.1	20	0.2
FMZ Zone C (Gr2)	7.2'	1.1	420	0.4
Scenario 2a: 9% slope, Fall, Offshore, Extreme Winds (Pre-Development)				
High load, Grass Fuels (Gr7)	42.9' (74.6' & 87.1')	6.0 (20.0 & 28.0)	20,054 (66,781 & 93,536)	1.2 (3.5 & 4.9)
Scenario 2b: 9% slope, Fall, Offshore, Extreme Winds (Post Development)				
FMZ Zones A and B (FM8)	2.1' (3.0' & 3.0')	0.1 (0.2 & 0.2)	29 (63 & 63)	0.2 (0.4 & 0.5)
FMZ Zone C (Gr2)	10.9' (18.0' & 18.0)	2.1 (6.2 & 6.2)	1,012 (3,037 & 3,037)	0.5 (1.3 & 1.6)
Scenario 3a: 5% slope, Fall, Offshore, Extreme Winds (Pre-Development)				
High load Grass Fuels (Gr7)	43.0' (74.6' & 87.1')	6.0 (20.0 & 28.0)	20,168 (66,846 & 93,591)	1.2 (3.5 & 4.9)
Scenario 3b: 5% slope, Fall, Offshore, Extreme Winds (Post Development)				
FMZ Zones A and B (FM8)	2.1' (3.0' & 3.0')	0.1 (0.2 & 0.2)	29 (63 & 63)	0.2 (0.4 & 0.5)
FMZ Zone C (Gr2)	10.9' (18.0' & 18.0')	2.1 (6.2 & 6.2)	1,018 (3,037 & 3,037)	0.5 (1.3 & 1.6)

[5] mph = miles per hour
[6] Spotting distance from a wind driven surface fire; it should be noted that the wind mph in parenthesis represent peak gusts of 50 mph and 70 mph, respectively.

This Plant Reference Guide is intended as a reference guide for commonly used native and ornamental plants. This is not an approved plant list. This guide will give the user certain characteristics of each plant listed. Plants and trees on the VCFD Prohibited Plant List shall not be installed within any new defensible space or fuel modification zone.

Defensible space and fuel modification zone provisions are intended to mitigate the risk to life and structures from intrusion of fire from wildland fire exposures, fire exposures from adjacent structures and to mitigate fires from spreading to wildland fuels that may threaten to destroy life, overwhelm fire suppression capabilities, or result in large property loss. Proper selection, installation, spacing and maintenance of plants and landscape is one of the key elements in the survivability of a structure during a wildfire.

Please see **VCFD Standard 515 – Defensible Space and Fuel Modification Zones** for Zone designations, plant and tree spacing, and maintenance requirements.

Fire-resistant does not mean fireproof! Even fire-resistant plants will burn if not well maintained. Keep your plants healthy with appropriate water, proper pruning and removal of dead material.

LEGEND

TYPE:	GC – Ground Cover SHRUB TREE	**WATER:**	VL – Very Low L – Low M – Medium H- High

SPACING: See VCFD Standard 515 -Defensible Space and Fuel Modification Zones

N: Native E/D: Evergreen/Deciduous

Ground Cover- Shrubs- Trees-

TARGET (Undesirable Plants) SPECIES ARE DESIGNATED WITH AN *. They are NOT ALLOWED within 30' of structures. Some may not be allowed within 50 -100' of structures - designated with (50 /100) after name. **It is highly recommended that these plants be removed from any existing defensible space zone.**

Plants highlighted in Green are known to be invasive species and have been known to degrade, change and/or displace native habitats.

Vines and climbing plants are not allowed on combustible structures and are therefore not included in the plant reference guide.

Robinia pseudoacacia *	Black Locust *	Tree	L	75’	30-40’		D
Sambucus mexicana *	Mexican Elderberry *	Tree	L	10-50’	10-25’	X	D
Sapium sebiferum	Chinese Tallow Tree	Tree	M	35’	35’		D
Schefflera actinophylla	Queensland Umbrella Tree	Tree	H, M	20’+	20’+		E
Schefflera pueckleri	Tupidanthus	Tree	H, M	20’+	20’+		E
Schinus molle *	California Pepper	Tree	L	25-40’	25-40’		E
Schinus terebithifolius *	Brazillian Pepper *	Tree	L	30’	30’		E
Sequoia sempervirens *	Coast Redwood *	Tree	H, M	70-16’	40’+	X	E
Sophora japonica *	Japanese Pagoda Tree	Tree	M, L	40’	40’		D
Stenocarpus sinatus	Firewheel Tree	Tree	M, L	30’	15’		D
Strelitzia nicolai	Giant Bird of Paradise	Tree	L	30’	15’		E
Syagrus romanzoffianum*	Queen Palm*	Tree	M	60’	20’		E
Tabebuia chrysotriha	Golden Trumpet Tree	Tree	M	25-30’	30’		E
Tabebuia impetiginosa	Pink Trumpet Tree	Tree	M	35’	30’		E
Taxodium mucronatum *	Montezuma Cypress *	Tree	H, VL	75’	35’		E/D
Tipuana tipu	Tipu Tree	Tree	M	50’	50’		D
Trachycarpus fortunei *(100)	Windmill Palm *	Tree	M	30’	6’		E
Tristania conferta	Brisbane Box	Tree	L, VL	30-60’	40’		E
Tupidanthus calyptratus	Tupidanthus	Tree	M	20’	15’		E
Ulmus parvifolia *	Chinese Elm *	Tree	M, L	40-60’	50-70’		E
Umbellularia californica *	California Bay *	Tree	L, VL	30-75’	30-75’	X	E
Washingtonia filifera *(100)	California Fan Palm *	Tree	L	60’	15’	X	E
Washingtonia robusta *(100)	Mexican Fan Palm *	Tree	L	100’	15’		E
Zelkoza serrata *	Sawleaf Zelkova *	Tree	M	60’	60’		D
Ziziphus jujuba *	Chinese Jujube *	Tree	M, L	20-30’	20-30’		D

VCFD Prohibited Plant List

VENTURA COUNTY FIRE PROTECTION DISTRICT
FIRE PREVENTION BUREAU
165 DURLEY AVENUE
CAMARILLO, CA 93010
www.vcfd.org
Office: 805-389-9738 Fax: 805-388-4356

410 – PROHIBITED PLANT LIST

This list was first published by the VCFD in 2014. It has been updated as of April 2019. It is intended to provide a list of plants and trees that are not allowed within a new required defensible space (DS) or fuel modification zone (FMZ). It is highly recommended that these plants and trees be thinned and or removed from existing DS and FMZs. In certain instances, the Fire Department may require the thinning and or removal.

This list was prepared by Hunt Research Corporation and Dudek & Associates, and reviewed by Scott Franklin Consulting Co, VCFD has added some plants and has removed plants only listed due to freezing hazard. Please see notes after the list of plants.

For questions regarding this list, please contact the Fire Hazard reduction Program (FHRP) Unit at 085-389-9759 or FHRP@ventura.org

Prohibited plant list:Botanical Name	Common Name	Comment*
Trees		
Abies species	Fir	F
Acacia species (numerous)	Acacia	F, I
Agonis juniperina	Juniper Myrtle	F
Araucaria species (A. heterophylla, A. araucana, A. bidwillii)	Araucaria (Norfolk Island Pine, Monkey Puzzle Tree, Bunya Bunya)	F
Callistemon species (C. citrinus, C. rosea, C. viminalis)	Bottlebrush (Lemon, Rose, Weeping)	F
Calocedrus decurrens	Incense Cedar	F
Casuarina cunninghamiana	River She-Oak	F
Cedrus species (C. atlantica, C. deodara)	Cedar (Atlas, Deodar)	F
Chamaecyparis species (numerous)	False Cypress	F
Cinnamomum camphora	Camphor	F
Cryptomeria japonica	Japanese Cryptomeria	F
Cupressocyparis leylandii	Leyland Cypress	F
Cupressus species (C. fobesii, C. glabra, C. sempervirens,)	Cypress (Tecate, Arizona, Italian, others)	F
Eucalyptus species (numerous)	Eucalyptus	F, I
Juniperus species (numerous)	Juniper	F
Larix species (L. decidua, L. occidentalis, L. kaempferi)	Larch (European, Japanese, Western)	F
Leptospermum species (L. laevigatum, L. petersonii)	Tea Tree (Australian, Tea)	F
Lithocarpus densiflorus	Tan Oak	F

Prohibited plant list:Botanical Name	Common Name	Comment*
Melaleuca species (M. linariifolia, M. nesophila, M. quinquenervia)	Melaleuca (Flaxleaf, Pink, Cajeput Tree)	F, I
Olea europea	Olive	I
Picea (numerous)	Spruce	F
Palm species (numerous)	Palm	F, I,
Pinus species (P. brutia, P. canariensis, P. b. eldarica, P. halepensis, P. pinea, P. radiata, numerous others)	Pine (Calabrian, Canary Island, Mondell, Aleppo, Italian Stone, Monterey)	F
Platycladus orientalis	Oriental arborvitae	F
Podocarpus species (P. gracilior, P. macrophyllus, P. latifolius)	Fern Pine (Fern, Yew, Podocarpus)	F
Pseudotsuga menziesii	Douglas Fir	F
Schinus species (S. molle, S. terebenthifolius)	Pepper (California and Brazilian)	F, I
Tamarix species (T. africana, T. aphylla, T. chinensis, T. parviflora)	Tamarix (Tamarisk, Athel Tree, Salt Cedar, Tamarisk)	F, I
Taxodium species (T. ascendens, T. distichum, T. mucronatum)	Cypress (Pond, Bald, Monarch, Montezuma)	F
Taxus species (T. baccata, T. brevifolia, T. cuspidata)	Yew (English, Western, Japanese)	F
Thuja species (T. occidentalis, T. plicata)	Arborvitae/Red Cedar	F
Tsuga species (T. heterophylla, T. mertensiana)	Hemlock (Western, Mountain)	F
Groundcovers, Shrubs & Vines		
Acacia species	Acacia (except dwarf/prostrate variety)	F
Adenostoma fasciculatum	Chamise	F
Adenostoma sparsifolium	Red Shanks	F
Agropyron repens	Quackgrass	F, I
Anthemis cotula	Mayweed	F, I
Arbutus menziesii	Madrone	F
Arctostaphylos species	Manzanita. Also note that Eastwood Manzanita grows to 8'	F
Arundo donax	Giant Reed	F, I
Artemisia species (A. abrotanium, A. absinthium, A. californica, A. caucasica, A. dracunculus, A. tridentata, A. pynocephala)	Sagebrush (Southernwood, Wormwood, California, Silver, True tarragon, Big, Sandhill)	F
*Atriplex species (numerous)***	Saltbush	F, I**
Avena fatua	Wild Oat	F
Baccharis pilularis	Coyote Bush	F
Bambusa species	Bamboo	F, I
Bougainvillea species	Bougainvillea	F, I, FR
Brassica species (B. campestris, B. nigra, B. rapa)	Mustard (Field, Black, Yellow) Wild Turnip	F, I

Prohibited plant list:Botanical Name	Common Name	Comment*
Bromus rubens	Foxtail, Red brome	F, I
Bromus carinatus	California brome	Grows to 5', Dies if cut
Castanopsis chrysophylla	Giant Chinquapin	F
Cardaria draba	Hoary Cress	I
Carpobrotus species	Ice Plant, Hottentot Fig	I
*Ceonothus griseus " Louis Edmunds***	Louis Edmunds Ceanothus	Grow higher than 18"*
*Ceonothus griseus var. horizontalis***	Carmel Creeper Ceonothus	Grows higher than 18"**
*Ceonothus griseus var. horizontalis "yankee point"**	Yankee Point Ceonothus	Grows higher than 18"**
*Ceonothus megacarpus***	Big pod ceonothus	Grows higher than 18"**
Cirsium vulgare	Wild Artichoke	F,I
Codariocalyx motorius	Telegraph Plant	F
Conyza bonariensis	Horseweed	F
Coprosma pumila	Prostrate Coprosma	F
Cortaderia selloana	Pampas Grass	F, I
Cytisus scoparius	Scotch Broom	F, I
Delosperma "alba"	White trailing Ice Plant	F
Dodonaea viscosa	Hopseed Bush	F
Drosanthemum Floribundum	Rosea Ice plant	F
Eriodictyon californicum	Yerba Santa	F
Eriogonum species (E. fasciculatum)	Buckwheat (California)	F
Fremontodendron species	Flannel Bush	F
Hedera species (H. canariensis, H. helix)	Ivy (Algerian, English)	I
Helix Canariensis	English Ivy	F
Heterotheca grandiflora	Telegraph Plant	F
Hordeum leporinum	Wild barley	F, I
Jasminum humile	Italian Jasmine	F
Juniperus species	Juniper	F
Lactuca serriola	Prickly Lettuce	I
Lamprathus aurantiacus	Bush Ice Plant	F
Lamprathus spectabilis	Trailing Ice Plant	F
Larix species (numerous)	Larch	F
Larrea tridentata	Creosote bush	F
Lepidium virginicum	Peppergrass	F
Leymus condensatus	Giant Wild Rye	Grows to 9' tall
Lolium multiflorum	Ryegrass	F, I
Lonicera japonica	Japanese Honeysuckle	F
Mahonia species	Mahonia	F
Miscanthus species	Eulalie Grass	F
Muhlenbergia species	Deer Grass	F

Prohibited plant list:Botanical Name	Common Name	Comment*
Nassella (stipa)leprida	Foothill needlegrass	Gets to 18" high. Cant cut to 4".
Nassella (stipa) pulchra	Purple needlegrass	Same comment as above
Nerium Oleander	Oleander	Toxic
Nicotiana species (N. bigelovii, N. glauca)	Tobacco (Indian, Tree)	F, I
Pennisetum setaceum	Fountain Grass	F, I
Perovskia atroplicifolia	Russian Sage	F
Phoradendron species	Mistletoe	F
Pickeringia montana	Chaparral Pea	F
Plumbago auriculate	Cape Plumbago	F
*Rhus (R. diversiloba, R. laurina, R. lentii)***	Sumac (Poison oak, Laurel, Pink Flowering)	F**. Poison oak presents a health hazard
Ricinus communis	Castor Bean	F, I
Rhus Lentii	Pink Flowering Sumac	F
Rosmarinus species	Rosemary (except dwarf/prostrate variety)	F
Salvia species (numerous)	Sage	F, I
Salsola australis	Russian Thistle	F, I
Senecio serpens	No common name	FR
Solanum Xantii	Purple Nightshade (toxic)	I, Toxic
Solanum Douglasii	Douglas Nightshade	Toxic
Silybum marianum	Milk Thistle	F, I
Tecoma capensis	Cape Honeysuckle	F
Thuja species	Arborvitae	F
Urtica urens	Burning Nettle	F
Vinca major	Periwnkle	I

*F = flammable, I = Invasive,

NOTES:

1. Plants on this list that are considered invasive are a partial list of commonly found plants. There are many other plants considered invasive that shall not be planted in a fuel modification zone and they can be found on The California Invasive Plant Council's Website www.cal-ipc.org/ip/inventory/index.php. Other plants not considered invasive at this time may be determined to be invasive after further study.
2. The absence of a particular plant, shrub, groundcover, or tree, from this list does not necessarily mean it is fire resistive.
3. Native, drought tolerant, plants are encouraged unless they are on this Prohibited Plant list or otherwise known as flammable or Invasive.
4. **: certain species of Ceonothus, Saltbush and Sumac need to be maintained free of dead materials, which builds up in the plant. Remove any poison oak (Sumac).
