Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
Agency Type: Not reported
Waste Type: Not reported
Threat to Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.
Reclamation: Not reported

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM STANDARD RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

Data Release Frequency: Quarterly

RCRA: Resource Conservation and Recovery Act Information

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized. In 1978, 24 inactive uranium mill tailings sites in Oregon, Idaho, Wyoming, Utah, Colorado, New Mexico, Texas, North Dakota, South Dakota, Pennsylvania, and on Navajo and Hopi tribal lands, were targeted for cleanup by the Department of Energy.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

STATE OF CALIFORNIA ASTM STANDARD RECORDS

AWP: Annual Workplan Sites
Known Hazardous Waste Sites. California DTSC's Annual Workplan (AWP), formerly BEP, identifies known hazardous substance sites targeted for cleanup.

Date of Government Version: 08/08/05
Date Data Arrived at EDR: 08/29/05
Date Made Active in Reports: 09/21/05
Number of Days to Update: 23

Source: California Environmental Protection Agency
Telephone: 916-323-3400
Last EDR Contact: 08/29/05
Next Scheduled EDR Contact: 11/28/05
Data Release Frequency: Annually

CAL-SITES: Calsites Database
The Calsites database contains potential or confirmed hazardous substance release properties. In 1996, California EPA reevaluated and significantly reduced the number of sites in the Calsites database.

Date of Government Version: 08/08/05
Date Data Arrived at EDR: 08/29/05
Date Made Active in Reports: 09/21/05
Number of Days to Update: 23

Source: Department of Toxic Substance Control
Telephone: 916-323-3400
Last EDR Contact: 08/29/05
Next Scheduled EDR Contact: 11/28/05
Data Release Frequency: Quarterly

CHMIRS: California Hazardous Material Incident Report System
California Hazardous Material Incident Reporting System. CHMIRS contains information on reported hazardous material incidents (accidental releases or spills).

Date of Government Version: 12/31/03
Date Data Arrived at EDR: 05/18/04
Date Made Active in Reports: 06/25/04
Number of Days to Update: 38

Source: Office of Emergency Services
Telephone: 916-845-8400
Last EDR Contact: 08/22/05
Next Scheduled EDR Contact: 11/21/05
Data Release Frequency: Varies

CORTESE: "Cortese" Hazardous Waste & Substances Sites List
The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites). This listing is no longer updated by the state agency.

Date of Government Version: 04/01/01
Date Data Arrived at EDR: 05/29/01
Date Made Active in Reports: 07/26/01
Number of Days to Update: 58

Source: CAL EPA/Office of Emergency Information
Telephone: 916-323-9100
Last EDR Contact: 07/26/05
Next Scheduled EDR Contact: 10/24/05
Data Release Frequency: No Update Planned

NOTIFY 65: Proposition 65 Records
Proposition 65 Notification Records. NOTIFY 65 contains facility notifications about any release which could impact drinking water and thereby expose the public to a potential health risk.

Date of Government Version: 10/21/93
Date Data Arrived at EDR: 11/01/93
Date Made Active in Reports: 11/19/93
Number of Days to Update: 18

Source: State Water Resources Control Board
Telephone: 916-445-3846
Last EDR Contact: 07/19/05
Next Scheduled EDR Contact: 10/17/05
Data Release Frequency: No Update Planned

TOXIC PITS: Toxic Pits Cleanup Act Sites
Toxic PITS Cleanup Act Sites. TOXIC PITS identifies sites suspected of containing hazardous substances where cleanup has not yet been completed.

Date of Government Version: 07/01/95
Date Data Arrived at EDR: 08/30/95
Date Made Active in Reports: 09/26/95
Number of Days to Update: 27

Source: State Water Resources Control Board
Telephone: 916-227-4364
Last EDR Contact: 08/01/05
Next Scheduled EDR Contact: 10/31/05
Data Release Frequency: No Update Planned

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SWF/LF (SWIS): Solid Waste Information System
Active, Closed and Inactive Landfills. SWF/LF records typically contain an inve ntory of solid waste disposal facilities or landfills. These may be active or i nactive facilities or open dumps that failed to meet RCRA Section 4004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 09/12/05
Date Data Arrived at EDR: 09/13/05
Date Made Active in Reports: 10/06/05
Number of Days to Update: 23

Data Release Frequency: Quarterly

DEED: Deed Restriction Listing
Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EDR PROPRIETARY HISTORICAL DATABASES

EDR Historical Gas Station and Dry Cleaners: EDR has searched select national collections of business directories and has collected listings of potential dry cleaner and gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning and gas station/filling station/service station establishments. The categories reviewed included, but were not limited to: *gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, dry cleaner, cleaners, laundry, laundromat, cleaning/laundry, wash & dry, etc.*

This information is meant to assist and complement environmental professionals in their conduct of environmental site assessments, and is not meant to be a substitute for a full historical investigation as defined in ASTM E1527. The information provided in this proprietary database may or may not be complete; i.e., the absence of a dry cleaner or gas station/filling station/service station site does not necessarily mean that such a site did not exist in the area covered by this report.

(A note on "dry cleaning" sites: it is not possible for EDR to differentiate between establishments that use PERC on-site as a cleaning solvent and sites that function simply as drop-off and pick-up locations or that are traditional wet cleaning/laundry facilities. Therefore, it is essential for environmental professionals to incorporate professional judgment in the evaluation of each site.)

Former Manufactured Gas (Coal Gas) Sites: The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.

BROWNFIELDS DATABASES

VCP: Voluntary Cleanup Program Properties
Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data

Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

GEOCHECK®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

HITCH RANCH - 282 ACRES
NORTH OF POINDEXTER AVENUE
MOORPARK, CA 93021

TARGET PROPERTY COORDINATES

Latitude (North):	34.287498 - 34° 17' 15.0"
Longitude (West):	118.894402 - 118° 53' 39.8"
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	325632.2
UTM Y (Meters):	3795463.0
Elevation:	567 ft. above sea level

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

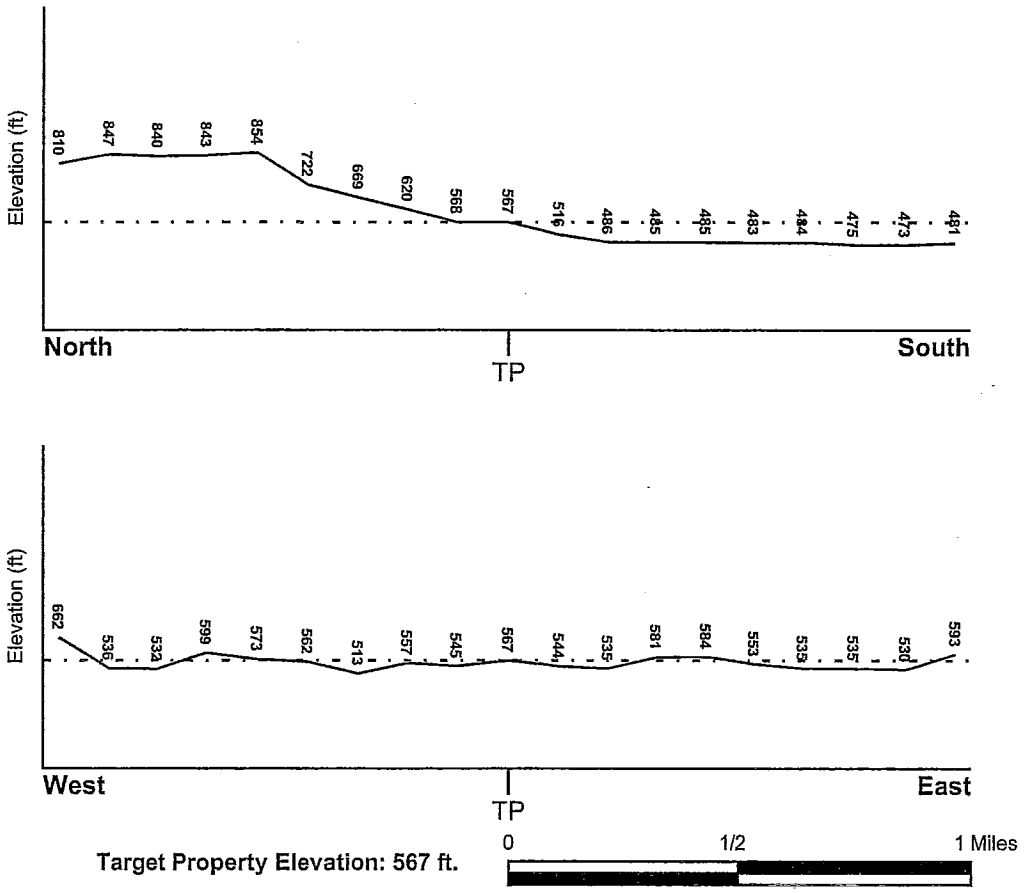
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

USGS Topographic Map:	34118-C8 MOORPARK, CA
General Topographic Gradient:	General South
Source:	USGS 7.5 min quad index

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
VENTURA, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property:	0607120005A
Additional Panels in search area:	0604130785B 0604130795B 0604130815B

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
MOORPARK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Tertiary
Series:	Pliocene
Code:	Tp *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	PICO
Soil Surface Texture:	sandy loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: HIGH

Depth to Bedrock Min: > 60 inches

Depth to Bedrock Max: > 60 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	14 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 6.00 Min: 2.00	Max: 8.40 Min: 7.90
2	14 inches	54 inches	stratified	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 6.00 Min: 2.00	Max: 8.40 Min: 7.90
3	54 inches	60 inches	stratified	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Poorly graded sand. COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 20.00 Min: 6.00	Max: 8.40 Min: 7.90

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: clay loam
sand
gravelly - sand
gravelly - sandy loam
loamy sand
loam
silty clay loam

Surficial Soil Types: clay loam
sand
gravelly - sand
gravelly - sandy loam
loamy sand
loam
silty clay loam

Shallow Soil Types: loamy fine sand

Deeper Soil Types: loam
coarse sand

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources... Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002. 7.5-Minute DEMs correspond to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

STATE RECORDS

California Drinking Water Quality Database
Source: Department of Health Services
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations for District 2, 3, 5 and 6
Source: Department of Conservation
Telephone: 916-323-1779

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

Laboratory Director

American Scientific Laboratories, LLC (ASL) accepts sample materials from clients for analysis with the assumption that all of the information provided to ASL verbally or in writing by our clients (and/or their agents), regarding samples being submitted to ASL, is complete and accurate. ASL accepts all samples subject to the following conditions:

1) ASL is not responsible for verifying any client-provided information regarding any samples submitted to the laboratory.

2) ASL is not responsible for any consequences resulting from any inaccuracies, omissions, or misrepresentations contained in client-provided information regarding samples submitted to the laboratory.

A Geologic Mapping Approach to Identify Radon Hot-Spots

A GEOLOGIC MAPPING APPROACH TO IDENTIFY RADON HOT-SPOTS IN CALIFORNIA AND RAMIFICATIONS FOR THE STATE'S RADON RISK PICTURE

Ronald Churchill, Ph.D.
Senior Engineering Geologist
California Geological Survey, Sacramento, California
Ron.Churchill@conservation.ca.gov

Abstract

The California Geological Survey (CGS), in cooperation with the California Department of Public Health--Radon Program, has completed seven detailed radon potential maps at 1:100,000 or 1:48,000 scales since 2005. The CGS mapping process uses: 1) geologic maps; 2) short-term indoor-radon data; 3) sediment, soil and rock uranium data; and 4) soil data. CGS maps depict up to 5 radon potential categories, defined by percentages of homes exceeding 4 pCi/L: very high, high, moderate, low or unknown. CGS mapped high radon potential areas in western Los Angeles County correlate well with high radon potential Zip Code areas identified by a 1991 study using year-long house radon measurements. The CGS maps show California has significant high radon areas but many are too small for detection by the 1990 statewide radon survey and, consequently, are not represented by the US EPA Radon Zones or the Lawrence Berkeley National Laboratory (LBNL) High Radon Project maps.

Introduction

The California Geological Survey (CGS) has had annual cooperative agreements with the California Department of Public Health (CDPH)--Radon Program since 2003 to prepare radon potential maps and assist with radon surveys[1]. During this period CGS completed detailed radon potential maps for the southern half of Los Angeles County, Ventura County (revision of a 1995 CGS map), San Luis Obispo County, Monterey County, Santa Cruz County, the Palos Verdes area of Los Angeles County, and the Lake Tahoe area (Figure 1). A radon potential map was prepared for Santa Barbara County in 1995 under an earlier cooperative agreement. All CGS maps completed thus far are within US EPA Radon Map Zone 1 and Zone 2 counties (Figure 2). Approximately 10.7 million individuals, 28 percent of the state's population, reside within the CGS mapped areas. The mapping priority for California coastal counties relates to the presence of Miocene age organic-rich siliceous marine shale and mudstone geologic units such as the Monterey Formation and the Rincon shale (Figure 3). Association of these units with elevated radon homes has been known since the late 1980s (Churchill, 1997). Reports accompanying CGS radon potential maps document procedures, data utilized, and contain estimates for the number of residents exposed to ≥ 4 picocuries per liter (pCi/L) indoor -radon concentration. The maps and reports are available for viewing and downloading on the CGS radon webpage at: http://www.conservation.ca.gov/cgs/minerals/hazardous_minerals/radon/Pages/Index.aspx

1 CGS radon mapping activities were partially funded through CDPH-Radon Program annual US EPA State Indoor-Radon Grants (SIRG) and partially through match funds provided by CGS.

CGS radon potential mapping overview

The CGS radon mapping goal is to identify the portions of a county or study area most likely to contain homes with indoor-radon concentrations at or above the US EPA recommended radon action level of 4 pCi/L. The CGS uses a geologically based mapping approach. This means that the location of one or more geologic units belonging to a given radon potential category defines the distribution of that radon potential category within the map. Many others have proposed this radon mapping approach and it has been successfully used in the United Kingdom (Appleton, 2005). For a discussion of the advantages of this approach for radon potential mapping over a simple random sampling of homes approach see Carlisle and Azzouz (1993).

CGS radon potential categories are based on short-term home radon test data and are defined as follows:

Very High: 50 percent or more home tests equal or exceed 4.0 pCi/L

High: 20 to 49.9 percent of home tests equal or exceed 4.0 pCi/L

Moderate: 5 to 19.9 percent of home tests equal or exceed 4.0 pCi/L

Low: 0 to 4.9 percent of home tests equal or exceed 4.0 pCi/L

Unknown: insufficient data are available to assign a radon potential.

All counties and areas mapped so far by CGS contain at least one high radon potential area (see Figure 4 map example). To date, the "Very High" radon potential category has only been required for the Lake Tahoe Area (see Figure 4). Maps completed since 2008 include the "Unknown" radon potential category where geologic units lack sufficient data for radon potential determination. These areas may be targets for future indoor-radon surveys, surface gamma-ray surveys or other radon evaluation work.

Geologic unit radon potentials are determined using indoor-radon measurements, uranium abundance data for soil, sediment and rock, and soil permeability and shrink-swell data. Except for indoor-radon measurements, data used for mapping are "off the shelf" from a variety of sources. California counties commonly contain more than 50 geologic units and some have more than 100 units[2]. Map preparation utilizes a Geographic Information System (GIS) which greatly facilitates data compilation, management and analysis for these large numbers of geologic units. GIS also allows the visual display of data distribution and values relative to individual geologic units. Visual inspection of such displayed data may reveal geographic trends within a geologic unit occurrence. If such a trend is observed the geologic unit occurrence may be subdivided and the subareas assigned different radon potentials to reflect the data trend.

Short-term, 2-3 day indoor-radon data from recent home surveys conducted by CDPH (described below) are used for geologic unit evaluations. When available, indoor-radon data from older

2 Information on 770 geologic units was compiled for developing the California Geological Survey's 1:750,000-scale Map of California Geology.

surveys and other CDPH compilations are examined but are primarily used for unit evaluations only if recent survey data are unavailable. For the CGS maps the number of indoor-radon tests available has ranged from 443 to 1,729. Experience has shown that about 25 short-term indoor-radon measurements are required to reliably categorize the radon potential of a geologic unit. This amount is consistent with the minimum number of samples required to reliably define sample population standard deviation (e.g., Noether, G., 1971, pp. 169-170) and for testing population normality (Razali and Wah, 2011). Interestingly, the British Geological Survey has found that 10-15 short-term measurements are the minimum required to reliably characterize soil radon gas at a site or a geologic unit (Appleton, 2005). Geologic units with less than 25 radon measurements may be assigned a "provisional" high or moderate rank if they have at least 10-15 measurements with a significant percentage exceeding 4 pCi/L, or if they have several measurements exceeding 10 pCi/L. Review of geologic unit data from adjacent completed radon potential maps may also result in provisional high or moderate radon potential rankings for units with few radon measurements in a current mapping area.

Uranium data sources commonly used for radon potential mapping are: National Uranium Resource Evaluation project (NURE) airborne equivalent uranium (eU) data and soil, sediment and rock sample uranium data; rock, soil and sediment sample uranium data from various published and unpublished geochemical research projects; and surface gamma-ray spectral eU measurements from research projects. Large amounts of data may be available for some counties but not others. For example, 1,347 miles of NURE project flight-lines containing approximately 54,800 gamma-ray spectral measurements were flown on a grid pattern with lines 2-4 miles apart north-south and 12 miles apart east-west in San Luis Obispo County. Additionally, 120 soil and 405 stream sediment uranium analyses are available from the NURE project for San Luis Obispo County. In contrast, no NURE airborne eU measurements or soil or stream sediment uranium data are available for metropolitan Los Angeles County, including the Palos Verdes Peninsula.

All uranium data types for a geologic unit are compared to the average crustal uranium abundance of about 2.5 parts per million (ppm) to qualitatively evaluate the unit's likely radon potential. Geologic units containing ≥ 5 ppm uranium (twice average crustal background) are generally considered anomalously high in uranium content, suggesting increased radon availability in rock and associated soil and sediment. Consequently, geologic units with the highest percentages of ≥ 5 ppm in a county or area are considered candidates for inclusion in the high or moderate radon potential categories. For example, if a geologic unit had only 12 indoor-radon measurements, but 3 (25%) exceeded 4 pCi/L and it had 10 soil uranium analyses with 6 exceeding 5 ppm uranium it would likely receive a provisional high radon potential classification. For NURE airborne eU data, geologic units containing the highest percentages of ≥ 5 ppm measurements may also be given provisional high or moderate radon potential classifications. Occasionally, much of the NURE eU data in a county exceeds 5.0 ppm (perhaps because of detector calibration issues when the data were collected). In these instances, 3 times crustal uranium abundance, 7.5 ppm uranium, is used for sample screening. Surface gamma-ray eU data are evaluated similarly, in reference to the ≥ 5 or ≥ 7.5 ppm thresholds. The purpose of this activity is to quickly identify those geologic units that often contain anomalous background uranium concentrations so they can be considered for inclusion in either the high radon potential

or moderate potential groups of geologic units. This is an important step in assigning radon potentials to geologic units that have few or no indoor-radon data.

Soil permeability and shrink-swell data for soils associated with geologic units are obtained from Natural Resource Conservation Service (NRCS) soil reports. Unfortunately, these data are based on type soil locations considered representative of the soil unit as a whole rather than from specific sites near indoor-radon test homes; but they are still useful. Previous work at elementary school sites (Churchill, 1993a and 1993b) has shown California soils with: 1) moderate permeability and low shrink-swell character, or 2) low permeability and high shrink-swell character, are often associated with higher radon potential areas. Soils with either high permeability, or low permeability and low shrink-swell character, are often associated with lower radon potential areas. Consequently, these soil characteristics are also considered, along with uranium data and indoor-radon data, in making provisional assignments of geologic units to radon potential categories. However, provisional high or moderate radon potential assignments are not made based upon soil data alone (i.e., if indoor-radon or uranium data are unavailable).

The data evaluation steps just described result in groupings of very high, high, moderate, low and unknown radon potential geologic units. Each group typically contains a mix of geologic units, some units with 25 or more indoor-radon measurements and some with fewer and occasionally a unit with no associated indoor-radon measurements. The resulting aggregate indoor-radon populations for each group are compared statistically to confirm they significantly differ from each other. This comparison is usually done using the Mann-Whitney nonparametric test because these aggregate population distributions are typically non-normal and non-lognormal in character. While indoor-radon population distributions for single geologic units are often lognormal, the resulting indoor-radon data population distributions for groups of geologic units are often non-lognormal, mandating the use of non-parametric statistical comparison tests. If testing shows that each group is statistically unique, radon potential group boundaries are developed based upon the boundaries of the geologic units making up each group. If two or more radon potential groups are not statistically distinct, then the group assignments of provisional geologic units will be re-evaluated and possibly changed or a radon potential group may be eliminated and its geologic units and indoor-radon data assigned to another radon potential group. Another option is to slightly adjust the radon potential group boundaries to achieve statistical separation of radon potential group populations. However, such adjustments should be small because the different radon potential categories should be similar from map to map.

Final CGS radon potential maps are produced at 1:100,000-scale for which 1 inch represents 1.58 miles (or 1 cm represents 1 km). Less commonly more detailed scales such as 1:48,000 are used. At 1:100,000-scale city blocks can be depicted and prominent highways and roads can be shown and labeled on the map base, assisting the map user in identifying specific locations of interest. Figure 4 is reproduced at approximately 1:100,000-scale and shows highway and street details and different radon potential areas.

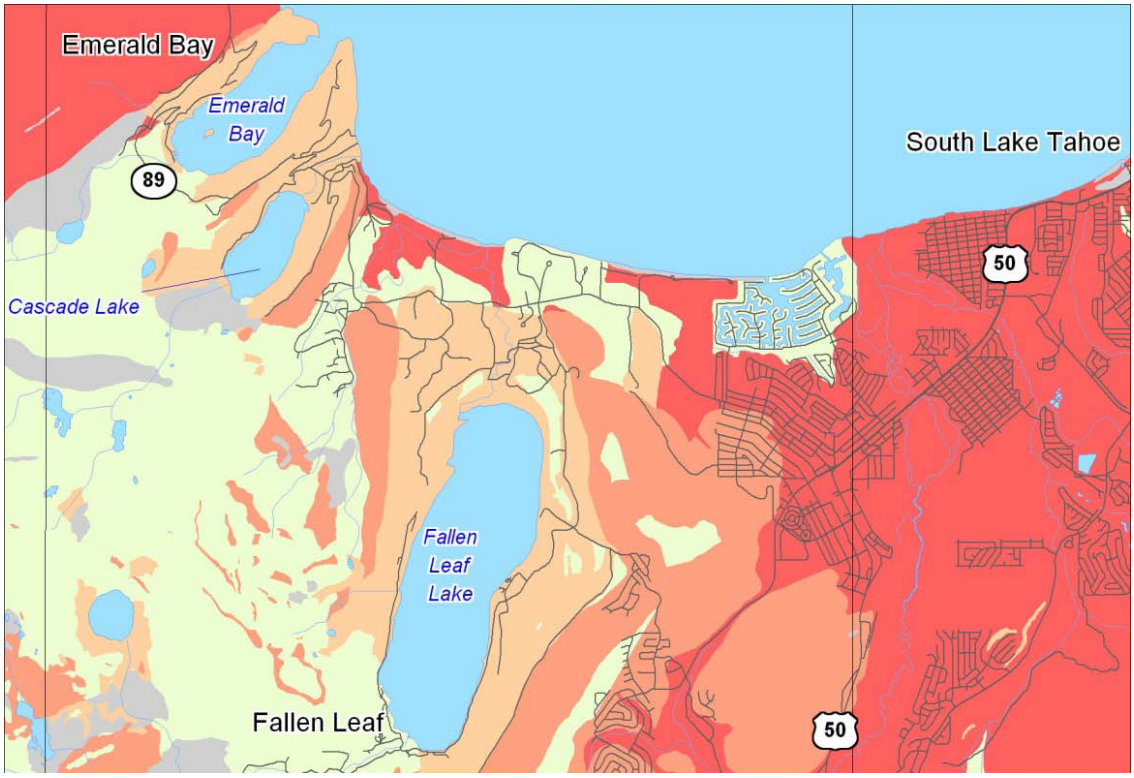

Figure 4. Part of the CGS Lake Tahoe Radon Potential Map.
The radon potential area categories are color coded as follows: red = very high radon potential; dark orange = high radon potential; light orange = moderate radon potential, pale green = low radon potential, and gray = unknown radon potential.

Geologic maps for radon potential mapping—requirements and limitations

Not every geologic map is suitable for radon potential mapping. In California, geologic maps at 1:100,000-scale (1 inch = 1.58 miles, or 1 cm = 1 km) or more detailed scale geologic maps such as 1:62,500-scale or 1:24,000-scale should be utilized for this purpose. At more detailed scales geologic map units often represent individual geologic formations, which generally have a predominant lithology and somewhat limited range of chemical composition (e.g., variation in uranium or radium concentration). Less detailed scale geologic maps (e.g., 1:250,000-scale or 1:750,000-scale) use more generalized map units defined by geologic time and origin (e.g., Miocene marine sediments). Less detailed scale geologic units typically consist of multiple geologic formations which may differ significantly from each other in lithology, chemistry, physical properties such as permeability and, consequently, in radon potentials. Table 1 provides examples illustrating differences in numbers of map units related to map scale for geologic maps.

If preexisting 1:100,000-scale geologic maps are not available for a county or map area, spatial geologic unit data must be compiled from multiple smaller scale maps such as 1:62,500-scale or 1:24,000-scale. This can be a time consuming process, particularly if the geologic map units are defined or mapped differently on different maps. Figure 5 shows geologic mapping for a small portion of the Lake Tahoe area at three different map scales 1:750,000, 1:250,000 and 1:100,000.

Examples	Number of Geologic Units Shown on Geologic Maps at Different Map Scales		
	1:750,000 (1 inch=11.8 miles)	1:250,000 (1 inch=3.9 miles)	1:100,000 (1 inch=1.6 miles)
Santa Cruz County	13	17	65
Lake Tahoe Area	11	36	141

Table 1. Comparison of a group of related geologic map units from California geologic maps at different map scales

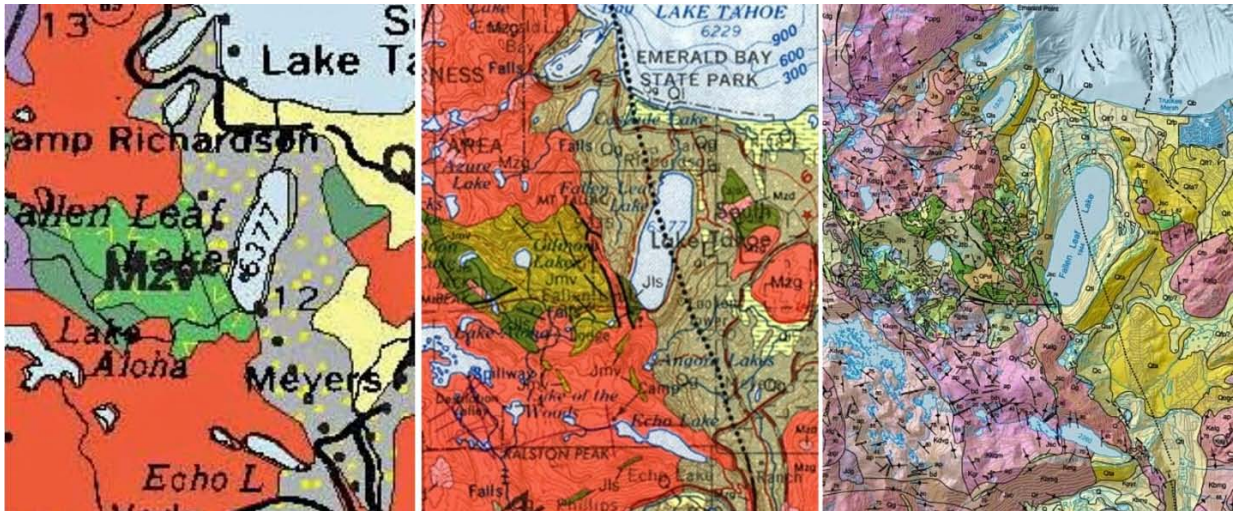

Figure 5. Geologic units from geologic maps developed at different map scales showing increase in geologic units and detail from left to right. The maps from left to right: 1:750:000-scale, 1:250,000-scale and 1:100,000-scale (the maps are not shown at their original scales). The area shown is at the south end of Lake Tahoe and each map is approximately 8.3 miles wide (E-W) and 10.7 miles long (N-S). The map references for these images are: Jennings, 1977; Wagner and others, 1981; and Saucedo, 2005.

Another geologic map issue is accuracy. At more detailed map scales geologic unit boundary locations are generally more accurately located because they require more field work than less detailed geologic maps. For 1:100,000-scale California geologic maps, geologic unit boundaries will often be accurate to better than plus or minus 1000 feet. Also, the size of map features that can be depicted should be kept in mind when using maps at various scales. A 1/16 inch wide line on a 1:250,000-scale map represents 1,302 feet. A 1/16 inch wide line on a 1:100,000-scale map represents 520 feet. A typical home lot parcel that appears to be located just inside a radon potential boundary on a 1:100,000-scale radon potential map is probably within the uncertainty of geologic unit boundary mapping. It may actually be underlain by an adjacent geologic unit with a different radon potential.

Public reception of CGS radon potential maps

CGS radon maps and accompanying reports are available for viewing and downloading on the CGS Radon webpage. CGS radon potential maps are advisory and non-regulatory in status. Recently, CGS radon webpage visits total about 5,800 per year and average about 480 per month. Several counties have placed the maps on their county websites. An iPhone app is now available for displaying CGS radon maps (Hobbs and Hobbs, 2012). CGS is receiving requests from property disclosure companies for its digital map radon potential area layers and recently has been able to start fulfilling those requests. Finally, detailed radon potential maps draw people to radon informational displays in public areas, particularly if the map covers the area where they reside. People want to find out what the radon potential is where they live.

CDPH indoor-radon surveys

In order to generate indoor-radon data for radon potential mapping, CGS assists CDPH-Radon Program indoor-radon survey efforts in reviewing address lists of owner occupied homes and preparing address lists for survey mail solicitations. The goal for solicitation mailing lists is to obtain a minimum of 25 to 30 indoor measurements for geologic units known or suspected to be associated with higher percentages of ≥ 4 pCi/L homes. With survey participation rates typically between 3 and 8 percent of solicitation letters, at least 600 addresses are randomly chosen for each likely radon-problem geologic unit if possible. If fewer than 600 addresses are available for a priority geologic unit all addresses related to that unit received a survey solicitation. After addresses for priority geologic units are assigned, the remaining addresses for the survey solicitation mailing list are assigned in an attempt to obtain some indoor-radon data for most or all of the remaining geologic units in the county or study area. Survey sampling generally starts between late November and early January and is completed by early May. Surveys utilize charcoal detectors exposed for 2-3 days and test results are provided directly to participants by CDPH contract radon laboratories within a few weeks after laboratory receipt of a detector. Once the CDPH-Radon Program obtains the survey test results from the laboratory they are incorporated into the online Radon Zip Code database for California and are made available to CGS for radon mapping projects. Survey participant names and addresses are proprietary and not available for public disclosure. Since 2003 all or portions of 14 counties have had indoor-radon surveys.

Does the CGS radon mapping approach using short-term home radon tests have merit?

Given the general consensus that short-term indoor-radon test data are less reliable than long-term test data, it is reasonable to question the reliability of CGS radon potential maps based on short-term test data. To check the mapping reliability, CGS maps for southern Los Angeles and Ventura counties were compared to a 1991 California Department of Health Services (DHS[3]) Indoor Air Quality study of 862 homes in 49 Zip Codes areas. Year-long alpha track measurements were conducted in the homes (Lui and others, 1991). If the DHS study high and medium radon potential Zip Code locations are similar to CGS high and moderate radon

3 California Department of Public Health was formerly named Department of Health Services.

potential area locations and if DHS and CGS ≥ 4 pCi/L home percentages are similar, it would be strong evidence supporting the CGS radon mapping approach.

Comparison of CGS mapping and DHS study results was done as follows:

1) Using GIS, DHS high and moderate radon potential Zip Code area locations were compared with CGS high and moderate radon potential area locations, and

2) Estimates of the average percentage of homes ≥ 4 pCi/L were prepared for DHS high and medium radon potential Zip Codes using CGS radon potential maps and compared with the averages reported in the DHS study.

For the first comparison, digital map layers for CGS radon potential areas and DHS high and medium radon potential Zip Code areas were compared. Figure 6 shows this comparison. The

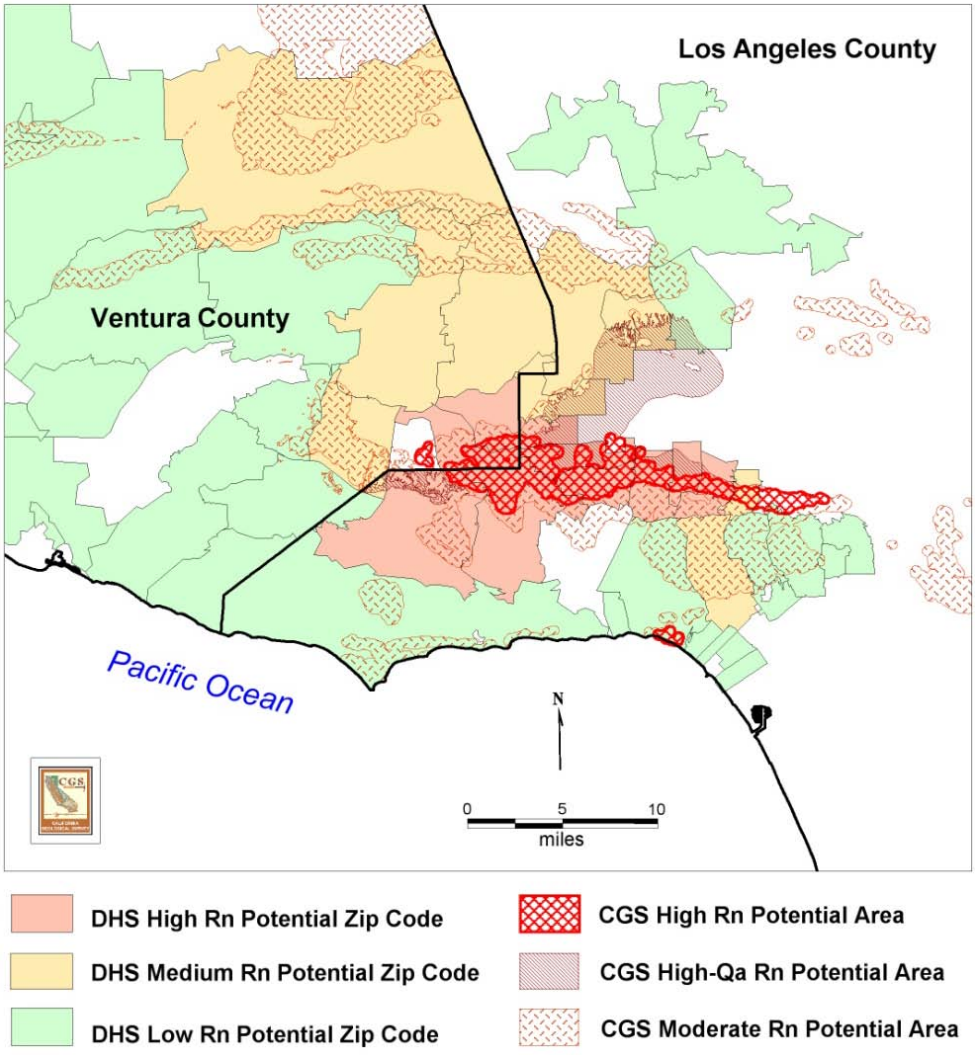

Figure 6. Comparison of CGS High and Moderate Radon Potential Areas with High, Medium and Low Radon Potential Zip Codes from Lui and others, 1991.

figure shows high and moderate CGS radon potential areas in close association with high and medium DHS zip code areas. The match is not perfect because CGS radon potential zone boundaries are based on geologic unit boundaries and Zip Code boundaries are administrative boundaries typically unrelated to geology. However, high and medium radon potential Zip Code areas generally contain significant portions of high and moderate CGS radon potential areas and high and medium Zip Code areas are not isolated from CGS high and moderate radon potential areas in the figure.

A small CGS high radon potential outlier is located along the Los Angeles County coast in a low potential DHS Zip Code 90272 (Pacific Palisades). Geologic mapping indicates high and moderate potential rock units present in the large east-west high potential area are also present at this location along the coast, exposed along canyons and likely underlying a younger alluvial unit. Limited indoor-radon data available during mapping was insufficient to confirm or reject a high radon potential classification for this area. The most recent 2010 update of the CDPH radon Zip Code database entry for this Zip Code shows about 4 percent of short-term home radon tests are ≥ 4 pCi/L (11 of 276). These results suggest a lower radon potential should be considered for this area if the south Los Angeles radon potential map is revised in the future.

For the second comparison, estimates for the average percent of residences exceeding 4 pCi/L were made for DHS High and Medium Radon Potential Zip Codes using CGS radon potential

County/Area	CGS Radon Potential Category	Percentage of ≥ 4 pCi/L Homes
southern Los Angeles	High	28.3
southern Los Angeles	High-Qa (alluvium)	20.6
southern Los Angeles	Moderate	9.7
southern Los Angeles	Low	2.4
Ventura	High	30.0
Ventura	Moderate	20.3
Ventura	Low	3.7

Table 2. CGS radon potential categories and percentages of ≥ 4 pCi/L homes for southern Los Angeles and Ventura counties provided in reports accompanying these maps.

	DHS average percent of residences exceeding 4 pCi/L reported by Lui and others (1991)	CGS estimate of average percent of residences exceeding 4 pCi/L
DHS High Radon Potential Zip Codes	**14***	**11.9**
DHS Medium Radon Potential Zip Codes	**8****	**7.7**

Table 3. Comparison of DHS and CGS estimates of High and Medium radon potential Zip Code areas in western Los Angeles and Ventura counties.

*The average of 7 Zip Code areas developed from 71 alpha track year-long measurements

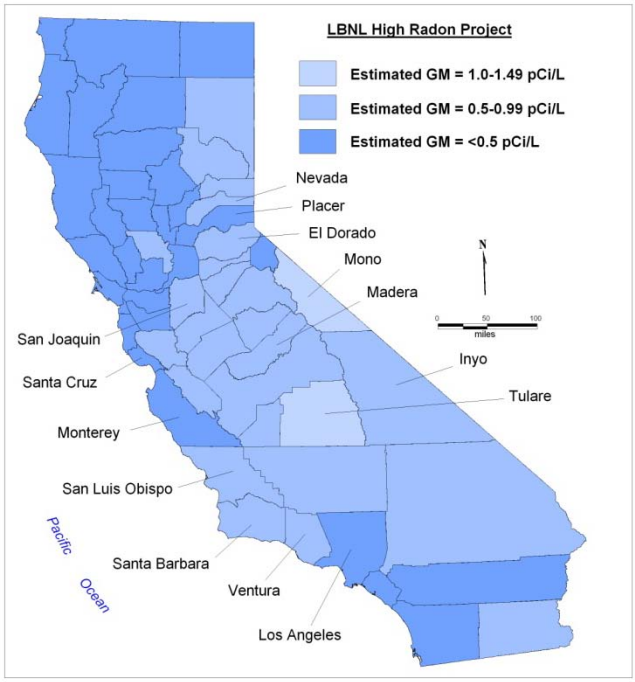
**The average for 10 Zip Code areas developed from 169 alpha track year-long measurements

maps and indoor-radon information from the map reports. To make these estimates, the relative percentage area for each CGS radon potential category present within each DHS Zip Code was obtained from the radon potential maps using GIS. This information and estimates for percentages of ≥ 4 pCi/L homes for each radon potential category, available from the Los Angeles and Ventura radon map reports, were used to make weighted average estimates of ≥ 4 pCi/L home percentages for each DHS Zip Code. These estimated percentages for each DHS Zip Code were then used to generate overall average percentages of ≥ 4 pCi/L estimates for DHS high and moderate radon potential Zip Codes. The individual Zip Codes vary in size (area). In developing the final averages, individual Zip Code ≥ 4 pCi/L home percentages were weighted to account for differences in Zip Code sizes. The right-hand column of Table 3 lists the resulting High and Medium Zip Code estimates derived from CGS radon maps and data. The High and Medium radon potential Zip Code averages from the 1991 DHS report, listed in the middle column of Table 3, compare well with the estimates derived from the CGS maps and reports.

In summary, similarities in geographic location and percentages of ≥ 4 pCi/L residences between high and medium DHS Zip Code radon potential areas and CGS high and moderate radon potential areas shown in Figure 6 and Table 3 are strong evidence supporting the validity of the CGS radon potential mapping approach.

Comparison of US EPA Radon Map and LBNL High-Radon Project Map with CGS Radon Potential Maps

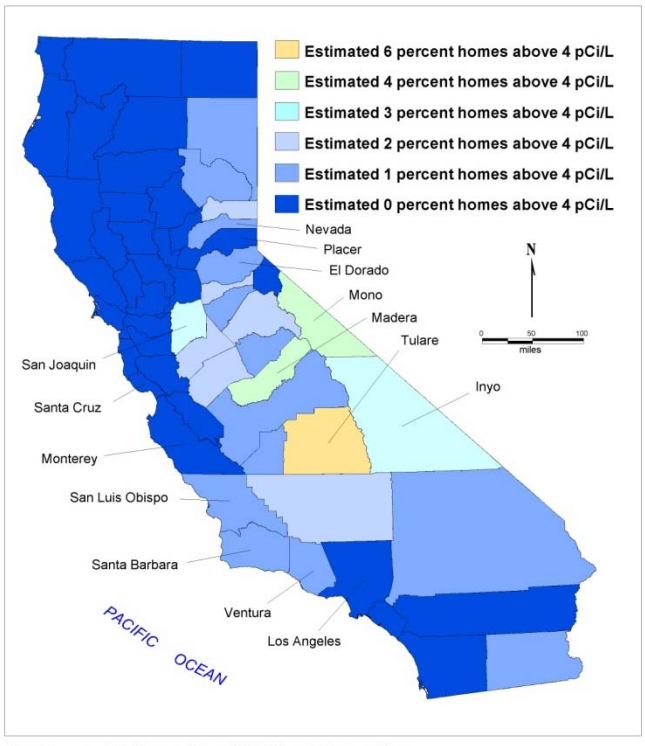
The US EPA Map of Radon Zones, finalized in 1993, was developed from the US Geological Survey (USGS) Geologic Radon Province Map. To develop the radon province map, the USGS identified approximately 360 separate geologic provinces in the United States, evaluating provinces for radon potential using available indoor-radon data, geology, aerial radioactivity data, soil parameters and home foundation types (US EPA, 1993). California contains all or part of 12 geologic provinces. During winter 1989-1990 a random population based indoor-radon survey generated 2-7 day measurements for 1,885 homes to support this radon mapping effort (i.e., the state residential radon survey, SRRS, for California). Survey sampling rates for many California counties were relatively low, particularly considering county geologic complexity previously discussed. Of 58 counties, one was not measured, six had 1-5 measurements, and only 24 had 25 or more measurements generated from this survey (US EPA, 1993). At the SRRS sampling rates, many California Counties have more geologic units than indoor-radon measurements. This raises the question of just how well SRRS data represent actual radon conditions of California counties.



USGS radon geologic province boundaries do not coincide with county or state political boundaries but define areas of general radon potential. US EPA subsequently developed the Map of Radon Zones by extrapolating information from the province to county level and assigning one of three radon zones to every county in the United States. The EPA map Zones 1, 2, and 3 have predicted average radon screening levels of > 4 pCi/L, ≤ 4 and ≥ 2 pCi/L, and < 2 pCi/L, respectively. If a county contains more than one geologic province, the county is assigned the screening level of the province containing the largest portion of county land area (US EPA, 1993).

In showing only one radon zone per county, the US EPA recognized at the time that significant high and low radon potential areas within a county may be obscured (US EPA 1993, p. I-5). This situation had to be addressed during the development of the California portion of the U.S EPA Map of Radon Zones. The radon hot-spot associated with the Rincon Shale in Santa Barbara and Ventura counties ultimately resulted in a change for these counties from an initial EPA Zone 2 classification to a Zone 1 classification, even though the Rincon shale only accounts for about 1.3 percent of the combined two county surface area. There was no other way to indicate the presence of California's first confirmed radon hot-spot on the EPA map (Figure 2 shows the EPA Radon Zones for California).

Similar in style to the EPA Map of Radon Zones, the Lawrence Berkeley National Laboratory (LBNL) High Radon Project maps, produced in the mid-1990s, also used single county rankings for radon potential. The High Radon project produced two radon potential maps, one ranking counties by geometric mean and the other ranking counties by estimated percent of homes with long-term living-area concentrations ≥ 4 pCi/L. The High Radon Project developed its California county rankings using the same short-term radon survey data as used for the EPA Map of Radon Zones. However, it used a statistical approach to examine the correlation between monitoring data and physical factors such as soil, geology, house, and meteorological characteristics to predict local indoor concentrations and make long-term exposure estimates. Maps showing LBNL High Radon Project predicted geometric means and percentages of ≥ 4 pCi/L homes for California counties are shown in Figures 7 and 8 respectively. The maps in Figures 7 and 8 were developed using LBNL-High Radon Project data available online at: http://energy.lbl.gov/IEP/high-radon/ctypred.htm



The visual impression presented by the EPA and LBNL radon maps are that most California counties do not have significant radon problems, especially when compared against counties in Midwestern and Northeastern states. Exceptions are Santa Barbara and Ventura counties on the EPA map with Zone 1 rankings. Tulare and possibly Madera, Mono, Inyo and San Joaquin counties are exceptions on the LBNL map with three to six percent estimated ≥ 4 pCi/L homes (Figure 8). Interestingly, the LBNL map of estimated county geometric mean radon concentrations (Figure 7) gives a different impression than the ≥ 4 pCi/L home percentages map. The county geometric mean map shows very low geometric mean estimates for Tulare, Madera, Mono, Inyo and San Joaquin counties. With single county radon ratings by design, the EPA and LBNL maps do not convey the presence of any sub-county variability in radon potentials. As a result, many people trying to become informed about radon do not realize that high, moderate, or low radon potential areas of significant size may be present in any county regardless of its zone ranking, geometric mean or estimated percentage of homes > 4 pCi/L.

In contrast to the US EPA and the LBNL High Radon Project maps, CGS mapping shows that within-county variability in radon potential is significant. Given the geologic complexity and relatively large land areas of California counties such variability is expected. Figure 9 shows CGS high and moderate radon potential areas overlain on the US EPA Map of Radon Zones for California. Table 4 provides information on total land areas and populations associated with CGS high and moderate radon potential categories by county.

Data source: http://energy.lbl.gov/IEP/high-radon/ctypred.htm

Figure 7. LBNL High Radon Project: Estimated Geometric Mean Radon Concentrations for California Counties

Data Source: http://energy.lbl.gov/IEP/high-radon/ctypred.htm

Figure 8. LBNL High Radon Project: Estimated Fraction of Homes with Long-term Living-area Radon Concentrations above 4 pCi/L for California Counties

Figure 9 and Table 4 show that high radon potential areas comprise relatively small percentages of county land area and population for counties mapped by CGS thus far. Moderate potential areas are usually larger in area and population than high radon potential areas. The remaining areas, consisting of low and unknown radon potentials, commonly account for the majority of county land area and population. These land area and population trends will likely continue for EPA Zone 2 California counties mapped in the future.

Individual high and moderate radon potential areas may contain large populations or be sparsely populated. In Figure 9, examples of sparsely populated high and moderate radon potential areas

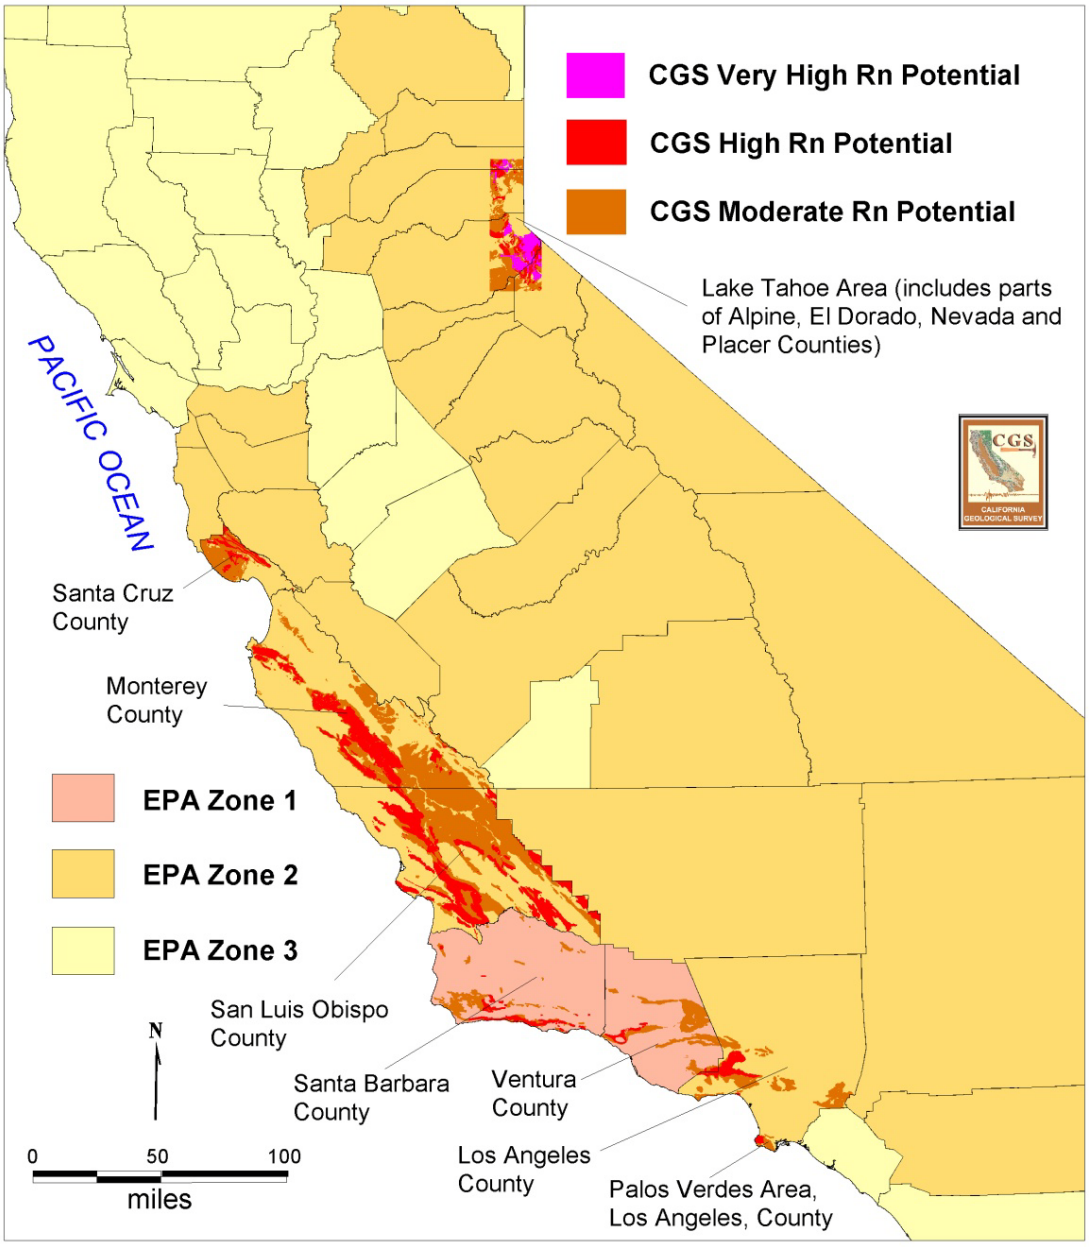


Figure 9. CGS very high, high and moderate radon potential areas overlain on part of the EPA Map of Radon Zones for California

County or Area Map	Radon Potential Category	Land Area (square miles)	Percent of County Land Area	Estimated Population (to nearest 1,000)	Percent of County Population
Santa Cruz	High	43.7	10.6	10,000	3.9
	Moderate	187.7	42.1	56,000	22.0

Table 4. Land Area and Population Information for County High and Moderate Radon Potential Categories. The Lake Tahoe county estimates are for those portions of the counties within the Lake Tahoe radon potential map area. The south Los Angeles county estimates are for all of Los Angeles County. Total land area and populations for these counties are listed in the fourth row for each county.

are those located in central and southern Monterey County and in eastern and southern San Luis Obispo County. Examples of high and moderate radon potential areas with high population densities are those located in Los Angeles County and along the south coast of Santa Barbara County.

CGS radon potential areas and average annual radon exposure estimates

CGS very high, high and moderate radon potential areas are compared with LBNL estimated California county percentages of homes with long-term living-area concentrations ≥ 4 pCi/L in Figure 10. The CGS high and moderate radon potential areas are based on percentages of homes

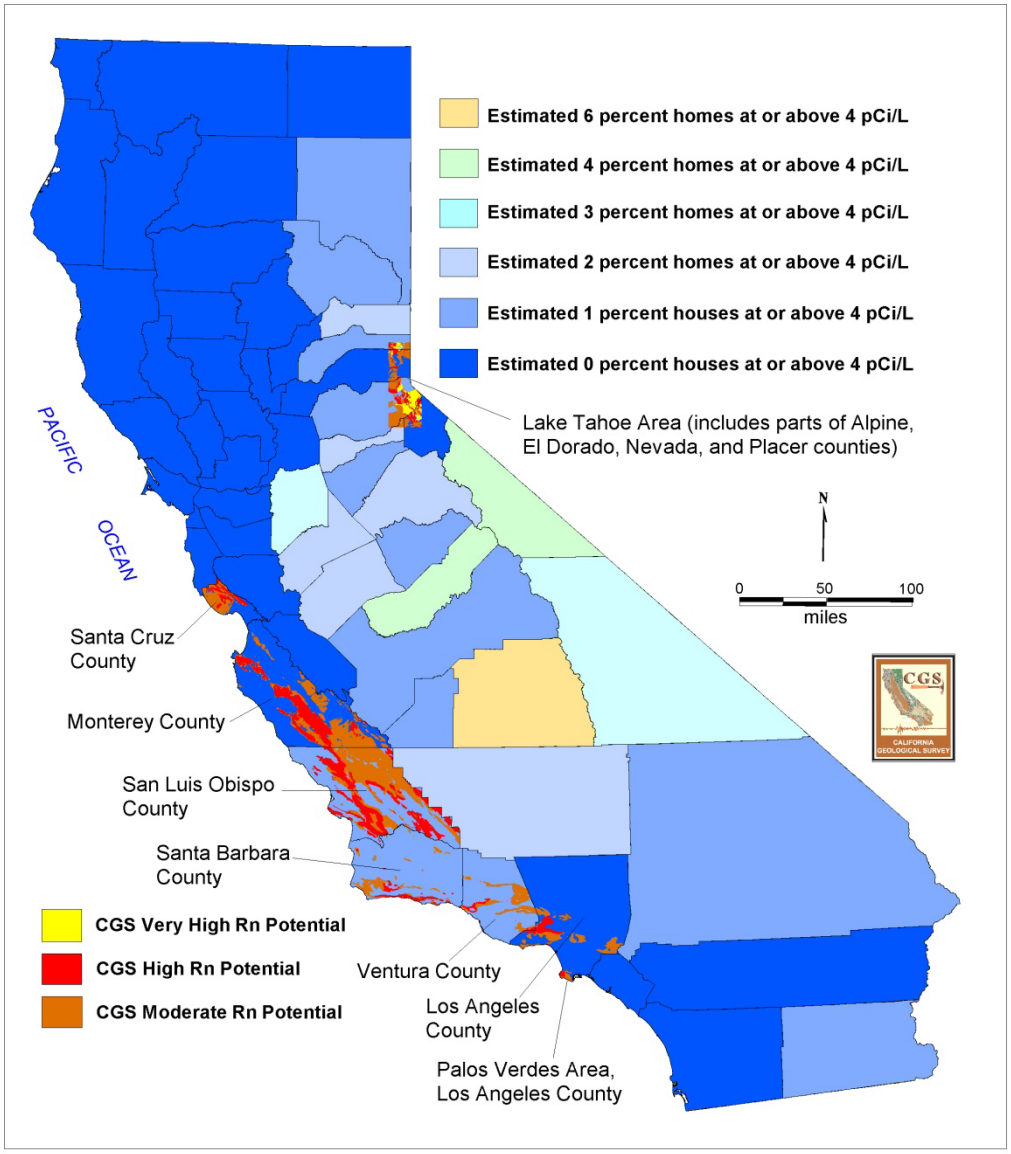

Figure 10. Comparison of LBNL High Radon Project estimated percent of ≥ 4 pCi/L county homes and CGS very high (Lake Tahoe only), high and moderate radon potential areas.

≥4 pCi/L in short-term tests. Short-term tests are closed-house "worst case" tests with seasonal bias compared to year-long open-house tests. Short-term tests from winter months generally exceed annual living area average radon conditions (Appleton, 2005; Lin and others, 1999; and Brookins, 1990). CGS percentage estimates of 4 pCi/L homes are shown in Table 5 for high and moderate radon potential categories and are very likely higher than what would be obtained from year-long radon test surveys of homes in these counties. In order to better compare CGS radon potential results with LBNL county estimates, a correction was applied to CGS short-term radon data to create simulated long-term indoor-radon databases for county high and moderate radon potential areas. Summary information for these simulated databases and associated population estimates are listed in Table 6.

Long-term radon concentration estimates based on short-term measurements are controversial and approximate. The estimated long-term radon measurement database used to build Table 6 was made using a correction factor from Lin and others (1999). These authors recognize the highly approximate nature of these corrections and state *"Due to the large temporal variability and other sources of variation, a short-term measurement can predict the long-term living area concentration only to within a factor of 1.8 or so, even after correcting for systematic biases."*

Radon Potential Group	**CGS Percentage Estimates of ≥ 4 pCi/L Homes from Short-term data**	**Estimated Population exposed to ≥ 4 pCi/L radon concentrations**

Table 5. CGS percentage estimates of ≥ 4 pCi/L homes based on short-term indoor-radon data for county high and moderate radon potential areas

Several of the authors of this paper were principal contributors to the High Radon Project. The county estimates from the LBNL High Radon Project shown in Figures 8 and 10 are derived from short-term test data, as previously mentioned, by these individuals.

To estimate the percentages of homes with long-term living-area concentrations ≥ 4 pCi/L, CGS short-term test data were divided by a correction factor of 1.3. This correction factor implies that a 5.2 pCi/L short-term test is approximately equivalent to a 4.0 pCi/L year-long test (i.e., 5.2 pCi/L/1.3=4/0 pCi/L). This correction factor is recommended by Lin and others (1999) for use with southwestern United States short-term radon data from homes without basements measured during winter. Percentages of ≥ 4 pCi/L homes were then determined from the revised County radon data for very high, high and moderate radon potential categories and listed in Table 6.

In reviewing the short-term indoor-radon data from CGS mapping projects, 48 initial tests of 5.2 pCi/L or higher concentrations had follow-up short-term tests. These follow-up tests were made anywhere from 15 days to 301 days after the initial test. The follow-up tests were 4 pCi/L or higher 77 percent of the time (in 37 tests). For nine tests with initial values of 4.0-5.1 pCi/L,

Radon Potential Group	Estimate of Percent Homes with average annual exposure of ≥ 4 pCi/L	Estimated Population exposed to ≥ 4 pCi/L average annual radon concentrations

Table 6. Percentage Estimates of Average Annual ≥ 4 pCi/L Homes for CGS High and Moderate Radon Potential Categories by County Based on Simulated Annual Radon Data Derived from Short-term Indoor-radon Measurements

only three follow-up tests were ≥ 4 pCi/L. These limited results suggest a 5.2 pCi/L threshold for short-term tests corresponding to ≥ 4 pCi/L long term -tests may have some merit.

Correction factors included in Lin and others (1999) range from 1.2, for a home in the Northwestern U.S without a basement, to 4.0 for a home in the Northwestern United States with a non-living area basement. However, most of their correction factors are below 2.4. Although there is uncertainty with these conversions, even if a 2.4 correction factor is used to convert CGS short-term radon data, the estimated annual average living area ≥ 4 pCi/L percentages for most CGS high radon potential areas will still significantly exceed the LBNL estimated county percentages shown in Figure 10.

The LBNL High Radon Project estimated zero percent ≥ 4 pCi/L homes for Santa Cruz, Monterey and Los Angeles counties. CGS mapping identified statistically significant high and moderate radon potential areas in these counties (DHS also did in Los Angeles and Ventura Counties in their study in 1991 Zip Code discussed above). These results point to the necessity of higher density radon surveys and a geologic approach to radon mapping for identifying the high and moderate radon potential areas typical for California.

Summary

In summary, CGS radon potential mapping using short-term home radon data, geologic mapping and other data has identified small but statistically significant high and moderate radon potential areas in eight counties and areas mapped since 2005. CGS mapping results agree closely with results from a 1991 DHS study of Los Angeles and Ventura county Zip Codes. That study used year-long radon-test data for homes, validating the CGS use of short-term radon-test data for homes and geologic mapping approach for identifying high and moderate radon potential areas in California.

High radon potential areas within California counties are typically small, often comprising just a few percent of county land area and with associated populations of a few thousand to a few tens of thousands of people. Los Angeles County is an exception because of its high population density and may have as many as 400,000 persons residing in high radon potential areas. Moderate radon potential areas typically are larger in county land area and population percentage than high radon potential areas. The combined high and moderate radon potential areas in a county are typically smaller in land area and population than the low radon potential portion of a county.

US EPA and LBNL radon potential maps, by design, are not able to represent the small to moderate sizes and scattered distribution of the high and moderate radon potential areas typical in California. The EPA radon map gives the impression that serious radon problems exist everywhere in Santa Barbara and Ventura counties, rather than for only about 2 percent of the land area (the high radon potential portions) of the counties. On the other hand, the EPA radon map does not convey the presence of small but significant high radon potential areas such as present in Los Angeles County. The LBNL map of estimated percentages of homes ≥ 4 pCi/L shows California counties generally have very low percentages and for some counties the estimated percentage is zero. CGS radon potential maps prepared for three counties with LBNL

zero percent estimated ≥ 4 pCi/L homes found small but statistically significant high and moderate radon potential areas in these counties. In other counties CGS high and moderate potential areas are present with estimated ≥ 4 pCi/L homes much higher than the LBNL overall county estimates. That county radon problems have been missed or underestimated in the LBNL county assessments underscores the need for a more detailed radon assessment approach in California than that employed by LBNL. Both the US EPA and LBNL radon potential maps utilize SRRS indoor-radon survey measurements. At the SRRS sampling rates, many California Counties have more geologic units than indoor-radon measurements. This raises the question of just how well SRRS data represent actual radon conditions of California counties. The CGS approach relies on greater numbers of home short-term radon tests, uses those tests and other data to assess radon potentials of individual geologic units, and defines radon potential areas by the presence of similar radon potential geologic units. This approach has proven effective at identifying California's scattered small to moderate sized high radon potential and moderate radon potential areas.

Acknowledgments

The author would like to thank two colleagues at CGS, John Clinkenbeard for suggestions to improve the text of this paper, and Milton Fonseca for providing GIS assistance with several figures.

Evaluation of Potential Indoor Radon Gas Exposure,
Proposed Residential Development

October 19, 2021
J.N.: 2677.00

Ms. Harriet Rapista
Comstock Homes
2301 Rosecrans Avenue, Ste. 1150
El Segundo, CA 90245

Subject: **Evaluation of Potential Indoor Radon Gas Exposure, Proposed Residential Development, Tentative Tract 5708 (Hitch Ranch Project), City of Moorpark, California.**

Dear Ms. Rapista,

Pursuant to your request, ***Albus & Associates, Inc***., is providing this letter to present our evaluation of potential indoor radon gas exposure in the proposed development. To assess the potential indoor radon gas exposure in the proposed development, we reviewed geologic conditions of the site and reviewed the referenced maps and publication concerning radon potential in the county of Ventura and other parts of California. Our work did not involve any physical measurement of radon gas at the site or any of the existing developments nearby.

Radon Background Information

Radon gas is a naturally-occurring colorless and odorless gas that forms from the radioactive decay of small amounts of uranium and thorium present in rocks and associated soils. Radon gas readily moves through rock and soils along fractures and pore spaces, but because of the relatively short half-lives of radon isotopes, radio activity of this gas is typically limited to a few meters to tens of meters from its source of origin but may be hundreds of meters in some cases. With respect to buildings, radon gas can enter buildings through their foundations and become trapped indoors. According to the U.S. Environmental Protection Agency (EPA), breathing air with a concentrated level of radon gas can result in an increased risk of developing lung cancer. While all buildings have a potential for elevated indoor radon levels, those buildings located on rocks and soils containing higher concentrations of uranium and thorium have an increased likelihood of elevated indoor radon levels. Such earth materials include organic-rich shales, some granitic rocks, rhyolites (extrusive igneous rock), and soils derived from these parent rocks.

There are no specific guidelines on what levels of radon gas are acceptable in the natural environment where future habitable structures are considered for construction. The concentration of radon gas in the natural environment is difficult to corollate to potential concentrations within a structure. The EPA recommends that action be taken to reduce radon in homes that have an average annual level greater than 4 pico-Curies per Liter, pCi/l. For evaluating the potential for radon gas to enter future homes, the key is to identify if the site is underlain by rocks or soils that tend to have higher than average levels of uranium and thorium within them and has historically shown to generate radon gas.

Geologic Site Conditions

Our previous investigations of the site (Albus-Keefe 2019, 2020) indicate the site is largely underlain to significant depths by bedrock materials assigned to the Saugus Formation. The Saugus Formation is a Pleistocene-age alluvial deposit associated with the ancestral Santa Clara River and consists of moderately hard to locally very hard interbedded sandstone and siltstone with occasional conglomerate beds and lenses. The Saugus Formation is generally mantled by a thin layer of topsoil. Alluvial and colluvial materials are also present on site within in the drainages.

The site is located on the southeast flank of the Moorpark Anticline. Bedding structure observed in the Saugus Formation generally dips at shallow angles (~3-6 degrees) to the south-southwest and is generally consistent with the regional trend reported for the area (Dibblee and Ehrenspeck, 1992a, 1992b). However, some local warping of the bedding structure was also noted in site exploration.

No faults with significant offset were exposed during our previous studies of the site nor reported by others. However, some minor faults (also commonly referred to as shears) and fractures were encountered within the Saugus Formation. The minor faults are generally 1/16- to 1/4-inch wide and are slightly cemented or have Bt soil development suggesting that they are pre-Holocene age features. The minor faults typically exhibit 12 inches or less of apparent displacement and either terminate within Saugus Formation or roll back into bedding and become undiscernible.

Potential Indoor Radon Gas Exposure

Geologic factors that influence the potential for elevated indoor radon gas exposure at a site include rock type and other geologic conditions, such as faulting and fracturing. The site has evidence of minor faulting. However, this faulting does not exhibit significant displacement and is unlikely to represent a continuous pathway by which radon gas can migrate along significant distances. Rock types that generally contain higher concentrations of uranium and thorium, which may cause elevated radon levels, include organic-rich shales, granitic rocks and rhyolites. Considering the site is underlain largely by Pleistocene-age alluvial deposits and not any of the aforementioned rock types, the potential for elevated indoor radon levels is low.

Furthermore, our review of the Radon Potential Zone Map for Ventura County, California, which was updated in 2006 by Churchill (2006a), indicates the site is within a zone defined as a “low potential for indoor levels above four picocuries per liter”. The radon zone designations on the map, as discussed in the accompanying report by Churchill (2006b), are based on the radon potential assignments of the geologic units within Ventura County. The radon potentials of the geologic units were evaluated using short-term indoor-radon measurement data provided by the Department of Health Services-Radon Program, airborne radiometric survey data from the NURE project data-National Uranium Resource Evaluation project, geologic maps from the Dibblee Foundation and California Geological Survey (CGS, aka California Division of Mines and Geology), and information on geologic units and indoor-radon measurements from Los Angeles and Santa Barbara Counties. The low potential zone, as defined in the report, are “geologic map units that likely have fewer than 6 percent of associated residences with radon levels that equal or exceed 4.0 pCi/l”.

Limitations

This report has been prepared for the exclusive use of **Comstock Homes**. This report is intended to aid in your assessment of potential for indoor radon gas exposure within the property. The findings in this report are based on the geologic data as described herein and the referenced literature. Other factors such as soil permeability, weather and climatic condition, building design and conditions, and building usage also influence indoor radon levels. As such, building-specific radon levels can only be determined by indoor radon testing.

This report has been prepared consistent with that level of care being provided by other professionals providing similar services at the same locale and time period. The contents of this report are professional opinions and as such, are not to be considered a guarantee or warranty.

This report has not been prepared for use by parties or projects other than those named or described herein. This report may not contain sufficient information for other parties or other purposes.

We appreciate this opportunity to be of service to you. If you should have any questions regarding the contents of this correspondence, please do not hesitate to call our office.

Sincerely,

1 Executive Summary

The purpose of the 'Hydrology Study Report - 2020 Update' is to present the results of 100-year and 10-year hydrology for the proposed Hitch Ranch Development project along Walnut Canyon Channel (WCC) in Moorpark. Please see Figure 1.

This study is consistent with the accepted 2005 Regional Master Plan (RMP) and the 2009 RMP Update for this part of the City of Moorpark. As stipulated in the RMP, a regional Detention Basin #3 is included along the main stem of the WCC, as well as three on-site local detention basins and the related stormwater facilities.

The hydrology study report shows that the proposed local and regional drainage facilities will successfully meet the following drainage requirements:

1. The project will reduce the projected post-development 100-year flow to below the existing pre-development 10-year flow condition at the westerly project boundary along WCC;
2. The project will meet the 830-cfs RMP requirement (2005, 2009) of the post-project 100-year flow being contained within the existing WCC along Los Angeles Avenue.

Due to of the long history of this project, this 2020 Update builds upon the various hydrology studied in the 1997, 2005, and 2009 reports related to Hitch Ranch and the surrounding developments along WCC. Therefore, this study is considered the most up-to-date for this part of the WCC drainage system.

This project achieves mitigation for hydrologic and hydraulic deficiencies in WCC as identified in the RMP. Structural deficiencies in the downstream reaches of WCC and the Walnut-Gabbert drainage facilities are not addressed in this report.

The latest hydrology software from Ventura County Watershed Protection District (VCWPD) and other technical tools were utilized for this purpose. Hydrology is presented for three conditions; the Existing Condition with no Hitch Ranch Development in place; an Ultimate Proposed Condition with the Hitch Ranch Development and other upstream developments in place; and Interim Proposed Condition assuming a regional detention basin at Casey Road has not been constructed.

2 Background

2.1 Existing/Proposed Site Description

The Hitch Ranch project consists of the conversion of 277.3 acres of naturally vegetated open space to a mix of residential, open space, flood detention, and transportation land uses. It is located in southeastern Ventura County within the City of Moorpark, just north of Poindexter Road in between Walnut Canyon Road and Gabbert Road. Hitch Ranch lies within the Walnut Canyon watershed, which drains a low-lying portion of the Santa Susana Mountains south west into the Arroyo Simi and ultimately into Calleguas Creek. Figure 1 shows the general location of the Hitch Ranch project site.

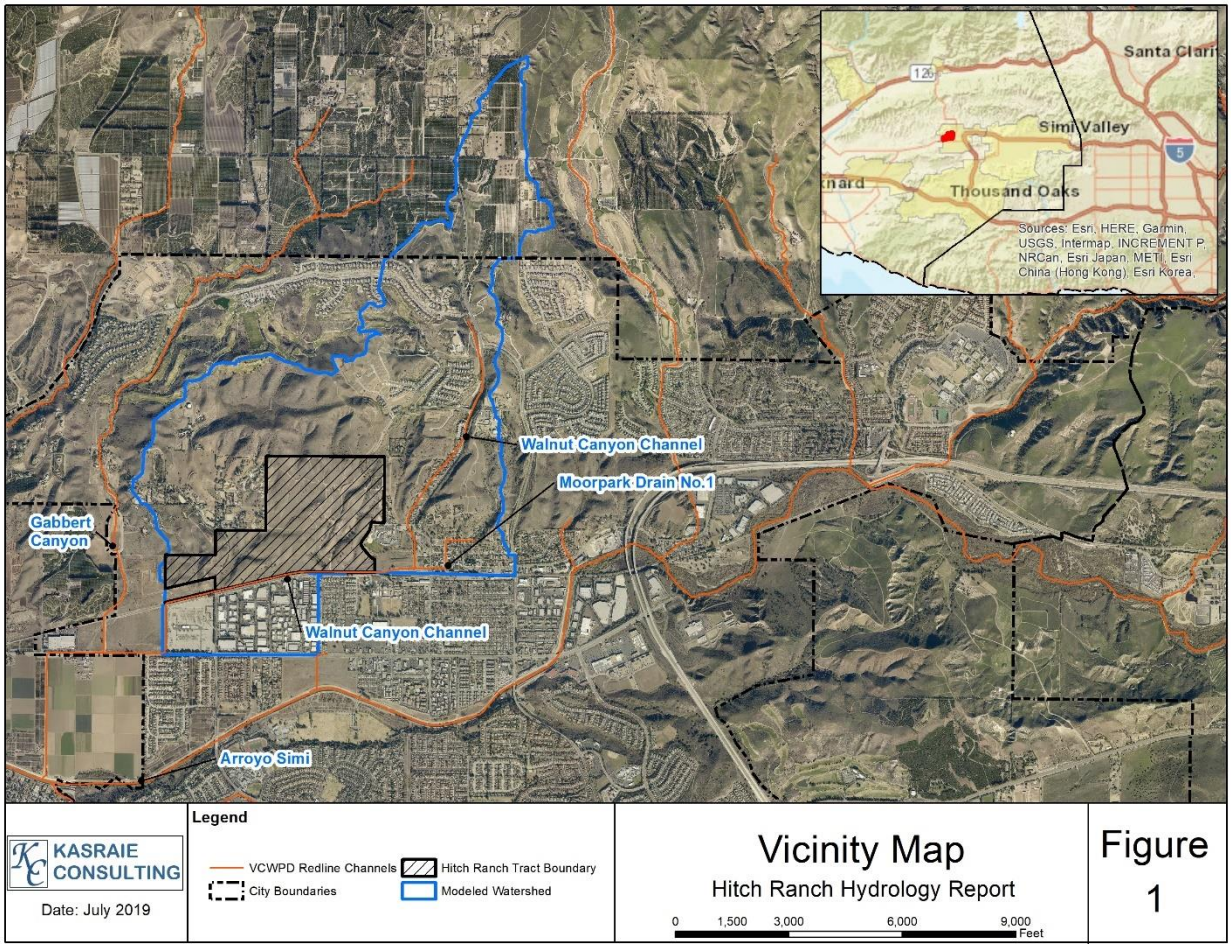

Figure 1: Vicinity Map

Table 1 and Figure 2, on the following page, outline proposed project and main land use categories based on tentative tract maps dated May 2019 (amended July 2019 to revise proposed detention Basins 2 and 3).

Table 1: Proposed Site Land Use Summary

LAND USE	AREA (acres)	% OF WATERSHED
Single Family Homes (261 Units)	59.9	21.4
Multi-Family Housing (253 Medium/241 High Density)	34.3	12.4
Natural Open Space	27.3	9.8
Open Space	32.5	11.7
Manufactured Slopes	45.1	16.3
Recreation Lot	6.75	2.4
Passive Recreation Lot	1.3	0.5
Public Facilities (Streets, Detention Basins, Easements, Park)	63.5	22.9
Not A Part	6.7	2.4
TOTAL	277.3	100

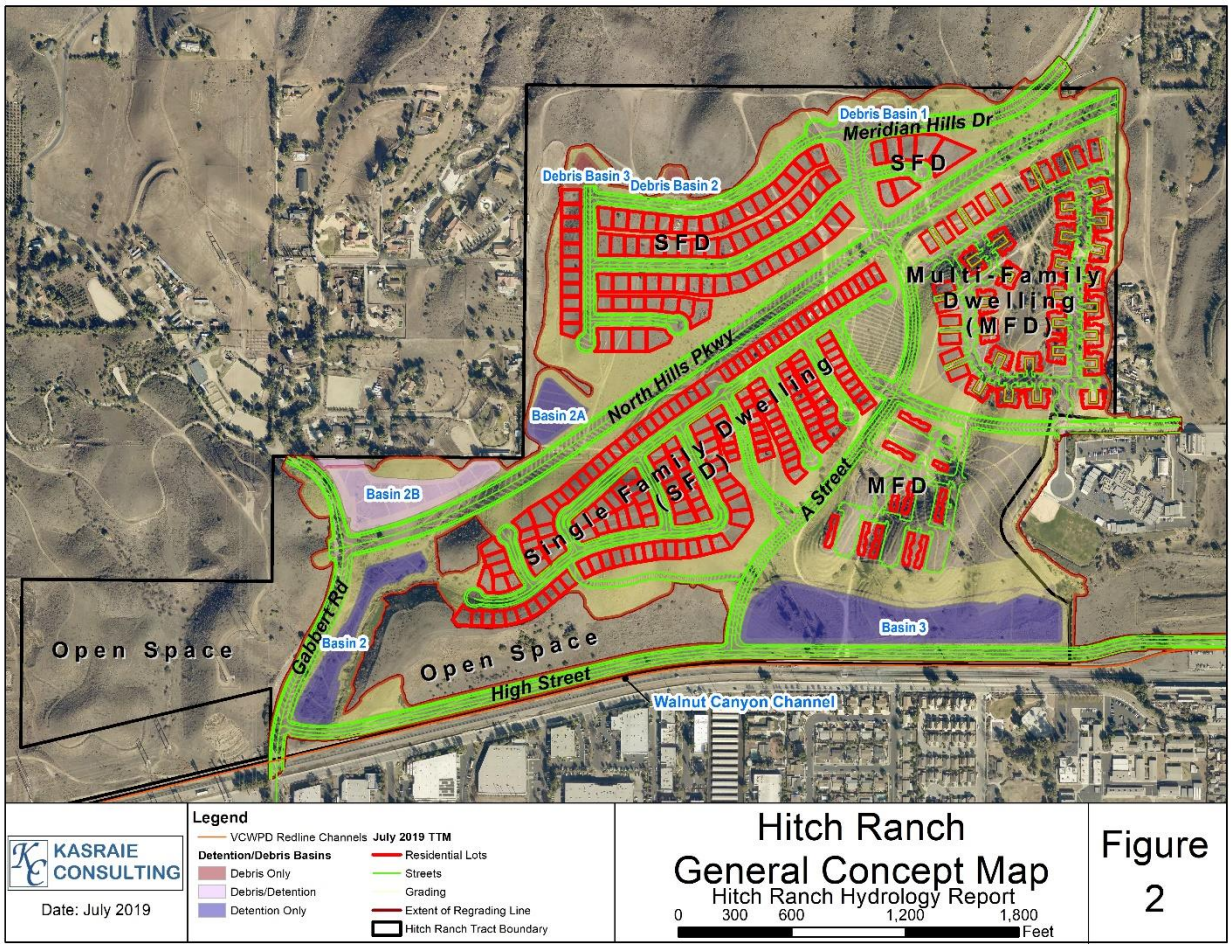

Figure 2: General Concept Map

2.2 Existing Watershed

2.2.1 Description

Walnut Canyon Channel (WCC) drains 2.8 square miles of the City of Moorpark south west approximately 2.3 miles prior to its confluence with Gabbert Canyon channel. This portion of the City lies in the foothills of the Santa Susana Mountains and terrain consists of moderate to steeply sloping hillsides. Approximately 56 % of the watershed remains undeveloped, with the remainder consisting of mixed residential, commercial, industrial, institutional, agricultural and transportation land uses. Table 2 provides a summary of watershed land uses.

Table 2. Walnut Canyon Watershed Land Use Distribution

LAND USE	% OF WATERSHED
Commercial	1%
Farmstead	1%
Golf Course	1%
Horse Ranch	1%
Industrial	10%
Institutional	2%
Open Space	0%
Orchard	9%
Residential	2%
Residential - 0.2 ac lot	5%
Residential - 0.4 ac lot	2%
Rural Residential	9%
Transportation	0%
Vacant	56%

WCC was originally constructed by the Soil Conservation Service (currently Natural Resources Conservation Service) between 1959 and 1962 and it is currently owned/maintained by VCWPD. Downstream of the post office, WCC is a rectangular concrete channel running west for 1.25 miles parallel to the Union Pacific Railroad (UPRR) tracks. After passing Gabbert Road and the Southern California Edison (SCE) Plant, the channel veers south under the tracks to Los Angeles Avenue, adding two storm drain junctions from SCE, before it again turns west and picks up flows from a City 72" RCP. It terminates at its confluence with Gabbert Canyon Channel. Channel depths range between 5 and 8 feet and base widths vary from 6 to 12 feet (see Table 3). Slope within this reach vary from 0.5 to 1.6 percent.

- FEMA Flood Insurance Study (FIS) – Includes Walnut Canyon Channel [Nolte, 2005]
- **Technical Addendum to Walnut and Gabbert Canyon Channel Flood Deficiency Study (Regional Master Plan) [2005, PACE]**
- Hitch Ranch Watershed Masterplan Study [2007, PACE]
- **Basis of Design Study, Commonwealth Studios – Interim Condition Flood Control Improvements, Walnut and Gabbert Canyon Watershed [2009, PACE]**
- Hitch Ranch Specific Plan Environmental Impact Report (EIR) [2011, PACE]
- FEMA Letter of Map Revision (LOMR) – Walnut Canyon Channel [2011, MRC]

Baseline modeling and subsequent deficiency/design studies in **boldface** provide preliminary conceptual level design alternatives; none of which have been adopted by specific ordinance. Each are described in more detail below.

3.1 Baseline Condition VCRAT Modeling [VCFCD/VCWPD, 1996]

100-year and 50-year VCRAT models of the entire Gabbert and Walnut Canyon watershed intended to represent a baseline condition in anticipation of flow changes due to future development. The 4,425-acre watershed was divided into 79 subareas ranging from 8 to 105 acres in size for VCRAT development.

3.2 Walnut and Gabbert Canyon Channel Flood Deficiency Study [RBF, 1997]

Ventura County Flood Control District (VCFCD, precursor to VCWPD) compared the flood conveyance capacity of the system to the modeled flowrates and determined that the Walnut and Gabbert Canyon flood control channels did not provide the desired level of flood protection. The limited hydraulic conveyance capacity of the existing channel system results in the flood protection deficiency which was documented in the *Walnut and Gabbert Canyon Channel Flood Deficiency Study (RBF, 1997).*

The 1997 study characterized deficiencies and developed a regional masterplan to increase flood protection levels. The plan proposed the implementation of various conveyance-oriented improvements as well as five regional detention basins. While the improvements were designed based on flows resulting from the 1996 land use conditions, it mandates future development projects mitigate hydrologic impacts from their projects and include allowances for the proposed regional drainage facilities. The chosen, least cost alternative (B) included:

- Construction of a 300 cfs underground Shasta Avenue diversion channel near the current eastern boundary of Hitch Ranch taking flows directly south to Arroyo Simi.
- Separation of the Gabbert and WCC systems by creating a dedicated WCC trapezoidal channel outlet to Arroyo Simi.
- 140 ac-ft of detention storage within the WCC watershed.

This plan was superseded by the Technical Addendum to Walnut and Gabbert Canyon Channel Flood Deficiency Study (Regional Master Plan) [2005, PACE].

3.3 Technical Addendum to Walnut and Gabbert Canyon Channel Flood Deficiency Study (Regional Master Plan) [2005, PACE]

A 2005 Addendum to the 1997 study, referred to as the Regional Master Plan (RMP) from this point forward, similarly mandated that future development projects include allowances for regional flood control facilities and comply with local drainage requirements. This study revises the 1997 regional masterplan to incorporate improvements proposed in the Moorpark West Corporate Center Flood Protection Project – Walnut Canyon Regional Detention Basin prepared in March 2003 by RBF. RMP components are illustrated on Figure 3.

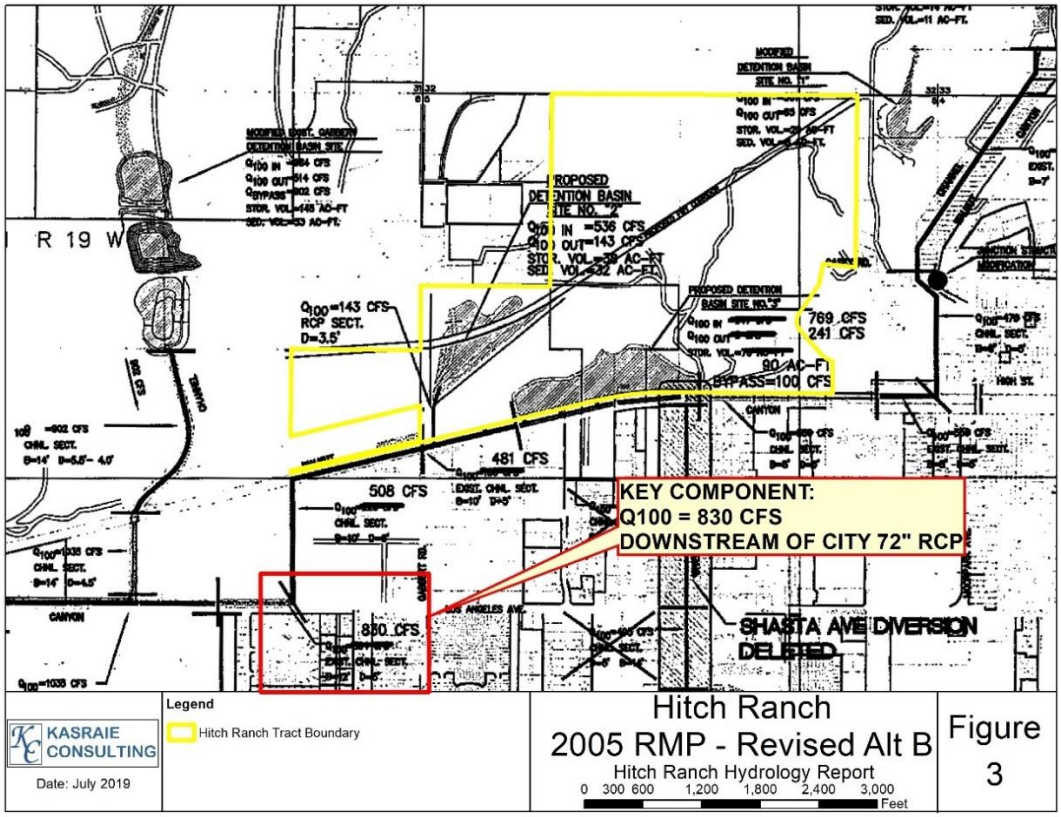

Figure 3: 2005 RMP – Revised Alternative B

The revised Alternative B includes:

- Elimination of the Shasta diversion channel and replaced it with 100 cfs by-pass between diversion from WCC to proposed Basin 3 and corresponding detention outlet back to WCC.
- Increased required storage in proposed Basin 3 from 70 to 90 ac-ft.
- Identified a target flow downstream of City of Moorpark 72" RCP, west of Southern California Edison (SCE) property was determined to be 830 cfs

3.4 Basis of Design Study, Commonwealth Studios – Interim Condition Flood Control Improvements, Walnut and Gabbert Canyon Watershed [2009, PACE]

A 2009 Update study *entitled Basis of Design Study, Commonwealth Studios – Interim Condition Flood Control Improvements, Walnut and Gabbert Canyon Watershed* [PACE] prepared for downstream Tract 5217 (immediately west of Southern California Edison property, adjacent to north and west bank of WCC) outlines their requirement to "construct offsite regional flood control improvements as discussed in the Walnut and Gabbert Canyon Watershed Masterplan approved June 2005" and that previous "owners of Hitch Ranch and Triliad Development have developed an agreement to allow Triliad to construct the proposed basin improvements on Hitch Ranch property". This would infer that there would be a cost sharing among benefitting parties. As of August 2019, Tract 5217 has not been developed.

4 Regulatory Framework

4.1 General Local Design/Hydrologic Mitigation Standards

New developments, such as Hitch Ranch, are commonly required to design localized mitigation for runoff flowing directly on or through their site. General regulatory guidance applicable to the project site include:

- City of Moorpark Municipal Code 17.76.050(76) Development standards states: "Drainage improvements must be designed so that after-development, drainage to adjacent parcels would not be increased above pre-development drainage quantities for any stormwater model between and including the ten (10) year and one hundred (100) year storms, nor will surface runoff be concentrated by this project."
- 2017 VCWPD Design Hydrology Manual: "To minimize the impacts of development on the existing drainage system, and in some cases to remedy existing drainage deficiencies, most Cities require that the consultant use detention to attenuate the 100-yr developed condition peak back to the 10-yr developed condition peak. For some watersheds with severe channel deficiencies, the mitigation goal has been the 10-yr undeveloped condition

peak. For the unincorporated County, the mitigation is normally no increase in flow for any design storm from the 10-, 25-, 50-, or 100-yr frequency."

4.2 Critical Additional Design/Hydrologic Mitigation Standards

During 2018-19, the developer and their consultants met with City and VCWPD staff, holding a series of discussions regarding the project. Updated existing condition and proposed condition hydrology including a regional detention basin (commonly known as Basin 3) peak discharge reduction concept similar to the 2005 RMP, along with a Hitch Ranch-Only mitigation measure involving local on-site detention basin facilities (following the general local design/mitigation standards outlined in the previous section) were provided.

After much discussion and collaboration, the Regional Detention Basin 3 concept was found to be the preferred alternative as it will provide the best opportunity to reduce peak discharges in the downstream reaches of WCC. The purpose of the remainder of this report is to demonstrate that the Hitch Ranch project, as shown on the May 2019 (amended July 2019) Tentative Tract Map (TTM), mitigates for local drainage impacts and supports Regional Flood Control (RFC) objectives and Local Flood Requirements (LFR) as outlined in the RMP (See Table 4).

Table 4: Regional Flood Control (RFC) Objectives and Local Flood Requirements (LFR)

Element		Governing Agency	Criteria
Performance Criteria	Regional Flood Control (RFC) Objectives	VCWPD	flood control components must be designed to achieve either 50-year conveyance in the channel with freeboard, or 100-year conveyance in the channel without freeboard but including super-elevation, whichever is greater
	Local Flood Requirements (LFR)	City of Moorpark	Proposed peak flows must not exceed existing flows leaving project site for the 10-, 25-, 50-, and 100-year storm events

Based on the required RFC and LFRs listed above, all designs are required to meet the following targets:

1. Reduce the projected post-development 100-year flow to below the existing pre-development 10-year flow condition at the westerly project boundary along WCC;
2. Meet the 830-cfs RMP requirement (2005, 2009) of the post-project 100-year flow being contained within the existing WCC along Los Angeles Avenue.

This 2020 Update, Hydrology Study Report, builds on all the previous hydrology studies, and it presents a new and up-to-date picture of the drainage improvements that the community has requested of the developer and their consultants.

In addition, VCWPD informed the community that since acceptance of the 2005 RMP, WCC facilities have shown signs of severe structural failures. The 2005 RMP and subsequent 2009 design study only addressed downstream hydrologic and hydraulic deficiencies.

No other remedy is offered to address the existing structural failures in the downstream channels, as they are considered to be outside the control of the Hitch Ranch Development project.

4.3 California Division of Safety of Dams (DSOD)

Large dams that may have a higher potential for public safety hazard are considered Jurisdictional Dams and fall under the oversight of the California Division of Safety of Dams (DSOD). Dams that have:

- A dam height more than 6 feet and impounds 50 acre-ft or more
- A dam height greater than 25 feet and impounds 15 acre-ft or more

Dam height is defined as "the vertical distance measured from the lowest point at the downstream toe of the dam to its maximum storage elevation".

Jurisdiction Dams require significant additional design, construction, and maintenance costs. Designs should minimize the likelihood of this classification.

4.4 VCWPD Detention Basin/Outlet Design Requirements

Based on the *VCWPD Design Manual* (1968) and unpublished 1991-92 guidance:

1. The emergency spillway must be designed to pass the unattenuated 100-year flow and is to be located at least 1-foot above the 100-year modeled design (through any primary/secondary outlets) water surface elevation.
2. A minimum freeboard of 3-feet must be provided above the top of the calculated, unattenuated flow over the emergency spillway.

5 Approach

To demonstrate that the Hitch Ranch project provides appropriate mitigation measures to meet LFR and RFC objectives outlined in previous Regional Master Plan (RMP), hydrologic analysis of the Walnut Canyon watershed was developed and results were evaluated with respect to the above criteria. Modeling was completed using VCRAT (Ventura County Rational Method Hydrology Model, version 2.64.0.37) for the 10-year/100-year Existing and 100-year Interim/Ultimate conditions summarized in Table 5. 25- and 50-year events will be included in a subsequent hydraulic study that includes design of the on-site storm drain system.

Table 5. Modeled Conditions

Condition	Land Use	Basin Configuration
Existing	Existing land use, no development in HR	Includes Basins 0, 5187-1 and 5187-2
Interim	Proposed land use (includes Hitch Ranch and Essex developments)	Includes Existing Basins (0, 5187-1, 5187-2) plus Proposed Hitch Ranch Basins 2A, 2B, 2, and 3
Ultimate	Proposed land use (includes Hitch Ranch, Mansi, and Essex developments)	Includes Existing Basins (0, 5187-1, 5187-2), Proposed Hitch Ranch Basins (2A, 2B, 2, and 3) plus Basin 1 (located immediately north of Casey Rd and the Boys and Girls Club)

5.1 Hydrology Model Development

Hydrology models for this study were developed in VCRAT 2.64 based in part on models developed for previous studies (VCRAT 2.5) and on an analysis of the most up-to-date spatial data. Models developed for previous modeling efforts were updated to reflect hydrologic changes resulting from: 1) VCRAT 2.64 methodological and source data updates (soils, curve numbers, actual imperviousness and rainfall), and 2) updates to plans for development within the watershed (including Hitch Ranch and Essex developments).

5.1.1 Existing Condition

There have been no significant changes in watershed land use since previous modeling efforts. Existing Condition models were developed by transcribing previous VCRAT 2.5 model parameters into VCRAT 2.64 and updating soil numbers, imperviousness and rainfall parameters based on the *2017 VCWPD Design Hydrology Manual*. The final product is a single, contiguous model (Nodes 1A-125A) for the 10- and 100-year frequencies from the WCC headwater, through the confluence with Gabbert Canyon Channel, to the outlet at Arroyo Simi.

5.1.2 Proposed Condition

VCRAT does not have the direct capability to model complex diversions or detention basins, therefore:

- The hydrograph split at the diversion and basin outlet rating curves needed to be determined outside the program. HydroCAD (version 10.00-21) was chosen for this purpose due to the ease of modeling complex outlets while connecting the entire system. Hydrographs were exported from an initial VCRAT run for individual and/or linear series of subareas. They were then used as input into HydroCAD as a "Link".
- Proposed Interim and Ultimate condition evaluations were each split into upstream (Nodes 1A-45A) and downstream (Nodes 45A-150A) VCRAT models. Outflow hydrographs from HydroCAD diversion calculations were imported into the downstream model to represent the time dependent split.

No significant changes are proposed for the watershed upstream of the proposed diversion for the Interim Condition, therefore model parameters from the Existing Condition (with a few minor exceptions) VCRAT model were used (flow at Node 44AC is the same in the Existing and Interim). For the Ultimate Condition, the only difference is that the incoming hydrograph was fattened and the rating curve from 2009 *Basis of Design Study, Commonwealth Studios – Interim Condition Flood Control Improvements, Walnut and Gabbert Canyon Watershed* was used at Node 32B representing Basin 1 (not built as of 07/31/19).

Downstream of the diversion, due to the significant changes included in the Hitch Ranch TTMs, subareas downstream of the Basin 3 diversion were developed based on an entirely new spatial analysis of proposed topography, soils, land uses, rainfall zones, Tc's, etc.

5.1.3 Parameter Estimation

Per VCWPD guidelines in the Hydrology Manual (VCWPD, 2017), hydrographs in the VCRAT models were fattened prior to reservoir routing at all detention basins (unless fattening resulted in reduced volumes).

A summary of VCRAT model input data sources and methods for parameterization is provided in Table 6. Additional details, background information and model input/output files can be found in the attached appendices.

Table 6: VCRAT Model Assumptions

Model Component	Data Source(s)	Parameterization Approach
Subareas (Figures 4 and 5)	1) LiDAR Topography (County of Ventura, 2016) 2) Storm Drains (City of Moorpark, 2015)	Existing Conditions/Proposed Conditions US Walnut Canyon diversion: Previously modeled subareas (PACE 2009) were reviewed and updated in consideration of 5 ft LiDAR contours (County of Ventura, 2016) and the City of Moorpark's digitized storm drain layer. Proposed Conditions (Hitch Ranch): Delineated based on grading and storm drain infrastructure illustrated in Tentative Tract Maps dated May 2019 (amended July 2019)
Rainfall (Figure 6)	Rainfall Zones, (NOAA, 2017), downloaded from the County of Ventura	Model boundaries are entirely within the South Mountain to Moorpark rainfall zone, as defined by the NOAA 2011 analysis.
Soils (Figure 7)	Soils shapefile, County of Ventura, 2010	Area weighted soil numbers were calculated for each subarea in ArcGIS.
Imperviousness (Figures 8 and 9)	1) Aerial Photograph (County of Ventura, 2016) 2) Exhibit 14B, Design Hydrology Manual, VCWPD, 2017 (actual imperviousness)	Actual imperviousness values were assigned to each land use. Imperviousness values for each subarea were then calculated by area-weighting the land uses.
Land Use (Figures 8 and 9)	1) Baseline Conditions Model (VCWPD, 1996) 2) Aerial Photograph (County of Ventura, 2016) 3) ECG TTM (June 2018)	Existing Conditions: designated based on those included in the 1996 VCWPD Baseline Conditions model with updates for Tract 5187 development. Proposed Conditions: designated based on the existing modeled land uses, with modifications to account for land uses proposed for Hitch Ranch in tentative tract maps dated June 2018 and planned development of the Essex property

Table 6: VCRAT Model Assumptions

Model Component	Data Source(s)	Parameterization Approach
Time of Concentration (Appendices 2a and 2b)	1) LiDAR Topography (County of Ventura 2016) 2) Storm Drains (City of Moorpark, 2015)	Existing Conditions/Proposed Conditions US Walnut Canyon diversion: Previously calculated (VCWPD 1996, PACE 2009) Tc's for the 100-year storm event were used where still relevant; 100-yr Tcs were prorated based on subarea slope and overland flow length for the 50-, 25-, and 10-year storm events. Proposed Conditions (Hitch Ranch): Calculated using VCWPD's Tc Calculator spreadsheet using flow paths measured in ArcGIS
Fattening (Table 7)	1) Soils shapefile, County of Ventura, 2010 2) Exhibit 14B, Design Hydrology Manual, VCWPD, 2017 (actual imperviousness)	Fattening was conducted prior to reservoir routing at all detention basins. Detention basins with no upstream storage facilities: areally-weighted curve numbers were calculated based on soils and land uses per VCWPD methodology, input into VCRAT with total storm event rainfall Detention basins downstream of other storage facilities: The yields for both the area tributary to the upstream basin and the area directly tributary to the downstream basin were calculated. These were then areally-weighted and the areally-weighted yield was used as the fattening factor.
Stage-Storage-Discharge Curves (Appendix 2)	1) ECG TTMs (May 2019, amended July 2019) 2) PACE 2009 modeling	Basins 0, 5187-1, 5187-2, and Basin 1: Based on PACE 2009 modeling Basins 2a, 2b, 2 and 3: determined by combining results obtained by using hydrographs exported from VCRAT as inflows to HydroCAD (Build 10.00-21) stormwater model software where rating curves were extracted.

10-/100-year Existing Condition and 100-year Interim/Ultimate Condition VCRAT input/output plots are in Appendix 5.

Table 7. Yield Adjustment Assumptions

Location	Node	CN	Rainfall (in)				Yield Adjustment (in)			
			100	50	25	10	100	50	25	10
Reg. Basin 0	5A	69	6.5	6	5.25	4.5	--	--	--	--
Tract 5187 Basin 1	7B	83	6.5	6	5.25	4.5	--	--	--	--
Tract 5187 Basin 2	28C	68	6.5	6	5.25	4.5	--	--	--	--
Reg. Basin 1 (Casey Road)	32B	--	--	--	--	--	2.7	2.3	1.8	1.3
Reg. Basin 3 at Diversion	45A[1]	--	--	--	--	--	2.9	2.5	2.0	1.5
Reg. Basin 3 - Direct	55B	73	6.5	6	5.25	4.5	--	--	--	--
Basin 2A	76C	62	6.5	6	5.25	4.5	--	--	--	--
Reg. Basin 2B (82C) – Two Incoming Nodes										
North Hills Pkwy Local Drains Directly to Basin 2B	77D[1]	--	--	--	--	--	1.8	1.5	1.0	0.8
Upstream of Basin 2B, not including outflow from Basin 2A	79B	--	--	--	--	--	1.8	1.5	1.0	0.8
Reg. Basin 2 (86B) – Two Incoming Nodes										
Local subarea + adjacent area to the east	82C	--	--	--	--	--	1.9	1.6	1.2	0.8
Undeveloped subarea directly west of Gabbert and Basin 2	83B[2]	--	--	--	--	--	--	--	--	--

[1]Applying Yield Adjustment (fattening) resulted in lower volumes, therefore it was not included in the final model for these nodes (45A and 77D)

[2]Subarea 83B is currently planned to remain undeveloped

5.2 Model Validation

A HEC-RAS 2D (5.0.7) hydraulic model was created using 2018 topography, ECG May 2019 (amended July 2019) TTMs, and inflow hydrographs from VCRAT to internally verify the final hydrologic modeling due to potential backwater and timing constraints. It produced similar results. This model is included as part of this submittal, Please see Chapter 7.

6 Hydrologic Design/Results

Four detention facilities are being proposed and were modeled to meet current requirements as identified in *Section 4 Regulatory Framework* section of this report.

6.1 Considerations Needed to Meet RFC and LFRs

The most critical RFC/LFR is the RMP (2005, 2009) requirement that any design results in the post-project 100-year flow being contained within the existing WCC along Los Angeles Avenue (LA Ave). This objective cannot be met by solely treating run-on (runoff that flows directly through the HR from other areas) and on-site flows. It requires the Hitch Ranch development to address off-site deficiencies within the framework of its own tract while addressing downstream features beyond its control (inflows near UPRR 10'x8' RCB and City 72" RCP). Issues include:

1. 100-year Ultimate/Interim Condition flows immediately upstream of Hitch Ranch (Node 45A) are 758 and 871 cfs. These calculated flows are near or above the target flow of 830 cfs without any addition of attenuated, on-site Hitch Ranch flows to the system. Any added inflow, including the local subarea (88B, 104 cfs) would violate the RMP requirement. Therefore, a portion of upstream flows must be diverted and detained in addition to the on-site runoff (Regional Basin 3). **This is the basis for needing a diversion structure.**
2. 100-year Ultimate/Interim incoming volume (Node 45A) of flow upstream of Hitch Ranch is 218 and 221 ac-ft respectively. It is not feasible for the entire amount to be detained; therefore, a portion will need to be allowed to by-pass Basin 3. Potential detention basins and outlets need to be optimized to ensure constructability while meeting the downstream target. **This is the basis for the needing a by-pass.**
3. Conceptually, if "no runoff" is allowed into WCC upstream of Gabbert Road, the peak flow at LA Avenue is 452 cfs (Node 93AC) at 19.32 hours into the model. Therefore, upstream flows are limited to 378 cfs at the same time (19.32 hours) which would require time to peak of released flows to be shifted. If 100 cfs flow upstream of HR is allowed to remain in the channel, then the peak at LA Ave is 552 cfs. **This is the basis for limitation, optimization, and lag of outlet flows from the detention basins,**
4. A single, primary outlet must be designed to limit outflow and provide adequate lag while minimizing required detention. Optimizing all three functions is difficult due to the stringent downstream requirement and magnitude of upstream, off-site flows. A dual-outlet system splits the functions such that the primary outlet controls the lag while the secondary controls the impoundment size. This division provides more design flexibility. **This is the basis for a dual-outlet.**

These constraints were outlined in the previous RMPs and lead to a similar conceptual conclusion:

1. A diversion structure at the upstream (eastern) HR boundary will need to be optimized such that flows above a certain threshold are sent from WCC to Regional Basin 3 while the remainder by-passes and continues downstream.
2. Proposed Basins 2 and 3 need to provide a significant lag in peak such that the majority of the flow in the downstream area has passed through the system.

Note: This is preliminary hydrologic design and does not include infiltration of a dead storage area with a low-flow outlet.

6.1.1 Diversion/Outlet Design

An in-line 8'x2' (rectangular orifice) hanging wall will be used to create backwater/head diverting flows (>139 cfs) through 6-8.37'x2.5' rectangular side orifices from WCC to Basin 3.

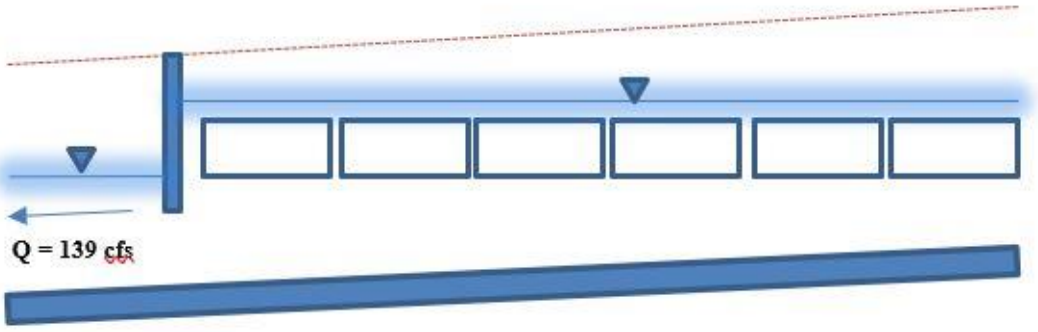

Figure 10: Conceptual Diversion By-pass to Basin 3

The following are descriptions of the initial outlet works design for each basin. Note that dimensions may be altered to fit standard and/or prefabricated components where necessary during final design. At that time the modeling will be adjusted to reflect the final component plans.

Basin 2A: The outlet will consist of a rectangular, concrete tower having a 24-foot perimeter. The low flow/primary outlet will consist of a single 33-inch, circular orifice opening in the tower. The top of the tower (weir) will serve as the emergency spillway. Two 39-inch RCPs, providing capacity for the unattenuated flow, will exit the tower towards Basin 2B.

Basin 2B: The low flow/primary outlet will be 2-18" RCPs that drain to Basin 2. A 93' long weir will serve as the emergency spillway, passing the unattenuated flow at 1.5' of head (C = 2.8). It will follow a similar configuration as Basin 0 (80' weir) with 2-60" RCPs leading to Basin 2. The emergency spillway design has some flexibility. At 2' of head, the weir would only need to

be 58’ long, but another 0.5’ would need to be added to the floodwall to meet freeboard requirements.

Basin 2: The outlet will consist of a rectangular, concrete tower having a 27-foot perimeter (similar to Basin 0). The low flow outlet will consist of a single 9-inch circular orifice in the tower, the primary outlet will be a 3’x2’ rectangular orifice in the tower, and the secondary outlet will be a weir created by the top of the tower. A 114’ long weir will serve as the emergency spillway, passing the unattenuated flow at 1.5’ of head (C = 2.8). It will follow a similar configuration as Basin 0 (Figure 11, 80’ weir) with 2-7.25’x4’ RCBs leading to WCC. The emergency spillway design has some flexibility. At 2’ of head, the weir would only need to be 74’ long, but another 0.5’ would need to be added to the floodwall to meet freeboard requirements.

Basin 3: The outlet will consist of a rectangular, concrete tower having a 34-foot perimeter (similar to Basin 0). The low flow outlet will consist of a single 9-inch circular orifice in the tower, the primary outlet will be a 6.25’x2’ rectangular orifice in the tower, and the secondary outlet will be a weir created by the top of the tower. A 137’ long weir will serve as the emergency spillway, passing the unattenuated flow at 2.0’ of head (C = 2.8). It will follow a similar configuration as Basin 0 (80’ weir) with 3-8’x4’ RCBs leading to WCC. The emergency spillway design has some flexibility. At 3’ of head, the weir would only need to be 75’ long, but another 1.0’ would need to be added to the floodwall to meet freeboard requirements.

Basins 2 and 3 were excavated to maximize storage which limits the gravity head available for discharge through the primary outlet to WCC. Basin 3 outlet pipes are carried to the channel further downstream to create reasonable slope. To prevent potential backflow from the channel to the basin, flap gates will be installed.

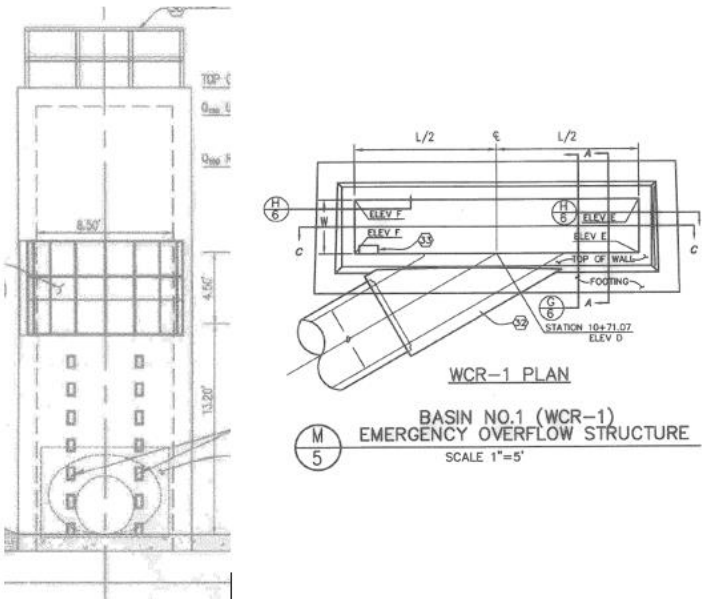

Figure 11: Walnut Canyon Basin 0 Outlet Tower and Emergency Spillway

Table 8 includes critical design features as well as VCRAT 100-yr Interim Condition WSEs:

Table 8: Proposed Detention Facilities

Name	Bottom Elevation	Low Flow Outlet	Primary Outlet	Secondary Outlet	VCRAT 100-yr Interim WSE (Node)	Emergency Spillway	Minimum Top of Basin Elevation (Volume, acft)	Required Floodwall Elevation (Length, ft)[3]
Basin 2A	512.0	None[0]	1-33" Circular Orifice (@512.0)	NONE	516.3 (76C)	24' Weir (@517.3)	522.0 (9.5)	NONE
Basin 2B	498.0[1]	None[1]	2-18" Circular Orifices (@498.0)	27' Weir (@506.1)	508.0 (80BC)	93' Weir (@508.9)	511.0 (32.9[2])	513.4 (761.0')
Basin 2	471.0	1-9" Circular Orifice (@ 471.0)	1-3'x2' Rectangular Orifice (@473.0)	27' Weir (@477.9)	478.5 (86B)	114' Weir (@480.3)	483.0 (22.2)	484.8 (292.0')
Basin 3	480.0	1-9" Circular Orifice (@ 480.0)	1-6.25'x2' Rectangular Orifice (@481.0)	34' Weir (488.0)	489.7 (56BD)	137' Weir (@491.0)	493.0 (88.7)	496.0 (622.0')

[0]Low Flow and Primary are the same.
[1]Low flow not modeled as it will below debris line.
[2]Elevation/Volume above required debris volume.
[3] Required Floodwall Elevation = WSE100 + 1' (Emergency Spillway Elevation) + Depth Over Emergency Spillway to Convey Unattenuated Flows + 3' Freeboard

Peak flows were evaluated at three locations to identify current deficiencies as well as determine necessary mitigation:

1. At the western, most downstream boundary of the Hitch Ranch development along WCC at Gabbert Road to confirm that local flood requirements (LFR) are met.
2. At the Union Pacific 10' x 8' RCB where WCC flow direction changes from west to south, resulting in added super-elevation considerations.
3. At Los Angeles Avenue, where WCC changes flow direction from south to west, immediately downstream of the incoming City of Moorpark 72-inch RCP west of the Southern California Edison property to verify that regional flood control/regional master plan (RMP) objectives are achieved.

Existing and the Proposed Interim Condition Peak Flows are included in Table 9:

Table 9: Existing and the Proposed Interim Condition Peak Flows

Location	Target Flow/Capacity cfs (Slope)	VCRAT Modeled Existing Q100 cfs (Node)	VCRAT Modeled Existing Q10 cfs (Node)	VCRAT Modeled Interim Q100 cfs (Node)
WCC @ Gabbert Road (10'x6' RCB) Location #1	833[1] (0.0051)	1477 (63AB)	**755** (63AB)	**704** (87AB)

WCC, Downstream of MPK 72" RCP (12'x5' RCC) Location #3	**830**[3] (0.0047)	1809 (68AC)	**905** (68AC)	**806** (90AC)

[1]Fr>1 = Supercritical
[2]Includes super-elevation based on 38-foot radius of curvature
3Based on previous RMP: Technical Addendum to Walnut and Gabbert Canyon Channel Flood Deficiency Study [2005, PACE]

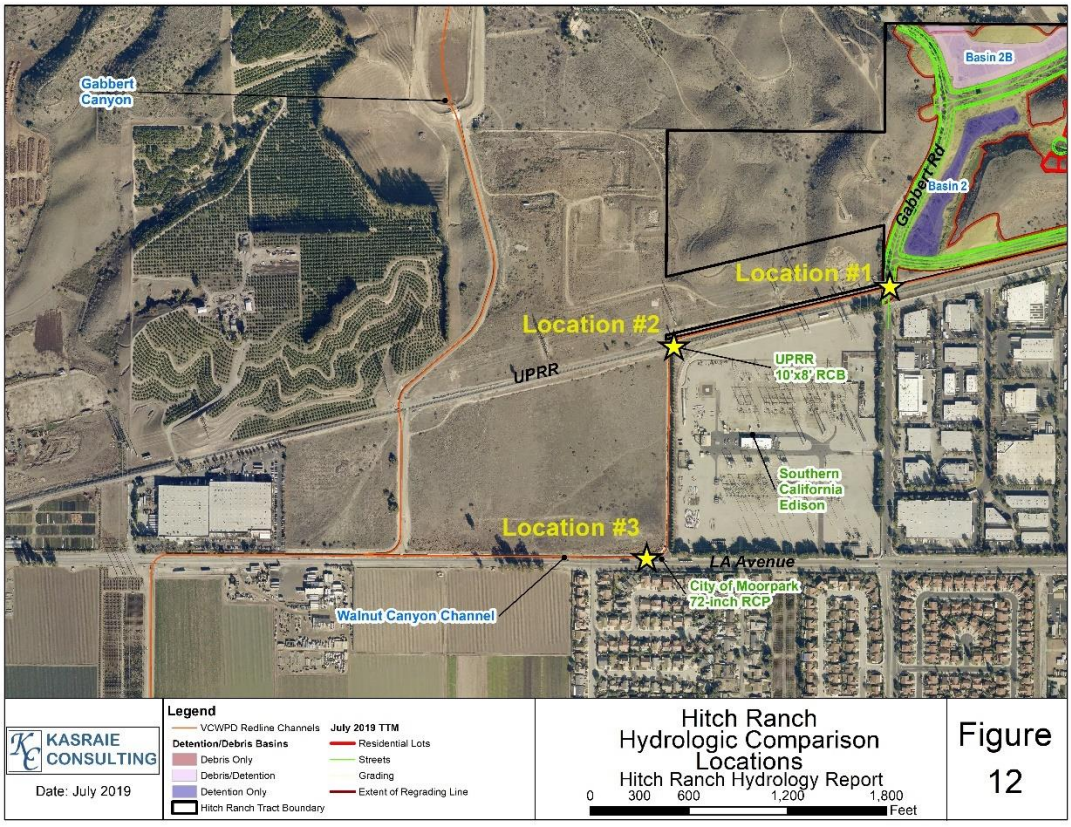

Figure 12: Hydrologic Comparison Locations

Designed diversion and detention facilities provide flow attenuation and time to peak lag which prevent 100-year flows from accumulating beyond the capacity of the downstream system. In addition, proposed Interim Condition 100-yr flows are below 10-yr existing flows along WCC. **Regional Flood Control (RFC) Objectives and Local Flood Requirements (LFR) are met with this design.** This project does not address structural deficiencies or failures of the existing WCC system.

6.2 California Division of Safety of Dams (DSOD) – Jurisdictional Dams

Each proposed detention basin was evaluated based on interpretation of the DSOD definitions as outlined in previous RMPs.

Basins 2 and 3 will be constructed by significantly excavating below the existing surface, creating a "pit" style impoundment. The previous RMPs and *2009 Basis of Design Study, Commonwealth Studios – Interim Condition Flood Control Improvements, Walnut and Gabbert Canyon Watershed* all discuss this type of design to maximize detention without becoming a "Jurisdictional Dam".

The purpose of this report is to outline proposed stormwater facilities to be used to meet required RFC and LFRs. Subsequent design phases will include additional discussion with City and County staff.

7 Walnut Canyon Channel Hydraulic Analysis

An initial hydraulic evaluation of the existing and proposed conditions was completed to:

1. Determine the overall benefit of the proposed system versus existing conditions.
2. Ensure/verify that the proposed system will likely work as intended. The designed stormwater facilities are made up of interdependent features needed to create necessary peak flow attenuation and increased lag time required to meet the RFC and LFRs in the RMP (2005, 2009). Tailwater within WCC is critical to the functionality of the Basin 2 and 3 outlet works. Neither HydroCAD nor VCRAT are able to address these issues explicitly.

The US Army Corps of Engineers (USACE) Hydraulic Engineering Center River Analysis System (HEC-RAS) was used to analyze hydraulics of WCC. A two-dimensional modeling scheme (RAS2D) was chosen since it best represents varied conditions in the overbanks and detention basins versus the main channel over the time and range of flows. Cells are allowed to vary in shape and size based on the visual detail needed within an area. Parameters are determined for each cell such as Stage versus Volume which is based on an elevation grid terrain model. Results are generated on a cell by cell basis within a mesh.

The validation HEC-RAS 2D model provided in this report is not intended to be used or submitted as a FEMA Letter of Map Change (LOMC) at this time.

7.1 RAS2D Model Components/Parameters

7.1.1 Terrain

RAS2D can generate a composite elevation model based on multiple grid sources and the users ranking of accuracies. Where data overlaps, the most accurate data is used. Elevation data sources are described as follows:

- **2005 Bare Earth LIDAR**: 2005 Ventura County Bare Earth LIDAR converted to a 1-foot cell grid.
- **2018 1-foot Site Contours**: Provided by ECG representing existing conditions converted to a 1-foot cell grid.
- **Main Channel**: A geo-referenced one-dimensional geometry HEC-RAS cross-section geometry of the main channel and immediate overbanks were created based on the 2005 and 2018 elevation data. It was then refined/corrected based on VCWPD plans for WCC and then converted to a 0.1' cell grid (Accuracy Order = 1)
- **Proposed Condition CAD**: The May 2019 (amended July 2019) ECG TTM was provided in CAD, digital format. The cut/fill boundary line and 3D breaklines (pad

elevations, street and open space contours) were converted to TIN and then 1-foot cell grid

All data sets were "snapped" to the same origin to ensure minimal resampling/interpolation in overlapping areas. The following table identifies which data sets were used both the existing and proposed terrain, including the assigned order of accuracy:

Table 10: RAS2D Elevation Terrain Sources

	Existing	Proposed
Proposed Condition CAD	NA	2
Main Channel	1	1
2018 1-foot Contours	2	3
2005- Bare Earth LIDAR	3	4

7.1.2 Manning's Roughness Factors

A roughness factor shapefile was created based on 2016 Ventura County aerial imagery and parcel data for existing conditions. The following values were assigned:

Table 11: RAS2D Manning's "n" Roughness Factors

Barren	0.040
Brush/Scrub	0.070
Buildings	2.000
Commercial/Institutional	0.060
Developed Medium Intensity	0.065
Industrial	0.080
Open Space	0.050
Railroad (including ROW)	0.045
Reinforced Concrete Channel (RCC)	0.015
Roadway	0.015
Unassigned	0.060

7.1.3 Inflow Hydrographs

VCRAT Interim Condition hydrographs at were extracted at all local inflow locations to proposed detention basins, WCC channel downstream of Hitch Ranch (HR), and at the WCC 96-inch RCP outlet near the Post Office. To obtain hydrographs in individual subareas contained in a series (VCRAT line), the model was re-run by putting the area of interest into its own bank. These include:

Table 12: RAS2D Inflow Hydrograph Locations

	VCRAT Node	RAS2D Label
Basin 2A	76C	76C
Basin 2B	73BC, 77D, 79B	73BC, 77D, 79B
Basin 2	81C, 82C, 83D	81C, 82B, 84A
Basin 3	53B, 55B	53B-EHR_Local, 47D
Local Area to WCC between East and West HR	58B	58B
WCC 96" RCP Outlet	45A	
Local Inflow to WCC at UPRR 10'x8' RCB	88B	65A
Inflow from Moorpark Drain 72" RCP	92C	68C

7.1.4 Mesh

The “mesh” is a set of regular and irregular polygons draped over the elevation terrain. It was initially created based on 25-foot squares. Breaklines and refinement polygons representing critical features such as roads and channels were used to force adjustments in the mesh to include computation points at their boundaries. For example, a refinement polygon was used to represent the area within WCC, forcing a single cell covering RCC bank to bank.

7.1.5 Detention Basin Outlet Structures

Detention basin outlet structures consists of a series of orifices, weirs, and culverts. Emergency spillways were not explicitly modeled since the purpose was to identify the system function under normal 100-yr design conditions.

Low Flow and Primary outlets are combined for Basins 2A and 2B, both of which are culvert pipe(s) These features are modeled culverts within as a 2D Area Connection with embankment height based on the proposed terrain.

Basins 2 and 3 each include a rectangular, concrete tower with orifice openings in the front (primary), a weir consisting of the top perimeter (secondary), and culvert outflow pipes in the back (primary + secondary). Modeling the towers explicitly requires using a series of 2D Area Connections (one for the front, one for the back). The low flow, circular orifice was modeled as a short culvert, while the primary outlet, rectangular orifice was modeled as a gate (set to be open the entire model run) on the Front 2D Area Connection. Also, although rectangular and at the top of the tower, the secondary outlet was added as a linear weir to the front 2D Area Connection extending upwards to the hydrologically determined emergency spillway elevation. The back 2D Area Connection Area includes the tower outlet pipes. The area and storage between the connections is minimal.

7.1.6 Boundary Conditions

Boundary condition lines were added to 8 locations at the downstream exterior of the mesh. Normal depth was used at each based on the immediate slope vicinity. Walnut_Out uses 0.0047, the slope of the channel.

7.2 RAS2D Results

Results are not intended for design purposes and are intended for general comparison purposes. The Mansi and Essex Development timelines for development are unknown and therefore benefits from upstream improvements such as Basin 1 at Casey Road may not be realized for the near future. Therefore, comparisons are between Existing and Interim Conditions. Once built benefits of the Hitch Ranch facilities will be even more pronounced.

7.2.1 Verification of VCRAT Hydrologic Routing and Outlet Works

RAS2D inflow hydrographs are based on VCRAT, however the remainder of the model is independent. Both models produce similar results (Table 13) therefore providing confidence the VCRAT are adequate with respect to routing and outlet functionality.

Table 13: Comparison of RAS2D and VCRAT at Select Locations for Interim Condition

	RAS2D		VCRAT		
	Outflow	Max WSE	Node	Outflow	Max WSE
Basin 2A	50	516.7	76C	49	516.3
Basin 2B	235	507.9	80BC	220	507.8
Basin 2	252	479.8	86B	186	479.2
Basin 3	361	489.5	56BD	413	489.8
Location #1: At Gabbert Road	742	NA	87AB	704	NA
Location #2: At UPRR	763	NA	89AB	717	NA
Location #3: Downstream of 72" RCP	816	NA	93AC	806	NA

7.2.2 Existing versus Proposed (Interim) RAS2D

Proposed facilities provide a significant benefit to the overall system that are not captured in models that solely rely on hydrologic calculations/routing. Flows and water surface elevations at select locations are shown in the following table.

Table 14: Existing versus Interim Peak 100-yr RAS 2D Flows

	Existing Q100	Existing WSE100	Interim Q100	Interim WSE100
Location #1: At Gabbert Road	978	478.1	704	476.5
Location #2: At UPRR	978	473.0	717	470.1
Location #3: Downstream of 72" RCP	NA[1]	NA[1]	806	457.9
Location #4 Over UPRR immediately Upstream of Gabbert Road (outflow from WCC)	416	478.2	0	NA

[1]The existing condition model was not taken downstream to the 72" RCP

Under existing conditions, there is a significant amount of flow overtopping the UPRR immediately upstream of Gabbert Road, which could impact the industrial/commercial area to

the south. This issue will be completely eliminated (does not include problems related to overflow from Arroyo Simi) under the interim condition (See Figure 13).

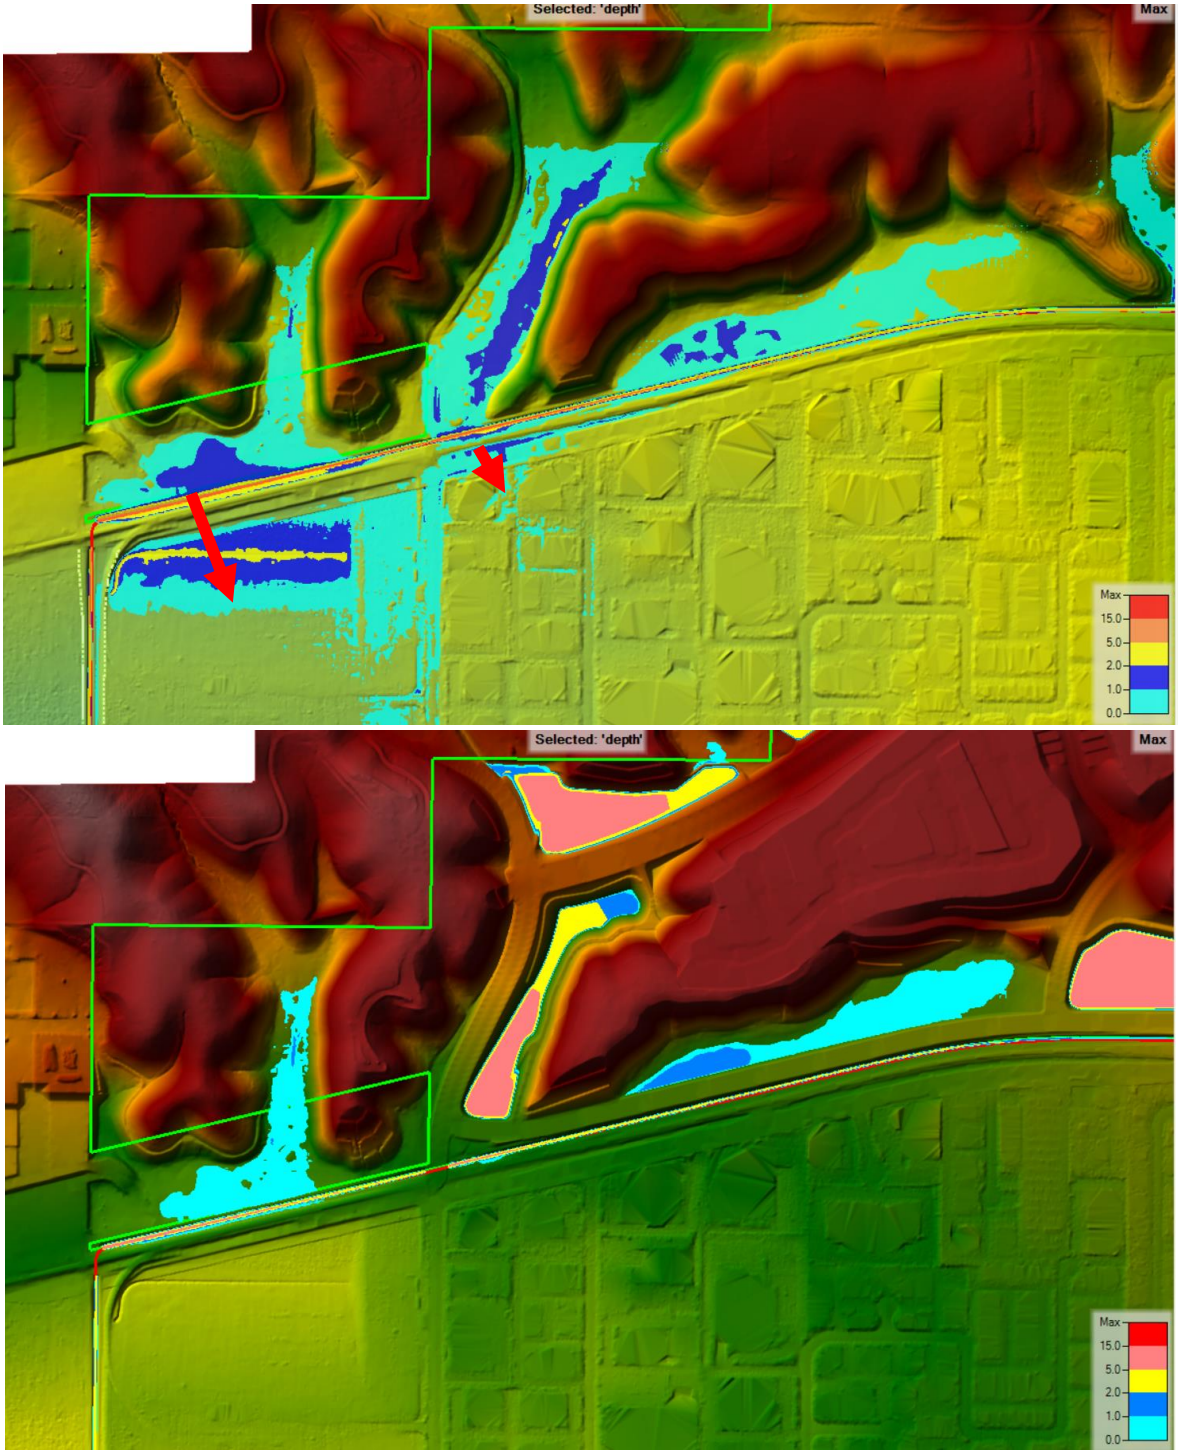

Figure 13 Existing (top) and Interim (bottom) RAS2D Flood Depths between Gabbert and UPRR

APPENDIX 1

Supplemental Modeling Information – VCRAT

Supplemental VCRAT Modeling Information

Modified Rational Method in VCRAT Version 2.64 (Ventura County, Build 2.64.0.37, 2018) is essentially the application of the rational method using input parameters which have been developed specifically for soil types and rainfall characteristics in Ventura County. The rational method is widely accepted for design studies and is based on the following two assumptions: 1) The peak rate of runoff at any point in the subarea is a function of the average rainfall intensity during the time of concentration to that point, and 2) The time of concentration is the time required for runoff to become established and flow from the hydraulically most remote portion of the drainage area to the subarea discharge point.

For a specified design storm, VCRAT calculates a hydrograph of runoff at all subarea collection points within the watershed, combines hydrographs from each subarea, and routes the combined hydrograph through the defined channel system. The program accounts for channel storage and it reports peak flow rates in each reach of each drain, coincident flowrates of tributaries at confluences, and hydrographs at subarea collection points as specified in the program input. The required input data for a subarea consists of the area, time of concentration (Tc), soil type, and design storm type. Channel routing parameters can be added if needed. If a subarea is provided with channel routing information, the program routes the accumulated flow from that subarea and any tributary subarea down to the collection point for the next subarea (downstream end of the channel) before it is confluenced with the hydrograph from the next downstream subarea. The result is the calculation of a peak flow rate and hydrograph based on a synthetic unit hydrograph for the specified design storm frequency.

Subareas

For the Hitch Ranch watershed, subareas were delineated based on most-recent available topography and storm drain data in ArcGIS. For areas outside of the Hitch Ranch watershed, previously delineated subareas were reviewed and modified where necessary.

Rainfall

VCRAT simulates rainfall by applying intensity-duration curves across 200 point mass curves designed to produce 80% of the volume within the first 80% of the hydrograph time. In 2011, NOAA analyzed rainfall data from a wide network of gauges across California. Having good resolution throughout Ventura County, this dataset was used to delineate zones of similar rainfall intensities, which are then called out by VCRAT to define the intensity-durations and mass curve.

The Walnut Canyon VCRAT model simulates conditions entirely within the *South Mountain to Moorpark* rainfall zone, as defined by the NOAA 2011 analysis.

Runoff Coefficient

VCRAT defines the runoff coefficient, an integral part of the rational equation, based on underlying soil type and imperviousness. The equation used by VCRAT to develop runoff coefficient curves is

$$C = 0.95*Imp+(1-Imp)*C$$

Soils

Soils in Ventura County were originally mapped by the Natural Resources Conservation Service in 1970 and grouped into seven hydrologically homogeneous groups. There are two soil types defined for each SCS Hydrologic Soil Group A, B, and C, and one soil type defined for SCS Soil Group D. Individual runoff coefficient curves for undeveloped soils were then developed theoretically by considering representative infiltration rates for various soil textures recommended by the NRCS and ASCE.

The runoff coefficient curves originally developed for Ventura County were updated in 2011 after a comparison with those used in similar hydrology methods throughout the United States found that those used in Ventura County are generally higher than other jurisdictions for pervious areas.

Imperviousness

Imperviousness is determined by applying actual imperviousness values from Exhibit 14 in the Ventura County Hydrology manual to designated existing and proposed land uses. Land uses for the existing Walnut Canyon watershed were designated based on those included in the 1996 VCWPD Baseline Conditions model with updates for Tract 5187 development. Land uses for the proposed Walnut Canyon watershed were designated based on existing land uses, with modifications to account for land uses proposed for Hitch Ranch in tentative tract maps dated June 2018 and planned development of the Essex property. The table below summarizes land use imperviousness assumptions used (VCWPD, 2017)

Land Use	Imperviousness	Land Use	Imperviousness
Detention	0	Golf Course	0
Residential - > 0.15 ac lot	65	Horse Ranch	47
Residential - 0.2 ac lot	47	Orchard	0
Residential - 0.25 ac lot	38	Rural Residential	20
Residential - Condos	69	Commercial	85
Transportation	100	Institutional	47
Vacant	0	Parks - Open Space	0

Time of Concentration

Time of concentration is calculated for each subarea based on the travel time for drainage along the longest flow path. The longest flow path is determined based on topography and conveyance infrastructure and then divided into segments depending on conveyance type (overland, natural channel, street, pipe, etc.). The length and slope of land area tributary to each conveyance type is measured and travel times are calculated based on flow velocities modified by wave velocity considerations. VCWPD provides a Tc Calculator spreadsheet, which can be downloaded at http://vcpublicworks.org/watershed-resources-and-technology/hydrology-program, which was used to calculate time of concentration values for the subareas within the Hitch Ranch watershed. The spreadsheet calculates time of concentration for each subarea based on length, slope, and area parameters defined for each conveyance segment and imperviousness, soil number, and rainfall values defined for the subarea as a whole. Subsequent to the completion of this analysis, VCWPD released their Tc Calculator Program, which calculates Tcs the same way as the spreadsheet, but is a stand-alone program.

Flow path parameters were measured and entered into the Tc calculator to calculate Tcs for the 100-year, 50-year, 25-year, and 10-year events for the subareas within the Hitch Ranch watershed. These subareas are those that either comprise the Hitch Ranch site or drain through it. For subareas outside of the Hitch Ranch watershed the 100 -year Tc's calculated by PACE in 2009 for the previous modeling effort were used. These Tcs were prorated to determine 50-year, 25-year, and 10-year Tcs based on the general slope of the watershed and the length of the overland flow according to the adjustments summarized in the table below.

Overland Flow	Category	Slope	Adjustment		
			50-yr	25-yr	10-yr
Short	3	Steep	0	1	1
Long	2	Moderate	1	2	2
Long	1	Gradual	1	2	3

Fattening

The modified rational method is intended to yield conservative peak flow values for design purposes. Hydrographs created using the modified rational method in Ventura County have a relatively short-duration peak due to the shape of the hyetograph which results in storm volumes which are generally less than would be calculated using different methods such as the NRCS Curve Number approach. To provide more comparable estimates of storm volumes, VCWPD developed a yield adjustment methodology, commonly referred to as hydrograph "fattening", to be used when the timing of the hydrograph surrounding the peak and resulting storm volumes are of significance such as in reservoir routing. Because there are numerous detention basins within the Walnut Canyon Channel watershed, a fattening analysis was conducted per the VCWPD Hydrology Manual (VCWPD, 2017) for all flows tributary to a detention basin.

Hydrographs were fattened prior to reservoir routing unless it resulted in a reduction in volume (i.e. 45A, 77D, 83B). For detention basins with tributaries devoid of upstream storage facilities, an areally-weighted curve number was calculated for the tributary area based on the tributary-averaged soil type and curve numbers for each land use (Hydrology Manual Exhibit 14a and 14b). To fatten hydrographs at these detention basins, the areally-weighted curve number could be entered directly into VCRAT along with the event-specific rainfall total.

For detention basins downstream of other detention basins, hydrographs were fattened using a slightly different method. First, the yield for the upstream basin is calculated based on fattened volume and watershed area. Then, the yield for the area in between the upstream basin and the downstream basin is calculated based on the NRCS yield equation. Lastly, the two yields are summed and divided by total watershed area upstream of the detention basin for which you are calculating the yield adjustment. This is entered into VCRAT as a yield adjustment.

Stage-Storage Tables

General basin descriptions and Interim/Ultimate Condition 2018 VCRAT model IDs are included in the table below. Basin 0, 5187-1, 5187-2, and Basin 1 curves were based on previous VCRAT modeling. Basin 2A, 2B, 2, and 3 relationships were determined by importing VCRAT hydrographs into HydroCAD (Build 10.00-21) stormwater model software where outlet rating curves for each basin were developed and re-imported back into VCRAT. Stage storage curves for Basins 2A, 2B, 2 and 3 can be found in Appendix 3.

Basin Name	Description	VCRAT ID
Basin 0	VCWPD Regional Detention Basin at NW Corner of Walnut Cyn Rd and Meridian Hills Dr (DWG Y3-4305)	5A
5187-1	Existing Local Detention Basin at SW Corner of Walnut Cyn Rd and Meridian Hills Dr (DWG 03-ML-10719)	7B
5187-2	Existing Local Detention Basin north of Meridian Hills Dr west of Breezy Glen Dr (DWG 03-ML-10719)	28CD
2A	Proposed Hitch Ranch Local Detention Basin (TTM May 2019 [amended July 2019], 0047.02_FG.dwg)	76C
2B	Proposed Hitch Ranch Local Debris and Detention (TTM May 2019 [amended July 2019], 0047.02_FG.dwg)	80BC
2	Proposed Hitch Ranch Regional Detention Basin (TTM May 2019 [amended July 2019], 0047.02_FG.dwg)	86B
3	Proposed Hitch Ranch Regional Detention Basin (TTM May 2019 [amended July 2019], 0047.02_FG.dwg)	56BD
1	Proposed Local Detention Basin on north side Casey Road across from the Boys and Girls Club	32B

Tc Calculator Data Sheets

Tc Calculator Data Sheet V6.1

Project Name and Number: Tc Calculator V6

USER INPUT IN BLUE FIELDS:		
Subarea Name =	46A	User Input
Watershed Area ac =	27.0	Calculated from flowpath data
% Imperviousness =	6	User Input
Land Use Description =	Open	DropMenu
Storm Frequency	10	DropMenu
Storm Zone =	So Mtn to Moorpark	DropMenu
Zone ID =	Rev1_10	Calculated
District Soil Number (1-7) =	3Rev	DropMenu- Rev for Revised C Coefficients
Tc for Intensity Calc min =	**21.00**	**Rounded, Use for Peak Flow Calc.**
Intensity in/hr =	1.520	Calculated
C_undeveloped =	0.374	Calculated
C_composite =	0.408	Calculated
Peak cfs =	16.89	Calculated
Calculated Tc=	**20.92**	**Calculated**

Instructions:

1. Set to manual calculations with File->Options->Formulas
2. Set max iterative calculations to 50
3. Enter required subarea and flowpath data in blue fields
4. Use site-specific topo or District 2005 LiDAR data for elevations
5. LiDAR and rain zone data at: http://vcwatershed.net/publicMaps/data
6. Clear any unnessary flowpath data from blue fields
7. Manually calculate with F9 or Formulas->Calculate Now
8. If error or comments appear, revise input data accordingly
9. Tc's in cells C12 and C17 should converge to the nearest minute.
10. Use result in C12 for peak flow calculation.
11. Print area is set for printing this page on one sheet.

Tc Calculator Data Sheet V6.1

Project Name and Number: Tc Calculator V6

USER INPUT IN BLUE FIELDS:		
Subarea Name =	46A	User Input
Watershed Area ac =	27.0	Calculated from flowpath data
% Imperviousness =	6	User Input
Land Use Description =	Open	DropMenu
Storm Frequency	100	DropMenu
Storm Zone =	So Mtn to Moorpark	DropMenu
Zone ID =	Rev1_100	Calculated
District Soil Number (1-7) =	3Rev	DropMenu- Rev for Revised C Coefficients
Tc for Intensity Calc min =	**15.00**	**Rounded, Use for Peak Flow Calc.**
Intensity in/hr =	2.764	Calculated
C_undeveloped =	0.440	Calculated
C_composite =	0.470	Calculated
Peak cfs =	35.39	Calculated
Calculated Tc=	**15.02**	**Calculated**

Instructions:

1. Set to manual calculations with File->Options->Formulas
2. Set max iterative calculations to 50
3. Enter required subarea and flowpath data in blue fields
4. Use site-specific topo or District 2005 LiDAR data for elevations
5. LiDAR and rain zone data at: http://vcwatershed.net/publicMaps/data
6. Clear any unnessary flowpath data from blue fields
7. Manually calculate with F9 or Formulas->Calculate Now
8. If error or comments appear, revise input data accordingly
9. Tc's in cells C12 and C17 should converge to the nearest minute.
10. Use result in C12 for peak flow calculation.
11. Print area is set for printing this page on one sheet.

Tc Calculator Data Sheet V6.1

Project Name and Number: Tc Calculator V6

USER INPUT IN BLUE FIELDS:		
Subarea Name =	52B	User Input
Watershed Area ac =	53.7	Calculated from flowpath data
% Imperviousness =	0	User Input
Land Use Description =	Open	DropMenu
Storm Frequency	100	DropMenu
Storm Zone =	So Mtn to Moorpark	DropMenu
Zone ID =	Rev1_100	Calculated
District Soil Number (1-7) =	2Rev	DropMenu- Rev for Revised C Coefficients
Tc for Intensity Calc min =	**11.00**	**Rounded, Use for Peak Flow Calc.**
Intensity in/hr =	3.245	Calculated
C_undeveloped =	0.484	Calculated
C_composite =	0.484	Calculated
Peak cfs =	85.06	Calculated
Calculated Tc=	**10.53**	**Calculated**

Instructions:

1. Set to manual calculations with File->Options->Formulas
2. Set max iterative calculations to 50
3. Enter required subarea and flowpath data in blue fields
4. Use site-specific topo or District 2005 LiDAR data for elevations
5. LiDAR and rain zone data at: http://vcwatershed.net/publicMaps/data
6. Clear any unnessary flowpath data from blue fields
7. Manually calculate with F9 or Formulas->Calculate Now
8. If error or comments appear, revise input data accordingly
9. Tc's in cells C12 and C17 should converge to the nearest minute.
10. Use result in C12 for peak flow calculation.
11. Print area is set for printing this page on one sheet.

Tc for Intensity Calc min =	**13.00**	**Rounded, Use for Peak Flow Calc.**
Intensity in/hr =	1.916	Calculated
C_undeveloped =	0.365	Calculated
C_composite =	0.389	Calculated
Peak cfs =	54.06	Calculated
Calculated Tc=	**13.22**	**Calculated**

Instructions:

1. Set to manual calculations with File->Options->Formulas
2. Set max iterative calculations to 50
3. Enter required subarea and flowpath data in blue fields
4. Use site-specific topo or District 2005 LiDAR data for elevations
5. LiDAR and rain zone data at: http://vcwatershed.net/publicMaps/data
6. Clear any unnessary flowpath data from blue fields
7. Manually calculate with F9 or Formulas->Calculate Now
8. If error or comments appear, revise input data accordingly
9. Tc's in cells C12 and C17 should converge to the nearest minute.
10. Use result in C12 for peak flow calculation.
11. Print area is set for printing this page on one sheet.

Tc Calculator Data Sheet V6.1

Project Name and Number: Tc Calculator V6

USER INPUT IN BLUE FIELDS:		
Subarea Name =	79B	User Input
Watershed Area ac =	30.1	Calculated from flowpath data
% Imperviousness =	17.4	User Input
Land Use Description =	LowRes1/3	DropMenu
Storm Frequency	100	DropMenu
Storm Zone =	So Mtn to Moorpark	DropMenu
Zone ID =	Rev1_100	Calculated
District Soil Number (1-7) =	4Rev	DropMenu- Rev for Revised C Coefficients
Tc for Intensity Calc min =	**6.00**	**Rounded, Use for Peak Flow Calc.**
Intensity in/hr =	4.334	Calculated
C_undeveloped =	0.450	Calculated
C_composite =	0.537	Calculated
Peak cfs =	70.63	Calculated
Calculated Tc=	**6.29**	**Calculated**

Instructions:

1. Set to manual calculations with File->Options->Formulas
2. Set max iterative calculations to 50
3. Enter required subarea and flowpath data in blue fields
4. Use site-specific topo or District 2005 LiDAR data for elevations
5. LiDAR and rain zone data at: http://vcwatershed.net/publicMaps/data
6. Clear any unnessary flowpath data from blue fields
7. Manually calculate with F9 or Formulas->Calculate Now
8. If error or comments appear, revise input data accordingly
9. Tc's in cells C12 and C17 should converge to the nearest minute.
10. Use result in C12 for peak flow calculation.
11. Print area is set for printing this page on one sheet.

Ventura County Watershed Protection District
Modified Rational Method Hydrology Program (VCRat v2.64)

Modified Rational Model Results Report

Job: 1 Project: WALNUT CANYON HYDROLOGY-EXISTING CONDITION 10YR (2017)

Project Description

2017 HYDROLOGY MANUAL CONVERSION FROM 2010 VERSION
MERGED PACE/RBF/HALL-FOREMAN MODELS - NO BASIN 1 AT CASEY ROAD
1996 LAND USE CONDITION - BASIN 0 (TR 5187) INCLUDED
NOTE1: ASSUMES ALL OF MOORPARK DRAIN NO.1 (43C - UPSTREAM MODEL) CAN REACH WCC AT HITCH RANCH
NOTE1: IN REALITY PIPE CAN ONLY CARRY 176 CFS OUT OF 266 CFS
NOTE2: ASSUMES ALL OF MP 72" RCP REACHES JUNCTION WITH WCC AT LA AVE
NOTE2: IN REALITY PIPE CAN ONLY CARRY 195 CFS OUT OF 351 CFS

VCRat version: 2.64.0.37
VCRain version: 201801
DOS EXE version: PC 2.64-201605
VCRain Curve Set: VCWPD 2016 Revised Curve Set
Curve A: REV1: South Mountain to Moorpark
Curve B: None
Curve C: None
Curve D: None

HYDROGRAPH PRINTOUT AT: 45A

DESCRIPTION: DRAINAGE AREA FOR PROPOSED ESSEX AND EAST 1/2 OF HR PROPOSED BASIN 3 LOCAL
TOTAL AREA TO HYDROGRAPH: 916 acres
HYDROGRAPH PEAK: 503 cfs
TIME OF PEAK: 1163 minutes
HYDROGRAPH VOLUME: 127.68 acre-ft

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 51A

DESCRIPTION: LOCAL SUBAREA DRAINING DIRECT TO WCC BETWEEN EAST AND WEST HR (OLD 37A WALNUT CYN PRIOR TO JCT W/ GABBERT,1/96 AERIAL PHOTO LU, Q100)
TOTAL AREA TO HYDROGRAPH: 1082 acres
HYDROGRAPH PEAK: 557 cfs
TIME OF PEAK: 1168 minutes
HYDROGRAPH VOLUME: 134.47 acre-ft

TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)

Ventura County Watershed Protection District
Modified Rational Method Hydrology Program (VCRat v2.64)

Modified Rational Model Results Report

Job: 1 Project: WALNUT CANYON HYDROLOGY-EXISTING CONDITION 100YR (2017)

Project Description

2017 HYDROLOGY MANUAL CONVERSION FROM 2010 VERSION
MERGED PACE/RBF/HALL-FOREMAN MODELS - NO BASIN 1 AT CASEY ROAD
1996 LAND USE CONDITION - BASIN 0 (TR 5187) INCLUDED
NOTE1: ASSUMES ALL OF MOORPARK DRAIN NO.1 (43C - UPSTREAM MODEL) CAN REACH WCC AT HITCH RANCH
NOTE1: IN REALITY PIPE CAN ONLY CARRY 176 CFS OUT OF 266 CFS
NOTE2: ASSUMES ALL OF MP 72" RCP REACHES JUNCTION WITH WCC AT LA AVE
NOTE2: IN REALITY PIPE CAN ONLY CARRY 195 CFS OUT OF 351 CFS

VCRat version: 2.64.0.37
VCRain version: 201801
DOS EXE version: PC 2.64-201605
VCRain Curve Set: VCWPD 2016 Revised Curve Set
Curve A: REV1: South Mountain to Moorpark
Curve B: None
Curve C: None
Curve D: None

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 44AC

DESCRIPTION: WCC MAIN + MOORPARK DRAIN NO. 1 (OLD 28AC WALNUT CYN DRN JCT W/MPK DRN NO.1;Q100 W/1996 LAND USE)
TOTAL AREA TO HYDROGRAPH: 865 acres
HYDROGRAPH PEAK: 818 cfs
TIME OF PEAK: 1158 minutes
HYDROGRAPH VOLUME: 212.89 acre-ft

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 51A

DESCRIPTION: LOCAL SUBAREA DRAINING DIRECT TO WCC BETWEEN EAST AND WEST HR (OLD 37A WALNUT CYN PRIOR TO JCT W/ GABBERT,1/96 AERIAL PHOTO LU, Q100)
TOTAL AREA TO HYDROGRAPH: 1082 acres
HYDROGRAPH PEAK: 1062 cfs
TIME OF PEAK: 1164 minutes
HYDROGRAPH VOLUME: 241.85 acre-ft

Ventura County Watershed Protection District
Modified Rational Method Hydrology Program (VCRat v2.64)

Job: 1 Project: WALNUT CANYON HYDROLOGY-EXISTING CONDITION 100YR (2017)

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 125A

DESCRIPTION: DUMMY
TOTAL AREA TO HYDROGRAPH: 4601 acres
HYDROGRAPH PEAK: 2975 cfs
TIME OF PEAK: 1172 minutes
HYDROGRAPH VOLUME: 705.98 acre-ft

TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)

Ventura County Watershed Protection District
Modified Rational Method Hydrology Program (VCRat v2.64)

Modified Rational Model Results Report

Job: 1 Project: WALNUT CANYON HYDROLOGY-INTERIM CONDITION 100YR (2017)

Project Description

PROPOSED MODEL AS OF 07/30/2019
2017 HYDROLOGY MANUAL
100 YR INTERIM CONDITION MODEL
US 45A - MERGED PACE/RBF/HALL-FOREMAN MODELS, 2018 LAND USE CONDITION
INCLUDES REG BASIN 0
INCLUDES IN-TRACT 5187 BASINS 1 AND 2
DOES NOT INCLUDE PROPOSED BASIN 1 AT CASEY ROAD (NOT BUILT AS OF 07/30/2019)

VCRat version: 2.64.0.37
VCRain version: 201801
DOS EXE version: PC 2.64-201605
VCRain Curve Set: VCWPD 2016 Revised Curve Set
Curve A: REV1: South Mountain to Moorpark
Curve B: None
Curve C: None
Curve D: None

RESERVOIR ROUTING AT 28C

DESCRIPTION: OLD 31BC

INCOMING HYDROGRAPH	PEAK (cfs):	208.16	VOLUME (acre-ft):	17.56	
NO HYDROGRAPH ADJUSTMENT					
RUNOFF FACTOR(in):	3.01	TOTAL RAIN(in):	6.50	SCS Curve: 68	
FATTENED HYDROGRAPH	PEAK (cfs):	208.16	VOLUME (acre-ft):	22.58	
RESERVOIR INFLOW:	PEAK (cfs):	208.16 @ 1155	VOLUME (acre-ft):	22.58	
MAXIMUM ELEVATION:	STAGE (ft):	717.96 @ 1162	VOLUME (acre-ft):	4.88	
EMERGENCY SPILLWAY:	ELEV (ft):	720.00	VOLUME (acre-ft):	7.05	
DIFFERENCE:	IN STAGE (ft):	-2.04	IN VOLUME (acre-ft):	2.17	
NO SPILL EXPECTED.	PERCNT OF VOLUME REMAINING TO SPILLWAY:			30.8%	
TOP OF DAM:	ELEV (ft):	721.00	VOLUME (acre-ft):	8.15	
DIFFERENCE	IN STAGE (ft):	-3.04	IN VOLUME (acre-ft):	3.27	
NO OVERTOP EXPECTED.	PERCNT OF VOLUME REMAINING TO TOP OF DAM:			40.1%	
RESERVOIR OUTFLOW:	PEAK (cfs):	85.10 @ 1162	VOLUME (acre-ft):	20.99

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 45A

DESCRIPTION: POST OFFICE, WC SCHOOL, AND PROPOSED ESSEX (FATTENING REDUCES VOLUME [RUNOFF FACTOR = 2.9] ---NO FATTENING USED)
TOTAL AREA TO HYDROGRAPH: 906 acres
HYDROGRAPH PEAK: 871 cfs
TIME OF PEAK: 1160 minutes
HYDROGRAPH VOLUME: 220.78 acre-ft

TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)

Modified Rational Model Results Report

Job: 1 Project: WALNUT CANYON HYDROLOGY-INTERIM CONDITION 100YR (2017)

Project Description

2017 HYDROLOGY MANUAL
100 YR INTERIM CONDITION MODEL
DS 45A - PROPOSED HITCH RANCH LAND USE (AUG 2018 TTM)
20190729HR_RegionalBasin3_4_ComboOutlet.hcp HYDROCAD MODEL USED 45A AS INPUT TO BASIN 3 DIVERSION STRUCTURE
46A AND 47D REPRESENT DIVERSION STRUCTURE BASED ON HYDROCAD 20190729HR_RegionalBasin3_4_ComboOutlet.hcp
IMPORTED HYDROGRAPHS DO NOT INCLUDE CASEY RD BASIN 1
EMERGENCY SPILLWAY SET TO 1' ABOVE HYDROCAD 100YR WSE
TOP OF DAM = WSE100 + 1' ESPILL + HEAD OVER ESPILL + 3' FREEBOARD
****RWG - RATING CURVES UP-TO-DATE AS OF 07/31/2019****
FLOODWALLS WILL BE REQUIRED AT BASIN 2B, 2, AND 3 TO MEET 3' FREEBOARD ABOVE ESPILL WSE REQUIREMENT
GOAL OF PROJECT:
1 - REDUCE FLOWS FROM HITCH RANCH LOCAL BELOW 10-YR EXISTING
2- REDUCE FLOW IN WCC AT LA AVE D/S OF 72" RCP TO 830 CFS OR LESS BASED ON 2005 PLAN
REDUCTION TO 508 CFS AT RR IS NOT NECESSARY TO MEET GOAL 2
NOTE1: ASSUMES ALL OF MOORPARK DRAIN NO.1 (43C - UPSTREAM MODEL) CAN REACH WCC AT HITCH RANCH
NOTE1: IN REALITY PIPE CAN ONLY CARRY 176 CFS OUT OF 266 CFS
NOTE2: ASSUMES ALL OF MP 72" RCP REACHES JUNCTION WITH WCC AT LA AVE
NOTE2: IN REALITY PIPE CAN ONLY CARRY 195 CFS OUT OF 351 CFS

VCRat version: 2.64.0.37
VCRain version: 201801
DOS EXE version: PC 2.64-201605
VCRain Curve Set: VCWPD 2016 Revised Curve Set
Curve A: REV1: South Mountain to Moorpark
Curve B: None
Curve C: None
Curve D: None

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 57AB

DESCRIPTION: COMBINED OUTFLOW FROM BASIN 3 AND BY-PASS DIVERTED UPSTREAM OF BASIN 3
TOTAL AREA TO HYDROGRAPH: 1083 acres
HYDROGRAPH PEAK: 525 cfs
TIME OF PEAK: 1193 minutes
HYDROGRAPH VOLUME: 242.22 acre-ft

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 58B

DESCRIPTION: EAST OF A STREET AND BASIN 3 (POTENTIAL WQ TREATMENT AREA) DRAINS DIRECT TO WCC - ASSUMED PIPE BELOW HIGH ABLE TO CARRY PEAK FLOW

TOTAL AREA TO HYDROGRAPH: 21 acres
HYDROGRAPH PEAK: 37 cfs
TIME OF PEAK: 1154 minutes
HYDROGRAPH VOLUME: 2.86 acre-ft

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 77D

DESCRIPTION: WEST HITCH RANCH (NORTH HILLS PKWY LOCAL DRAINS DIRECTLY TO BASIN 2B) - DID NOT FATTEN, REDUCES VOLUME
TOTAL AREA TO HYDROGRAPH: 9 acres
HYDROGRAPH PEAK: 22 cfs
TIME OF PEAK: 1153 minutes
HYDROGRAPH VOLUME: 2.15 acre-ft

TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)

RESERVOIR ROUTING AT 80B

DESCRIPTION: Basin 2B

```
**********************************************************************************
*      INCOMING HYDROGRAPH  PEAK (cfs):    384.01         VOLUME (acre-ft):     66.35      *
*      NO HYDROGRAPH ADJUSTMENT                                                  *
*      NO HYDROGRAPH FATTENING                                                   *
*      RESERVOIR INFLOW:    PEAK (cfs):    384.01 @ 1156  VOLUME (acre-ft):     66.35      *
*      MAXIMUM ELEVATION:   STAGE (ft):    507.80 @ 1185  VOLUME (acre-ft):     20.82      *
*      EMERGENCY SPILLWAY:   ELEV (ft):    508.90         VOLUME (acre-ft):     24.72      *
*          DIFFERENCE:   IN STAGE (ft):     -1.10      IN VOLUME (acre-ft):      3.90      *
*          NO SPILL EXPECTED.       PERCNT OF VOLUME REMAINING TO SPILLWAY:     15.8%      *
*      TOP OF DAM:           ELEV (ft):    513.40         VOLUME (acre-ft):     43.20      *
*          DIFFERENCE    IN STAGE (ft):     -5.60      IN VOLUME (acre-ft):     22.38      *
*          NO OVERTOP EXPECTED.   PERCNT OF VOLUME REMAINING TO TOP OF DAM:     51.8%      *
*      RESERVOIR OUTFLOW:   PEAK (cfs):    219.94 @ 1185  VOLUME (acre-ft):     54.74      *

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 85BC

DESCRIPTION: COMBINES OUTFLOW FROM BASIN 2B AND LOCAL BASIN 2/EAST AND WEST OF BASIN 2 SUBAREAS
TOTAL AREA TO HYDROGRAPH: 460 acres
HYDROGRAPH PEAK: 227 cfs
TIME OF PEAK: 1185 minutes
HYDROGRAPH VOLUME: 62.93 acre-ft

TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 93AC

DESCRIPTION: LA Avenue - COMBINED WCC + INCOMING MP 72" RCP ***TARGET LOCATION -> WE WANT Q100 < 830CFS)***
TOTAL AREA TO HYDROGRAPH: 1805 acres
HYDROGRAPH PEAK: 806 cfs
TIME OF PEAK: 1159 minutes
HYDROGRAPH VOLUME: 373.58 acre-ft

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 150A

DESCRIPTION: DUMMY

TOTAL AREA TO HYDROGRAPH: 4616 acres
HYDROGRAPH PEAK: 2227 cfs
TIME OF PEAK: 1206 minutes
HYDROGRAPH VOLUME: 704.51 acre-ft

TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)

PROJECT 4 WALNUT CANYON HYDROLOGY-INTERIM CONDITION 100YR (2017)
DESCRIP 2017 HYDROLOGY MANUAL
DESCRIP 100 YR INTERIM CONDITION MODEL
DESCRIP DS 45A - PROPOSED HITCH RANCH LAND USE (AUG 2018 TTM)
DESCRIP 20190729HR_RegionalBasin3_4_ComboOutlet.hcp HYDROCAD MODEL USED 45A AS INPUT TO BASIN 3 DIVERSION STRUCTURE
DESCRIP 46A AND 47D REPRESENT DIVERSION STRUCTURE BASED ON HYDROCAD 20190729HR_RegionalBasin3_4_ComboOutlet.hcp
DESCRIP IMPORTED HYDROGRAPHS DO NOT INCLUDE CASEY RD BASIN 1
DESCRIP EMERGENCY SPILLWAY SET TO 1' ABOVE HYDROCAD 100YR WSE
DESCRIP TOP OF DAM = WSE100 + 1' ESPILL + HEAD OVER ESPILL + 3' FREEBOARD
DESCRIP ****RWG - RATING CURVES UP-TO-DATE AS OF 07/31/2019****
DESCRIP FLOODWALLS WILL BE REQUIRED AT BASIN 2B, 2, AND 3 TO MEET 3' FREEBOARD ABOVE ESPILL WSE REQUIREMENT
DESCRIP GOAL OF PROJECT:
DESCRIP 1 - REDUCE FLOWS FROM HITCH RANCH LOCAL BELOW 10-YR EXISTING
DESCRIP 2- REDUCE FLOW IN WCC AT LA AVE D/S OF 72" RCP TO 830 CFS OR LESS BASED ON 2005 PLAN
DESCRIP REDUCTION TO 508 CFS AT RR IS NOT NECESSARY TO MEET GOAL 2
DESCRIP NOTE1: ASSUMES ALL OF MOORPARK DRAIN NO.1 (43C - UPSTREAM MODEL) CAN REACH WCC AT HITCH RANCH
DESCRIP NOTE1: IN REALITY PIPE CAN ONLY CARRY 176 CFS OUT OF 266 CFS
DESCRIP NOTE2: ASSUMES ALL OF MP 72" RCP REACHES JUNCTION WITH WCC AT LA AVE
DESCRIP NOTE2: IN REALITY PIPE CAN ONLY CARRY 195 CFS OUT OF 351 CFS

RESERVOIR ROUTING AT 7B

DESCRIPTION: IN-TRACT BASIN AT "BASIN 1A"

```
*      INCOMING HYDROGRAPH  PEAK (cfs):    117.64         VOLUME (acre-ft):     13.76      *
*      NO HYDROGRAPH ADJUSTMENT                                                             *
*      RUNOFF FACTOR(in):   4.56      TOTAL RAIN(in):   6.50      SCS Curve: 83             *
*      FATTENED HYDROGRAPH  PEAK (cfs):    117.64         VOLUME (acre-ft):     17.11      *
*      RESERVOIR INFLOW:    PEAK (cfs):    117.64 @ 1154  VOLUME (acre-ft):     17.11      *
*      MAXIMUM ELEVATION:   STAGE (ft):    661.19 @ 1165  VOLUME (acre-ft):      3.23      *
*      EMERGENCY SPILLWAY:   ELEV (ft):    665.00         VOLUME (acre-ft):      6.85      *
*          DIFFERENCE:   IN STAGE (ft):     -3.81      IN VOLUME (acre-ft):      3.62      *
*          NO SPILL EXPECTED.       PERCNT OF VOLUME REMAINING TO SPILLWAY:     52.8%      *
*      TOP OF DAM:           ELEV (ft):    666.00         VOLUME (acre-ft):      7.85      *
*          DIFFERENCE    IN STAGE (ft):     -4.81      IN VOLUME (acre-ft):      4.62      *
*          NO OVERTOP EXPECTED.   PERCNT OF VOLUME REMAINING TO TOP OF DAM:     58.8%      *
*      RESERVOIR OUTFLOW:   PEAK (cfs):     53.32 @ 1165  VOLUME (acre-ft):     15.79      *
```

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 45A

DESCRIPTION: POST OFFICE, WC SCHOOL, AND PROPOSED ESSEX (FATTENING REDUCES VOLUME [RUNOFF FACTOR = 2.9] ---NO FATTENING USED)
TOTAL AREA TO HYDROGRAPH: 906 acres
HYDROGRAPH PEAK: 758 cfs
TIME OF PEAK: 1160 minutes
HYDROGRAPH VOLUME: 218.98 acre-ft

TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)

PROJECT 4 WALNUT CANYON HYDROLOGY-INTERIM CONDITION 100YR (2017)
DESCRIP 2017 HYDROLOGY MANUAL
DESCRIP 100 YR INTERIM CONDITION MODEL
DESCRIP DS 45A - PROPOSED HITCH RANCH LAND USE (AUG 2018 TTM)
DESCRIP 20190729HR_RegionalBasin3_4_ComboOutlet.hcp HYDROCAD MODEL USED 45A AS INPUT TO BASIN 3 DIVERSION STRUCTURE
DESCRIP 46A AND 47D REPRESENT DIVERSION STRUCTURE BASED ON HYDROCAD 20190729HR_RegionalBasin3_4_ComboOutlet.hcp
DESCRIP IMPORTED HYDROGRAPHS DO NOT INCLUDE CASEY RD BASIN 1
DESCRIP EMERGENCY SPILLWAY SET TO 1' ABOVE HYDROCAD 100YR WSE
DESCRIP TOP OF DAM = WSE100 + 1' ESPILL + HEAD OVER ESPILL + 3' FREEBOARD
DESCRIP ****RWG - RATING CURVES UP-TO-DATE AS OF 07/31/2019****
DESCRIP FLOODWALLS WILL BE REQUIRED AT BASIN 2B, 2, AND 3 TO MEET 3' FREEBOARD ABOVE ESPILL WSE REQUIREMENT
DESCRIP GOAL OF PROJECT:
DESCRIP 1 - REDUCE FLOWS FROM HITCH RANCH LOCAL BELOW 10-YR EXISTING
DESCRIP 2- REDUCE FLOW IN WCC AT LA AVE D/S OF 72" RCP TO 830 CFS OR LESS BASED ON 2005 PLAN
DESCRIP REDUCTION TO 508 CFS AT RR IS NOT NECESSARY TO MEET GOAL 2
DESCRIP NOTE1: ASSUMES ALL OF MOORPARK DRAIN NO.1 (43C - UPSTREAM MODEL) CAN REACH WCC AT HITCH RANCH
DESCRIP NOTE1: IN REALITY PIPE CAN ONLY CARRY 176 CFS OUT OF 266 CFS
DESCRIP NOTE2: ASSUMES ALL OF MP 72" RCP REACHES JUNCTION WITH WCC AT LA AVE
DESCRIP NOTE2: IN REALITY PIPE CAN ONLY CARRY 195 CFS OUT OF 351 CFS

Ventura County Watershed Protection District
Modified Rational Method Hydrology Program (VCRat v2.64)

Modified Rational Model Results Report

Job: 1 Project: WALNUT CANYON HYDROLOGY-INTERIM CONDITION 100YR (2017)

Project Description

2017 HYDROLOGY MANUAL
100 YR INTERIM CONDITION MODEL
DS 45A - PROPOSED HITCH RANCH LAND USE (AUG 2018 TTM)
20190729HR_RegionalBasin3_4_ComboOutlet.hcp HYDROCAD MODEL USED 45A AS INPUT TO BASIN 3 DIVERSION STRUCTURE
46A AND 47D REPRESENT DIVERSION STRUCTURE BASED ON HYDROCAD 20190729HR_RegionalBasin3_4_ComboOutlet.hcp
IMPORTED HYDROGRAPHS DO NOT INCLUDE CASEY RD BASIN 1
EMERGENCY SPILLWAY SET TO 1' ABOVE HYDROCAD 100YR WSE
TOP OF DAM = WSE100 + 1' ESPILL + HEAD OVER ESPILL + 3' FREEBOARD
****RWG - RATING CURVES UP-TO-DATE AS OF 07/31/2019****
FLOODWALLS WILL BE REQUIRED AT BASIN 2B, 2, AND 3 TO MEET 3' FREEBOARD ABOVE ESPILL WSE REQUIREMENT
GOAL OF PROJECT:
1 - REDUCE FLOWS FROM HITCH RANCH LOCAL BELOW 10-YR EXISTING
2- REDUCE FLOW IN WCC AT LA AVE D/S OF 72" RCP TO 830 CFS OR LESS BASED ON 2005 PLAN
REDUCTION TO 508 CFS AT RR IS NOT NECESSARY TO MEET GOAL 2
NOTE1: ASSUMES ALL OF MOORPARK DRAIN NO.1 (43C - UPSTREAM MODEL) CAN REACH WCC AT HITCH RANCH
NOTE1: IN REALITY PIPE CAN ONLY CARRY 176 CFS OUT OF 266 CFS
NOTE2: ASSUMES ALL OF MP 72" RCP REACHES JUNCTION WITH WCC AT LA AVE
NOTE2: IN REALITY PIPE CAN ONLY CARRY 195 CFS OUT OF 351 CFS

RESERVOIR ROUTING AT 56F

DESCRIPTION: EMERGENCY SPILLWAY DESIGNED TO PASS 1084 CFS AT 2' OVER 140 WEIR CREST (C=2.8)

```
*******************************************************************************
*      INCOMING HYDROGRAPH  PEAK (cfs):    981.44         VOLUME (acre-ft):    164.02      *
*      NO HYDROGRAPH ADJUSTMENT                                                *
*      NO HYDROGRAPH FATTENING                                                 *
*      RESERVOIR INFLOW:    PEAK (cfs):    981.44 @ 1156  VOLUME (acre-ft):    164.02      *
*      MAXIMUM ELEVATION:   STAGE (ft):    489.49 @ 1226  VOLUME (acre-ft):     57.31      *
*      EMERGENCY SPILLWAY:   ELEV (ft):    491.00         VOLUME (acre-ft):     70.56      *
*          DIFFERENCE:   IN STAGE (ft):     -1.51      IN VOLUME (acre-ft):     13.24      *
*          NO SPILL EXPECTED.       PERCNT OF VOLUME REMAINING TO SPILLWAY:     18.8%      *
*      TOP OF DAM:           ELEV (ft):    496.00         VOLUME (acre-ft):    117.01      *
*          DIFFERENCE    IN STAGE (ft):     -6.51      IN VOLUME (acre-ft):     59.70      *
*          NO OVERTOP EXPECTED.   PERCNT OF VOLUME REMAINING TO TOP OF DAM:     51.0%      *
*      RESERVOIR OUTFLOW:   PEAK (cfs):    351.10 @ 1226  VOLUME (acre-ft):    133.09      *

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 73BC

DESCRIPTION: CONFLUENCE OF WEST HITCH RANCH (WEST AND MIDDLE FORK) - UPSTREAM OF BASIN 2B
TOTAL AREA TO HYDROGRAPH: 316 acres
HYDROGRAPH PEAK: 272 cfs
TIME OF PEAK: 1158 minutes
HYDROGRAPH VOLUME: 26.16 acre-ft

TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 77D

DESCRIPTION: WEST HITCH RANCH (NORTH HILLS PKWY LOCAL DRAINS DIRECTLY TO BASIN 2B) - DID NOT FATTEN, REDUCES VOLUME
TOTAL AREA TO HYDROGRAPH: 9 acres
HYDROGRAPH PEAK: 22 cfs
TIME OF PEAK: 1153 minutes
HYDROGRAPH VOLUME: 2.15 acre-ft

TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)	TIME (min)	FLOW (cfs)

HYDROGRAPH PRINTOUT AT: 81C

DESCRIPTION: WEST HITCH RANCH - EAST OF BASIN 2, DRAINS DIRECTLY TO BASIN 2
TOTAL AREA TO HYDROGRAPH: 10 acres
HYDROGRAPH PEAK: 34 cfs
TIME OF PEAK: 1153 minutes
HYDROGRAPH VOLUME: 3.68 acre-ft

Hydrograph Printouts

HYDROGRAPH PRINTOUT AT: 88B

DESCRIPTION: LOCAL SUBAREA TO 10X8 RCB AT RR
TOTAL AREA TO HYDROGRAPH: 70 acres
HYDROGRAPH PEAK: 104 cfs
TIME OF PEAK: 1156 minutes
HYDROGRAPH VOLUME: 14.28 acre-ft

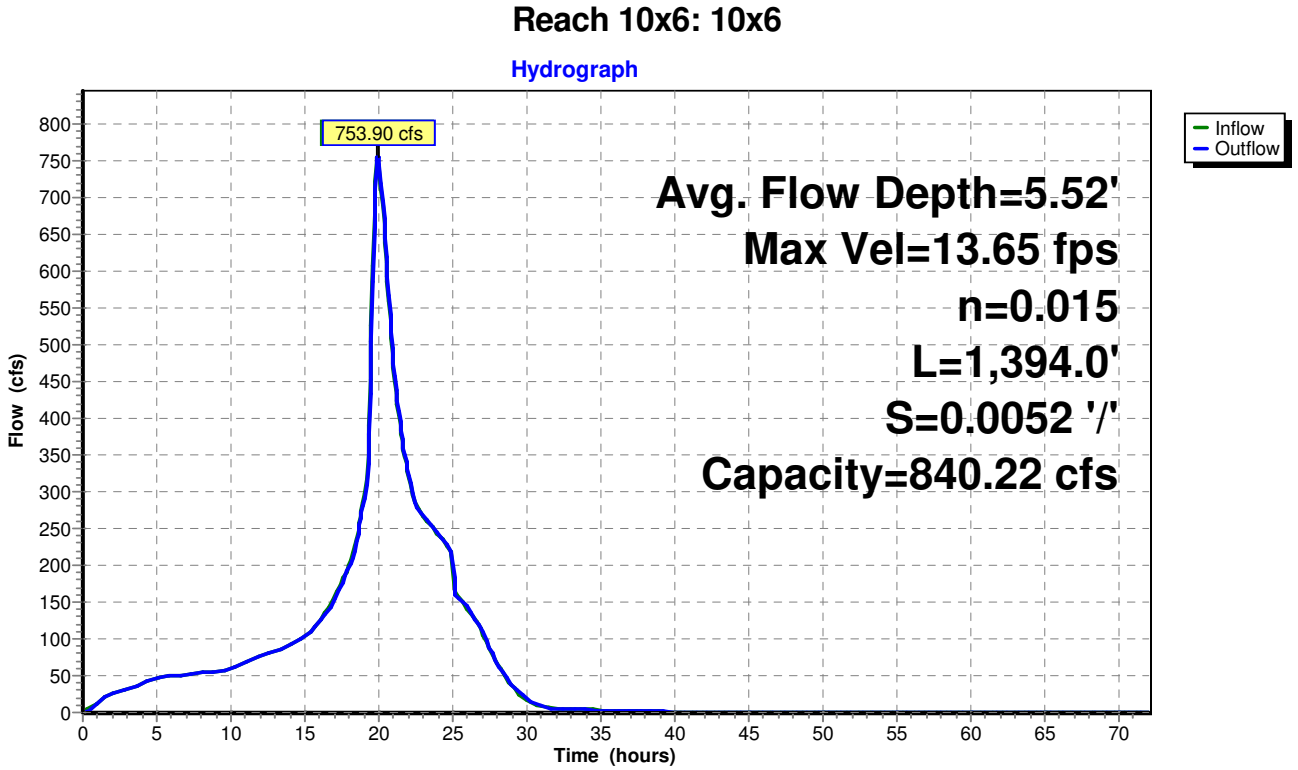
Summary for Reach 10x6: 10x6



Inflow = 754.13 cfs @ 19.91 hrs, Volume= 350.954 af
Outflow = 753.90 cfs @ 19.93 hrs, Volume= 350.954 af, Atten= 0%, Lag= 1.3 min

Routing by Dyn-Stor-Ind method, Time Span= 0.00-71.97 hrs, dt= 0.08330 hrs / 3
Max. Velocity= 13.65 fps, Min. Travel Time= 1.7 min
Avg. Velocity = 3.87 fps, Avg. Travel Time= 6.0 min

Peak Storage= 76,997 cf @ 19.93 hrs
Average Depth at Peak Storage= 5.52'
Bank-Full Depth= 6.00' Flow Area= 60.0 sf, Capacity= 840.22 cfs

10.00' x 6.00' deep channel, n= 0.015
Length= 1,394.0' Slope= 0.0052 '/'
Inlet Invert= 468.25', Outlet Invert= 460.94'

Stage-Discharge for Reach 10x6: 10x6

Elevation (feet)	Velocity (ft/sec)	Discharge (cfs)
468.25	0.00	0.00
468.29	0.73	0.44
468.33	1.30	1.12
468.37	1.72	2.06
468.41	2.06	3.37
468.45	2.38	4.83
468.49	2.69	6.44

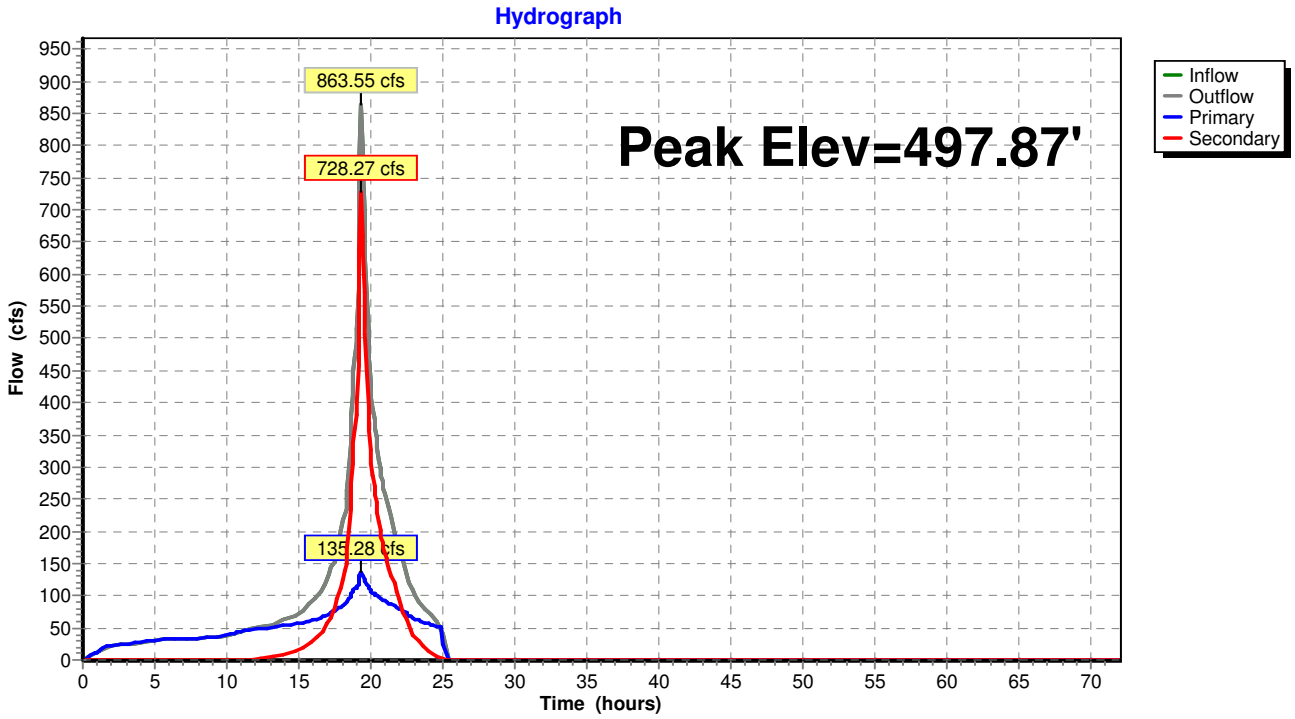
Summary for Pond DiversionStructure: DiversionStructure

[57] Hint: Peaked at 497.87' (Flood elevation advised)

Inflow	=	863.55 cfs @	19.33 hrs,	Volume=	220.901 af
Outflow	=	863.55 cfs @	19.33 hrs,	Volume=	220.901 af, Atten= 0%, Lag= 0.0 min
Primary	=	135.28 cfs @	19.33 hrs,	Volume=	108.106 af
Secondary	=	728.27 cfs @	19.33 hrs,	Volume=	112.794 af



Routing by Dyn-Stor-Ind method, Time Span= 0.00-71.97 hrs, dt= 0.08330 hrs / 3
Peak Elev= 497.87' @ 19.33 hrs

Device	Routing	Invert	Outlet Devices
#1	Primary	493.76'	**96.0" W x 24.0" H Vert. Orifice/Grate** C= 0.600
#2	Secondary	495.25'	**108.0" W x 30.0" H Vert. Orifice/Grate X 6.00** C= 0.600

Primary OutFlow Max=134.95 cfs @ 19.33 hrs HW=497.86' TW=483.07' (Dynamic Tailwater)
└**1=Orifice/Grate** (Orifice Controls 134.95 cfs @ 8.43 fps)

Secondary OutFlow Max=723.01 cfs @ 19.33 hrs HW=497.86' TW=488.52' (Dynamic Tailwater)
└**2=Orifice/Grate** (Orifice Controls 723.01 cfs @ 5.36 fps)

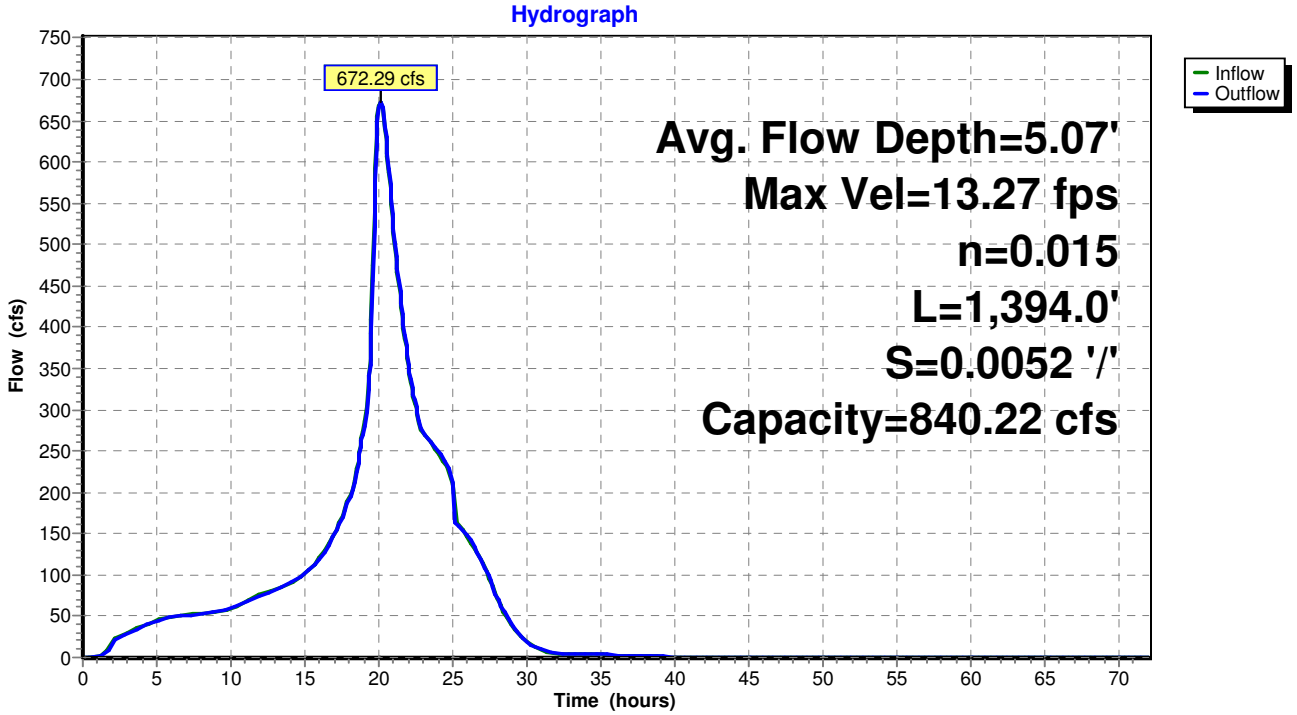
Summary for Reach 10x6: 10x6



Inflow = 672.37 cfs @ 20.09 hrs, Volume= 348.036 af
Outflow = 672.29 cfs @ 20.11 hrs, Volume= 348.036 af, Atten= 0%, Lag= 1.2 min

Routing by Dyn-Stor-Ind method, Time Span= 0.00-71.97 hrs, dt= 0.08330 hrs / 3
Max. Velocity= 13.27 fps, Min. Travel Time= 1.8 min
Avg. Velocity = 3.83 fps, Avg. Travel Time= 6.1 min

Peak Storage= 70,614 cf @ 20.11 hrs
Average Depth at Peak Storage= 5.07'
Bank-Full Depth= 6.00' Flow Area= 60.0 sf, Capacity= 840.22 cfs

10.00' x 6.00' deep channel, n= 0.015
Length= 1,394.0' Slope= 0.0052 '/'
Inlet Invert= 468.25', Outlet Invert= 460.94'

Stage-Discharge for Reach 10x6: 10x6

LEGAL DESCRIPTION

ALL THAT CERTAIN REAL PROPERTY SITUATED IN THE COUNTY OF VENTURA, STATE OF CALIFORNIA, DESCRIBED AS FOLLOWS:

PARCEL 1:

LOTS 14 AND 16 AND THAT PORTION OF LOTS 22 AND 23, FREMONT SUBDIVISION OF RANCHO SIMI, IN THE CITY OF MOORPARK, COUNTY OF VENTURA, STATE OF CALIFORNIA, AS PER MAP RECORDED IN BOOK 3, PAGE 39 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY, LYING NORTHERLY OF THE RIGHT OF WAY OF THE SOUTHERN PACIFIC RAILROAD 100 FEET WIDE, AS DESCRIBED IN DEED RECORDED IN BOOK 58, PAGE 590 OF DEEDS.

ASSESSOR'S PARCEL NO: 511-0-020-170

PARCEL 2:

PART OF TRACT "S" AND "T" OF PART OF TRACT "L" OF RANCHO SIMI, IN THE CITY OF MOORPARK, COUNTY OF VENTURA, STATE OF CALIFORNIA, AS PER MAP SHOWING THE TOWNSITE OF MOORPARK AND LANDS OF MADELINE R. POINDEXTER, A RE-SUBDIVISION OF FREMONT TRACT, AS PER MAP RECORDED IN BOOK 5, PAGE 5 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY, DESCRIBED AS FOLLOWS:

BEGINNING AT A POINT WHICH IS COMMON TO THE NORTHEAST CORNER OF LOT "S" AND THE NORTHWEST CORNER OF LOT "T", THENCE, FROM SAID POINT OF BEGINNING,

1st: SOUTH 89°55' WEST 1320 FEET ALONG THE NORTH LINE OF SAID LOT "S" TO THE NORTHEAST CORNER OF THAT CERTAIN PARCEL OF LAND CONVEYED TO WILLIAM HEDGES, BY DEED DATED MARCH 3, 1909, RECORDED IN BOOK 117, PAGE 217 OF DEEDS; THENCE,

2nd: SOUTH 1964.16 FEET ALONG THE EAST LINE OF SAID LANDS OF WILLIAM HEDGES TO THE NORTHWEST CORNER OF LOT 14, AS SHOWN ON MAP ENTITLED "MAP OF FREMONT" A SUBDIVISION OF LOT "L" OF THE RANCHO SIMI, VENTURA CO., CAL." AND RECORDED IN BOOK 3, PAGE 39 OF MAPS; THENCE AT RIGHT ANGLES,

3rd: EAST 1320 FEET ALONG THE NORTH LINE OF SAID LOT 14, TO A POINT IN THE BOUNDARY LINE BETWEEN SAID LOTS "S" AND "T"; THENCE, AT RIGHT ANGLES,

4th: SOUTH 660 FEET ALONG THE BOUNDARY LINE BETWEEN LOTS 14 AND 16 OF SAID FREMONT TRACT, AND TRACT "T" ABOVE DESCRIBED TO THE SOUTHEAST CORNER OF SAID LOT 16 OF SAID FREMONT TRACT; THENCE AT RIGHT ANGLES,

5th: WEST 330 FEET ALONG THE SOUTH LINE OF SAID LOT 16 TO THE NORTHEAST CORNER OF LOT 23 OF SAID FREMONT TRACT; THENCE, AT RIGHT ANGLES,

6th: SOUTH 429.66 FEET ALONG THE EAST LINE OF LOT 23 TO A POINT IN THE NORTH LINE OF THE RIGHT OF WAY OF THE SOUTHERN PACIFIC RAILROAD; THENCE ALONG SAME,

7th: EASTERLY ALONG A CURVE TO THE RIGHT (THE LONG CHORD OF WHICH BEARS NORTH 88°37' EAST) 330.66 FEET TO A POINT; THENCE,

8th: EAST 990 FEET ALONG THE NORTH LINE OF SAID RAILROAD RIGHT OF WAY TO THE SOUTHWEST CORNER OF THAT CERTAIN PARCEL OF LAND CONVEYED TO ALICE N. GRAHAM, BY DEED DATED OCTOBER 25, 1911 AND RECORDED IN BOOK 130, PAGE 33 OF DEEDS; THENCE, STILL ALONG THE NORTH LINE OF THE RIGHT OF WAY OF THE SOUTHERN PACIFIC RAILROAD,

9th: EAST 588.06 FEET TO THE SOUTHWEST CORNER OF THAT CERTAIN PARCEL OF LAND AS CONVEYED TO LEONARD R. ELVER AND NELLIE B. ELVER, HIS WIFE, BY DEED DATED JANUARY 7, 1931, RECORDED IN BOOK 340, PAGE 198 OF OFFICIAL RECORDS; THENCE ALONG THE WEST AND NORTH LINES OF THE LANDS SO CONVEYED,

10th: NORTH 696.96 FEET TO A 1 ¼" X 6" PIPE; THENCE,

11th: NORTH 61°30' EAST 258.72 FEET TO A 2 X 66" PIPE; THENCE,

12th: NORTH 2230.14 FEET TO A POINT IN THE NORTH LINE OF SAID TRACT "T" IN THE SOUTH LINE OF LOT 32, AS THE SAME IS SHOWN ON MAP ENTITLED "MAP OF THE VALLETTE TRACT, BEING A SUBDIVISION OF LOT 2 OF BLOCK "L" OF RANCHO SIMI, VENTURA CO., CAL." AND RECORDED IN BOOK 3, PAGE 41 OF MAPS, AND AT THE NORTHWEST CORNER OF THE LANDS CONVEYED TO MAXWELL W. WRIGHT, BY DEED DATED SEPTEMBER 10, 1914 RECORDED IN BOOK 144, PAGE 283 OF DEEDS; THENCE,

13th: SOUTH 89°53' WEST 1805.166 FEET ALONG THE SOUTH LINE OF VALLETTE TRACT, AND ALONG THE NORTH LINE OF TRACT "T" TO THE POINT OF BEGINNING.

EXCEPT THOSE PORTIONS OF LAND DESCRIBED AS ESTATES 1, 2 AND 3 IN THE FINAL ORDER OF CONDEMNATION, CASE NO. SC 16973, SUPERIOR COURT OF CALIFORNIA, COUNTY OF VENTURA, A CERTIFIED COPY OF WHICH RECORDED DECEMBER 18, 1997 AS DOCUMENT NO. 97-172929 OF OFFICIAL RECORDS.

ASSESSOR'S PARCEL NO: 511-0-020-110, 130, 160, 180

PARCEL 3:

PORTIONS OF LOT "R" AND "S" AS SHOWN ON MAP OF A PART OF TRACT "L" OF THE RANCHO SIMI, IN THE CITY OF MOORPARK, COUNTY OF VENTURA, STATE OF CALIFORNIA, AS PER MAP RECORDED IN BOOK 5, PAGE 5 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY DESCRIBED AS A WHOLE AS FOLLOWS:

BEGINNING AT A POINT ON THE WEST LINE OF SAID LOT "S" DISTANT NORTH THEREON 660 FEET FROM THE SOUTHWEST CORNER OF SAID LOT "S"" THENCE ALONG THE WEST LINE OF LOTS "S" AND "R",

1st: SOUTH 1617 FEET TO THE NORTH LINE OF THE 100-FOOT RIGHT OF WAY OF THE SOUTHERN PACIFIC RAILROAD; THENCE, ALONG SAID NORTH LINE,

2nd: NORTH 79°10' EAST 1703.46 FEET TO THE SOUTHEAST CORNER OF SAID LOT "R"; THENCE ALONG THE EAST LINE OF SAID LOT "R",

3rd: NORTH 551.76 FEET TO THE NORTHEAST CORNER OF SAID LOT "R"; THENCE,

4th: WEST ALONG THE NORTH LINES OF SAID LOT "R", 330 FEET TO THE SOUTHWEST CORNER OF LOT 16 OF FREMONT TRACT, AS PER MAP RECORDED IN BOOK 3, PAGE 39 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY; THENCE,

5th: NORTH ALONG THE WEST LINE OF LOTS 16 AND 14 OF SAID FREMONT TRACT, 660 FEET TO THE NORTHWEST CORNER OF SAID LOT 14; THENCE,

6th: WEST 1320 FEET TO THE POINT OF BEGINNING.

EXCEPT THE INTEREST IN A STRIP OF LAND 40 FEET WIDE, AS GRANTED TO VENTURA COUNTY FOR "ROAD PURPOSES" IN DEED RECORDED IN BOOK 127, PAGE 326 OF DEEDS.

ALSO EXCEPT ONE HALF OF ALL MINERAL, OIL, GAS AN OTHER HYDROCARBON SUBSTANCES IN AND UNDER SAID LAND WITHOUT, HOWEVER, ANY RIGHT OF SURFACE ENTRY OR ANY RIGHT OF ENTRY IN AND TO THE SUBSURFACE THEREOF AT A DEPTH OF LESS THAN 500 FEET BENEATH THE SURFACE OF OFFICIAL RECORDS THE DEVELOPMENT OR REMOVAL OF SAID SUBSTANCES, AS RESERVED BY SENA BAUER, A LIFE ESTATE, WALTER W. BAUER, CHARLES E. BAUER, ELLEN REGINA BAUER, FRANCES D. ARBOGAST MERICLE, WHO ACQUIRED TITLE AS FRANCES B. ARBOGAST AND SERENA H. BAUER COX, WHO ACQUIRED TITLE AS SERENA H. BAUER, IN DEED RECORDED SEPTEMBER 12, 1961 IN BOOK 2045, PAGE 334 OF OFFICIAL RECORDS.

ASSESSOR'S PARCEL NO: 511-0-020-195

PARCEL 4:

THE EAST HALF OF THE SOUTHEAST QUARTER OF SECTION 6, TOWNSHIP 2 NORTH, RANGE 19 WEST, RANCHO SIMI, IN THE CITY OF MOORPARK, COUNTY OF VENTURA, STATE OF CALIFORNIA, AS SHOWN ON MAP ENTITLED "MAP OF THE LAND OF RANCHO SIMI, IN VENTURA AND LOS ANGELES COUNTIES, CALIFORNIA", AND RECORDED IN BOOK 3, PAGE 7 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY, AND PARTICULARLY DESCRIBED AS FOLLOWS:

BEGINNING AT A POINT IN THE CENTERLINE OF THAT CERTAIN PUBLIC ROAD, 60 FEET WIDE, LOCALLY KNOWN AS AND CALLED "LOS ANGELES AVENUE" AT THE CORNER COMMON TO SECTIONS 5, 6, 7 AND 8 OF TOWNSHIP 2 NORTH, RANGE 19 WEST, RANCHO SIMI, AS SHOWN ON THE ABOVE DESCRIBED MAP, SAID POINT OF BEGINNING BEING THE SOUTHWEST CORNER OF TRACT "Q" AS SHOWN ON MAP ENTITLED "MAP OF PART OF TRACT "L" OF RANCHO SIMI, VENTURA COUNTY, CALIFORNIA, SHOWING THE TOWNSITE OF MOORPARK AND LANDS OF MADELEINE R. POINDEXTER, A RE-SUBDIVISION OF FREMONT TRACT" AND RECORDED IN BOOK 5, PAGE 5 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF VENTURA COUNTY; THENCE, FROM SAID POINT OF BEGINNING,

1st: NORTH 2640 FEET TO THE SOUTHEAST CORNER OF LOT 56 OF VALLETTE TRACT, AS PER MAP RECORDED IN BOOK 3, PAGE 41 OF MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF SAID COUNTY; THENCE, AT RIGHT ANGLES,

2nd: WEST 1320 FEET TO THE SOUTHWEST CORNER OF SAID LOT 56 OF VALLETTE TRACT, AT THE NORTHEAST CORNER OF THAT CERTAIN PARCEL OF LAND, CONVEYED TO MARY FRANCES ESTATES, BY DEED DATED OCTOBER 22, 1902 AND RECORDED IN BOOK 87, PAGE 120 OF DEEDS; THENCE AT RIGHT ANGLES,

3rd: SOUTH 2640 FEET ALONG THE EAST LINE OF SAID LANDS OF MARY FRANCES ESTATES TO A POINT IN THE CENTERLINE OF SAID LOS ANGELES AVENUE; THENCE, ALONG SAME,

4th: EAST 1320 FEET TO THE POINT OF BEGINNING.

EXCEPT THAT PORTION LYING SOUTHERLY OF THE NORTHERLY LINE OF THAT CERTAIN STRIP 100 FEET WIDE DESCRIBED IN THE DEED TO THE SOUTHERN PACIFIC RAILROAD COMPANY, RECORDED NOVEMBER 13, 1899 IN BOOK 58, PAGE 596 OF DEEDS.

ALSO EXCEPT THAT PORTION LYING WITHIN THAT CERTAIN STRIP 345 FEET WIDE DESCRIBED IN DEED TO SOUTHERN CALIFORNIA EDISON COMPANY, RECORDED OCTOBER 22, 2010 AS INSTRUMENT NO. 20101022-0016306 OF OFFICIAL RECORDS.

ASSESSOR'S PARCEL NO: 511-0-200-245

EXISTING EASEMENTS (SEE TITLE REPORT FOR FULL ITEM SUMMARY)

2. SIMI LAND & WATER COMPANY EASEMENT, OR ITS ASSIGNS, FOR ENTRY AND WATER COLLECTION AND DISTRIBUTION PER BOOK 29, PAGE 500 OF DEEDS.
3. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR PUBLIC UTILITIES PER BOOK 339, PAGE 109 OF OFFICIAL RECORDS.
4. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR PUBLIC UTILITIES PER BOOK 968, PAGE 442 OF OFFICIAL RECORDS.
5. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR PUBLIC UTILITIES PER BOOK 1001, PAGE 544 OF OFFICIAL RECORDS.
6. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR PUBLIC UTILITIES PER BOOK 1001, PAGE 550 OF OFFICIAL RECORDS.
7. VENTURA COUNTY FLOOD CONTROL DISTRICT EASEMENT FOR FLOOD CONTROL PER BOOK 2141, PAGE 551 OF OFFICIAL RECORDS.
8. VENTURA COUNTY FLOOD CONTROL DISTRICT EASEMENT FOR FLOOD CONTROL PER BOOK 2141, PAGE 556 OF OFFICIAL RECORDS.
9. VENTURA COUNTY FLOOD CONTROL DISTRICT EASEMENT FOR FLOOD CONTROL PER BOOK 2141, PAGE 558 OF OFFICIAL RECORDS.
10. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR PUBLIC UTILITIES AND ROADS PER BOOK 2347, PAGE 225 OF OFFICIAL RECORDS.
11. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR ROADS PER BOOK 3243, PAGE 379 OF OFFICIAL RECORDS.
12. SOUTHERN CALIFORNIA EDISON COMPANY EASEMENT FOR PUBLIC UTILITIES AND ROADS PER BOOK 3243, PAGE 387 OF OFFICIAL RECORDS.
13. A-B PROPERTIES, A CALIFORNIA GENERAL PARTNERSHIP, EASEMENT FOR ACCESS ROAD, UTILITIES, AND SLOPE PER AS INSTRUMENT NO. 2001-012562 OF OFFICIAL RECORDS.
16. AT&T EASEMENT FOR FIBER OPTIC CABLE ALONG RAILROAD CORRIDOR PER AS INSTRUMENT NO. 2009-106766 OF OFFICIAL RECORDS.
17. VENTURA COUNTY WATERSHED PROTECTION DISTRICT EASEMENT FOR FLOOD CONTROL PURPOSE OF PERIODIC INUNDATION WITH FLOOD AND/OR STORM DRAINAGE WATER PER AS INSTRUMENT NO. 2012-155707 OF OFFICIAL RECORDS.
18. LEVEL3 COMMUNICATION, LLC EASEMENT FOR TELECOMMUNICATIONS AND INCIDENTAL PURPOSES PER AS INSTRUMENT NO. 2013-146419 OF OFFICIAL RECORDS.
19. SPRINT COMMUNICATIONS COMPANY, LP EASEMENT FOR TELECOMMUNICATIONS AND INCIDENTAL PURPOSES PER AS INSTRUMENT NO. 2013-205739 OF OFFICIAL RECORDS.
20. QUEST COMMUNICATIONS INTERNATIONAL INC., ET AL. EASEMENT FOR TELECOMMUNICATIONS AND INCIDENTAL PURPOSES PER AS INSTRUMENT NO. 2014-011258 OF OFFICIAL RECORDS.

PROPOSED EASEMENTS

1. VARIABLE WIDTH UTILITY AND ACCESS EASEMENT TO VENTURA COUNTY WATERWORKS DISTRICT NO. 1. (CURB-TO-CURB ALONG ALL PRIVATE STREETS/ALLEYS/DRIVES AND ALL OTHER LOCATIONS SPECIFIED ON THE PLANS).
2. VARIABLE WIDTH UTILITY AND ACCESS EASEMENT TO HOA.
3. VARIABLE WIDTH ACCESS EASEMENT TO CITY OF MOORPARK.

UTILITIES

WATER	VENTURA COUNTY WATERWORKS DISTRICT NO. 1
SEWER	VENTURA COUNTY WATERWORKS DISTRICT NO. 1
STORM DRAIN	CITY OF MOORPARK VENTURA COUNTY WATERSHED PROTECTION DISTRICT
ELECTRIC	SOUTHERN CALIFORNIA EDISON
GAS	SOUTHERN CALIFORNIA GAS COMPANY
TELEPHONE	FRONTIER COMMUNICATIONS
CABLE TELEVISION	SPECTRUM CABLE
SOLID WASTE	SIMI VALLEY LANDFILL & RECYCLING CENTER c/o WASTE MANAGEMENT / G.I. INDUSTRIES
FIRE PROTECTION	VENTURA COUNTY FIRE DEPARTMENT

EXISTING UTILITY LEGEND

- W — POTABLE WATER LINE
- RW — RECYCLED WATER LINE
- S — SEWER LINE
- E — ELECTRICAL LINE
- G — NATURAL GAS LINE
- COMM — COMMUNICATION LINE
- OHW — OVERHEAD WIRES
- FOC — FIBER OPTIC LINE

PROPOSED UTILITY LEGEND

- W — POTABLE WATER LINE
- RW — RECYCLED WATER LINE
- S — SEWER LINE
- SD — STORM DRAIN LINE
- SEWER MANHOLE
- STORM DRAIN MANHOLE

EARTHWORK

EARTHWORK ESTIMATES:

CUT: 2,730,000 CUBIC YARDS
FILL: 2,730,000 CUBIC YARDS
IMPORT: 0 CUBIC YARDS
EXPORT: 0 CUBIC YARDS (NOTE: EARTHWORK IS INTENDED TO BALANCE ON-SITE)

THE ABOVE QUANTITIES ARE APPROXIMATE IN PLACE VOLUMES CALCULATED FROM THE EXISTING GROUND TO THE PROPOSED FINISH GRADE OR SUBGRADE. EXISTING GROUND IS DEFINED BY THE CONTOURS ON THE PLAN. PROPOSED FINISH GRADE IS DEFINED AS THE DESIGN SURFACE ELEVATION OF EARTH TO BE CONSTRUCTED. PROPOSED SUBGRADE ELEVATION IS DEFINED AS THE DESIGN SURFACE ELEVATION OF EARTH TO BE CONSTRUCTED BENEATH PAVEMENTS OR STRUCTURES.

THE EARTHWORK QUANTITIES ABOVE ARE FOR PERMIT PURPOSES ONLY. THEY HAVE NOT BEEN FACTORED TO ACCOUNT FOR CHANGES IN VOLUME DUE TO BULKING, SHRINKAGE, CLEARING AND GRUBBING, OVER EXCAVATION AND RE-COMPACTION, AND OTHER REMEDIAL GRADING CONSTRUCTION METHODS.

LEGEND

5. PRELIMINARY GRADING, DRAINAGE, & UTILITIES
6. PRELIMINARY GRADING, DRAINAGE, & UTILITIES

GENERAL NOTES

GENERAL:

1. ALL DIMENSIONS AND AREAS SHOWN ARE APPROXIMATE ONLY.
2. PROJECT SITE IS WITHIN THE MOORPARK UNIFIED SCHOOL DISTRICT.
3. STREETS B-N SHALL BE PRIVATE AND MAINTAINED BY THE HOA.
4. STREETS SHOWN ON THIS TENTATIVE TRACT MAP SHALL BE IN ACCORDANCE WITH THE REQUIREMENTS OF THE CITY OF MOORPARK PUBLIC WORKS AND COMMUNITY DEVELOPMENT DEPARTMENTS.
5. MULTIPLE FINAL MAPS MAY BE RECORDED FROM THIS TENTATIVE TRACT MAP IN ACCORDANCE WITH THE STATE OF CALIFORNIA SUBDIVISION MAP ACT.

UTILITIES:

6. ALL NEW UTILITIES WILL BE UNDERGROUND.
7. NEW UTILITY LOCATIONS AND EASEMENTS ARE APPROXIMATE.
8. NEW STORM DRAINAGE IMPROVEMENTS ON PRIVATE STREETS ARE TO BE PRIVATE AND MAINTAINED BY THE HOA. NEW STORM DRAINAGE IMPROVEMENTS WITHIN THE PUBLIC RIGHT-OF-WAY ARE TO BE PUBLIC AND MAINTAINED BY THE CITY OF MOORPARK OR VCWPD.
9. SURFACE STORMWATER QUALITY TREATMENT FACILITIES SHALL BE PRIVATE AND MAINTAINED BY THE HOA.
10. NEW SEWER MAINS ARE TO BE PUBLIC AND TO BE DEDICATED TO VENTURA COUNTY WATERWORKS DISTRICT (VCWWD) NO. 1. NEW SEWER MAINS SHALL BE PER VCWWD NO. 1 STANDARDS.
11. NEW WATER MAINS ARE TO BE PUBLIC AND TO BE DEDICATED TO TO VCWWD NO. 1. NEW WATER MAINS SHALL BE PER VCWWD NO. 1 STANDARDS.
12. FIRE HYDRANT LOCATIONS TO BE DETERMINED BY VENTURA COUNTY FIRE DEPARTMENT.

SURVEY NOTES

BASIS OF BEARINGS: THE BASIS OF BEARINGS FOR THIS MAP IS THE CALIFORNIA COORDINATE SYSTEM OF 1983 (CCS83), ZONE 5, EPOCH 2017.50 AS DETERMINED LOCALLY BY A LINE BETWEEN CONTINUOUS GLOBAL POSITIONING STATIONS (CGPS) AND/OR CONTINUOUS OPERATING REFERENCE STATIONS (CORS) MPWD & TOST BEING SOUTH 35°20'10" EAST AS DERIVED FROM GEODETIC VALUES PUBLISHED BY THE CALIFORNIA SPATIAL REFERENCE CENTER (CSRC).

COORDINATES AND DISTANCES SHOWN HEREON HAVE BEEN SCALED AND TRANSLATED TO A LOCAL GROUND COORDINATE SYSTEM BASED UPON THE FOLLOWING CALCULATED VALUES AT POINT 204:

COMBINED SCALE FACTOR - 0.9999332300
CCS83 GRID COORDINATE - N 1928392.48, E 6290311.15
LOCAL GROUND COORDINATE - N 928392.48, E 290311.15

BENCHMARK: THE VERTICAL DATUM OF THIS SURVEY IS THE NORTH AMERICAN VERTICAL DATUM OF 1988 (NAVD88), PER GEOID MODELING (GEOID12B) AND LEVEL TIES TO POINTS 23 AND 24 FROM VENTURA COUNTY BENCHMARK (VCPD 139), BEING A 3-1/2" BC STAMPED "VENTURA COUNTY SURVEYOR 1965 BM 37-13" IN A HEADWALL ON THE WESTERLY SIDE OF GABBERT ROAD, SOUTHERLY OF THE UNION PACIFIC RAILROAD.

LOCATION MAP

SCALE 0 3000 6000 IN FEET

GENERAL PLAN

SCALE 0 500 1000 IN FEET

GENERAL NOTES

1- ALL STATIONING REFERS TO CENTERLINE OF CONSTRUCTION.

2- ELEVATIONS SHOWN ARE IN FEET ABOVE U.S.C.&G.S. MEAN SEA LEVEL DATUM, 1929.

3- TOPOGRAPHIC FEATURES, BOTH CONTOURS AND CULTURE, ARE PER SURVEY COMPLETED IN 1961.

4- EXCEPT AS OTHERWISE SHOWN ALL UTILITIES ARE TO BE MAINTAINED IN PLACE.

5- EXISTING PRIVATE IMPROVEMENTS WHICH LIE WITHIN THE RIGHTS-OF-WAY FOR THE CHANNEL IMPROVEMENT, UNLESS OTHERWISE SHOWN, WILL BE REMOVED BY THE OWNERS THEREOF OR ABANDONED IN PLACE.

6- FOR TABLE OF HYDRAULIC ELEMENTS SEE SH. 15

7- FOR SUMMARY OF PRINCIPAL EARTHWORK QUANTITIES SEE SHEET 2

8- INDICATED CHANNEL GRADE ELEVATIONS ARE THE ELEVATION OF THE INVERT AT THE BASE OF THE WALLS.

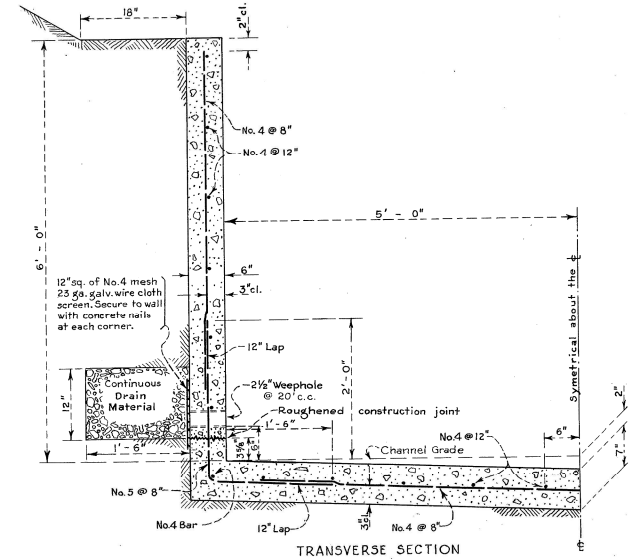
TYPICAL CHANNEL SECTION

STRUCTURAL NOTES



1. All reinforcing bars shall be intermediate grade billet steel, ASTM A15-58T, with deformations conforming to ASTM A305-56T.
2. All bar bends and hooks shall conform to the "Manual of Standard Practice", ACI 315-57.
3. Indicated bar spacing is center to center of bars; bar cover is clear distance between surface of bar and face of concrete.
4. All reinforcing bars shall terminate 2" from the concrete surfaces unless otherwise shown.
5. All splices in bar reinforcement shall be lapped 24 bar diameters unless otherwise shown.
6. No splices in principal reinforcement, other than shown on the drawings, will be permitted without approval of the engineer.
7. Exposed edges of concrete shall be chamfered or rounded.
8. Longitudinal reinforcement in open channel and box sections, unless otherwise shown, shall be placed parallel to the channel ℄ with spacing measured at right angles or radially thereto.
9. Transverse reinforcement, unless otherwise shown, shall be placed at right angles to the channel ℄ in tangent reaches and radially in curved reaches. In curved reaches, bars in both walls and slabs shall be placed with spacing measured at the channel ℄.
10. Transverse joints, unless otherwise shown, shall be placed at right angles or radially to the channel ℄ and joints in walls and slabs shall be in the same transverse plane.
11. Transverse Joint 'A' shall be used in open channel sections and, except as otherwise shown or approved by the engineer, shall be spaced 50' apart. Spacing shall be reduced where necessary to avoid proximity to pipe inlets or to joints specifically designated on the plans. In no case shall joint spacing be less than 10' nor shall any joint be located within 30" of a pipe inlet.
12. Transverse Joint 'B' shall be used between open channel sections and box culvert sections.
13. Longitudinal construction joints at the base and at the tops of walls shall be cleaned by sandblasting and thoroughly washed prior to placing adjacent concrete.

SECTION A-A

Scale: 3/8" = 1'-0"

GENERAL NOTES

1- The So. Pacific Co. will furnish and drive all piles and will construct and remove the temporary bridge.
2- The track will remain in service at all times.
3- The contractor shall furnish and place struts between each pair of 10" H-piles
4- The contractor shall furnish and place 3" x 12" timber lagging between adjacent 10" H-piles during excavation for the culvert to serve as a bulkhead to retain the earth banks and as an outside form for the culvert.
5- The contractor shall fill outside the 3" x 12" timber lagging with dry sand as required so as to maintain the ground level at least 6" above the bottom of the bridge abutment bulkheads at all times.
6- Upon completion of the culvert the contractor shall remove the struts and lagging above the top of the culvert and place compacted backfill to the bottom of the WF bridge stringers and loose fill to the top of the stringers.
7- For earthwork diagrams and structural notes see Sheet 20.

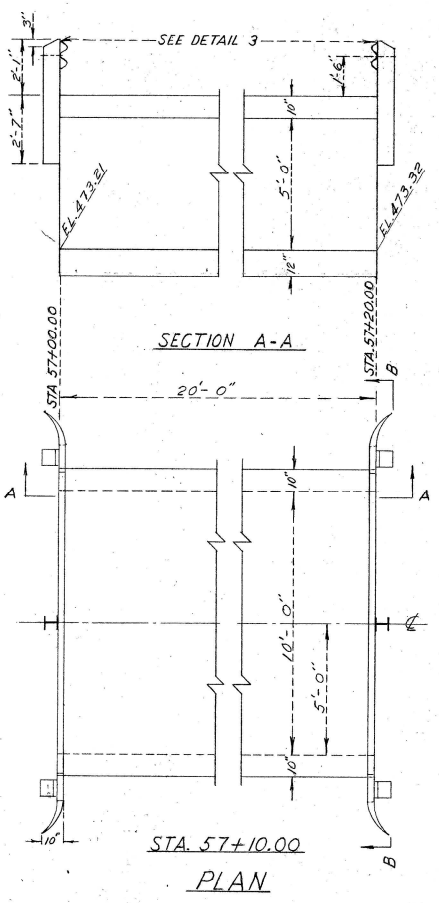
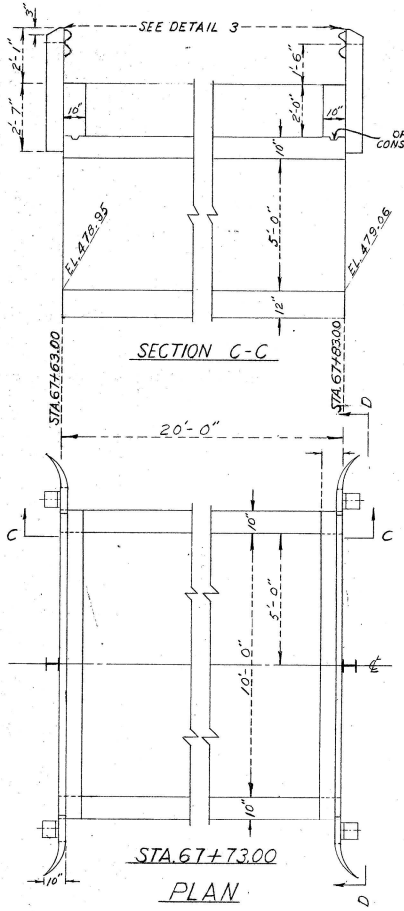
SHEET NO. 23 OF 33
DRAWING NO. 7-E-15518

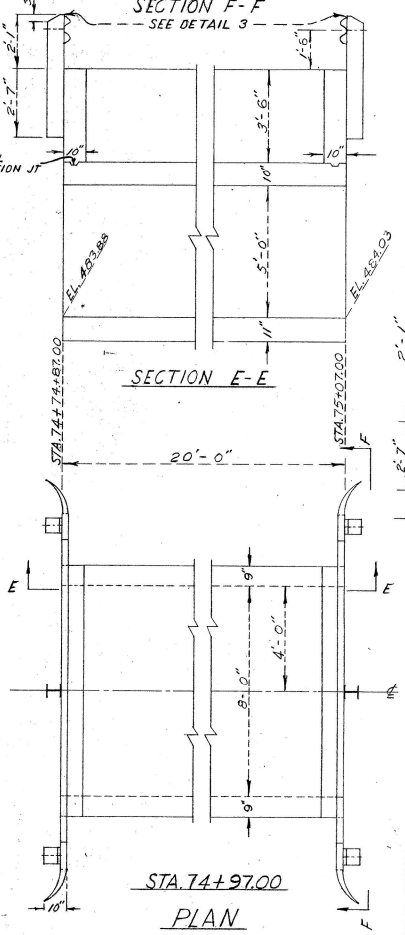
REVISIONS

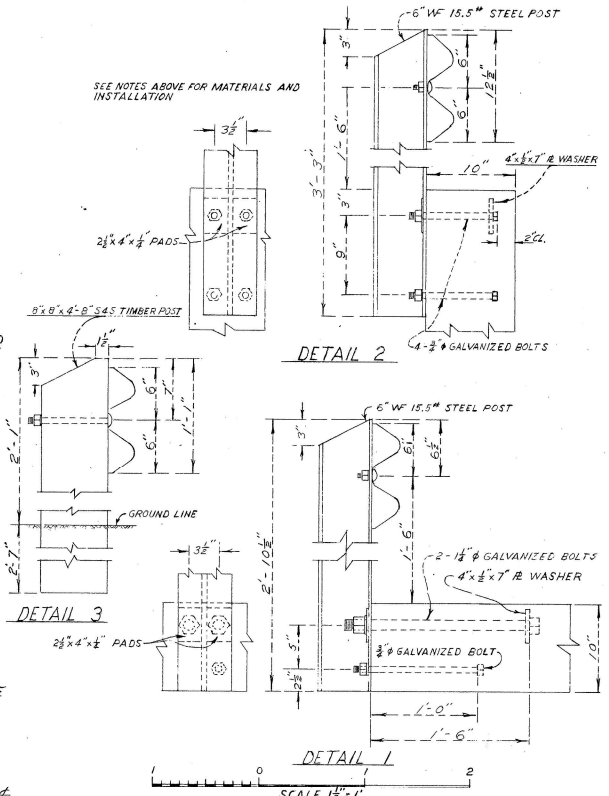


USDA-SCS-PORTLAND, OREG. 1962 M-3688



Y-3-136





GUARD RAIL NOTES

1. GUARD RAIL SHALL BE ARMCO 12 GAGE FLEX-BEAM GUARD RAIL OR EQUAL.
2. TERMINAL SECTIONS SHALL BE ARMCO 10 GAGE OR EQUAL.
3. METAL POSTS SHALL BE 6" WF 15.5lb. STEEL POSTS OR EQUAL.
4. RAILING TO POST FASTENING SHALL BE MADE ACCORDING T MANUFACTURERS SPECS.
5. ALL ANCHOR BOLTS SHALL HAVE HEX NUTS AND CUT WASHERS.
6. LOCK WASHERS SHALL BE PROVIDED FOR TOP ANCHOR BOLTS.
7. FOR TOP ANCHOR BOLTS WELD 2½"x4½"x¼" PADS ON WF POST.
8. HOLES IN METAL POSTS SHALL BE SLOTTED FOR VERTICAL ADJUSTMENT.
9. THE CONTRACTOR SHALL PROVIDE SUITABLE SHEET METAL SHIMS TO ALIGN POSTS.
10. ALL METAL PARTS SHALL BE GALVANIZED.
11. WOOD POSTS SHALL BE 8"x8"x4'-8" S4S TIMBER POSTS. THAT PORTION OF POST TO BE BELOW GROUND SHALL BE DIPPED IN HOT TAR OR ASPHALT. ABOVE GROUND THE POST SHALL BE PAINTED WITH THREE COATS OF WHITE PAINT.

STRUCTURAL NOTES

1. Except as specifically shown, the location of transverse construction joints shall be optional with the contractor. In no case however, shall joints be placed less than 10' apart or within 30" of any pipe outlet.
2. Except for Joint B, all other transverse joints in both slabs and walls, shall be keyed joints as detailed for longitudinal construction joints at base of walls. Transverse reinforcement shall be placed 3" from the joint and longitudinal reinforcement shall be continuous thru the joint.
3. At the option of the contractor, walls and top slab may be placed in the same pour; after placing wall concrete a 2 hour time delay will be required before top slab concrete is placed over it.
4. For additional structural notes, see Sheet 16

NOTES

1. Station locations of borings and off-sets refer to the ℄ of channel construction.
2. Elevations shown represent the ground surface at the site of the test hole. Indicated depths are in feet.
3. Sub-surface data shown hereon is intended to apply only at the location of the test holes, and to the depths indicated.
4. All soil classifications shown are field classifications.
5. No ground water was encountered at the time of exploration.
6. All borings were drilled with a 3" hand auger.
7. Borings no. 1 thru 20 were made in August, 1961, Borings 5A & 5B in Sept. 1961, and Borings 8A & 8B in Oct 1961.
8. On borings 8A & 8B, the indicated conduit sub-grade elevation represents the bottom of excavation in sidehill cut.

STRUCTURAL NOTES

GENERAL:

1. DIMENSIONS FROM FACE OF CONCRETE TO STEEL ARE TO THE NEAREST EDGE OF BAR AND SHALL BE TWO INCHES UNLESS OTHERWISE SHOWN.
2. CONCRETE DIMENSIONS SHALL BE MEASURED HORIZONTALLY OR VERTICALLY ON THE PROFILE, AND PARALLEL TO OR AT RIGHT ANGLES (OR RADIALLY) TO CENTERLINE OF CHANNEL ON THE PLAN EXCEPT AS OTHERWISE SHOWN.
3. ALL BAR BENDS AND HOOKS SHALL CONFORM TO THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" (ACI 318–95) SECTION 7.3.
4. PLACING OF REINFORCEMENT SHALL CONFORM TO THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" (ACI 318–95) SECTION 7.3.
5. TRANSVERSE CONSTRUCTION JOINTS SHALL NOT BE PLACED WITHIN 30 INCHES OF MANHOLE OR JUNCTION STRUCTURE OPENING, OR SIDE INLETS.
6. TRANSVERSE CONSTRUCTION JOINTS IN WALLS AND SLABS SHALL BE IN THE SAME PLANE. NO STAGGERING OF JOINTS WILL BE PERMITTED. TRANSVERSE CONSTRUCTION JOINTS SHALL BE NORMAL OR RADIAL TO THE CENTERLINE OF CONSTRUCTION UNLESS OTHERWISE SHOWN.
7. THE TRANSVERSE REINFORCING STEEL SHALL TERMINATE ONE AND ONE–HALF INCHES FROM THE CONCRETE SURFACES UNLESS OTHERWISE SHOWN ON THE PLANS.
8. EXPOSED EDGES OF CONCRETE MEMBERS SHALL BE CHAMFERED.
9. NO SPLICES IN TRANSVERSE STEEL REINFORCEMENT WILL BE PERMITTED OTHER THAN SHOWN IN THE DRAWING WITHOUT APPROVAL OF THE ENGINEER. NO MORE THAN ONE SPLICE SHALL BE PERMITTED IN ANY LONGITUDINAL BAR BETWEEN TRANSVERSE JOINTS. SPLICES SHALL BE STAGGERED.
10. ALL LAP SPLICES SHALL CONFORM TO THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" (ACI 318–95) SECTION 12.15. LONGITUDINAL STEEL SHALL BE LAPPED 24 BAR DIAMETER AT SPLICES. TRANSVERSE STEEL SHALL BE LAPPED USING THE FOLLOWING TABLE:

BAR SIZE	#4	#5	#6	#7	#8	#9	#10	#11	#14	#18
LENGTH OF LAP SPLICE	25"	31"	38"	54"	62"	70"	79"	87"	TENSION LAP SPLICING NOT PERMITTED	

ADDITIONAL NOTES FOR R.C. OPEN CHANNEL SECTIONS:

11. LONGITUDINAL STEEL SHALL TERMINATE TWO INCHES FROM TRANSVERSE CONSTRUCTION JOINTS.
12. TRANSVERSE CONSTRUCTION JOINTS SHALL BE SPACED NOT TO EXCEED 50 FEET NOR BE LESS THAN 10 FEET, MEASURED ALONG THE CENTERLINE OF CONSTRUCTION, EXCEPT AS OTHERWISE SHOWN ON THE DRAWINGS.
13. TRANSVERSE CONSTRUCTION JOINTS SHALL BE PLACED AT THE JUNCTION OF RECTANGULAR OPEN CHANNEL SECTIONS WITH CLOSED CONDUIT SECTIONS.
14. THE MAXIMUM SPACING OF BARS IN CURVED SECTIONS SHALL NOT EXCEED THAT SHOWN ON THE TYPICAL SECTIONS, UNLESS OTHERWISE SHOWN ON THE DRAWINGS. STEEL SHALL BE PLACED RADIALLY FROM THE MAXIMUM SPACING.
15. AT THE BEGINNING AND ENDING OF ALL POURS, A COMPLETE CURTAIN OF REINFORCEMENT COMPOSED OF B_1, B_4, AND B_7 BARS SHALL BE PLACED THREE INCHES FROM THE TRANSVERSE CONSTRUCTION JOINT.
16. ALL TRANSVERSE JOINTS SHALL BE PROVIDED WITH 1 1/2" x 3/4" FORMED GROOVE IN THE INSIDE FACE AND TOP OF WALLS AND WITH 3/4" TOOLED JOINT IN THE BOTTOM SLAB.
17. THE BAR LENGTHS TABULATED FOR TRANSITIONS ARE APPLICABLE TO THE LARGER SECTION ONLY. THE BARS REQUIRING ADJUSTMENT ARE THOSE TABULATED IN THE TABLE HEREON AND SHALL BE ADJUSTED AS NECESSARY WITHIN THE TRANSITION.
18. TRANSVERSE WALL JOINTS SHALL HAVE A 4" POLYVINYL CHLORIDE WATERSTOP (SPLIT RIBBED CENTER BULB TYPE) WHICH SHALL BE CONTECH VINYLSTOP NO. 4315, BURKE VINYLOK WATERSTOP R.S.B. 316–4, OR AN APPROVED EQUAL.
19. THE LONGITUDINAL WALL JOINTS SHALL HAVE A 4" POLYVINYL CHLORIDE WATERSTOP (RIBBED TYPE) WHICH SHALL BE BURKE VINYLOK WATERSTOP R.316–4, WATER SEALS INC. FLEXSTRIP OR AN APPROVED EQUAL. THE WATERSTOP SHALL BE TIED TO THE OUTSIDE OF THE REINFORCING STEEL AT THE TOP AND BOTTOM WITH ONE PIECE OF WIRE AT APPROXIMATELY 1'–0" SPACING, PUNCHING SHALL NOT BE ALLOWED. THE WATERSTOP SHALL BE CONTINUOUS FOR EACH WALL SECTION.
20. B_1 BARS MAY BE SPLICED ABOVE THE LONGITUDINAL CONSTRUCTION JOINT. USE LAP SHOWN IN THE TABLE HEREON.
21. THE LONGITUDINAL CONSTRUCTION JOINTS SHALL BE CONTINUOUS.

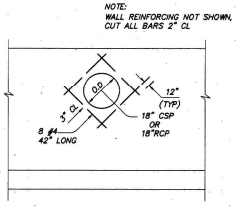
NOTES FOR SUBDRAIN SYSTEM



1. SUBDRAINS SHALL BE INSTALLED BEHIND RC OPEN CHANNEL WALLS AS SHOWN ON PLAN AND PROFILE SHEET 2
2. SUBDRAIN CLEANOUT SHALL BE PLACED AT DESIGNATED LOCATIONS AS SHOWN ON PLAN AND PROFILE SHEET 2
3. ALL PIPE SHALL BE PERFORATED AND SHALL BE POLYVINYL CHLORIDE (PVC) PLASTIC (SCHEDULE 40). PIPE PERFORATIONS SHALL BE ON 120 DEGREE ARC AND FACE OUTWARD FROM THE WALL. (SEE DETAIL HEREON)
4. SUBDRAIN INLETS AND CLEANOUT ENDS SHALL BE LOCATED A MINIMUM OF 2 FEET FROM TRANSVERSE CONSTRUCTION JOINTS.
5. SUBDRAIN INLETS SHALL BE SET IN WALL AND NO PART OF IT SHALL PROTRUDE BEYOND THE INSIDE FACE OF CHANNEL WALL, SEE DETAIL HEREON.
6. UPON COMPLETION OF THE PROJECT, CONTRACTOR SHALL CLEAR ALL SUBDRAINS OF DIRT, RUBBLE, OR OTHER RESTRICTIONS THAT WOULD PROHIBIT FREE FLOW OF WATER THROUGH THE SUBDRAIN PIPE.
7. FILTER AND DRAIN MATERIAL SHALL BE PLACED UP TO PIPE INVERT PRIOR TO INSTALLING PIPE.
8. THE IMPERVIOUS PLUG SHALL CONSIST OF CLASS 500-C-2500 CONCRETE.

File Closing Date:

All permit conditions contained in the original permit remain in full force except as modified by the conditions contained herein.

SEE ATTACHED SPECIAL CONDITIONS FOR PERMIT 2008-074A

In addition to the above special conditions (if any), all conditions, terms and provisions of the original and/or modified permit(s) not modified herein, remain unchanged and in full force and effect.

Permittee's Signature — TUGAN K. LALL — Permittee (print name) — Date 5/15/09

Applicant Signature — CITY OF MOORPARK — Applicant (print name)

Engineer/Manager — Date 14 July 2009

Form 11/2004

SPECIAL CONDITIONS

1. All permit conditions contained in the original permit remain in full force except as clarified or modified by the conditions contained herein.
2. Work on the portion of the construction covered by this modification shall be completed in accordance with the plans and specifications attached and identified as Exhibit "C" (Walnut Canyon Channel Improvements at High Street, revised sheets 2, 3, 5, and 6, which are WPD Drawing Nos. Y-3-4650, -4651, -4653, and -4654 respectively, last revised 7-09-09, with hand corrections in red on sheets 2 and 5).
3. This modification is for the sole purpose of allowing the following changes to the original plans: the addition of 4 feet of 96" RCP at the downstream end of the junction structure, Sta 96+11.18 (Sheet 2, change B); the addition of 8 feet of 96" RCP at the downstream end of the transition structure, Sta 98+30 (Sheet 3, change A); the extension of the transition structure by 2 feet, Sta 93+87.18 (Sheet 2, change C); the extension of the transition structure by 2 feet, Sta 100+04.75 (Sheet 3, change A); the addition of an 18" RCP lateral connection at Sta 99+82.60 (Sheet 3, change B); the removal of an existing 12" PVC lateral connection at Sta 94+69 (Sheet 2, change A) by abandoning in place; the addition of a 20-foot wide double leaf chain-link gate at Sta 100+56.75 (Sheet 3, change D); the change of SE (sand equivalent) in a typical bedding section from SE>75 to SE >= 30 or as approved by the District (Sheet 6, Change A); the change of location of two manholes, one to the junction structure at Sta 96+21.18 (Sheet 2, change B), and the other to the transition structure at Sta 98+40 (Sheet 3, change C); the change of location of the fence along the eastern right-of-way to 12 feet west (Sheet 3, change E); and the change in the height of the parapet wall at Sta 93+45.18 from 18" to 23" (Sheet 2, change G and Sheet 5, change B).
4. The transition structure located at Sta 98+30 to 98+52.75, including the manhole located at Sta 98+40, must be constructed according to the shop drawings that have been submitted to and approved by the District. The steel and other design details based on the approved shop drawings for this transition must be incorporated into the as-built drawings upon completion of construction.
5. There are still discrepancies in the stationing of the downstream transition structure on sheets 2 and 5. These discrepancies have been noted in red by the District on Exhibit "C." All construction and as-built drawings shall be based on the corrected stations as shown on the hand-corrected plans (Exhibit "C") accompanying this modification.

SPECIAL CONDITIONS

1. All permit conditions contained in the original permit remain in full force except as clarified or modified by the conditions contained herein.
2. Work on the portion of the construction covered by this modification shall be completed in accordance with the plans and specifications attached and identified as Exhibit "C" (Walnut Canyon Channel Improvements at High Street, revised sheets 2, 3, 5, and 6, which are WPD Drawing Nos. Y-3-4650, -4651, -4653, and -4654 respectively, last revised 7-09-09, with hand corrections in red on sheets 2 and 5).
3. This modification is for the sole purpose of allowing the following changes to the original plans: the addition of 4 feet of 96" RCP at the downstream end of the junction structure, Sta 96+11.18 (Sheet 2, change B); the addition of 8 feet of 96" RCP at the downstream end of the transition structure, Sta 98+30 (Sheet 3, change A); the extension of the transition structure by 2 feet, Sta 93+87.18 (Sheet 2, change C); the extension of the transition structure by 2 feet, Sta 100+04.75 (Sheet 3, change A); the addition of an 18" RCP lateral connection at Sta 99+82.60 (Sheet 3, change B); the removal of an existing 12" PVC lateral connection at Sta 94+69 (Sheet 2, change A) by abandoning in place; the addition of a 20-foot wide double leaf chain-link gate at Sta 100+56.75 (Sheet 3, change D); the change of SE (sand equivalent) in a typical bedding section from SE>75 to SE >= 30 or as approved by the District (Sheet 6, Change A); the change of location of two manholes, one to the junction structure at Sta 96+21.18 (Sheet 2, change B), and the other to the transition structure at Sta 98+40 (Sheet 3, change C); the change of location of the fence along the eastern right-of-way to 12 feet west (Sheet 3, change E); and the change in the height of the parapet wall at Sta 93+45.18 from 18" to 23" (Sheet 2, change G and Sheet 5, change B).
4. The transition structure located at Sta 98+30 to 98+52.75, including the manhole located at Sta 98+40, must be constructed according to the shop drawings that have been submitted to and approved by the District. The steel and other design details based on the approved shop drawings for this transition must be incorporated into the as-built drawings upon completion of construction.
5. There are still discrepancies in the stationing of the downstream transition structure on sheets 2 and 5. These discrepancies have been noted in red by the District on Exhibit "C." All construction and as-built drawings shall be based on the corrected stations as shown on the hand-corrected plans (Exhibit "C") accompanying this modification.

___ I hereby affirm that I have a Certificate of Consent to self-insure, or a certified copy Certificate of Worker's Compensation Insurance, or a certified copy thereof (Sec. 3800 Labor Code), which is hereby furnished.

___ I, as applicant, am a licensed contractor, or I am exclusively contracting with licensed contractors to construct the project who will furnish the District evidence of Worker's Compensation Insurance prior to beginning work.

___ I certify that in the performance of the work for which this permit is issued, I shall not employ any person in any manner so as to become subject to the Worker's Compensation laws of California (I acknowledge that, if , after making this certification, I should become subject to the Worker's Compensation provision of the Labor Code, I must forthwith comply with such provisions or this permit shall be deemed revoked.)

I hereby acknowledge that the information above is correct and that all permitted acts shall be in accordance with Ordinance No. FC 18 (for Watercourse Permit) and approved plans, if applicable. In consideration of the Ventura County Watershed Protection District issuing this permit. I agree to comply with all terms of this permit including Standard Conditions and Special Provisions. I also agree that all work specified herein shall be commenced within sixty (60) days after the permit is issued or by the date of commencement as set forth above, whichever is earlier, and that all work will be pursued to its completion with reasonable diligence. All work under this permit shall be completed by the completion date specified above, or within one hundred eighty (180) days after the issuance. I understand that this permit may be revoked by the District at any time.

APPLICANT: ROBERT W. ANDERSON (Print Name) **APPLICANT:** _____ (Signature)

ADDRESS: 1956 PALM DR., #E, VENTURA, CA **TELEPHONE NO.:** 805-650-5125

I, hereby acknowledge that upon completion of work covered by this permit the permittee shall accept the improvement not deemed to be the responsibility of the District and shall own, operate and maintain said improvements in accordance with acceptable practice and the requirements of this permit. I understand that this permit may be revoked by the District at any time.

PERMITTEE TUCKER K. LAU (Print Name) Moorpark (City/District - Print) City Engineer (Title / Position) **Date:** 8/28/08

PERMITTEE SIGNATURE: _____ **TITLE:** Public Works Director

Permit Approved By _____ **Title/Position** Permit Manager **Date Issued:** 11 March 2009

NOTIFY PERMIT ENGINEER AT LEAST 48 HOURS PRIOR TO THE COMMENCEMENT OF WORK

FORM 11/22

STANDARD CONDITIONS
APPLICANT

1. Applicant shall maintain District's right-of -way free from any and all debris resulting from the performance of the work under this permit.
2. Activities and uses authorized under this permit are subject to any instructions of the Engineer-Manager or his representative. All instruction must be strictly observed.
3. Any work performed under this permit prior to notification of the District will be subject to whatever action the District deems necessary, including restoration to condition existing before work was begun.
4. Any damage caused to structures owned and operated by District by reason of exercise of the permit shall be repaired by the applicant at his expense and to the satisfaction of the District.
5. This permit is valid only to the extent of District jurisdiction. Permits required by other interested agencies and consent of other interested agencies and the underlying fee owner of District easement lands shall be the responsibility of the applicant. Nothing contained in this permit shall be construed as a relinquishment of any rights now held by the District.
6. Applicant shall indemnify, defend and hold the District, its officers, agents and employees harmless from any and all claims, costs, expenses, liabilities, defense, legal costs, and judgments for damages arising out of, or in any way connected with, the exercise of this permit by applicant or its contractors, agents employees and invitees.
7. Unless otherwise specified herein, this permit is subject to all prior unexplored encroachment permits for the facilities covered by this permits.
8. If conditions change or new acts are discerned concerning the effects of the activities and uses authorized under this permit, or for other good cause, the District way modify the permit in order to protect life and property.
9. Applicant shall provide the District with record drawings (as built) signed by a registered civil engineer and approved by the permittee, depicting the work authorized by the permit within 30 days after installation. Applicant and/or Applicant's or registered engineer, shall be liable for all costs incurred by the District as result of inaccurate record data.
10. Applicant shall cause any bond, if required by the permit, to remain in effect to guarantee all the work to be performed and all the materials to be furnished under this permit against defects in materials or workmanship for a period of one (1) year from the date of final acceptance of the completed work by the District. Applicant shall, within reasonable time after receipt of written notice thereof, make good (at his own expense or at his surety's expense) and without cost of District, any defects in materials or workmanship, which may develop during said one-year period to other work caused by such defects or repairing of the same.
11. Applicant shall pay District all monies due upon written notification and within 30 days of the final inspection.
12. Applicants shall be responsible for the work covered by this permit until all work is deemed completed by the District and Permittee. Permittee shall have no obligation or liability until the acceptance of the work covered by this permit.
13. This permit shall be deemed complete only when all the requirements of the permits are satisfied, and applicant has provided District with written documentation for permittee of satisfactory acceptance of the work performed by applicant.

STANDARD CONDITIONS
PERMITTEE

1. Permittee shall accept all responsibility for perimeter's facilities constructed by applicant pursuant to this permit, upon completion of all work and approval by District and permittee.
2. Any structure or portions thereof placed upon District rights-of -way, or which affect District structures, shall be removed, revised, and/or relocated by permittee without cost to the District, should future activities of the District so require, unless otherwise specified by the District.
3. If the facility subject to this permit changes ownership, the permittee must advise the new owner to contact the District concerning the need for the issuance of the permit modification.
4. No modification, upgrading or reconstruction of facilities covered by this permit is authorized without a prior approval by District.
5. Permittee shall designate, in writing a person responsible for the activities covered by this permit and shall notify District when changes occur,
6. Permittee shall indemnify, defend and hold the District, its officers, agents and employees harmless from any and all claims, costs, expenses, liabilities, defense and legal costs and judgment for damages arising out of, or in any way connected with, the exercise of this permit by permittee or its contractor, agents, employees and invitees.
7. Permittee shall comply with the requirements of the Ventura Countywide Stormwater Quality Management Program (VCSQMP), as well as other state and federal requirements of the Clean Water Act.

SPECIAL CONDITIONS

1. Work shall be completed in accordance with the plans and specifications attached and identified as Exhibit "A" (VCWPD drawings entitled Walnut Canyon Channel Improvements at High Street, Y-3-4649 through Y-3-4659, 11 Sheets), Exhibit "B" (City of Moorpark drawings entitled Storm Drain Improvement Plans, Moorpark Drain #1 Re-Alignment - High Street Improvements, 3 Sheets, Dwg. No. 08-ML-10909), and the Standard and Special Conditions and Provisions of this permit.

2. This permit is for the purpose of allowing the following changes in Walnut Canyon Drain: the construction of approximately 382 feet of 96" RCP, 113 feet of transition structure, 50 feet of junction structure, and 152 feet of 72" RCP. The new construction will tie into the existing 6'x5' RCC at Sta. 100+46.75 at the upstream end and into the existing 8'x5' RCC at Sta. 93+37.18 at the downstream end. The work will also include the removal of approximately 320 feet of existing 8'x5' RCC and 420 feet of existing 6'x5' RCC.

3. This permit is for the purpose of allowing the following changes in Moorpark Drain No. 1: the construction of approximately 229 feet of 6'W X 3.5'H RCB, 40 feet of transition structure and 48 feet of 60-inch RCP. The new construction will tie into the existing RCB at Sta. 4+77.00 at the upstream end and junction with the new 96-inch RCP for Walnut Canyon Drain at Sta. 1+34.84. The work will also include the removal of approximately 320 feet of the existing 6'W X 3.5'H RCB in High Street.

4. Permits required by other agencies and consent of property owners shall be the sole responsibility of the Permittee.

5. The Permittee is responsible for the operation, maintenance, repair, and reconstruction of all improvements until completion and acceptance of the entire system by the District. It is understood that upon completion of the work and official acceptance of said work by the District, 1) the Permittee (City of Moorpark) shall be responsible for all maintenance, repair and reconstruction of the street and related appurtenances, as well as Moorpark Drain No. 1, in perpetuity and 2) the District shall be responsible for the maintenance, repair and reconstruction of Walnut Canyon Drain. In the future, should the District require that work be accomplished on Walnut Canyon Drain, the Permittee will be obligated to perform that work required to remove, repair and/or reconstruct the street to accommodate the District's work on said storm drain.

6. No work shall be carried out in the vicinity of the 2" gas line (approximately Sta 96+85) until written approval from the Gas Company is obtained and submitted to the District.

7. No work shall be carried out in the vicinity of the 8" water line (approximately Sta 97+02) until written approval from the relevant water company (VCWW) is obtained and submitted to the District.

8. This permit does not authorize future encroachments; however, anyone wishing to perform maintenance, repair, or reconstruction, or construct, install, or place anything in the District's easement can apply to the District for separate encroachment permits.

9. If the removals, repair and/or reconstruction requested by the District are not accomplished within the time frame specified in writing by the District, without further notice to Permittee the District may contract out or perform the removal, relocation, repair or reconstruction of the improvements at the sole expense of the Permittee for the actual cost of the work, including administrative costs.

10. This project shall not be considered complete in the field until all District permit conditions have been complied with to the satisfaction of the District, as determined by the District at its sole discretion.

11. This project shall not be officially accepted by the District until all accounts have been brought up to date and all invoices paid in full.

12. During the course of construction, the Permittee shall pay all invoices in full within 30 days of receiving them. Failure to do so may result in the issuance of a Notice of Non-Compliance or a Stop Work at the District's discretion.

13. This permit shall not be closed and the improvements shall not be accepted by the District until the additional easements required for Walnut Canyon Channel have been conveyed to the District and the easement documents recorded with the County Recorder's office. In addition, in order for the As-Built plans to be deemed complete, the approved easement metes and bounds shall be delineated on the Right of Way Map, Sheet 9 of the plan set.

14. Permittee shall notify the Permit Inspection Coordinator by calling 805-650-4060 and faxing the Pre-Construction Meeting Form attached to 805-654-3350 at least 5 working days prior to the commencement of work to schedule a pre-construction meeting. Any work performed prior to the pre-construction meeting or without the appropriate notification of the Permit Inspection Coordinator may be subject to rejection and may have to be re-done. In addition, upon completion of work the Permittee must arrange for a post-construction meeting. The permit cannot be closed and unexpended funds cannot be returned until a post-construction meeting has been held and all outstanding deficiencies and issues resolved.

15. Prior to or at the pre-construction meeting, the Permittee shall provide the District Representative/Inspector with a schedule of work that includes the timing and location of work.

16. Permittee shall immediately notify the District in writing of any changes that may impact the conditions or uses authorized under this permit.

17. Permittee is responsible for on-going coordination with the District Representative/ Inspector for issues and conditions related to this permit. Activities and uses authorized under this permit are subject to any instructions from the engineer - manager or his representative. All instructions must be strictly observed. Additionally, all work must be performed in the presence of the District's inspector, unless otherwise authorized.

18. Proof of automobile coverage, Worker's Compensation and General Liability Insurance shall be submitted by the Permittee and/or Permittee's contractor prior to or at the Pre-Construction Meeting. The coverage shall have the Ventura County Watershed Protection District named as an additional insured and a copy of the current policy together with the General Liability Endorsement Page and the Workers' Compensation Subrogation Waiver Page shall be kept on file with the District for the duration of this permit.

19. In the event Permittee's and/or Permittee's contractor(s) Worker's Compensation and/or General Liability Insurance Certificates expire prior to the expiration date of the permit, it shall be the Permittee's responsibility to ensure the new certificates are sent to the District prior to the insurance policy expiration date and that the policy remains in full force and effect. Failure to provide the District with current insurance certificates is cause for a Stop Work Notice to be issued by the District on the project.

20. Following completion of construction and prior to official acceptance of the project by the District, the Permittee shall provide to the District mylar As-Built plans accompanied by a scanned digital image uncompressed .TIF file with a minimum standard resolution of 300 DPI or an AutoCAD file on CD or DVD for Walnut Canyon Channel and a scanned digital image uncompressed .TIF file with a minimum standard resolution of 300 DPI or an AutoCAD file on CD or DVD for Moorpark Drain No. 1.

21. Permittee shall take appropriate measures to mitigate potential damage to the existing Ventura County Watershed Protection District facilities. Any damage caused to District's facilities during the exercise of this permit shall be repaired at the Permittee's expense, to the satisfaction of this District. Permittee shall immediately restore to original conditions or better all District facilities that are damaged or disturbed.

22. No modification, upgrading, repair or reconstruction of the facilities covered by this permit is authorized without prior written approval from this District.

23. The project site shall be secured at all times to prevent unauthorized entry into the District's rights-of-way and access roads.

24. The Ventura County Watershed Protection District has not reviewed the structural calculations, geotechnical recommendations, or channel hydraulics associated with the construction of the improvements along Moorpark Drain # 1 as shown on Exhibit "B". The City of Moorpark is acting as the responsible agency for all issues related to the construction of the Moorpark Drain #1 improvements.

25. Permittee shall provide for all surveying and construction staking to ensure compliance with the plans and specifications. Permittee shall provide the District with the basic survey control information, signed and stamped by a licensed surveyor, used to perform the construction survey. Permittee shall additionally provide the District's Representative/Inspector with a copy of current complete survey notes, signed and stamped by a licensed surveyor, for area of the work subject to this permit to ensure compliance with the design grades.

26. The design of the project is presently based on a temporary benchmark; therefore, the Permittee shall establish survey control based on a permanent benchmark in the field prior to the performance of any work, including grading, associated with this permit. This updated survey control information shall be reflected on the As-Built plans.

27. Permittee or Contractor shall send submittals, mix designs, shop drawings and material test results for the fill, backfill, sub-grade materials, concrete, slurry, pipe concrete, and steel to Permittee's Engineer for review and approval. After approving, the Engineer shall provide said submittals to the District Engineer for oversight review and approval. The District shall also have oversight review and concurrence on excavation and shoring plans. For each submittal, no associated work shall commence until the Permittee has received the District's signed approval.

28. The fill and backfill material shall be free of organic material, rubbish, debris, and bituminous type pavement. Permittee shall be responsible for ensuring a certificate of non-contamination has been submitted to the District Engineer/Representative prior to placement of the fill.

29. The minimum relative compaction of all fill and backfill shall be 90 percent. Applicant/ Permittee shall provide the District with written documentation from a licensed soils/ geotechnical engineer that the required compaction has been met prior to proceeding with the next construction component.

30. **Compaction Testing.** The work on this permit is subject to performing compaction tests and obtaining approval by the Permittee's Engineer and District Engineer. Compaction tests shall be performed by a Certified Geotechnical Engineering firm licensed in the State of California. Test results shall be submitted to the Permittee's Engineer and District Engineer concurrently and shall include, but not be limited to, the following: 3 point maximum density-optimum moisture curve, a sketch indicating where compaction tests were performed and at indicated depths, and a tabulation of compaction results in percentage of maximum density.

    In all cases, the 3 point maximum density-optimum moisture curve shall be determined prior to performing field compaction tests. Test results shall be made available on the day compaction tests are performed in the field when requested by the Permittee's Engineer, District Engineer or District Inspector.

    For large compaction requirements, Permittee's Contractor shall coordinate with the District Engineer on the number of tests required, location and pre-determined vertical depths.

31. Permittee shall ensure the existence of an adequate all-weather access road on one side of the channel at all times.

32. The Permittee shall comply with all conditions and requirements of the Ventura Countywide Stormwater Quality Management Program (VCSQMP), the Ventura Countywide Storm Water Permit, NPDES Permit No. CAS004002, as well as other applicable requirements of the Porter-Cologne Act and the Clean Water Act. This shall include, but not be limited to, the following requirements:

    - All non-storm water discharges other than those that are allowable per NPDES Permit CAS004002 are prohibited.
    - Storm water discharges containing pollutants that have not been reduced to the maximum extent practicable are prohibited.
    - Permittee is responsible for the quality of discharges that enter the storm drain system and any degradation of receiving water quality resulting from such discharge.

33. If the project will result in land disturbing activity of greater than 1 acre, the Permittee shall comply with the requirements of NPDES Permit No. CAS000002, Waste Discharge Requirements for Discharges of Storm Water Runoff Associated with Construction Activities (General Construction Permit). This shall include, but not be limited to the following requirements:

    - Permittee is responsible for implementation of a Stormwater Pollution Prevention Plan (SWPPP), and, if necessary, the Permittee shall modify the SWPPP at the request of the District representative during the course of the subject permit term. No further work shall be performed until adequate measures are implemented.
    - All non-storm water discharges are prohibited
    - All storm water discharges from construction sites shall implement Best Management Practices to reduce pollutants to the maximum extent practicable.

34. Permittee shall operate and maintain the site with the proper construction BMP's in a manner to reduce the discharge of pollutants to the maximum extent practicable. Permittee shall have available on-site for review a Stormwater Pollution Prevention Plan (SWPPP). The District reserves the right to require changes to the plans in the event that control measures are inadequate to control water pollution effectively. No further work shall be performed until adequate measures are implemented.

35. Any work performed within or adjacent to the bed and banks of the channel during the rainy season (November 1 to April 30) shall have a five-day clear weather forecast from the District. All debris, forms, etc. shall be removed from the channel and the site stabilized with appropriate BMP's to the satisfaction of the District in the event the District indicates rain in the forecast. No construction, which can obstruct the channel capacity and/or cause the transport of sediment, debris, or construction materials, shall be performed prior to obtaining a five-day clear weather forecast from the District.

36. The Permittee assumes all responsibility for work performed within or adjacent to a basin and/or channel during the rainy season (November 1 through April 30), including the need for water diversion plans, rainy season BMP's and all other additional requirements deemed necessary by the District or other legal authority.

37. Permittee shall submit its Water Control and Diversion Plan to the District for review and concurrence prior to commencement of work. The Plan shall illustrate BMP's implemented for preventing materials, including but not limited to dust, pieces of concrete and rebar from entering the streambed. The Water Diversion and Control Plan shall also detail a system capable of controlling illicit discharges during the rainy season. Permittee shall provide the District with a copy of the SWPPP updated for work within the channel area during the rainy season. The District reserves the right to require changes to the plans in the event it may be detrimental to the channel area.

38. No dumping of material into the channel or District facilities is allowed. Violation will result in the issuance of a Notice of Non-Compliance or Stop Work at the District's discretion.

39. No stockpiling of excavated material will be allowed within the bed and banks of the channel or District's rights-of-way. All excavated material not used during the construction operations shall be properly disposed of off-site in accordance with local, state and federal regulations.

40. No discharge of construction water to the downstream channel will be allowed. Permittee shall employ approved techniques that ensure all construction water is collected and properly disposed of in accordance with local, state, and federal regulations.

41. Spoils storage areas and staging/storage areas for equipment and materials shall be located outside of the channel area.

42. Equipment used in conjunction with the performance of this permit shall be removed at the end of each workday from the channel area. Additionally, refueling and other equipment maintenance shall be performed in a designated area outside the bed and banks of the channel to ensure petroleum products or other pollutants from the equipment will not enter the channel under any flow.

43. Any equipment or vehicles driven and/or operated within or adjacent to the channel shall be checked and maintained daily to prevent leaks of materials that, if introduced into the water environment, could be deleterious to aquatic life.

44. Stationary equipment such as motors, pumps, generators, and welders located within or adjacent to the channel shall be positioned over drip pans.

45. The cleanup of all spills shall begin immediately. The Department shall be notified immediately by the Permittee of any spills and shall be consulted regarding clean-up procedures.

46. Raw cement/concrete or washings thereof, asphalt, paint or other coating material, oil or other petroleum products, or any other substances which could be hazardous to aquatic life, resulting from project related activities, shall be disposed of at an approved disposal site in accordance with Local, State and Federal regulations. Any of these materials placed within or where they may enter the channel by the Permittee shall be removed immediately.

47. No debris, soil, silt, sand, bark, trash, cement or concrete or washings thereof, oil or petroleum products, bituminous materials or other organic or earthen material from any construction, or associated activity of whatever nature shall be allowed to enter into or be placed where it can be washed by rainfall or runoff waters into waters under the regulatory jurisdiction of the District.

48. The Permittee shall employ good housekeeping practices by complying with all litter and pollution laws. All construction materials shall be collected and properly disposed of off-site. All contractors, subcontractors and employees shall also obey these laws and it shall be the responsibility of the Permittee to ensure compliance.

PERMIT MODIFICATION
PUBLIC WORKS AGENCY
VENTURA COUNTY WATERSHED PROTECTION DISTRICT
800 South Victoria Avenue, Ventura, CA 93009
(805) 654-2001

Applicant: CITY OF MOOORPARK REDEVELOP.AGENCY
Address: 799 MOORPARK AVENUE
MOORPARK, CA 93021
Phone #: (805)517-6217
Watercourse: WALNUT CANYON STORM DRAIN
Zone: 3
Purpose:

Permit #: 2008074-A
Project #: 8B875
Mod #:

THIS PERMIT ALLOWS WORK ON THE PORTION OF THE CONSTRUCTION COVERED BY THIS MODIFICATION SHALL BE COMPLETED IN ACCORDANCE WITH THE PLANS & SPECIFICATIONS ATTACHED & IDENTIFIED AS EXHIBIT "C". WALNUT CANYON CHANNEL IMPROVEMENTS AT HIGH STREET, REVISED SHEETS 2, 3, 5, AND 6, WHICH ARE WPD DRAWING NOS. Y-3-4650, -4651, -4653, AND -4654 RESPECTIVELY, LAST REVISED ON 07/09/2009, WITH HAND CORRECTIONS IN RED ON SHEETS 2 & 5.

Plan Check Deposit:	$0.00	*Receipt#*		
Inspection Deposit:	$0.00	*Receipt#*		
Application Fee:	$180.00	*Receipt#*	8201	07/14/2009

Inspection Fee:	$0.00	*Receipt#*		
Facility Use Fee:	$0.00	*Receipt#*		
Access Key Deposit:	$0.00	*Receipt#*	8201	
Performance Security:	$0.00			

Work Start Date: 7/14/2009
Issue Date: 7/14/2009
Expiration Date: 9/30/2009

Estimated Completion Date: 9/30/2009
Final Inspection:
File Closing Date:

All permit conditions contained in the original permit remain in full force except as modified by the conditions contained herein.

SEE ATTACHED SPECIAL CONDITIONS FOR PERMIT 2008-074A

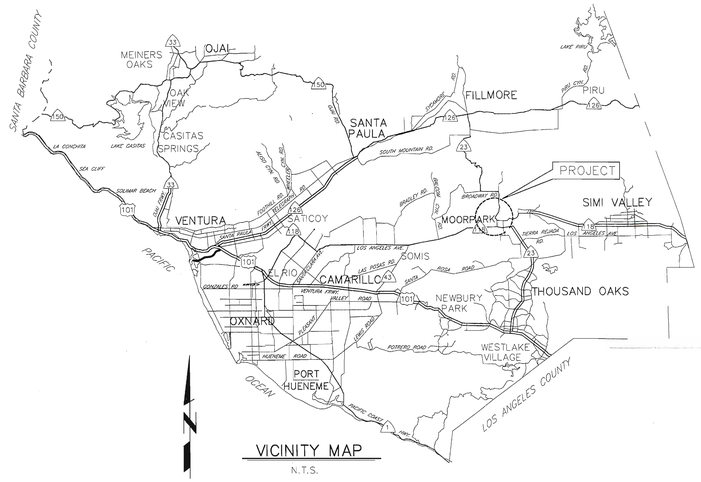
In addition to the above special conditions (if any), all conditions, terms and provisions of the original and/or modified permit(s) not modified herein, remain unchanged and in full force and effect.

Permittee's Signature — TUGAN K. LALL — Permittee (print name) — Date 5/15/09

Applicant Signature — CITY OF MOORPARK — Applicant (print name)

Engineer/Manager — Date 14 July 2009

Form 11/2004



SPECIAL CONDITIONS

1. All permit conditions contained in the original permit remain in full force except as clarified or modified by the conditions contained herein.
2. Work on the portion of the construction covered by this modification shall be completed in accordance with the plans and specifications attached and identified as Exhibit "C" (Walnut Canyon Channel Improvements at High Street, revised sheets 2, 3, 5, and 6, which are WPD Drawing Nos. Y-3-4650, -4651, -4653, and -4654 respectively, last revised 7-09-09, with hand corrections in red on sheets 2 and 5).
3. This modification is for the sole purpose of allowing the following changes to the original plans: the addition of 4 feet of 96" RCP at the downstream end of the junction structure, Sta 96+11.18 (Sheet 2, change B); the addition of 8 feet of 96" RCP at the downstream end of the transition structure, Sta 98+30 (Sheet 3, change A); the extension of the transition structure by 2 feet, Sta 93+87.18 (Sheet 2, change C); the extension of the transition structure by 2 feet, Sta 100+04.75 (Sheet 3, change A); the addition of an 18" RCP lateral connection at Sta 99+82.60 (Sheet 3, change B); the removal of an existing 12" PVC lateral connection at Sta 94+69 (Sheet 2, change A) by abandoning in place; the addition of a 20-foot wide double leaf chain-link gate at Sta 100+56.75 (Sheet 3, change D); the change of SE (sand equivalent) in a typical bedding section from SE>75 to SE >= 30 or as approved by the District (Sheet 6, Change A); the change of location of two manholes, one to the junction structure at Sta 96+21.18 (Sheet 2, change B), and the other to the transition structure at Sta 98+40 (Sheet 3, change C); the change of location of the fence along the eastern right-of-way to 12 feet west (Sheet 3, change E); and the change in the height of the parapet wall at Sta 93+45.18 from 18" to 23" (Sheet 2, change G and Sheet 5, change B).
4. The transition structure located at Sta 98+30 to 98+52.75, including the manhole located at Sta 98+40, must be constructed according to the shop drawings that have been submitted to and approved by the District. The steel and other design details based on the approved shop drawings for this transition must be incorporated into the as-built drawings upon completion of construction.
5. There are still discrepancies in the stationing of the downstream transition structure on sheets 2 and 5. These discrepancies have been noted in red by the District on Exhibit "C." All construction and as-built drawings shall be based on the corrected stations as shown on the hand-corrected plans (Exhibit "C") accompanying this modification.

SPECIAL CONDITIONS

1. All permit conditions contained in the original permit remain in full force except as clarified or modified by the conditions contained herein.
2. Work on the portion of the construction covered by this modification shall be completed in accordance with the plans and specifications attached and identified as Exhibit "C" (Walnut Canyon Channel Improvements at High Street, revised sheets 2, 3, 5, and 6, which are WPD Drawing Nos. Y-3-4650, -4651, -4653, and -4654 respectively, last revised 7-09-09, with hand corrections in red on sheets 2 and 5).
3. This modification is for the sole purpose of allowing the following changes to the original plans: the addition of 4 feet of 96" RCP at the downstream end of the junction structure, Sta 96+11.18 (Sheet 2, change B); the addition of 8 feet of 96" RCP at the downstream end of the transition structure, Sta 98+30 (Sheet 3, change A); the extension of the transition structure by 2 feet, Sta 93+87.18 (Sheet 2, change C); the extension of the transition structure by 2 feet, Sta 100+04.75 (Sheet 3, change A); the addition of an 18" RCP lateral connection at Sta 99+82.60 (Sheet 3, change B); the removal of an existing 12" PVC lateral connection at Sta 94+69 (Sheet 2, change A) by abandoning in place; the addition of a 20-foot wide double leaf chain-link gate at Sta 100+56.75 (Sheet 3, change D); the change of SE (sand equivalent) in a typical bedding section from SE>75 to SE >= 30 or as approved by the District (Sheet 6, Change A); the change of location of two manholes, one to the junction structure at Sta 96+21.18 (Sheet 2, change B), and the other to the transition structure at Sta 98+40 (Sheet 3, change C); the change of location of the fence along the eastern right-of-way to 12 feet west (Sheet 3, change E); and the change in the height of the parapet wall at Sta 93+45.18 from 18" to 23" (Sheet 2, change G and Sheet 5, change B).
4. The transition structure located at Sta 98+30 to 98+52.75, including the manhole located at Sta 98+40, must be constructed according to the shop drawings that have been submitted to and approved by the District. The steel and other design details based on the approved shop drawings for this transition must be incorporated into the as-built drawings upon completion of construction.
5. There are still discrepancies in the stationing of the downstream transition structure on sheets 2 and 5. These discrepancies have been noted in red by the District on Exhibit "C." All construction and as-built drawings shall be based on the corrected stations as shown on the hand-corrected plans (Exhibit "C") accompanying this modification.

GENERAL NOTES

1. ELEVATIONS SHOWN ARE IN US FEET, NATIONAL GEODETIC VERTICAL DATUM OF 1929.
2. STATIONS SHOWN ON DRAWINGS ARE ALONG CENTERLINE OF STRUCTURE.
3. E.G.L. AND H.G.L. ARE SHOWN FOR FUTURE REFERENCE BY THE DISTRICT ONLY.
4. NUMBERS IN ⬡ INDICATE BID ITEMS UNDER WHICH PAYMENT WILL BE MADE.
5. LETTERS AND NUMBERS IN ⊖ INDICATE THE DETAIL CALL-OUT AND SHEET ON WHICH REFERENCE DETAIL IS SHOWN.
6. NUMBERS IN △ REFER TO NOTES ON THE SAME SHEET UNLESS OTHERWISE NOTED.
7. TREES DESIGNATED BY ▨ SHALL BE REMOVED. ALL OTHERS SHALL BE PROTECTED IN PLACE.
8. TOPOGRAPHY AND CROSS SECTIONS FOR THIS PROJECT WERE TAKEN FROM SURVEYS PERFORMED BY CVE ENGINEERING
9. SOIL TEST BORINGS FOR THE PROJECT WERE MADE IN 2001, 2006, AND 2008 AND THEIR LOCATION IS MARKED BY THE SYMBOL ◓. SUBSURFACE SOIL INVESTIGATION RESULTS ARE FURNISHED FOR INFORMATION ONLY, IN ACCORDANCE WITH SUBSECTION 2-7 OF THE STANDARD SPECIFICATIONS, AND NO WARRANTY IS MADE THEREFOR.
10. EXISTING IMPROVEMENTS WITHIN THE RIGHT OF WAY AND WORK AREAS SHALL REMAIN AND SHALL BE PROTECTED UNLESS OTHERWISE NOTED. DAMAGED IMPROVEMENTS SHALL BE REPLACED IN KIND TO A CONDITION EQUAL TO OR BETTER THAN THAT WHICH EXISTED PRIOR TO CONSTRUCTION.
11. UTILITIES ARE SHOWN AS KNOWN TO EXIST AT TIME OF SURVEY. UTILITIES MAY HAVE BEEN OMITTED, MISPLACED, AND/OR RELOCATED. CONTRACTOR SHALL EXERCISE CARE IN EXCAVATION AND SHALL PROTECT ALL UTILITIES.
12. SYMBOL ▲ INDICATES THE LOCATION OF THE HORIZONTAL AND VERTICAL CONTROL POINTS WHICH WILL BE FURNISHED BY THE AGENCY FOR THE CONSTRACTOR'S USE.
    TBM: BCR OF THE SOUTH CURB OF HIGH STREET AND THE INTERSECTION OF MOORPARK ROAD
    ELEV.=(510.31 TC)
    BASIS OF BEARING: THE BEARING OF NORTH 89°54'16" WEST AS SHOWN AS THE CENTERLINE OF HIGH STREET (PER 358 O.R. 9).
13. CONTRACTOR SHALL NOTIFY UTILITY OWNERS A MINIMUM OF 48 HOURS PRIOR TO STARTING WORK IN AREAS AFFECTING THEIR FACILITIES:

SOUTHERN CALIFORNIA EDISON CO.	TEL. NO. (805) 654-7472	CASEY SCHOONOVER
SOUTHERN CALIFORNIA GAS CO.	TEL. NO. (818) 700-3614	MARK WHITE

NOTES:

1. INSTALL 96" REINFORCED CONCRETE PIPE WITH 1" OF INTERIOR CONCRETE LINING INSIDE DIAMETER OF PIPE PER VCWPD STANDARDS.
2. CONSTRUCT RCB TO RCP TRANSITION STRUCTURE PER SPPWC, 2006 EDITION, STD. PLAN 342-1 OR (E/6)
3. MANHOLE SHAFT AND APPURTENANCES, AT STA. 96+32.60, AND 98+00.00 SHALL BE CONSTRUCTED PER STANDARD PLANS, SPPWC 324-1, WHERE MANHOLE SHAFT SHALL TAPER FROM DA = 48" TO 30". MANHOLE COVERS SHALL BE CAST WITH THE LETTERS "VCWPD". THE LETTERS SHALL BE 2 1/2" HIGH WITH 1/2" LINE WIDTH. MANHOLE COVERS SHALL ALSO HAVE A LIFTING SLOT IN ADDITION TO THE PICK HOLE. MANHOLE SHAFT CONNECTION TO RC STRUCTURE SHALL BE CONSTRUCTED PER STANDARD PLANS, SPPWC 322-1.
4. SAWCUT, REMOVE, AND DISPOSE OF EXISTING CONCRETE DRAINAGE CHANNEL FROM STA. 93+37.18 TO STA. 100+46.75. REPLACE WITH ENGINEERED FILL TO 90 OR 95 (AT ROAD SECTIONS) PERCENT RELATIVE COMPACTION AT 1 TO 3 PERCENT OVER OPTIMUM SOIL-WATER CONTENT, UNLESS OTHERWISE SPECIFIED AS REQUIRING SPECIAL COMPACTION. (SEE RJR GEOTECHNICAL REPORT FOR ADDITIONAL RECOMMENDATIONS)
5. HIGH STREET IMPROVEMENTS PER SEPARATE PLANS.
6. CONSTRUCT CURB OPENING CATCH BASIN WITH LOCAL DEPRESSION, PER SPPWC, 2006 EDITION, STD PLANS 301-2 AND 313-2, RESPECTIVELY, WHERE WIDTH=5', V-DEPTH=4' A=60'.
7. REMOVE AND DISPOSE OF INTERFERING CHAIN LINK FENCE AND GATES WITHIN THE RIGHT OF WAY.
8. INSTALL 5FT HIGH CHAIN-LINK FENCE PER SPPWC 600-2, 2006 EDITION.
9. EXISTING IMPROVEMENTS WITHIN THE RIGHT OF WAY AND WORK AREA LIMITS SHALL BE PROTECTED IN PLACE UNLESS OTHERWISE NOTED. DAMAGED IMPROVEMENTS SHALL BE REPLACED IN KIND TO ITS ORIGINAL CONDITION OR BETTER TO THE SATISFACTION OF THE PROJECT ENGINEER AT CONTRACTOR'S EXPENSE.
10. INSTALL 5FT HIGH X 15FT WIDE SINGLE LEAF CHAIN-LINK GATE PER SPPWC 600-2, 2006 EDITION. CHAIN-LINK GATE SHALL BE 25FT AWAY FROM THE CURB OF THE DRIVEWAY APPROACH.
11. CONSTRUCT DRIVEWAY APPROACH PER SPPWC 110-1 (TYPE B) W=15', X=3', Y=4'

PLAN

SCALE OF FEET

NOTES:

1. INSTALL 96" REINFORCED CONCRETE PIPE WITH 1" OF INTERIOR CONCRETE LINING INSIDE DIAMETER OF PIPE PER VCWPD STANDARDS.
2. CONSTRUCT RCB TO RCP TRANSITION STRUCTURE PER SPPWC, 2006 EDITION, STD. PLAN 342-1.
3. MANHOLE SHAFT AND APPURTENANCES, AT STA. 96+32.60, AND 98+00.00 SHALL BE CONSTRUCTED PER STANDARD PLANS, SPPWC 324-1 WHERE MANHOLE SHAFT SHALL TAPER FROM DA = 48" TO 30". MANHOLE COVERS SHALL BE CAST WITH THE LETTERS "VCWPD". THE LETTERS SHALL BE 2 1/2" HIGH WITH 1/2" LINE WIDTH. MANHOLE COVERS SHALL ALSO HAVE A LIFTING SLOT IN ADDITION TO THE PICK HOLE. MANHOLE SHAFT CONNECTION RC STRUCTURE SHALL BE CONSTRUCTED PER STANDARD PLANS, SPPWC 322-1.
4. SAWCUT, REMOVE, AND DISPOSE OF EXISTING CONCRETE DRAINAGE CHANNEL FROM STA. 93+37.18 TO STA. 100+46.75. REPLACE WITH ENGINEERED FILL TO 90 (OR 95 AT ROAD SECTIONS) PERCENT, RELATIVE COMPACTION AT 1 TO 3 PERCENT OVER OPTIMUM SOIL-WATER CONTENT, UNLESS OTHERWISE SPECIFIED AS REQUIRING SPECIAL COMPACTION. (SEE RJR GEOTECHNICAL REPORT FOR ADDITIONAL RECOMMENDATIONS)
5. HIGH STREET IMPROVEMENTS PER SEPARATE PLANS.
6. INSTALL 72" REINFORCED CONCRETE PIPE WITH 1" OF INTERIOR CONCRETE LINING INSIDE DIAMETER OF PIPE PER VCWPD STANDARDS.
7. REMOVE AND DISPOSE OF INTERFERING CHAIN LINK FENCE AND GATES WITHIN THE RIGHT OF WAY.
8. INSTALL 5FT HIGH CHAIN-LINK FENCE PER SPPWC 600-2, 2006 EDITION.
9. EXISTING IMPROVEMENTS WITHIN THE RIGHT OF WAY AND WORK AREA LIMITS SHALL BE PROTECTED IN PLACE UNLESS OTHERWISE NOTED. DAMAGED IMPROVEMENTS SHALL BE REPLACED IN KIND TO ITS ORIGINAL CONDITION OR BETTER TO THE SATISFACTION OF THE PROJECT ENGINEER AT CONTRACTOR'S EXPENSE.
10. INSTALL 5FT HIGH X 15FT WIDE SINGLE LEAF CHAIN-LINK GATE PER SPPWC 600-2, 2006 EDITION. CHAIN-LINK GATE SHALL BE 25FT AWAY FROM THE CURB OF THE DRIVEWAY APPROACH.
11. CONSTRUCT CMB ACCESS ROAD PER (L 6)
12. CONSTRUCT DRIVEWAY APPROACH PER SPPWC 110-1 (TYPE B) W=15', X=3', Y=4'

STRUCTURAL NOTES

GENERAL:

1. DIMENSIONS FROM FACE OF CONCRETE TO STEEL ARE TO THE NEAREST EDGE OF BAR AND SHALL BE TWO INCHES UNLESS OTHERWISE SHOWN.
2. CONCRETE DIMENSIONS SHALL BE MEASURED HORIZONTALLY OR VERTICALLY ON THE PROFILE, AND PARALLEL TO OR AT RIGHT ANGLES (OR RADIALLY) TO CENTERLINE OF CHANNEL ON THE PLAN EXCEPT AS OTHERWISE SHOWN.
3. ALL BAR BENDS AND HOOKS SHALL CONFORM TO THE 2008 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR REINFORCED CONCRETE" (ACI 318–08), SECTION 7.3.
4. PLACING OF REINFORCEMENT SHALL CONFORM TO THE 2008 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR REINFORCED CONCRETE" (ACI 318–08), SECTION 7.5.
5. TRANSVERSE CONSTRUCTION JOINTS SHALL NOT BE PLACED WITHIN 30 INCHES OF MANHOLE OR JUNCTION STRUCTURE OPENING, OR SIDE INLETS.
6. TRANSVERSE CONSTRUCTION JOINTS IN WALLS AND SLABS SHALL BE IN THE SAME PLANE. NO STAGGERING OF JOINTS WILL BE PERMITTED. TRANSVERSE CONSTRUCTION JOINTS SHALL BE NORMAL OR RADIAL TO THE CENTERLINE OF CONSTRUCTION UNLESS OTHERWISE SHOWN.
7. THE TRANSVERSE REINFORCING STEEL SHALL TERMINATE ONE AND ONE–HALF INCHES FROM THE CONCRETE SURFACES UNLESS OTHERWISE SHOWN ON THE PLANS.
8. EXPOSED EDGES OF CONCRETE MEMBERS SHALL BE CHAMFERED.
9. NO SPLICES IN TRANSVERSE STEEL REINFORCEMENT WILL BE PERMITTED OTHER THAN SHOWN IN THE DRAWING WITHOUT APPROVAL OF THE ENGINEER. NO MORE THAN ONE SPLICE SHALL BE PERMITTED IN ANY LONGITUDINAL BAR BETWEEN TRANSVERSE JOINTS. SPLICES SHALL BE STAGGERED.
10. ALL LAP SPLICES SHALL CONFORM TO THE 2005 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR REINFORCED CONCRETE" (ACI 318–08), SECTION 12.15. LONGITUDINAL STEEL SHALL BE LAPPED 24 BAR DIAMETER AT SPLICES. TRANSVERSE STEEL SHALL BE LAPPED USING THE FOLLOWING TABLE:

BAR SIZE	#4	#5	#6	#7	#8	#9	#10	#11	#14	#18
LENGTH OF LAP SPLICE	25"	31"	37"	62"	81"	103"	130"	160"	TENSION LAP SPLICING NOT PERMITTED	

ADDITIONAL NOTES FOR R.C. OPEN CHANNEL SECTIONS:

11. LONGITUDINAL STEEL SHALL TERMINATE TWO INCHES FROM TRANSVERSE CONSTRUCTION JOINTS.
12. TRANSVERSE CONSTRUCTION JOINTS SHALL BE SPACED NOT TO EXCEED 50 FEET NOR BE LESS THAN 10 FEET, MEASURED ALONG THE CENTERLINE OF CONSTRUCTION, EXCEPT AS OTHERWISE SHOWN ON THE DRAWINGS.
13. TRANSVERSE CONSTRUCTION JOINTS SHALL BE PLACED AT THE JUNCTION OF RECTANGULAR OPEN CHANNEL SECTIONS WITH CLOSED CONDUIT SECTIONS.
14. THE MAXIMUM SPACING OF BARS IN CURVED SECTIONS SHALL NOT EXCEED THAT SHOWN ON THE TYPICAL SECTIONS, UNLESS OTHERWISE SHOWN ON THE DRAWINGS. STEEL SHALL BE PLACED RADIALLY FROM THE MAXIMUM SPACING.
15. AT THE BEGINNING AND ENDING OF ALL POURS, A COMPLETE CURTAIN OF REINFORCEMENT COMPOSED OF B_1, B_4, AND B_7 BARS SHALL BE PLACED THREE INCHES FROM THE TRANSVERSE CONSTRUCTION JOINT.
16. ALL TRANSVERSE JOINTS SHALL BE PROVIDED WITH 1 1/2" x 3/4" FORMED GROOVE IN THE INSIDE FACE AND TOP OF WALLS AND WITH 3/4" TOOLED JOINT IN THE BOTTOM SLAB.
17. THE BAR LENGTHS TABULATED FOR TRANSITIONS ARE APPLICABLE TO THE LARGER SECTION ONLY. THE BARS REQUIRING ADJUSTMENT ARE THOSE TABULATED IN THE TABLE HEREON AND SHALL BE ADJUSTED AS NECESSARY WITHIN THE TRANSITION.
18. TRANSVERSE WALL JOINTS SHALL HAVE A 4" POLYVINYL CHLORIDE WATERSTOP (SPLIT RIBBED CENTER BULB TYPE) WHICH SHALL BE CONTECH VINYLSTOP NO. 431S, BURKE VINYLOK WATERSTOP R.S.B. 316–4, OR AN APPROVED EQUAL.
19. THE LONGITUDINAL WALL JOINTS SHALL HAVE A 4" POLYVINYL CHLORIDE WATERSTOP (RIBBED TYPE) WHICH SHALL BE BURKE VINYLOK WATERSTOP R316–4, WATER SEALS INC. FLEXSTRIP OR AN APPROVED EQUAL. THE WATERSTOP SHALL BE TIED TO THE OUTSIDE OF THE REINFORCING STEEL AT THE TOP AND BOTTOM WITH ONE PIECE OF WIRE AT APPROXIMATELY 1'–0" SPACING, PUNCHING SHALL NOT BE ALLOWED. THE WATERSTOP SHALL BE CONTINUOUS FOR EACH WALL SECTION.
20. B_1 BARS MAY BE SPLICED ABOVE THE LONGITUDINAL CONSTRUCTION JOINT. USE LAP SHOWN IN THE TABLE HEREON.
21. THE LONGITUDINAL CONSTRUCTION JOINTS SHALL BE CONTINUOUS.
22. THE SPACING OF THE LONGITUDINAL BARS IN THE SLAB SHALL BE BASED ON THE DISTANCE BETWEEN THE LONGITUDINAL CORNER BARS NEAREST THE INSIDE FACE OF THE STRUCTURE AND THE NUMBER OF BARS SPECIFIED IN THE TABLE. THE SPACING IN THE WALLS SHALL BE BASED ON THE WALL HEIGHT AND THE NUMBER OF BARS IN THE TABLE.

STRUCTURAL NOTES

GENERAL:

1. DIMENSIONS FROM FACE OF CONCRETE TO STEEL ARE TO THE NEAREST EDGE OF BAR AND SHALL BE TWO INCHES UNLESS OTHERWISE SHOWN.
2. CONCRETE DIMENSIONS SHALL BE MEASURED HORIZONTALLY OR VERTICALLY ON THE PROFILE AND PARALLEL TO OR AT RIGHT ANGLES (OR RADIALLY) TO CENTERLINE OF CONDUIT ON THE PLAN UNLESS OTHERWISE SHOWN.
3. ALL BAR BENDS AND HOOKS SHALL CONFORM TO THE 2008 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" (ACI 318–08), SECTION 7.3.
4. PLACEMENT OF REINFORCING STEEL SHALL CONFORM TO THE 2005 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" (ACI 318–08), SECTION 7.5.
5. TRANSVERSE CONSTRUCTION JOINTS SHALL NOT BE PLACED WITHIN 30 INCHES OF MANHOLE OR JUNCTION STRUCTURE OPENINGS, OR SIDE INLETS UNLESS OTHERWISE SHOWN.
6. TRANSVERSE CONSTRUCTION JOINTS IN WALLS AND SLABS SHALL BE IN THE SAME PLANE. NO STAGGERING OF JOINTS WILL BE PERMITTED. ALL TRANSVERSE CONSTRUCTION JOINTS SHALL BE NORMAL OR RADIAL TO THE CENTERLINE OF CONSTRUCTION UNLESS OTHERWISE SHOWN.
7. THE TRANSVERSE REINFORCING STEEL SHALL TERMINATE TWO INCHES FROM THE CONCRETE SURFACE UNLESS OTHERWISE SHOWN ON THE STRUCTURAL DETAILS.
8. EXPOSED EDGES OF CONCRETE MEMBERS SHALL BE CHAMFERED.
9. NO SPLICES IN TRANSVERSE STEEL REINFORCEMENT WILL BE PERMITTED OTHER THAN AS SHOWN ON THE DRAWINGS WITHOUT APPROVAL FROM THE ENGINEER. NO MORE THAN ONE SPLICE WILL BE PERMITTED IN ANY LONGITUDINAL BAR BETWEEN TRANSVERSE JOINTS. SPLICES SHALL BE STAGGERED.
10. ALL SPLICES SHALL CONFORM TO THE 2005 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" (ACI 318–08), SECTION 12.15. ALL STEEL SHALL BE LAPPED USING THE FOLLOWING TABLE (CLASS B SPLICES):

BAR SIZE	#4	#5	#6	#7	#8	#9	#10	#11	#14	#18
LENGTH OF LAP SPLICE	25"	31"	37"	62"	81"	103"	130"	160"	TENSION LAP SPLICING NOT PERMITTED	
THE LAP LENGTH SHALL BE BASED ON THE SMALLER SIZE BAR.										

ADDITIONAL NOTES FOR RC TRANSITION SECTION:

11. LONGITUDINAL STEEL SHALL BE CONTINUOUS AND EXTENDED THROUGH ALL CONSTRUCTION JOINTS.
12. UNLESS OTHERWISE SHOWN ON THE DRAWINGS, TRANSVERSE JOINT KEYWAYS (IN BOTH SLABS AND WALLS), SHALL BE PLACED AT THE END OF EACH POUR, BUT THE SPACING THEREOF SHALL NOT EXCEED 50 FEET OR BE LESS THAN 10 FEET.
13. UNLESS OTHERWISE SHOWN ON THE DETAILS, IN CURVED SECTIONS, TRANSVERSE BARS SHALL BE PLACED RADIALLY. STRAIGHT TRANSVERSE BARS IN TOP AND BOTTOM SLABS SHALL BE PLACED AS SHOWN ON THE TYPICAL SECTIONS. SPACING SHALL BE AT THE CENTERLINE OF CONSTRUCTION FOR SINGLE–BARREL BOXES, UNLESS OTHERWISE NOTED. STRAIGHT BARS AND L–BARS IN WALLS SHALL BE SPACED AS SHOWN ON TYPICAL SECTIONS, WITH THE SPACING MEASURED BETWEEN THE VERTICAL LEGS OF BARS.
14. AT THE BEGINNING AND END OF ALL POURS, A CURTAIN OF REINFORCEMENT COMPOSED OF B, C, C_2, D, F, G, AND H BARS SHALL BE PLACED THREE INCHES FROM THE TRANSVERSE CONSTRUCTION JOINT.
15. THE VERTICAL WALL STEEL IN THE INTERIOR WALLS AND IN THE INTERIOR FACE OF EXTERIOR WALLS MAY BE SPLICED AT THE CONSTRUCTION JOINT AT THE BASE OF THE WALL. THE LAP SPLICE SHALL BE ACCORDANCE WITH THE TABLE UNDER GENERAL NOTE 10.
16. IN ALL SECTIONS, LAP C AND C_2 BARS. THE VERTICAL LENGTH OF C AND C_2 BARS HAS BEEN CALCULATED FOR A 3 1/2" STARTER WALL. IF THE HEIGHT OF THE STARTER WALL VARIES, THE VERTICAL LENGTH OF THE C AND C BARS SHALL BE VARIED CORRESPONDINGLY, SO AS TO MAINTAIN THE REQUIRED LAP SPLICE BETWEEN THE TWO BARS IN ACCORDANCE WITH THE TABLE UNDER GENERAL NOTE 10. THE LENGTH OF THE LAPS SHALL BE BASED ON THE SMALLER BAR.
17. TRANSVERSE WALL JOINTS SHALL HAVE A 4" POLYVINYL CHLORIDE WATERSTOP (SPLIT RIBBED CENTER BULB TYPE) WHICH SHALL BE CONTECH VINYLSTOP NO. 431S, BURKE VINYLOK WATERSTOP R.S.B. 316–4, OR AN APPROVED EQUAL.
18. DRILL A ONE INCH DIAMETER HOLE AND INJECT AN APPROVED NON–SHRINK GROUT INTO THE HOLE PRIOR TO PLACEMENT OF THE BAR
19. THE LONGITUDINAL WALL JOINTS SHALL HAVE A 4" POLYVINYL CHLORIDE WATERSTOP (RIBBED TYPE) WHICH SHALL BE BURKE VINYLOK WATERSTOP R.316–4, WATER SEALS INC. FLEXSTRIP OR AN APPROVED EQUAL. THE WATERSTOP SHALL BE TIED TO THE OUTSIDE OF THE REINFORCING STEEL AT THE TOP AND BOTTOM WITH ONE PIECE OF WIRE AT APPROXIMATELY 1'–0" SPACING, PUNCHING SHALL NOT BE ALLOWED. THE WATERSTOP SHALL BE CONTINUOUS FOR EACH WALL SECTION.
20. TWO LONGITUDINAL BARS SHALL BE PLACED AT EACH CORNER LOCATION. AS SHOWN ON THE DETAIL. THE REMAINING LONGITUDINAL BARS SHALL BE EQUALLY SPACED BETWEEN THE CORNER BARS WITH A MAXIMUM SPACING OF 18 INCHES IN EACH FACE OF THE SLABS AND WALLS AND NEED NOT CORRESPOND TO THE NUMBER OR LOCATION SHOWN ON THE DETAIL SEE THE TABLE FOR LONGITUDINAL BAR TOTALS.
21. STATIONS ARE MEASURED RADIALLY FROM SURVEY CONTROL LINE TO THE CENTER LINE OF RC BOX.

SPEC. NO.
PROJ. NO. 88875

WALNUT CANYON CHANNEL IMPROVEMENTS AT HIGH STREET
RIGHT OF WAY MAP

SHEET 9 OF 11
DRAWING NO. Y-3-4657

SECTION 1

APPLICABLE SPECIFICATIONS AND STANDARDS

1–1 All work shall be performed in accordance with the provisions of the latest edition of the Standard Specifications for Public Works Construction (SSPWC)(GREEN BOOK) and the Standard Plans for Public Works Construction (SPPWC), both prepared and promulgated by the Southern California chapters of the American Public Works Association and the Associated General Contractors of California, and these Special Provisions.

SECTION 2

GRADING PERMITS

2–1 Material exported or wasted outside of the project right–of–way shown on the plans are subject to all requirements of the Grading Ordinance. The requirements may include, but are not limited to, submitting of a grading plan prepared by a Civil Engineer, obtaining a grading permit, paying the permit fee, posting a grading bond, hiring professional engineering and testing services for compacting fills, constructing drainage facilities and providing erosion protection. These requirements are the responsibility of the owner of the land on which the material is placed.

SECTION 3

CONSTRUCTION MATERIALS

3–1 The Engineer may require certificates of compliance with the specifications for materials or manufactured items produced outside of the job site. Such certificates will not relieve the Contractor from the requirements of providing material and manufactured items complying with the specifications even though they have been incorporated into the job.

SECTION 4

EXCAVATION SAFETY

4–1 This work shall consist of performing all work required to meet the excavation safety requirements specified in Subsection 7–10.4.

SECTION 5

CONSTRUCTION SURVEYS

5–1 SCOPE

Surveys to be provided by the Contractor and/or the Developer's Engineer shall conform to the general industry standards and the following minimum quality and standards.

5–2 PERFORMANCE AND ACCURACY

The surveys shall be accomplished with sufficient precision to result in the required accuracy and shall be performed under the supervision of a Land Surveyor or Civil Engineer licensed by the State of California. The requirements herein shall apply to the minimum essential control required to accomplish establishment of lines and grades by the Contractor, and to provide the Engineer the necessary references for insuring construction accuracy. The method used to establish working stakes will be at the Contractor's option.

5–3 DETAILS OF STAKING

5–3.1 Alignment

Centerline alignment stakes or offset stakes shall be set at a maximum of 50–foot intervals and at all curve points, angle points, changes in elevation or wall height. On curves, stakes shall be set at 25–foot intervals.

5–3.2 Rough Grade Stake

For rough grading, with cuts or fills, at least one line of stakes shall be set on catch or hinge points, or an offset line. These stakes shall be marked with cut or fill to permit rough finishing of the grading plane. Where slope check points have been set near the elevation of the grading plane, they may be used as rough grade stakes. The longitudinal interval shall be 50 feet.

5–3.3 Final Grade Stakes

For RC spillways 10–foot or less in width, one set of final grade stakes shall be established in the invert to control and to check all elements of the structural section. Two sets, one on each side of the invert shall be established for any facility in excess of the above. These shall be in addition to those set outside the limits of the structure or the excavation. Offset distance from each edge of structure or centerline shall be constant.

Grade shall refer to the plane of the finished invert or slope surface. The mark on the stake shall be on the plane or at a uniform vertical offset from the plane of the finished surface. Longitudinal spacing will be 50 feet for tangent alignment and grade. Spacing will be reduced to 25 feet when radius of curvature is less than 1,000 feet or when rate of change of slope is less than 0.005 ft/ft. Prior to concrete placement, grade stakes and forms shall be checked.

For pipe conduits, stakes shall be set at the ends and at grade and line breaks. If conduit is to be constructed in stages, the ends of the staged lengths shall be staked.

When ends of long, straight runs are not intervisible, intermediate stakes shall be set. The finished pipe grades shall be controlled by optical sighting devices. Use of stringline will not be allowed.

5–3.4 Embankment Stakes

Rough grade stakes shall be placed 25 feet O.C. at toe of embankment and along the dam axis.
Fine grade stakes shall be placed prior to trimming the overbuilt slops.

5–3.5 Minor Drainage Structure Stakes

Beginning and ending points of all side inlets and drains, and any grade or line breaks shall be properly staked and referenced. For long side drains, requirements of Subsection 3.3 shall apply. Horizontal and vertical locations of junctions, drop inlets, risers, manholes shall be staked. A minimum of two stakes should be set in each case. Elevations of all reference points shall be shown on the notes and at the site.

5–3.6 Fence

For fence along a right–of–way line not parallel to the channel centerline, the reference shall be set as follows:

(1) For tangent alignment, set intervisible points at breaks in terrain or at a maximum interval of 200' ±.
(2) Set points for changes in alignment.
(3) Set stakes at regular interval on curves. Use an interval of 50 feet for radii of 1,000 feet and greater; use 25 feet for shorter radii.

5–3.7 Miscellaneous

Survey staking for miscellaneous facilities shall be performed as required by the Engineer.

5–4 SURVEY NOTES

All survey notes shall be kept on 8–1/2" x 11" standard Agency forms. Master copies of forms will be provided to the Contractor at the preconstruction conference. Notes shall indicate the name of the project, the Contractor, the firm performing surveys and party chief, and shall be dated. Two copies of the notes shall be provided to the Engineer or his representative within one day of performance. No construction work shall be initiated on an increment of the project before survey notes for said increment are received by the Engineer or his field representative. The original notes shall be retained by the surveyor and submitted to the Engineer upon completion of work organized in a proper order in a loose–leaf folder.

SECTION 6

DIVERSION AND CONTROL OF WATER

6–1 SCOPE

This work shall consist of the diversion and control of all water entering into the construction area or otherwise affecting construction activities.

6–2 CONSTRUCTIONS METHODS

All permanent construction shall be performed in a site free from water. The Contractor shall construct, maintain, and operate all necessary cofferdams, pumps, channels, flumes, drains and/or other temporary diversion and protective works required for diversion and control of all water, whatever its source, during construction. In order to reduce sediments from being transported downstream, the Contractor shall complete all work on the diversion channel prior to disturbing or altering the flow in the natural channel. Inundation of partially completed work due to lack of control during nonworking periods will not be permitted, and may be cause for requiring removal of work already completed with replacement at the Contractor's expense.

Prior to beginning work involving diversion and control of water, the Contractor shall submit a water control plan to the Engineer. During construction, if circumstances require changes to the original water control plan, a revised water control plan shall be promptly submitted to the Engineer. No responsibility shall accrue to the Engineer or the Agency as a result of the plan or as a result of knowledge of the plan. The Contractor shall hold the Agency and the Engineer harmless from legal action taken by any third party with respect to construction and operation of the diversion and protective work.

Construction and operations of the diversion and control works shall be in accordance with the water control plan submitted, except as deviation therefrom may be specifically approved by the Engineer. All works installed by the Contractor in connection with dewatering, control, and diversion of water but not specified to become permanent part of the project, shall be removed and the site restored, insofar as practical, to its original condition prior to completion of construction or when directed by the Engineer.

SECTION 7

SUBGRADE STABILIZATION

7–1 SCOPE

This work shall consist of subgrade stabilization and shall be performed in accordance with the Standard Specifications, the plans, and these Special Provisions. (See Subsection 300–7.3).

7–2 CONSTRUCTION MATERIALS

Well graded crushed rock material approved by the Engineer and the developer's soil engineer shall be used for stabilization. If float rock or other ungraded rock mixture is used for stabilization, it shall be mixed with the native material to fill all voids before structure construction begins.

7–3 CONSTRUCTION METHODS

7–3.1 Subgrade stabilization shall be performed to insure the suitability of subgrade to withstand the load of the proposed structure and of the formwork, reinforcing steel supports, foot traffic, and similar items.

7–3.2 The need for and extent of subgrade stabilization will be determined by the developer's engineer and approved by Engineer. If and where not needed, subgrade stabilization shall not be performed.

7–3.3 Use of subgrade stabilization material for water control will not be allowed, unless a specifically designed mix is used and properly incorporated into a subdrain system.

SECTION 8

EXCAVATION

8–1 SCOPE

This work shall consist of excavation for the construction of RC spillways and pipes, and appurtenant work and shall be performed in accordance with the Standard Specifications, the Plans, and these Special Provisions.

8–2 CONSTRUCTION METHODS

Excavation shall be performed in accordance with Subsection(s) 300–7.3 and 306–1.1 respectively. Excavated material may be used for fill and backfill subject to Engineer approval. Excess excavation material shall be disposed of outside the project limits.

SECTION 9

FILL AND BACKFILL

9–1 SCOPE

This work shall consist of fill for reinforced concrete major structures, RC spillways, pipes, and related facilities and shall conform to the Standard Specifications, the Plans, and these Special Provisions.

9–2 CONSTRUCTION MATERIALS

Fill materials shall constitute both native and imported materials required to fill and backfill over and around the structures as shown on the plans, excluding filter materials and bedding for RC pipes. Fill materials shall be approved by the Engineer prior to use.

9–3 CONSTRUCTION METHODS

9–3.1 Fill and backfill for RC spillways and pipes shall be performed in accordance with Subsection 300–7.4.

9–3.2 The moisture content of the fill material shall be maintained within 1 percent below and 3 percent above optimum. The optimum moisture content for each site or soil type will be determined by the testing laboratory doing the control.

9–3.3 No material shall be deposited against the outside walls of the reinforced concrete spillways and the end top of cast–in–place RC box spillway until the concrete within the entire cross section of said cast–in–place RC box has developed a strength of not less than 4000 psi in compression, as determined for quality control by the methods specified in ASTM C 31.

SECTION 10

REINFORCING STEEL FOR MAJOR STRUCTURES

10–1 SCOPE

This work shall consist of reinforcing steel furnishing, bending, fabricating and placing for major concrete structures, including reinforced concrete spillways, bubbler, intake structures, head walls, and other structures incorporated therein and shall be performed in accordance with the Standard Specifications, the plans, and these Special Provisions.

10–2 CONSTRUCTION MATERIALS

All reinforcing steel shall be Grade 60 billet steel conforming to Subsection 201–2.

10–3 CONSTRUCTION METHODS

10–3.1 Reinforcing Steel Shop Drawings

Prior to fabricating the reinforcing steel, the Contractor shall submit four copies of the reinforcing steel take–off/placing diagram shop drawings for review. However, furnishing of the shop drawings to the Engineer shall not be construed to imply that the shop drawings will be reviewed for accuracy. The Contractor shall be wholly and completely responsible for the accuracy of the shop drawings and for furnishing and placing the reinforcing steel in accordance with the details shown on the plans and as specified. Comments on the shop drawings by the Engineer shall be addressed by the Contractor immediately upon receipt and revised and/or corrected shop drawings shall be resubmitted prior to steel reinforcing placement on the job site.

SECTION 11

CONCRETE FOR MAJOR STRUCTURES

11–1 SCOPE

This work shall consist of portland cement concrete for reinforced concrete spillways, bubbler, intake structures, parapet walls, transitions, and other structures incorporated therein, and shall be constructed in accordance with the Standard Specifications, the plans, and these Special Provisions.

11–2 CONSTRUCTION MATERIALS

11–2.1 Portland Cement

Cement shall be Type II, low alkali portland cement conforming to ASTM C 150 and the low alkali requirements of Table 2 therein.

11–2.2 Aggregate

Aggregate shall conform to Alternate Rock Material – Type S as specified in Section 400. All aggregate shall meet the requirements of the combined aggregate gradation C. Soundness loss determined by California Test Method 214 shall not exceed 10 percent.

11–2.3 Strength Requirements

All concrete shall attain a minimum 28–day compressive strength of 4000 psi, in accordance with Subsection 201–1.1.3. Use of any mix other than the approved shall be grounds for rejection and removal of concrete already placed.

In the event that concrete test cylinders fail to meet the strength requirements of the specifications, the concrete placed on the job shall be cored. The Engineer shall determine the frequency and location of the cores to provide representative sampling. The Contractor shall pay the Agency the cost of such coring and testing. The cores obtained shall be tested for ultimate compressive strength in accordance with ASTM C 174 and ASTM C 42. No test shall be less than 90 percent of the specified 28–day strength. The Engineer shall determine the volumes of concrete which are deficient in strength. Acceptance or removal shall be in accordance with the applicable specifications.

As an alternate method, the Contractor may determine when the concrete compressive strength has attained 4000 psi. He may, at his own expense, make, cure, and deliver concrete specimens according to ASTM C 31, Field Cure Procedures, in molds supplied by the Agency. The method of curing specimens must be approved by the Engineer. The Agency's Material Laboratory will test the samples for compressive strength at such time during a normal workday as the Contractor deems satisfactory. The Contractor shall arrange for the samples to be delivered.

11–2.4 Joint Sealant

When required on the plans, joint sealant shall comply with Subsection 201–3.6

11–2.5 Curing Compound

Curing compound shall comply with Subsection 201–4.1, Type I–D, with red fugitive dye.

11–3 CONSTRUCTION METHODS

11–3.1 Sequence of Placement of Concrete

A minimum of 16 hours shall elapse between alternate placement of portland cement concrete in adjacent sections both longitudinally and transversely along the construction joints in the invert slabs. Similar minimum elapsed time shall be required for alternate pours in the walls and top slabs.

Continuous pours of sections in excess of 50 feet long will not be allowed unless otherwise indicated on the plans. The Contractor shall maintain a uniform placement pattern approved by the Engineer.

11–3.2 Invert Slabs

Following consolidation of the placed concrete by vibration method, the concrete shall be struck off or screeded to the required grade by means of a straight edge. A small amount of concrete is to be pushed ahead of the straight edge to fill in the low spots. Immediately after strike off, the concrete shall be worked with a "bull float" or "darby" until a smooth surface is obtained. As the sheen begins to leave the surfaces, edging and jointing working shall be done.

When the concrete has set sufficiently for proper finishing, a two–step operation of floating and troweling shall be used on the invert. The first step shall be floating of the concrete surface, with power equipment, until a smooth uniform surface is acquired. When the concrete has hardened so that water and fine material will not be worked to the surface, the second step of the finishing operation shall commence. This step shall be the finishing of the invert surface with a power steel trowel.

All edging and jointing work should be re–marked before the second step or steel troweling operations to insure sharp and clean markings.

If shoring is used for construction, it shall be performed in such a manner as not to interfere with the finishing of the invert slab. No deviation from this requirement will be allowed. Solid sheeting will not be allowed.

11–3.3 Vertical Walls

11–3.3.1 Finishing of Top Walls

In order to provide for accurate and even surface finish, forms for the RC channel spillway, bubbler structure and head walls construction shall not extend above finished wall grade. Chamfer strips shall be provided on both inside and outside forms. Edging of concrete corners will not be allowed.

11–3.3.2 Grouting

Grout mixture shall be provided at all horizontal construction joints as required by Subsection 303–1.8.2. The depth of the grout shall not be less than 2 inches and not more than 4 inches measured vertically. The grout mixture shall be placed as uniformly as possible immediately prior to placement of concrete.

When small amounts of grout mixture are required, the Engineer may allow the use of grout mixed on site. The grout mixed on site shall consist of 1 part cement and 2 parts concrete sand. For on site mix, the aggregate and cement shall conform to Sections 200 and 201, respectively.

11–3.4 Placing Concrete Under Adverse Weather Conditions

The following is in addition to the requirements of Subsection 303–1.8.7.

If quick setting is encountered, the concrete shall not be retempered. Rather than introducing free water at the plant, water may be added to a dry batched mix through a certified water meter near the project site. If this is done, other specification requirements are not waived. The total elapsed time between the addition of cement to the aggregates and discharging the completed mix shall not exceed 90 minutes with concrete temperatures less than 85° F. With higher concrete temperatures, less time will be allowed, as approved by the Engineer.

11–3.5 Curing

Curing shall comply with Subsection 303–1.10.

11–3.6 Corrective Measures

In the event cracks in excess of 0.03 inch in width occur in the structure, the cracks shall be injected with an epoxy approved by the Engineer, to the level of finish concrete.

REGISTERED PROFESSIONAL ENGINEER ROBERT W. ANDERSON C–058383 EXP. 12–31–10 CIVIL STATE OF CALIFORNIA

SPEC. NO.
PROJ. NO. 88875

WALNUT CANYON CHANNEL IMPROVEMENTS AT HIGH STREET
PROJECT SPECIFICATIONS

SHEET 10 OF 11
DRAWING NO. Y–3–4658

SECTION 12

LADDERS

12–1 SCOPE

This work shall consist of furnishing and installation of ladders and shall be performed in accordance with the Standard Specifications, the Standard Plans, and these Special Provisions.

12–2 CONSTRUCTION MATERIALS AND METHODS

12–2.1 Ladders

Ladders shall consist of steps and pipe handles and shall be installed at locations shown on the plans.

12–2.1.1 Steps

Steps shall conform to the SPPWC Standard Plan 635–2 and/or 636–1 at the Engineer's option.

12–2.1.2 Pipe Handles

Pipe handles shall meet the requirements of Subsection 206–5.

SECTION 13

ACCESS ROAD

13–1 SCOPE

This work shall consist of access road construction and shall be performed in accordance with the Standard Specifications, the plans, and these Special Provisions.

13–2 CONSTRUCTION MATERIALS

13–2.1 Crushed Miscellaneous Base (CMB) Surfacing

Surfacing shall consist of CMB meeting the requirements of the fine gradation of Subsection 200–2.4, except that percentage passing No. 200 sieve shall range between 7% and 11%.

13–2.2 Asphalt Concrete (AC) Surfacing

13–2.2.1 Processed Miscellaneous Base (PMB) Surfacing

PMB shall conform to the requirements of Subsection 200–2.5 for fine grading.

13–2.2.2 Asphalt Concrete

AC shall conform to the requirements of Subsection 400–4 and shall be Type III–B3–AR–4000 or 8000, Type III–C3–AR–4000 or 8000.

13–3 CONSTRUCTION METHODS

13–3.1 Subgrade

Subgrade shall be prepared in accordance with Subsection 301–1. The relative compaction and tolerances shall be per Subsections 301–1.3 and 301–1.4 respectively for base and sub–base material.

13–3.2 Crushed Miscellaneous Base (CMB) Surfacing

Surfacing shall be a minimum of 6" thick and shall be constructed in accordance with Subsection 301–2, except that the relative compaction shall not be less than 95 percent.

13–3.3 Asphalt Concrete (AC)

13–3.3.1 Processed Miscellaneous Base

Construction of the PMB shall be performed in accordance with Subsection 301–2 and to the dimensions shown on the Plans.

13–3.3.2 Asphalt Concrete

Construction of AC shall be performed in accordance with Subsection 302–5 and to the dimensions shown on the plans. AC construction shall be performed after all other work is completed.

SECTION 14

CHAIN LINK FENCE AND GATE

14–1 SCOPE

This work shall consist of furnishing and installing 5–foot high chain link fence, 5–foot high by 15–foot wide single leaf and walk–in gate(s) and shall be performed in accordance with the Standard Specifications, the Plans, and these Special Provisions.

14–2 CONSTRUCTION MATERIALS

Materials for chain link fence and gate(s) shall conform to Subsection 206–6 and Standard Plan 600–0 of SPPWC, except that Subsection 206–6.3 is revised to provide knuckled selvage on bottom and top edges of chain link fabric.

14–3 CONSTRUCTION METHODS

Chain link fence and gate(s) shall be installed at locations shown on the plans. The construction shall be performed in accordance with Standard Plan 600–0 of SPPWC, except that it shall be provided with a top rail.

GENERAL NOTES

1. ELEVATIONS SHOWN ARE IN US FEET, NATIONAL GEODETIC VERTICAL DATUM OF 1929.
2. STATIONS SHOWN ON DRAWINGS ARE ALONG CENTERLINE OF STRUCTURE.
3. E.G.L. AND H.G.L. ARE SHOWN FOR FUTURE REFERENCE BY THE DISTRICT ONLY.
4. NUMBERS IN ⬡ INDICATE BID ITEMS UNDER WHICH PAYMENT WILL BE MADE.
5. LETTERS AND NUMBERS IN ⊖ INDICATE THE DETAIL CALL-OUT AND SHEET ON WHICH REFERENCE DETAIL IS SHOWN.
6. NUMBERS IN △ REFER TO NOTES ON THE SAME SHEET UNLESS OTHERWISE NOTED.
7. TREES DESIGNATED BY ▨ SHALL BE REMOVED. ALL OTHERS SHALL BE PROTECTED IN PLACE.
8. TOPOGRAPHY AND CROSS SECTIONS FOR THIS PROJECT WERE TAKEN FROM SURVEYS PERFORMED BY CVE ENGINEERING
9. SOIL TEST BORINGS FOR THE PROJECT WERE MADE IN 2001, 2006, AND 2008 AND THEIR LOCATION IS MARKED BY THE SYMBOL ◓. SUBSURFACE SOIL INVESTIGATION RESULTS ARE FURNISHED FOR INFORMATION ONLY, IN ACCORDANCE WITH SUBSECTION 2-7 OF THE STANDARD SPECIFICATIONS, AND NO WARRANTY IS MADE THEREFOR.
10. EXISTING IMPROVEMENTS WITHIN THE RIGHT OF WAY AND WORK AREAS SHALL REMAIN AND SHALL BE PROTECTED UNLESS OTHERWISE NOTED. DAMAGED IMPROVEMENTS SHALL BE REPLACED IN KIND TO A CONDITION EQUAL TO OR BETTER THAN THAT WHICH EXISTED PRIOR TO CONSTRUCTION.
11. UTILITIES ARE SHOWN AS KNOWN TO EXIST AT TIME OF SURVEY. UTILITIES MAY HAVE BEEN OMITTED, MISPLACED, AND/OR RELOCATED. CONTRACTOR SHALL EXERCISE CARE IN EXCAVATION AND SHALL PROTECT ALL UTILITIES.
12. SYMBOL ▲ INDICATES THE LOCATION OF THE HORIZONTAL AND VERTICAL CONTROL POINTS WHICH WILL BE FURNISHED BY THE AGENCY FOR THE CONSTRACTOR'S USE.
    TBM: BCR OF THE SOUTH CURB OF HIGH STREET AND THE INTERSECTION OF MOORPARK ROAD
    ELEV.=(510.31 TC)
    BASIS OF BEARING: THE BEARING OF NORTH 89°54'16" WEST AS SHOWN AS THE CENTERLINE OF HIGH STREET (PER 358 O.R. 9).
13. CONTRACTOR SHALL NOTIFY UTILITY OWNERS A MINIMUM OF 48 HOURS PRIOR TO STARTING WORK IN AREAS AFFECTING THEIR FACILITIES:

SOUTHERN CALIFORNIA EDISON CO.	TEL. NO. (805) 654-7472	CASEY SCHOONOVER

C_3	136'	89°54'19"	213.40'	135.78'

NOTES:

1. INSTALL 96" REINFORCED CONCRETE PIPE WITH 1" OF INTERIOR CONCRETE LINING INSIDE DIAMETER OF PIPE PER VCWPD STANDARDS.
2. CONSTRUCT RCB TO RCP TRANSITION STRUCTURE PER SPPWC, 2006 EDITION, STD. PLAN 342-1 OR E 6
3. MANHOLE SHAFT AND APPURTENANCES, AT STA. 96+32.60, AND 98+00.00 SHALL BE CONSTRUCTED PER STANDARD PLANS, SPPWC 324-1, WHERE MANHOLE SHAFT SHALL TAPER FROM DA = 48" TO 30". MANHOLE COVERS SHALL BE CAST WITH THE LETTERS "VCWPD". THE LETTERS SHALL BE 2 1/2" HIGH WITH 1/2" LINE WIDTH. MANHOLE COVERS SHALL ALSO HAVE A LIFTING SLOT IN ADDITION TO THE PICK HOLE. MANHOLE SHAFT CONNECTION TO RC STRUCTURE SHALL BE CONSTRUCTED PER STANDARD PLANS, SPPWC 322-1.
4. SAWCUT, REMOVE, AND DISPOSE OF EXISTING CONCRETE DRAINAGE CHANNEL FROM STA. 93+37.18 TO STA. 100+46.75. REPLACE WITH ENGINEERED FILL TO 90 OR 95 (AT ROAD SECTIONS) PERCENT RELATIVE COMPACTION AT 1 TO 3 PERCENT OVER OPTIMUM SOIL-WATER CONTENT, UNLESS OTHERWISE SPECIFIED AS REQUIRING SPECIAL COMPACTION. (SEE RJR GEOTECHNICAL REPORT FOR ADDITIONAL RECOMMENDATIONS)
5. HIGH STREET IMPROVEMENTS PER SEPARATE PLANS.
6. CONSTRUCT CURB OPENING CATCH BASIN WITH LOCAL DEPRESSION, PER SPPWC, 2006 EDITION, STD PLANS 301-2 AND 313-2, RESPECTIVELY, WHERE WIDTH=5', V-DEPTH=4' A=60'.
7. REMOVE AND DISPOSE OF INTERFERING CHAIN LINK FENCE AND GATES WITHIN THE RIGHT OF WAY.
8. INSTALL 5FT HIGH CHAIN-LINK FENCE PER SPPWC 600-2, 2006 EDITION.
9. EXISTING IMPROVEMENTS WITHIN THE RIGHT OF WAY AND WORK AREA LIMITS SHALL BE PROTECTED IN PLACE UNLESS OTHERWISE NOTED. DAMAGED IMPROVEMENTS SHALL BE REPLACED IN KIND TO ITS ORIGINAL CONDITION OR BETTER TO THE SATISFACTION OF THE PROJECT ENGINEER AT CONTRACTOR'S EXPENSE.
10. INSTALL 5FT HIGH X 15FT WIDE SINGLE LEAF CHAIN-LINK GATE PER SPPWC 600-2, 2006 EDITION. CHAIN-LINK GATE SHALL BE 25FT AWAY FROM THE CURB OF THE DRIVEWAY APPROACH.
11. CONSTRUCT DRIVEWAY APPROACH PER SPPWC 110-1 (TYPE B) W=15', X=3', Y=4'

	–	–		

STRUCTURAL NOTES

GENERAL:

1. DIMENSIONS FROM FACE OF CONCRETE TO STEEL ARE TO THE NEAREST EDGE OF BAR AND SHALL BE TWO INCHES UNLESS OTHERWISE SHOWN.
2. CONCRETE DIMENSIONS SHALL BE MEASURED HORIZONTALLY OR VERTICALLY ON THE PROFILE, AND PARALLEL TO OR AT RIGHT ANGLES (OR RADIALLY) TO CENTERLINE OF CHANNEL ON THE PLAN EXCEPT AS OTHERWISE SHOWN.
3. ALL BAR BENDS AND HOOKS SHALL CONFORM TO THE 2008 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR REINFORCED CONCRETE" (ACI 318–08), SECTION 7.3.
4. PLACING OF REINFORCEMENT SHALL CONFORM TO THE 2008 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR REINFORCED CONCRETE" (ACI 318–08), SECTION 7.5.
5. TRANSVERSE CONSTRUCTION JOINTS SHALL NOT BE PLACED WITHIN 30 INCHES OF MANHOLE OR JUNCTION STRUCTURE OPENING, OR SIDE INLETS.
6. TRANSVERSE CONSTRUCTION JOINTS IN WALLS AND SLABS SHALL BE IN THE SAME PLANE. NO STAGGERING OF JOINTS WILL BE PERMITTED. TRANSVERSE CONSTRUCTION JOINTS SHALL BE NORMAL OR RADIAL TO THE CENTERLINE OF CONSTRUCTION UNLESS OTHERWISE SHOWN.
7. THE TRANSVERSE REINFORCING STEEL SHALL TERMINATE ONE AND ONE–HALF INCHES FROM THE CONCRETE SURFACES UNLESS OTHERWISE SHOWN ON THE PLANS.
8. EXPOSED EDGES OF CONCRETE MEMBERS SHALL BE CHAMFERED.
9. NO SPLICES IN TRANSVERSE STEEL REINFORCEMENT WILL BE PERMITTED OTHER THAN SHOWN IN THE DRAWING WITHOUT APPROVAL OF THE ENGINEER. NO MORE THAN ONE SPLICE SHALL BE PERMITTED IN ANY LONGITUDINAL BAR BETWEEN TRANSVERSE JOINTS. SPLICES SHALL BE STAGGERED.
10. ALL LAP SPLICES SHALL CONFORM TO THE 2005 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR REINFORCED CONCRETE" (ACI 318–08), SECTION 12.15. LONGITUDINAL STEEL SHALL BE LAPPED 24 BAR DIAMETER AT SPLICES. TRANSVERSE STEEL SHALL BE LAPPED USING THE FOLLOWING TABLE:

BAR SIZE	#4	#5	#6	#7	#8	#9	#10	#11	#14	#18
LENGTH OF LAP SPLICE	25"	31"	37"	62"	81"	103"	130"	160"	TENSION LAP SPLICING NOT PERMITTED	

ADDITIONAL NOTES FOR R.C. OPEN CHANNEL SECTIONS:

11. LONGITUDINAL STEEL SHALL TERMINATE TWO INCHES FROM TRANSVERSE CONSTRUCTION JOINTS.
12. TRANSVERSE CONSTRUCTION JOINTS SHALL BE SPACED NOT TO EXCEED 50 FEET NOR BE LESS THAN 10 FEET, MEASURED ALONG THE CENTERLINE OF CONSTRUCTION, EXCEPT AS OTHERWISE SHOWN ON THE DRAWINGS.
13. TRANSVERSE CONSTRUCTION JOINTS SHALL BE PLACED AT THE JUNCTION OF RECTANGULAR OPEN CHANNEL SECTIONS WITH CLOSED CONDUIT SECTIONS.
14. THE MAXIMUM SPACING OF BARS IN CURVED SECTIONS SHALL NOT EXCEED THAT SHOWN ON THE TYPICAL SECTIONS, UNLESS OTHERWISE SHOWN ON THE DRAWINGS. STEEL SHALL BE PLACED RADIALLY FROM THE MAXIMUM SPACING.
15. AT THE BEGINNING AND ENDING OF ALL POURS, A COMPLETE CURTAIN OF REINFORCEMENT COMPOSED OF B_1, B_4, AND B_7 BARS SHALL BE PLACED THREE INCHES FROM THE TRANSVERSE CONSTRUCTION JOINT.
16. ALL TRANSVERSE JOINTS SHALL BE PROVIDED WITH 1 1/2" x 3/4" FORMED GROOVE IN THE INSIDE FACE AND TOP OF WALLS AND WITH 3/4" TOOLED JOINT IN THE BOTTOM SLAB.
17. THE BAR LENGTHS TABULATED FOR TRANSITIONS ARE APPLICABLE TO THE LARGER SECTION ONLY. THE BARS REQUIRING ADJUSTMENT ARE THOSE TABULATED IN THE TABLE HEREON AND SHALL BE ADJUSTED AS NECESSARY WITHIN THE TRANSITION.
18. TRANSVERSE WALL JOINTS SHALL HAVE A 4" POLYVINYL CHLORIDE WATERSTOP (SPLIT RIBBED CENTER BULB TYPE) WHICH SHALL BE CONTECH VINYLSTOP NO. 431S, BURKE VINYLOK WATERSTOP R.S.B. 316–4, OR AN APPROVED EQUAL.
19. THE LONGITUDINAL WALL JOINTS SHALL HAVE A 4" POLYVINYL CHLORIDE WATERSTOP (RIBBED TYPE) WHICH SHALL BE BURKE VINYLOK WATERSTOP R316–4, WATER SEALS INC. FLEXSTRIP OR AN APPROVED EQUAL. THE WATERSTOP SHALL BE TIED TO THE OUTSIDE OF THE REINFORCING STEEL AT THE TOP AND BOTTOM WITH ONE PIECE OF WIRE AT APPROXIMATELY 1'–0" SPACING, PUNCHING SHALL NOT BE ALLOWED. THE WATERSTOP SHALL BE CONTINUOUS FOR EACH WALL SECTION.
20. B_1 BARS MAY BE SPLICED ABOVE THE LONGITUDINAL CONSTRUCTION JOINT. USE LAP SHOWN IN THE TABLE HEREON.
21. THE LONGITUDINAL CONSTRUCTION JOINTS SHALL BE CONTINUOUS.
22. THE SPACING OF THE LONGITUDINAL BARS IN THE SLAB SHALL BE BASED ON THE DISTANCE BETWEEN THE LONGITUDINAL CORNER BARS NEAREST THE INSIDE FACE OF THE STRUCTURE AND THE NUMBER OF BARS SPECIFIED IN THE TABLE. THE SPACING IN THE WALLS SHALL BE BASED ON THE WALL HEIGHT AND THE NUMBER OF BARS IN THE TABLE.

STRUCTURAL NOTES

GENERAL:

1. DIMENSIONS FROM FACE OF CONCRETE TO STEEL ARE TO THE NEAREST EDGE OF BAR AND SHALL BE TWO INCHES UNLESS OTHERWISE SHOWN.
2. CONCRETE DIMENSIONS SHALL BE MEASURED HORIZONTALLY OR VERTICALLY ON THE PROFILE AND PARALLEL TO OR AT RIGHT ANGLES (OR RADIALLY) TO CENTERLINE OF CONDUIT ON THE PLAN UNLESS OTHERWISE SHOWN.
3. ALL BAR BENDS AND HOOKS SHALL CONFORM TO THE 2008 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" (ACI 318–08), SECTION 7.3.
4. PLACEMENT OF REINFORCING STEEL SHALL CONFORM TO THE 2005 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" (ACI 318–08), SECTION 7.5.
5. TRANSVERSE CONSTRUCTION JOINTS SHALL NOT BE PLACED WITHIN 30 INCHES OF MANHOLE OR JUNCTION STRUCTURE OPENINGS, OR SIDE INLETS UNLESS OTHERWISE SHOWN.
6. TRANSVERSE CONSTRUCTION JOINTS IN WALLS AND SLABS SHALL BE IN THE SAME PLANE. NO STAGGERING OF JOINTS WILL BE PERMITTED. ALL TRANSVERSE CONSTRUCTION JOINTS SHALL BE NORMAL OR RADIAL TO THE CENTERLINE OF CONSTRUCTION UNLESS OTHERWISE SHOWN.
7. THE TRANSVERSE REINFORCING STEEL SHALL TERMINATE TWO INCHES FROM THE CONCRETE SURFACE UNLESS OTHERWISE SHOWN ON THE STRUCTURAL DETAILS.
8. EXPOSED EDGES OF CONCRETE MEMBERS SHALL BE CHAMFERED.
9. NO SPLICES IN TRANSVERSE STEEL REINFORCEMENT WILL BE PERMITTED OTHER THAN AS SHOWN ON THE DRAWINGS WITHOUT APPROVAL FROM THE ENGINEER. NO MORE THAN ONE SPLICE WILL BE PERMITTED IN ANY LONGITUDINAL BAR BETWEEN TRANSVERSE JOINTS. SPLICES SHALL BE STAGGERED.
10. ALL SPLICES SHALL CONFORM TO THE 2005 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" (ACI 318–08), SECTION 12.15. ALL STEEL SHALL BE LAPPED USING THE FOLLOWING TABLE (CLASS B SPLICES):

BAR SIZE	#4	#5	#6	#7	#8	#9	#10	#11	#14	#18
LENGTH OF LAP SPLICE	25"	31"	37"	62"	81"	103"	130"	160"	TENSION LAP SPLICING NOT PERMITTED	
THE LAP LENGTH SHALL BE BASED ON THE SMALLER SIZE BAR.										

ADDITIONAL NOTES FOR RC TRANSITION SECTION:

11. LONGITUDINAL STEEL SHALL BE CONTINUOUS AND EXTENDED THROUGH ALL CONSTRUCTION JOINTS.
12. UNLESS OTHERWISE SHOWN ON THE DRAWINGS, TRANSVERSE JOINT KEYWAYS (IN BOTH SLABS AND WALLS), SHALL BE PLACED AT THE END OF EACH POUR, BUT THE SPACING THEREOF SHALL NOT EXCEED 50 FEET OR BE LESS THAN 10 FEET.
13. UNLESS OTHERWISE SHOWN ON THE DETAILS, IN CURVED SECTIONS, TRANSVERSE BARS SHALL BE PLACED RADIALLY. STRAIGHT TRANSVERSE BARS IN TOP AND BOTTOM SLABS SHALL BE PLACED AS SHOWN ON THE TYPICAL SECTIONS. SPACING SHALL BE AT THE CENTERLINE OF CONSTRUCTION FOR SINGLE–BARREL BOXES, UNLESS OTHERWISE NOTED. STRAIGHT BARS AND L–BARS IN WALLS SHALL BE SPACED AS SHOWN ON TYPICAL SECTIONS, WITH THE SPACING MEASURED BETWEEN THE VERTICAL LEGS OF BARS.
14. AT THE BEGINNING AND END OF ALL POURS, A CURTAIN OF REINFORCEMENT COMPOSED OF B, C, C_2, D, F, G, AND H BARS SHALL BE PLACED THREE INCHES FROM THE TRANSVERSE CONSTRUCTION JOINT.
15. THE VERTICAL WALL STEEL IN THE INTERIOR WALLS AND IN THE INTERIOR FACE OF EXTERIOR WALLS MAY BE SPLICED AT THE CONSTRUCTION JOINT AT THE BASE OF THE WALL. THE LAP SPLICE SHALL BE ACCORDANCE WITH THE TABLE UNDER GENERAL NOTE 10.
16. IN ALL SECTIONS, LAP C AND C_2 BARS. THE VERTICAL LENGTH OF C AND C_2 BARS HAS BEEN CALCULATED FOR A 3 1/2" STARTER WALL. IF THE HEIGHT OF THE STARTER WALL VARIES, THE VERTICAL LENGTH OF THE C AND C BARS SHALL BE VARIED CORRESPONDINGLY, SO AS TO MAINTAIN THE REQUIRED LAP SPLICE BETWEEN THE TWO BARS IN ACCORDANCE WITH THE TABLE UNDER GENERAL NOTE 10. THE LENGTH OF THE LAPS SHALL BE BASED ON THE SMALLER BAR.
17. TRANSVERSE WALL JOINTS SHALL HAVE A 4" POLYVINYL CHLORIDE WATERSTOP (SPLIT RIBBED CENTER BULB TYPE) WHICH SHALL BE CONTECH VINYLSTOP NO. 431S, BURKE VINYLOK WATERSTOP R.S.B. 316–4, OR AN APPROVED EQUAL.
18. DRILL A ONE INCH DIAMETER HOLE AND INJECT AN APPROVED NON–SHRINK GROUT INTO THE HOLE PRIOR TO PLACEMENT OF THE BAR
19. THE LONGITUDINAL WALL JOINTS SHALL HAVE A 4" POLYVINYL CHLORIDE WATERSTOP (RIBBED TYPE) WHICH SHALL BE BURKE VINYLOK WATERSTOP R.316–4, WATER SEALS INC. FLEXSTRIP OR AN APPROVED EQUAL. THE WATERSTOP SHALL BE TIED TO THE OUTSIDE OF THE REINFORCING STEEL AT THE TOP AND BOTTOM WITH ONE PIECE OF WIRE AT APPROXIMATELY 1'–0" SPACING, PUNCHING SHALL NOT BE ALLOWED. THE WATERSTOP SHALL BE CONTINUOUS FOR EACH WALL SECTION.
20. TWO LONGITUDINAL BARS SHALL BE PLACED AT EACH CORNER LOCATION. AS SHOWN ON THE DETAIL. THE REMAINING LONGITUDINAL BARS SHALL BE EQUALLY SPACED BETWEEN THE CORNER BARS WITH A MAXIMUM SPACING OF 18 INCHES IN EACH FACE OF THE SLABS AND WALLS AND NEED NOT CORRESPOND TO THE NUMBER OR LOCATION SHOWN ON THE DETAIL SEE THE TABLE FOR LONGITUDINAL BAR TOTALS.
21. STATIONS ARE MEASURED RADIALLY FROM SURVEY CONTROL LINE TO THE CENTER LINE OF RC BOX.

SECTION 1

APPLICABLE SPECIFICATIONS AND STANDARDS

1–1 All work shall be performed in accordance with the provisions of the latest edition of the Standard Specifications for Public Works Construction (SSPWC)(GREEN BOOK) and the Standard Plans for Public Works Construction (SPPWC), both prepared and promulgated by the Southern California chapters of the American Public Works Association and the Associated General Contractors of California, and these Special Provisions.

SECTION 2

GRADING PERMITS

2–1 Material exported or wasted outside of the project right–of–way shown on the plans are subject to all requirements of the Grading Ordinance. The requirements may include, but are not limited to, submitting of a grading plan prepared by a Civil Engineer, obtaining a grading permit, paying the permit fee, posting a grading bond, hiring professional engineering and testing services for compacting fills, constructing drainage facilities and providing erosion protection. These requirements are the responsibility of the owner of the land on which the material is placed.

SECTION 3

CONSTRUCTION MATERIALS

3–1 The Engineer may require certificates of compliance with the specifications for materials or manufactured items produced outside of the job site. Such certificates will not relieve the Contractor from the requirements of providing material and manufactured items complying with the specifications even though they have been incorporated into the job.

SECTION 4

EXCAVATION SAFETY

4–1 This work shall consist of performing all work required to meet the excavation safety requirements specified in Subsection 7–10.4.

SECTION 5

CONSTRUCTION SURVEYS

5–1 SCOPE

Surveys to be provided by the Contractor and/or the Developer's Engineer shall conform to the general industry standards and the following minimum quality and standards.

5–2 PERFORMANCE AND ACCURACY

The surveys shall be accomplished with sufficient precision to result in the required accuracy and shall be performed under the supervision of a Land Surveyor or Civil Engineer licensed by the State of California. The requirements herein shall apply to the minimum essential control required to accomplish establishment of lines and grades by the Contractor, and to provide the Engineer the necessary references for insuring construction accuracy. The method used to establish working stakes will be at the Contractor's option.

5–3 DETAILS OF STAKING

5–3.1 Alignment

Centerline alignment stakes or offset stakes shall be set at a maximum of 50–foot intervals and at all curve points, angle points, changes in elevation or wall height. On curves, stakes shall be set at 25–foot intervals.

5–3.2 Rough Grade Stake

For rough grading, with cuts or fills, at least one line of stakes shall be set on catch or hinge points, or an offset line. These stakes shall be marked with cut or fill to permit rough finishing of the grading plane. Where slope check points have been set near the elevation of the grading plane, they may be used as rough grade stakes. The longitudinal interval shall be 50 feet.

5–3.3 Final Grade Stakes

For RC spillways 10–foot or less in width, one set of final grade stakes shall be established in the invert to control and to check all elements of the structural section. Two sets, one on each side of the invert shall be established for any facility in excess of the above. These shall be in addition to those set outside the limits of the structure or the excavation. Offset distance from each edge of structure or centerline shall be constant.

Grade shall refer to the plane of the finished invert or slope surface. The mark on the stake shall be on the plane or at a uniform vertical offset from the plane of the finished surface. Longitudinal spacing will be 50 feet for tangent alignment and grade. Spacing will be reduced to 25 feet when radius of curvature is less than 1,000 feet or when rate of change of slope is less than 0.005 ft/ft. Prior to concrete placement, grade stakes and forms shall be checked.

For pipe conduits, stakes shall be set at the ends and at grade and line breaks. If conduit is to be constructed in stages, the ends of the staged lengths shall be staked.

When ends of long, straight runs are not intervisible, intermediate stakes shall be set. The finished pipe grades shall be controlled by optical sighting devices. Use of stringline will not be allowed.

5–3.4 Embankment Stakes

Rough grade stakes shall be placed 25 feet O.C. at toe of embankment and along the dam axis.
Fine grade stakes shall be placed prior to trimming the overbuilt slops.

5–3.5 Minor Drainage Structure Stakes

Beginning and ending points of all side inlets and drains, and any grade or line breaks shall be properly staked and referenced. For long side drains, requirements of Subsection 3.3 shall apply. Horizontal and vertical locations of junctions, drop inlets, risers, manholes shall be staked. A minimum of two stakes should be set in each case. Elevations of all reference points shall be shown on the notes and at the site.

5–3.6 Fence

For fence along a right–of–way line not parallel to the channel centerline, the reference shall be set as follows:

(1) For tangent alignment, set intervisible points at breaks in terrain or at a maximum interval of 200' ±.
(2) Set points for changes in alignment.
(3) Set stakes at regular interval on curves. Use an interval of 50 feet for radii of 1,000 feet and greater; use 25 feet for shorter radii.

5–3.7 Miscellaneous

Survey staking for miscellaneous facilities shall be performed as required by the Engineer.

5–4 SURVEY NOTES

All survey notes shall be kept on 8–1/2" x 11" standard Agency forms. Master copies of forms will be provided to the Contractor at the preconstruction conference. Notes shall indicate the name of the project, the Contractor, the firm performing surveys and party chief, and shall be dated. Two copies of the notes shall be provided to the Engineer or his representative within one day of performance. No construction work shall be initiated on an increment of the project before survey notes for said increment are received by the Engineer or his field representative. The original notes shall be retained by the surveyor and submitted to the Engineer upon completion of work organized in a proper order in a loose–leaf folder.

SECTION 6

DIVERSION AND CONTROL OF WATER

6–1 SCOPE

This work shall consist of the diversion and control of all water entering into the construction area or otherwise affecting construction activities.

6–2 CONSTRUCTIONS METHODS

All permanent construction shall be performed in a site free from water. The Contractor shall construct, maintain, and operate all necessary cofferdams, pumps, channels, flumes, drains and/or other temporary diversion and protective works required for diversion and control of all water, whatever its source, during construction. In order to reduce sediments from being transported downstream, the Contractor shall complete all work on the diversion channel prior to disturbing or altering the flow in the natural channel. Inundation of partially completed work due to lack of control during nonworking periods will not be permitted, and may be cause for requiring removal of work already completed with replacement at the Contractor's expense.

Prior to beginning work involving diversion and control of water, the Contractor shall submit a water control plan to the Engineer. During construction, if circumstances require changes to the original water control plan, a revised water control plan shall be promptly submitted to the Engineer. No responsibility shall accrue to the Engineer or the Agency as a result of the plan or as a result of knowledge of the plan. The Contractor shall hold the Agency and the Engineer harmless from legal action taken by any third party with respect to construction and operation of the diversion and protective work.

Construction and operations of the diversion and control works shall be in accordance with the water control plan submitted, except as deviation therefrom may be specifically approved by the Engineer. All works installed by the Contractor in connection with dewatering, control, and diversion of water but not specified to become permanent part of the project, shall be removed and the site restored, insofar as practical, to its original condition prior to completion of construction or when directed by the Engineer.

SECTION 7

SUBGRADE STABILIZATION

7–1 SCOPE

This work shall consist of subgrade stabilization and shall be performed in accordance with the Standard Specifications, the plans, and these Special Provisions. (See Subsection 300–7.3).

7–2 CONSTRUCTION MATERIALS

Well graded crushed rock material approved by the Engineer and the developer's soil engineer shall be used for stabilization. If float rock or other ungraded rock mixture is used for stabilization, it shall be mixed with the native material to fill all voids before structure construction begins.

7–3 CONSTRUCTION METHODS

7–3.1 Subgrade stabilization shall be performed to insure the suitability of subgrade to withstand the load of the proposed structure and of the formwork, reinforcing steel supports, foot traffic, and similar items.

7–3.2 The need for and extent of subgrade stabilization will be determined by the developer's engineer and approved by Engineer. If and where not needed, subgrade stabilization shall not be performed.

7–3.3 Use of subgrade stabilization material for water control will not be allowed, unless a specifically designed mix is used and properly incorporated into a subdrain system.

SECTION 8

EXCAVATION

8–1 SCOPE

This work shall consist of excavation for the construction of RC spillways and pipes, and appurtenant work and shall be performed in accordance with the Standard Specifications, the Plans, and these Special Provisions.

8–2 CONSTRUCTION METHODS

Excavation shall be performed in accordance with Subsection(s) 300–7.3 and 306–1.1 respectively. Excavated material may be used for fill and backfill subject to Engineer approval. Excess excavation material shall be disposed of outside the project limits.

SECTION 9

FILL AND BACKFILL

9–1 SCOPE

This work shall consist of fill for reinforced concrete major structures, RC spillways, pipes, and related facilities and shall conform to the Standard Specifications, the Plans, and these Special Provisions.

9–2 CONSTRUCTION MATERIALS

Fill materials shall constitute both native and imported materials required to fill and backfill over and around the structures as shown on the plans, excluding filter materials and bedding for RC pipes. Fill materials shall be approved by the Engineer prior to use.

9–3 CONSTRUCTION METHODS

9–3.1 Fill and backfill for RC spillways and pipes shall be performed in accordance with Subsection 300–7.4.

9–3.2 The moisture content of the fill material shall be maintained within 1 percent below and 3 percent above optimum. The optimum moisture content for each site or soil type will be determined by the testing laboratory doing the control.

9–3.3 No material shall be deposited against the outside walls of the reinforced concrete spillways and the end top of cast–in–place RC box spillway until the concrete within the entire cross section of said cast–in–place RC box has developed a strength of not less than 4000 psi in compression, as determined for quality control by the methods specified in ASTM C 31.

SECTION 10

REINFORCING STEEL FOR MAJOR STRUCTURES

10–1 SCOPE

This work shall consist of reinforcing steel furnishing, bending, fabricating and placing for major concrete structures, including reinforced concrete spillways, bubbler, intake structures, head walls, and other structures incorporated therein and shall be performed in accordance with the Standard Specifications, the plans, and these Special Provisions.

10–2 CONSTRUCTION MATERIALS

All reinforcing steel shall be Grade 60 billet steel conforming to Subsection 201–2.

10–3 CONSTRUCTION METHODS

10–3.1 Reinforcing Steel Shop Drawings

Prior to fabricating the reinforcing steel, the Contractor shall submit four copies of the reinforcing steel take–off/placing diagram shop drawings for review. However, furnishing of the shop drawings to the Engineer shall not be construed to imply that the shop drawings will be reviewed for accuracy. The Contractor shall be wholly and completely responsible for the accuracy of the shop drawings and for furnishing and placing the reinforcing steel in accordance with the details shown on the plans and as specified. Comments on the shop drawings by the Engineer shall be addressed by the Contractor immediately upon receipt and revised and/or corrected shop drawings shall be resubmitted prior to steel reinforcing placement on the job site.

SECTION 11

CONCRETE FOR MAJOR STRUCTURES

11–1 SCOPE

This work shall consist of portland cement concrete for reinforced concrete spillways, bubbler, intake structures, parapet walls, transitions, and other structures incorporated therein, and shall be constructed in accordance with the Standard Specifications, the plans, and these Special Provisions.

11–2 CONSTRUCTION MATERIALS

11–2.1 Portland Cement

Cement shall be Type II, low alkali portland cement conforming to ASTM C 150 and the low alkali requirements of Table 2 therein.

11–2.2 Aggregate

Aggregate shall conform to Alternate Rock Material – Type S as specified in Section 400. All aggregate shall meet the requirements of the combined aggregate gradation C. Soundness loss determined by California Test Method 214 shall not exceed 10 percent.

11–2.3 Strength Requirements

All concrete shall attain a minimum 28–day compressive strength of 4000 psi, in accordance with Subsection 201–1.1.3. Use of any mix other than the approved shall be grounds for rejection and removal of concrete already placed.

In the event that concrete test cylinders fail to meet the strength requirements of the specifications, the concrete placed on the job shall be cored. The Engineer shall determine the frequency and location of the cores to provide representative sampling. The Contractor shall pay the Agency the cost of such coring and testing. The cores obtained shall be tested for ultimate compressive strength in accordance with ASTM C 174 and ASTM C 42. No test shall be less than 90 percent of the specified 28–day strength. The Engineer shall determine the volumes of concrete which are deficient in strength. Acceptance or removal shall be in accordance with the applicable specifications.

As an alternate method, the Contractor may determine when the concrete compressive strength has attained 4000 psi. He may, at his own expense, make, cure, and deliver concrete specimens according to ASTM C 31, Field Cure Procedures, in molds supplied by the Agency. The method of curing specimens must be approved by the Engineer. The Agency's Material Laboratory will test the samples for compressive strength at such time during a normal workday as the Contractor deems satisfactory. The Contractor shall arrange for the samples to be delivered.

11–2.4 Joint Sealant

When required on the plans, joint sealant shall comply with Subsection 201–3.6

11–2.5 Curing Compound

Curing compound shall comply with Subsection 201–4.1, Type I–D, with red fugitive dye.

11–3 CONSTRUCTION METHODS

11–3.1 Sequence of Placement of Concrete

A minimum of 16 hours shall elapse between alternate placement of portland cement concrete in adjacent sections both longitudinally and transversely along the construction joints in the invert slabs. Similar minimum elapsed time shall be required for alternate pours in the walls and top slabs.

Continuous pours of sections in excess of 50 feet long will not be allowed unless otherwise indicated on the plans. The Contractor shall maintain a uniform placement pattern approved by the Engineer.

11–3.2 Invert Slabs

Following consolidation of the placed concrete by vibration method, the concrete shall be struck off or screeded to the required grade by means of a straight edge. A small amount of concrete is to be pushed ahead of the straight edge to fill in the low spots. Immediately after strike off, the concrete shall be worked with a "bull float" or "darby" until a smooth surface is obtained. As the sheen begins to leave the surfaces, edging and jointing working shall be done.

When the concrete has set sufficiently for proper finishing, a two–step operation of floating and troweling shall be used on the invert. The first step shall be floating of the concrete surface, with power equipment, until a smooth uniform surface is acquired. When the concrete has hardened so that water and fine material will not be worked to the surface, the second step of the finishing operation shall commence. This step shall be the finishing of the invert surface with a power steel trowel.

All edging and jointing work should be re–marked before the second step or steel troweling operations to insure sharp and clean markings.

If shoring is used for construction, it shall be performed in such a manner as not to interfere with the finishing of the invert slab. No deviation from this requirement will be allowed. Solid sheeting will not be allowed.

11–3.3 Vertical Walls

11–3.3.1 Finishing of Top Walls

In order to provide for accurate and even surface finish, forms for the RC channel spillway, bubbler structure and head walls construction shall not extend above finished wall grade. Chamfer strips shall be provided on both inside and outside forms. Edging of concrete corners will not be allowed.

11–3.3.2 Grouting

Grout mixture shall be provided at all horizontal construction joints as required by Subsection 303–1.8.2. The depth of the grout shall not be less than 2 inches and not more than 4 inches measured vertically. The grout mixture shall be placed as uniformly as possible immediately prior to placement of concrete.

When small amounts of grout mixture are required, the Engineer may allow the use of grout mixed on site. The grout mixed on site shall consist of 1 part cement and 2 parts concrete sand. For on site mix, the aggregate and cement shall conform to Sections 200 and 201, respectively.

11–3.4 Placing Concrete Under Adverse Weather Conditions

The following is in addition to the requirements of Subsection 303–1.8.7.

If quick setting is encountered, the concrete shall not be retempered. Rather than introducing free water at the plant, water may be added to a dry batched mix through a certified water meter near the project site. If this is done, other specification requirements are not waived. The total elapsed time between the addition of cement to the aggregates and discharging the completed mix shall not exceed 90 minutes with concrete temperatures less than 85° F. With higher concrete temperatures, less time will be allowed, as approved by the Engineer.

11–3.5 Curing

Curing shall comply with Subsection 303–1.10.

11–3.6 Corrective Measures

In the event cracks in excess of 0.03 inch in width occur in the structure, the cracks shall be injected with an epoxy approved by the Engineer, to the level of finish concrete.

PROJECT SPECIFICATIONS

SHEET 10 OF 11
DRAWING NO. Y–3–4658

SECTION 12

LADDERS

12–1 SCOPE

This work shall consist of furnishing and installation of ladders and shall be performed in accordance with the Standard Specifications, the Standard Plans, and these Special Provisions.

12–2 CONSTRUCTION MATERIALS AND METHODS

12–2.1 Ladders

Ladders shall consist of steps and pipe handles and shall be installed at locations shown on the plans.

12–2.1.1 Steps

Steps shall conform to the SPPWC Standard Plan 635–2 and/or 636–1 at the Engineer's option.

12–2.1.2 Pipe Handles

Pipe handles shall meet the requirements of Subsection 206–5.

SECTION 13

ACCESS ROAD

13–1 SCOPE

This work shall consist of access road construction and shall be performed in accordance with the Standard Specifications, the plans, and these Special Provisions.

13–2 CONSTRUCTION MATERIALS

13–2.1 Crushed Miscellaneous Base (CMB) Surfacing

Surfacing shall consist of CMB meeting the requirements of the fine gradation of Subsection 200–2.4, except that percentage passing No. 200 sieve shall range between 7% and 11%.

13–2.2 Asphalt Concrete (AC) Surfacing

13–2.2.1 Processed Miscellaneous Base (PMB) Surfacing

PMB shall conform to the requirements of Subsection 200–2.5 for fine grading.

13–2.2.2 Asphalt Concrete

AC shall conform to the requirements of Subsection 400–4 and shall be Type III–B3–AR–4000 or 8000, Type III–C3–AR–4000 or 8000.

13–3 CONSTRUCTION METHODS

13–3.1 Subgrade

Subgrade shall be prepared in accordance with Subsection 301–1. The relative compaction and tolerances shall be per Subsections 301–1.3 and 301–1.4 respectively for base and sub–base material.

13–3.2 Crushed Miscellaneous Base (CMB) Surfacing

Surfacing shall be a minimum of 6" thick and shall be constructed in accordance with Subsection 301–2, except that the relative compaction shall not be less than 95 percent.

13–3.3 Asphalt Concrete (AC)

13–3.3.1 Processed Miscellaneous Base

Construction of the PMB shall be performed in accordance with Subsection 301–2 and to the dimensions shown on the Plans.

13–3.3.2 Asphalt Concrete

Construction of AC shall be performed in accordance with Subsection 302–5 and to the dimensions shown on the plans. AC construction shall be performed after all other work is completed.

SECTION 14

CHAIN LINK FENCE AND GATE

14–1 SCOPE

This work shall consist of furnishing and installing 5–foot high chain link fence, 5–foot high by 15–foot wide single leaf and walk–in gate(s) and shall be performed in accordance with the Standard Specifications, the Plans, and these Special Provisions.

14–2 CONSTRUCTION MATERIALS

Materials for chain link fence and gate(s) shall conform to Subsection 206–6 and Standard Plan 600–0 of SPPWC, except that Subsection 206–6.3 is revised to provide knuckled selvage on bottom and top edges of chain link fabric.

14–3 CONSTRUCTION METHODS

Chain link fence and gate(s) shall be installed at locations shown on the plans. The construction shall be performed in accordance with Standard Plan 600–0 of SPPWC, except that it shall be provided with a top rail.

WALNUT CANYON CHANNEL IMPROVEMENTS AT HIGH STREET
PROJECT SPECIFICATIONS

SHEET 11 OF 11
DRAWING NO. Y–3–4659

CITY OF MOORPARK
PUBLIC WORKS DEPARTMENT

GENERAL STORM DRAIN NOTES

1. STATIONS SHOWN ON STORM DRAIN DRAWINGS ARE ALONG CENTER LINE OF STRUCTURE, UNLESS OTHERWISE SHOWN.
2. STATIONS AND INVERT ELEVATIONS OF PIPE INLETS SHOWN ON THE PROFILES ARE THE INSIDE FACE OF THE STRUCTURE, UNLESS OTHERWISE SHOWN.
3. INLETS IN STREETS SHALL BE PER APWA STANDARD PLANS AS SHOWN. LENGTH IS AS SHOWN ON THE PLANS.
4. CURVED STORM DRAINS SHALL BE CONSTRUCTED WITH 8 FEET LENGTHS OF R.C.P. WITH ONE END BEVELED FOR 90 FEET RADIUS, OR WITH 8 FEET LENGTHS OF R.C.P. WITH BOTH ENDS BEVELED FOR 45 FEET RADIUS, OR WITH 4 FEET LENGTHS OF R.C.P. WITH BOTH ENDS BEVELED FOR 22.5 FEET RADIUS.
5. STORM DRAIN PIPE SHALL BE D-2000 R.C.P., UNLESS OTHERWISE SHOWN.
6. DRAINAGE STRUCTURES SHALL CONFORM TO APWA STANDARD PLANS, EXCEPT AS NOTED ON THE PLANS.
7. ALL MANHOLE FRAMES AND COVERS SHALL HAVE A MINIMUM OF 30" IN DIAMETER CLEAR ACCESS OPENING.
8. TRAFFIC CONTROL PLANS WILL BE PROVIDED FOR ANY WORK WITHIN THE PUBLIC RIGHT-OF-WAY. TRAFFIC CONTROL PLANS SHALL CONFORM TO THE REQUIREMENTS OF CHAPTER 5 OF THE CALTRANS TRAFFIC MANUAL. TRAFFIC CONTROL PLAN MUST BE SUBMITTED TO THE CITY ENGINEER 20 DAYS PRIOR TO IMPLEMENTATION OF THE TRAFFIC CONTROL. THE CITY ENGINEER'S WRITTEN APPROVAL MUST BE OBTAINED PRIOR TO IMPLEMENTATION OF THE TRAFFIC CONTROL.
9. NO DEVIATIONS FROM THESE PLANS SHALL BE MADE UNLESS A CHANGE ORDER IS APPROVED BY THE CITY ENGINEER.
10. ALL CONTRACTORS AND SUB-CONTRACTORS SHALL POSSESS A VALID CITY OF MOORPARK BUSINESS TAX LICENSE AND A VALID CALIFORNIA STATE CONTRACTOR'S LICENSE PRIOR TO COMMENCING WORK.
11. APPROVAL OF THESE PLANS BY THE CITY OR ITS AGENTS DOES NOT RELIEVE THE DEVELOPER'S ENGINEER AND THE APPLICANT OF THE RESPONSIBILITY FOR THE CORRECTION OF ERRORS OR OMISSIONS DISCOVERED DURING CONSTRUCTION. ALL APPROPRIATE PLAN REVISIONS SHALL BE PROMPTLY SUBMITTED TO THE CITY ENGINEER FOR REVIEW AND APPROVAL, PRIOR TO CONTINUANCE OF CONSTRUCTION OF THE AFFECTED IMPROVEMENTS.
12. ALL WORK SHALL BE PERFORMED DURING CITY WORKING HOURS AND SUBJECT TO INSPECTION BY THE PUBLIC WORKS DEPARTMENT. WHERE OVERTIME INSPECTION IS NEEDED, SUBJECT TO THE AVAILABILITY OF AN INSPECTOR AND APPROVED BY THE CITY ENGINEER, THE CONTRACTOR WILL BE BILLED FOR SAID INSPECTION SERVICES AS PROVIDED IN THE MOST RECENTLY ADOPTED RESOLUTION WHICH ESTABLISHES THE FEES FOR SUCH SERVICES.
13. CONTRACTOR SHALL VERIFY ALL CONDITIONS AND DIMENSIONS AND SHALL REPORT ALL DISCREPANCIES TO THE ENGINEER BEFORE THE COMMENCEMENT OR CONTINUANCE OF WORK.
14. UTILITY LOCATIONS AND DEPTHS SHOWN HEREON HAVE BEEN PLOTTED IN ACCORDANCE WITH DATA FURNISHED BY THE UTILITY COMPANIES. NEITHER THE CITY NOR THE ENGINEER ASSUME RESPONSIBILITY FOR THE ACCURACY OF THE INFORMATION RECEIVED FOR EACH COMPANY. THE CONTRACTOR SHALL BE RESPONSIBLE FOR PROTECTING ALL PUBLIC AND PRIVATE PROPERTY INSOFAR AS IT MAY BE AFFECTED BY THESE OPERATIONS. ALL COSTS FOR PROTECTING, REMOVING, AND RESTORING EXISTING IMPROVEMENTS SHALL BE BORNE BY THE CONTRACTOR.
15. EROSION CONTROL MEASURES SHALL BE PROVIDED FOR IN ALL WORK IN CONFORMANCE WITH NPDES REQUIREMENTS YEAR-ROUND. THE SWPPP AND EROSION CONTROL PLANS MUST BE REVISED ANNUALLY AND SUBMITTED TO THE CITY ENGINEER FOR REVIEW AND APPROVAL NO LATER THAN SEPTEMBER 1 OF EACH YEAR.
16. "AS-BUILT" DRAWING PLANS SHALL BE SUBMITTED PRIOR TO FINAL WALK-THROUGH INSPECTION AND ACCEPTANCE OF THE IMPROVEMENTS BY THE CITY.
17. THESE PLANS SHALL REMAIN VALID FOR A PERIOD OF TWO YEARS FROM THE DATE OF THE CITY ENGINEER'S SIGNATURE. IF WORK HAS NOT BEEN INITIATED AND DILIGENTLY PURSUED WITHIN SUCH PERIOD, THE PLANS SHALL BE SUBJECT TO A NEW REVIEW FOR COMPLIANCE WITH THEN CURRENT STANDARDS AND POLICIES.
18. THE CONTRACTOR SHALL PROTECT ALL EXISTING PROPERTIES FROM DAMAGE. ACCESS TO PROPERTIES ADJACENT TO ALL AREAS OF WORK SHALL BE MAINTAINED AT ALL TIMES
19. PRIOR TO CONSTRUCTION, THE CONTRACTOR SHALL CONTACT UNDERGROUND SERVICE ALERT (USA) TOLL FREE AT 1-(800) 227-2600, AT LEAST 48 HOURS PRIOR TO ANY WORK.
20. WRITTEN RIGHTS OF ENTRY FROM ALL PROPERTY OWNERS WHO'S PROPERTY ARE ENCROACHED UPON BY THE DRAINAGE FACILITY, WATER DISCHARGED BY THE DRAINAGE FACILITY, CONSTRUCTION EQUIPMENT, SPOILS OR MATERIALS, WILL BE PROVIDED TO THE CITY ENGINEER PRIOR TO THE START OF CONSTRUCTION.
21. THE CONTRACTOR IS RESPONSIBLE TO PROVIDE ALL NECESSARY CONSTRUCTION SURVEYING TO COMPLETE THE WORK. REFERENCE POINTS SHALL BE LOCATED NO MORE THAN 50 FEET APART AND SHALL BE MARKED WITH ALL INFORMATION PERTINENT TO THE FACILITY BEING CONSTRUCTED. EACH STRUCTURE SHALL BE PROVIDED WITH NO LESS THAN 2 REFERENCE POINTS
22. ALL WORK SHALL CONFORM TO THE LATEST EDITION OF THE "STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION" AND SUPPLEMENTS THERETO.
23. THE CONTRACTOR SHALL COMPLY WITH ALL APPLICABLE FEDERAL, STATE AND LOCAL SAFETY REQUIREMENTS.
24. NO CONCRETE SHALL BE PLACED UNTIL THE FORMS AND REINFORCING STEEL HAVE BEEN PLACED, INSPECTED AND APPROVED BY THE CITY. THE CONTRACTOR SHALL NOTIFY THE CITY AT LEAST 24 HOURS IN ADVANCE FOR INSPECTION. FAILURE TO PROCURE INSPECTION WILL REQUIRE REMOVAL OF UN-INSPECTED IMPROVEMENTS.
25. CONCRETE BACKFILL IS REQUIRED WHEN THE PIPE HAS LESS THAN ONE FOOT OF COVER. THE CONCRETE BACKFILL SHALL CONSIST OF 335-E-14P PORTLAND CEMENT CONCRETE POURED FROM WALL TO WALL OF TRENCH AND FROM BOTTOM OF TRENCH TO A MINIMUM OF 4 INCHES OVER THE TOP OF THE PIPE. ADDITIONAL MEASURES WILL BE REQUIRED IF PIPE MAY EXPERIENCE EXCESSIVE LOADS.
26. ALL PIPES SHALL BE PLACED IN TRENCHES PER DETAIL A, SHEET 3.
27. ALL BACKFILL AND FILLS OUTSIDE OF STREET RIGHT-OF-WAY SHALL BE COMPACTED TO THE GEOTECHNICAL ENGINEERS RECOMMENDATIONS, OR AT LEAST 90 PERCENT OF MAXIMUM DENSITY AS DETERMINED BY A.S.T.M. SOIL COMPACTION TEST D 1557 METHOD "D". THIS SHALL BE CERTIFIED BY A GEOTECHNICAL ENGINEER.
28. ALL BACKFILL AND FILLS WITHIN STREET RIGHT-OF- WAY SHALL BE COMPACTED IN ACCORDANCE WITH SECTION 306-1.3 OF THE STANDARD SPECIFICATIONS UNLESS OTHERWISE NOTED. CONTRACTOR SHALL NOTIFY THE INSPECTOR AT LEAST 24 HOURS IN ADVANCE OF SOIL TESTING OR AS REQUIRED.
29. PIPE SHALL BE EMBEDDED A MINIMUM OF 5 INCHES INTO ALL STRUCTURES INCLUDING INLET AND OUTLET HEADWALLS, UNLESS OTHERWISE SPECIFIED.
30. UNLESS OTHERWISE SPECIFIED IN THE PROFILE ON THESE PLANS, THE RCP AND RCB SHALL BE MANUFACTURED WITH A MINIMUM CONCRETE COVER OVER THE STEEL IN THE INVERT OF 1.5 INCHES.
31. THE CONTRACTOR SHALL PROVIDE A DRAINAGE SYSTEM FOR CONTRIBUTORY FLOWS THAT WILL BE OPERABLE AT ALL TIMES UNTIL THE STORM DRAIN SYSTEM IS ACCEPTED FOR MAINTENANCE BY THE CITY OF MOORPARK, OR THE VCWPD.
32. EXISTING UTILITIES SHALL BE MAINTAINED IN PLACE BY THE CONTRACTOR, UNLESS OTHERWISE NOTED.
33. ALL OPENINGS RESULTING FROM THE CUTTING OR PARTIAL REMOVAL OF EXISTING CULVERTS, PIPES OR SIMILAR STRUCTURES SHALL BE SEALED WITH 8 INCHES OF BRICK AND MORTAR OR A MINIMUM OF 6 INCHES OF CONCRETE, UNLESS OTHERWISE SHOWN.
34. CONTRACTOR SHALL OBTAIN A NPDES PERMIT, AND PREPARE A STORM WATER POLLUTION CONTROL PLAN (SWPCP), AND SUBMIT TO THE CITY FOR APPROVAL. YEAR-ROUND ADHERENCE TO THE REQUIREMENTS OF THESE DOCUMENTS MUST BE MAINTAINED. FAILURE TO ADHERE TO THE REQUIREMENTS IS GROUNDS FOR SUSPENSION OR REVOCATION OF PERMITS, SEVERE FINES AND OR IMPRISONMENT.
35. ALL ABOVE GROUND CONCRETE DRAINAGE STRUCTURES SHALL BE OMAHA TAN COLORED CONCRETE, AS APPROVED BY THE CITY ENGINEER AND TO THE EXTENT POSSIBLE, SHALL INCORPORATE NATURAL STRUCTURE AND LANDSCAPE TO REDUCE THEIR VISIBILITY.
36. ALL SUBDRAINS SHALL CONNECT DIRECTLY TO DRAIN INLET STRUCTURES AND SHALL BE LOCATED IN THE DRAIN STRUCTURE FOR CONVENIENT ACCESS AND TESTING.

NPDES GENERAL NOTES

1. CONSTRUCTION SITES SHALL BE MAINTAINED IN SUCH A CONDITION THAT AN ANTICIPATED STORM OR CONSTRUCTION ACTIVITY DOES NOT CARRY WASTES OR POLLUTANTS OFF THE SITE.
2. DISCHARGES OF MATERIAL OTHER THAN STORM WATER ARE ALLOWED ONLY WHEN NECESSARY FOR PERFORMANCE AND COMPLETION OF CONSTRUCTION PRACTICES AND WHERE THEY DO NOT: CAUSE OR CONTRIBUTE TO A VIOLATION OF ANY WATER QUALITY STANDARD; CAUSE OR THREATENED OF CAUSE POLLUTION, CONTAMINATION, OR NUISANCE; OR CONTAIN A HAZARDOUS SUBSTANCE IN A QUANTITY REPORTABLE UNDER FEDERAL REGULATIONS 40 CFR PARTS 117 & 302.
3. POTENTIAL POLLUTANTS INCLUDE BUT ARE NOT LIMITED TO: SOLID OR LIQUID CHEMICAL SPILLS: WASTES FROM PAINTS, STAINS, SEALANTS, GLUES, LIMES, PESTICIDES, HERBICIDES, WOOD PRESERVATIVES AND SOLVENTS; ASBESTOS, FIBERS, PAINT FLAKES OR STUCCO FRAGMENTS; FUELS, OILS, LUBRICANTS, AND HYDRAULIC, RADIATOR OR BATTERY FLUIDS; FERTILIZERS, VEHICLE/EQUIPMENT WASH WATER AND CONCRETE WASH WATER; CONCRETE, DETERGENT OR FLOATABLE WASTES; WASTES FROM ANY ENGINE/EQUIPMENT STEAM CLEANING OR CHEMICAL DEGREASING; AND SUPERCHLORINATED POTABLE WATER LINE FLUSHINGS.
4. DURING CONSTRUCTION, DISPOSAL OF SUCH POTENTIAL POLLUTANTS SHOULD OCCUR IN A SPECIFIED AND CONTROLLED TEMPORARY AREA ON-SITE, PHYSICALLY SEPARATED FROM POTENTIAL STORM WATER RUN-OFF, WITH ULTIMATE DISPOSAL IN ACCORDANCE WITH LOCAL, STATE, AND FEDERAL REQUIREMENTS.
5. DEWATERING OF CONTAMINATED GROUNDWATER, OR DISCHARGING CONTAMINATED SOILS VIA SURFACE EROSION, IS PROHIBITED. DEWATERING OF NON-CONTAMINATED GROUNDWATER REQUIRES A NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PERMIT FROM THE RESPECTIVE STATE OF WATER QUALITY CONTROL BOARD.
6. ALL ACTIVITIES WILL CONFORM TO VENTURA COUNTY WIDE STORM WATER QUALITY MANAGEMENT PROGRAM NPDES PERMIT NO. CAS004002 AND CALIFORNIA STORM WATER BEST MANAGEMENT PRACTICES HANDBOOK.

BEST MANAGEMENT PRACTICES

CA001 – DEWATERING OPERATIONS
CA002 – PAVING OPERATIONS
CA010 – MATERIAL DELIVERY AND STORAGE
CA011 – MATERIAL USE
CA012 – SPILL PREVENTION AND CONTROL
CA020 – SOLID WASTE MANAGEMENT
CA021 – HAZARDOUS WASTE MANAGEMENT
CA022 – CONTAMINATED SOIL MANAGEMENT
CA023 – CONCRETE WASTE MANAGEMENT
CA030 – VEHICLE AND EQUIPMENT CLEANING
CA031 – VEHICLE AND EQUIPMENT FUELING
CA032 – VEHICLE AND EQUIPMENT MAINTENANCE
CA040 – EMPLOYEE/SUBCONTRACTOR TRAINING
ESC01 – SCHEDULING
ESC02 – PRESERVATION OF EXISTING VEGETATION
ESC10 – SEEDING AND PLANTING
ESC11 – MULCHING
ESC20 – GEOTEXTILES AND MATS
ESC21 – DUST CONTROLS

BASIS OF BEARING:

THE BEARING OF NORTH 89°53'47" WEST ON THE CENTERLINE OF HIGH STREET WAS USED AS THE BASIS OF BEARING.

BENCHMARK:

T.B.M. – BCR OF THE SOUTH CURB OF HIGH STREET AND THE INTERSECTION OF MOORPARK ROAD. ELEV.=(510.31 TC)

PRIVATE ENGINEERS NOTICE TO CONTRACTORS

THE EXISTENCE AND LOCATION OF ANY UNDERGROUND UTILITY PIPES OR STRUCTURES SHOWN ON THESE PLANS ARE OBTAINED BY A SEARCH OF THE AVAILABLE RECORDS. TO THE BEST OF OUR KNOWLEDGE, THERE ARE NO EXISTING UTILITIES EXCEPT AS SHOWN ON THIS MAP. THE CONTRACTOR IS REQUIRED TO TAKE DUE PRECAUTIONARY MEASURES TO PROTECT THE UTILITY LINES SHOWN AND ANY OTHER LINES NOT OF RECORD OR SHOWN ON THIS DRAWING.

ROBERT W. ANDERSON R.C.E. 58583 — DATE 2-19-09

NOTE:
EXISTING UTILITIES AND FACILITIES ABOVE AND BELOW THE GROUND ARE LOCATED FROM THE BEST AVAILABLE RECORD INFORMATION. THE CONTRACTOR SHALL TAKE DUE PRECAUTIONARY MEASURES TO PROTECT THE UTILITIES OR FACILITIES SHOWN ON THE PLANS FROM HARM. ATTENTION IS DIRECTED TO POSSIBLE EXISTENCE OF UNDERGROUND UTILITIES OR FACILITIES NOT SHOWN TO THE CITY OR IN A LOCATION DIFFERENT FROM THAT WHICH IS SHOWN ON THE PLANS. THE CONTRACTOR SHALL TAKE STEPS TO ASCERTAIN THE EXACT LOCATION OF ALL UNDERGROUND UTILITIES AND FACILITIES PRIOR TO DOING WORK IN ORDER TO AVOID DAMAGE OF SUCH UTILITY OR FACILITY OR TO INTERFERE WITH THEIR SERVICE.

NOTE:
THE EXISTENCE AND LOCATION OF ANY UNDERGROUND UTILITY PIPES OR STRUCTURE SHOWN ON THESE PLANS ARE OBTAINED BY A SEARCH OF THE AVAILABLE RECORDS TO THE BEST OF OUR KNOWLEDGE. THE CONTRACTOR IS REQUIRED TO TAKE OUR PRECAUTIONARY MEASURES TO PROTECT THE UTILITY LINES AND ANY OTHER LINES NOT OF RECORD OR NOT SHOWN ON THIS DRAWING. PRIOR TO EXCAVATION THE CONTRACTOR SHALL CALL TOLL FREE (800) 422-4133 TO VERIFY THE UNDERGROUND LOCATION OF GAS AND TELEPHONE LINES. IT SHALL BE THE OWNER AND CONTRACTORS SOLE RESPONSIBILITY TO VERIFY THE LOCATION OF ALL UTILITIES PRIOR TO START OF CONSTRUCTION AND VERIFY THE EXISTENCE OF KNOWN AND UNKNOWN LINES.

UNDERGROUND SERVICE ALERT
Call: Toll FREE 1 – 800 422-4133
TWO WORKING DAYS BEFORE YOU DIG
CAUTION: Remember that the USA Center notifies only those utilities belonging to the center. There could be other utilities present at the work site. The center will inform you of whom they will notify.

NOTES:

1. INSTALL 96" REINFORCED CONCRETE PIPE WITH 1" OF INTERIOR CONCRETE LINING INSIDE DIAMETER OF PIPE PER VCWPD STANDARDS.
2. CONSTRUCT RCB TO RCP TRANSITION STRUCTURE PER SPPWC, 2006 EDITION, STD. PLAN 342-1 OR (E/5)
3. MANHOLE SHAFT AND APPURTENANCES, AT STA. 96+21.18, AND 98+40.00 SHALL BE CONSTRUCTED PER STANDARD PLANS, SPPWC 324-1, WHERE MANHOLE SHAFT SHALL TAPER FROM DA = 48" TO 30". MANHOLE COVERS SHALL BE CAST WITH THE LETTERS "VCWPD". THE LETTERS SHALL BE 2 1/2" HIGH WITH 1/2" LINE WIDTH. MANHOLE COVERS SHALL ALSO HAVE A LIFTING SLOT IN ADDITION TO THE PICK HOLE. MANHOLE SHAFT CONNECTION TO RC STRUCTURE SHALL BE CONSTRUCTED PER STANDARD PLANS, SPPWC 322-1.
4. SAWCUT, REMOVE, AND DISPOSE OF EXISTING CONCRETE DRAINAGE CHANNEL FROM STA. 93+37.18 TO STA. 100+46.75. REPLACE WITH ENGINEERED FILL TO 90 OR 95 (AT ROAD SECTIONS) PERCENT RELATIVE COMPACTION AT 1 TO 3 PERCENT OVER OPTIMUM SOIL-WATER CONTENT, UNLESS OTHERWISE SPECIFIED AS REQUIRING SPECIAL COMPACTION. (SEE RJR GEOTECHNICAL REPORT FOR ADDITIONAL RECOMMENDATIONS)
5. HIGH STREET IMPROVEMENTS PER SEPARATE PLANS.
6. CONSTRUCT CURB OPENING CATCH BASIN WITH LOCAL DEPRESSION, PER SPPWC, 2006 EDITION, STD PLANS 301-2 AND 313-2, RESPECTIVELY, WHERE WIDTH=5', V-DEPTH=4' A=60'.
7. REMOVE AND DISPOSE OF INTERFERING CHAIN LINK FENCE AND GATES WITHIN THE RIGHT OF WAY.
8. INSTALL 5FT HIGH CHAIN-LINK FENCE PER SPPWC 600-2, 2006 EDITION.
9. EXISTING IMPROVEMENTS WITHIN THE RIGHT OF WAY AND WORK AREA LIMITS SHALL BE PROTECTED IN PLACE UNLESS OTHERWISE NOTED. DAMAGED IMPROVEMENTS SHALL BE REPLACED IN KIND TO ITS ORIGINAL CONDITION OR BETTER TO THE SATISFACTION OF THE PROJECT ENGINEER AT CONTRACTOR'S EXPENSE.
10. INSTALL 5FT HIGH X 15FT WIDE SINGLE LEAF CHAIN-LINK GATE PER SPPWC 600-2, 2006 EDITION. CHAIN-LINK GATE SHALL BE 25FT AWAY FROM THE CURB OF THE DRIVEWAY APPROACH. INSTALL GATE LATCH PER DETAIL (D/5)
11. CONSTRUCT DRIVEWAY APPROACH PER SPPWC 110-1 (TYPE B) W=15', X=3', Y=4'

NOTE: ADDITIONAL 2' BAR LENGTH SHALL BE SPLICED AND LAPPED PER STRUCTURAL NOTE #10 HEREON.

STRUCTURAL NOTES

GENERAL:

1. DIMENSIONS FROM FACE OF CONCRETE TO STEEL ARE TO THE NEAREST EDGE OF BAR AND SHALL BE TWO INCHES UNLESS OTHERWISE SHOWN.
2. CONCRETE DIMENSIONS SHALL BE MEASURED HORIZONTALLY OR VERTICALLY ON THE PROFILE AND PARALLEL TO OR AT RIGHT ANGLES (OR RADIALLY) TO CENTERLINE OF CONDUIT ON THE PLAN UNLESS OTHERWISE SHOWN.
3. ALL BAR BENDS AND HOOKS SHALL CONFORM TO THE 2008 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" (ACI 318–08), SECTION 7.3.
4. PLACEMENT OF REINFORCING STEEL SHALL CONFORM TO THE 2005 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" (ACI 318–08), SECTION 7.5.
5. TRANSVERSE CONSTRUCTION JOINTS SHALL NOT BE PLACED WITHIN 30 INCHES OF MANHOLE OR JUNCTION STRUCTURE OPENINGS, OR SIDE INLETS UNLESS OTHERWISE SHOWN.
6. TRANSVERSE CONSTRUCTION JOINTS IN WALLS AND SLABS SHALL BE IN THE SAME PLANE. NO STAGGERING OF JOINTS WILL BE PERMITTED. ALL TRANSVERSE CONSTRUCTION JOINTS SHALL BE NORMAL OR RADIAL TO THE CENTERLINE OF CONSTRUCTION UNLESS OTHERWISE SHOWN.
7. THE TRANSVERSE REINFORCING STEEL SHALL TERMINATE TWO INCHES FROM THE CONCRETE SURFACE UNLESS OTHERWISE SHOWN ON THE STRUCTURAL DETAILS.
8. EXPOSED EDGES OF CONCRETE MEMBERS SHALL BE CHAMFERED.
9. NO SPLICES IN TRANSVERSE STEEL REINFORCEMENT WILL BE PERMITTED OTHER THAN AS SHOWN ON THE DRAWINGS WITHOUT APPROVAL FROM THE ENGINEER. NO MORE THAN ONE SPLICE WILL BE PERMITTED IN ANY LONGITUDINAL BAR BETWEEN TRANSVERSE JOINTS. SPLICES SHALL BE STAGGERED.
10. ALL SPLICES SHALL CONFORM TO THE 2005 EDITION OF THE AMERICAN CONCRETE INSTITUTE'S "BUILDING CODE REQUIREMENTS FOR STRUCTURAL CONCRETE" (ACI 318–08), SECTION 12.15. ALL STEEL SHALL BE LAPPED USING THE FOLLOWING TABLE (CLASS B SPLICES):

BAR SIZE	#4	#5	#6	#7	#8	#9	#10	#11	#14	#18
LENGTH OF LAP SPLICE	25"	31"	37"	62"	81"	103"	130"	160"	TENSION LAP SPLICING NOT PERMITTED	

THE LAP LENGTH SHALL BE BASED ON THE SMALLER SIZE BAR.

ADDITIONAL NOTES FOR RC TRANSITION SECTION:

11. LONGITUDINAL STEEL SHALL BE CONTINUOUS AND EXTENDED THROUGH ALL CONSTRUCTION JOINTS.
12. UNLESS OTHERWISE SHOWN ON THE DRAWINGS, TRANSVERSE JOINT KEYWAYS (IN BOTH SLABS AND WALLS), SHALL BE PLACED AT THE END OF EACH POUR, BUT THE SPACING THEREOF SHALL NOT EXCEED 50 FEET OR BE LESS THAN 10 FEET.
13. UNLESS OTHERWISE SHOWN ON THE DETAILS, IN CURVED SECTIONS, TRANSVERSE BARS SHALL BE PLACED RADIALLY. STRAIGHT TRANSVERSE BARS IN TOP AND BOTTOM SLABS SHALL BE PLACED AS SHOWN ON THE TYPICAL SECTIONS, SPACING SHALL BE AT THE CENTERLINE OF CONSTRUCTION FOR SINGLE–BARREL BOXES, UNLESS OTHERWISE NOTED. STRAIGHT BARS AND L–BARS IN WALLS SHALL BE SPACED AS SHOWN ON TYPICAL SECTIONS, WITH THE SPACING MEASURED BETWEEN THE VERTICAL LEGS OF BARS.
14. AT THE BEGINNING AND END OF ALL POURS, A CURTAIN OF REINFORCEMENT COMPOSED OF B, C, C_2, D, F, G, AND H BARS SHALL BE PLACED THREE INCHES FROM THE TRANSVERSE CONSTRUCTION JOINT.
15. THE VERTICAL WALL STEEL IN THE INTERIOR WALLS AND IN THE INTERIOR FACE OF EXTERIOR WALLS MAY BE SPLICED AT THE CONSTRUCTION JOINT AT THE BASE OF THE WALL. THE LAP SPLICE SHALL BE ACCORDANCE WITH THE TABLE UNDER GENERAL NOTE 10.
16. IN ALL SECTIONS, LAP C AND C_2 BARS, THE VERTICAL LENGTH OF C AND C_2 BARS HAS BEEN CALCULATED FOR A 3 1/2" STARTER WALL. IF THE HEIGHT OF THE STARTER WALL VARIES, THE VERTICAL LENGTH OF THE C AND C BARS SHALL BE VARIED CORRESPONDINGLY, SO AS TO MAINTAIN THE REQUIRED LAP SPLICE BETWEEN THE TWO BARS IN ACCORDANCE WITH THE TABLE UNDER GENERAL NOTE 10. THE LENGTH OF THE LAPS SHALL BE BASED ON THE SMALLER BAR.
17. TRANSVERSE WALL JOINTS SHALL HAVE A 4" POLYVINYL CHLORIDE WATERSTOP (SPLIT RIBBED CENTER BULB TYPE) WHICH SHALL BE CONTECH VINYLSTOP NO. 431S, BURKE VINYLOK WATERSTOP R.S.B. 316–4, OR AN APPROVED EQUAL.
18. DRILL A ONE INCH DIAMETER HOLE AND INJECT AN APPROVED NON–SHRINK GROUT INTO THE HOLE PRIOR TO PLACEMENT OF THE BAR
19. THE LONGITUDINAL WALL JOINTS SHALL HAVE A 4" POLYVINYL CHLORIDE WATERSTOP (RIBBED TYPE) WHICH SHALL BE BURKE VINYLOK WATERSTOP R.316–4, WATER SEALS INC. FLEXSTRIP OR AN APPROVED EQUAL. THE WATERSTOP SHALL BE TIED TO THE OUTSIDE OF THE REINFORCING STEEL AT THE TOP AND BOTTOM WITH ONE PIECE OF WIRE AT APPROXIMATELY 1'–0" SPACING, PUNCHING SHALL NOT BE ALLOWED. THE WATERSTOP SHALL BE CONTINUOUS FOR EACH WALL SECTION.
20. TWO LONGITUDINAL BARS SHALL BE PLACED AT EACH CORNER LOCATION. AS SHOWN ON THE DETAIL. THE REMAINING LONGITUDINAL BARS SHALL BE EQUALLY SPACED BETWEEN THE CORNER BARS WITH A MAXIMUM SPACING OF 18 INCHES IN EACH FACE OF THE SLABS AND WALLS AND NEED NOT CORRESPOND TO THE NUMBER OR LOCATION SHOWN ON THE DETAIL SEE THE TABLE FOR LONGITUDINAL BAR TOTALS.
21. STATIONS ARE MEASURED RADIALLY FROM SURVEY CONTROL LINE TO THE CENTER LINE OF RC BOX.

Executive Summary

The existing 1.5 miles of Gabbert Canyon Channel and 2.5 miles of Walnut Canyon Channel, located in the City of Moorpark, consist primarily of improved concrete channels which were originally constructed by the Soil Conservation Service (SCS) between 1959 and 1962. These facilities collect and convey storm runoff to the Arroyo Simi from a total tributary watershed drainage of 6.91 square miles. Comparison of the existing hydraulic capacities for the flood control channel sections to the estimated runoff quantities indicates that the channels cannot provide the desired level of flood protection. The limited hydraulic conveyance capacity of the existing channel system results in the flood protection deficiency and is documented on the current Flood Insurance Rate Map (FIRM) for the City of Moorpark. The existing hydraulic capacities can only provide conveyance which correspond to equivalent return periods as low as 5-years, depending upon the location. This report presents a comprehensive engineering investigation of the hydraulic deficiencies associated with this regional flood control channel system. The primary objective of the study is to develop and evaluate alternative drainage improvements and stormwater management measures that provide: (1) the necessary level of flood protection, (2) compatibility with existing and future landuse, (3) provide the maximum public benefit for least costs, (4) minimize impact to existing facilities, (5) elimination of the hydraulic deficiencies, and (6) identify minimum drainage requirements for future development within the watershed. The intent of this document is to develop a conceptual design for a recommended system of comprehensive stormwater management measures which will provide the watershed planning framework to allow implementation of the regional flood control improvements and continued development within the watershed.

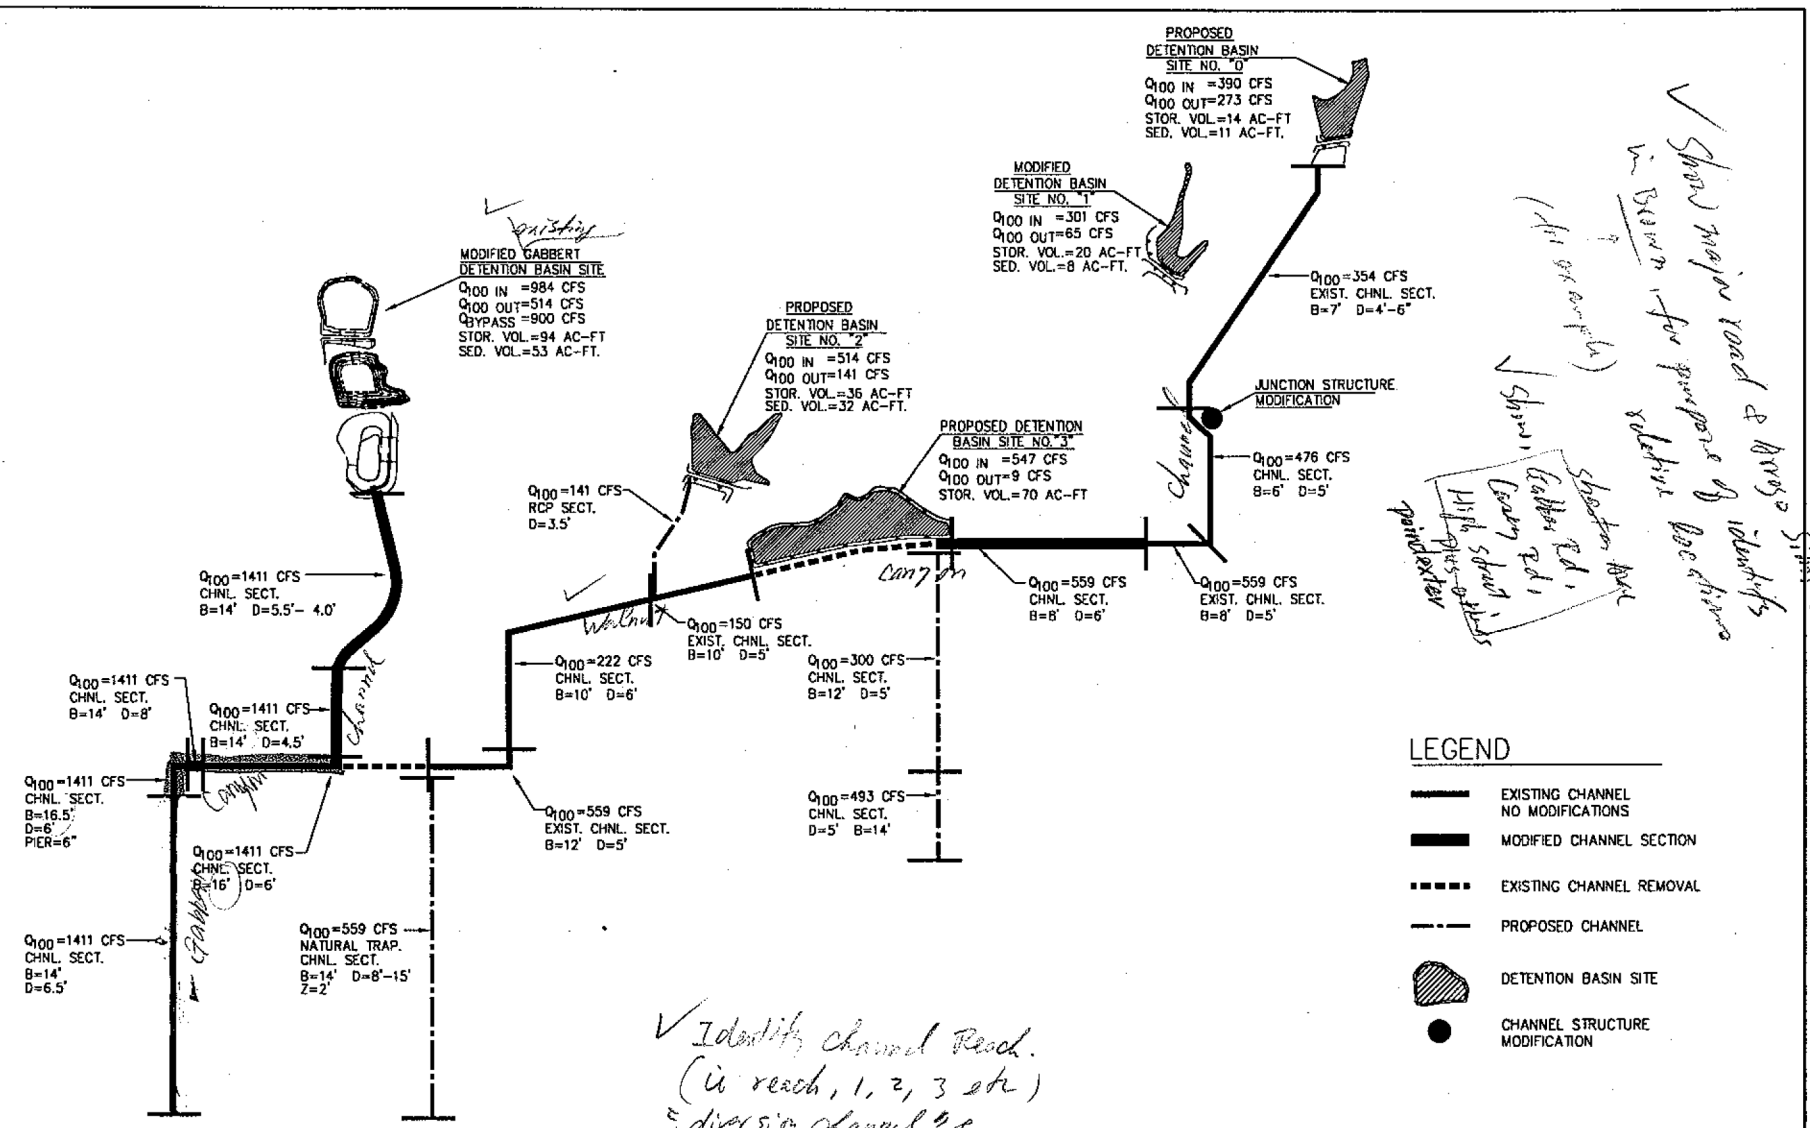
What is the difference of (4) & (2) ?

Various combinations of individual storage and conveyance oriented flood control elements were integrated into comprehensive system which would provide the required level of flood protection. The conveyance system improvements included: (1) increasing the hydraulic capacity of the existing channel section through either reconstruction to enlarge the section or extending wall heights, (2) construction of a channel diversion systems to split a portion of the flow, (3) removal of hydraulic restrictions, and (4) channel outlet relocation and reconstruction. The conveyance oriented improvements primarily involved modifications to the existing channel sections in order to minimize acquisition of ~~significant~~ additional right-of-way. The flood control storage alternatives included both on-line and off-line gravity operated stormwater detention basins. The detention basins also incorporated requirements for debris storage ~~facilities~~. Detention basin configurations and locations were developed to maximize available storage volume while minimizing impact to property. Another primary consideration which limited the size of the flood control storage facilities was to ensure that the detention were not ~~within~~ the jurisdiction of the California Division of Safety of Dams (DSOD).

so large as to fall in

maximize the overall drainage system capacity with

The proposed correction of the flood control deficiency must be evaluated on a watershed basis through the application of a systems approach since the various drainage elements have a combined impact on the channel. The feasibility evaluation resulted in screening the available channel "system" alternatives to a maximum of eight for detailed consideration, from a total of ninety-eight which were developed in the plan formulation. The objective was to optimize the effectiveness of the system



through incorporating the existing facilities into the recommended program to the maximum extent possible. The primary components associated with each of the eight channel "system" alternatives are indicated in the *Table E.1 - Summary Description of Alternative Channel Systems*. All alternatives have some similar required construction elements which include: (1) modification of Gabbert Canyon Debris Basin to provide detention storage, (2) additional detention basins located upstream at the headworks of Walnut Canyon, adjacent to Gabbert Road, and upstream of Casey Road, (3) channel reconstruction for the 1,900 feet portion of Walnut Canyon Channel upstream of High Street, and (4) all systems require improvement of 2,655- feet Gabbert Canyon Channel between the Walnut Channel confluence and the existing Gabbert Debris Basin. In addition to these elements, the alternatives evaluated various combinations of additional detention basins, diversion systems, or relocated channel outlets to the Arroyo Simi.

(See Exhibit 1 Alt B for relative locations)

Table E.1 - Summary Description of Alternative Channel Systems

Alt. No.	Gabbert Basin Modification	Additional Detention Basins	Gabbert Channel Reaches	Walnut Channel Reaches	Diversion Channel System	Channel Outlet Relocation
A	Improved to 94 ~~AF~~ ac-ft Detention Storage	0,1,2,3 (V_{total} = 140 AF)	1,2,3	2	300 cfs	Gabbert & Walnut
B	Improved to 94 ~~AF~~ Detention Storage	0,1,2,3 (V_{total} = 140 AF)	1,2,3	2	300 cfs	Walnut
C	Improved to 94 ~~AF~~ Detention Storage	0,1,2,3 (V_{total} = 140 AF)	Entire Channel	2	300 cfs	None
D	Improved to 94 ~~AF~~ Detention Storage	0,1,2,5 (V_{total} = 380 AF)	1,2,3	2	None	Gabbert & Walnut
E	Improved to 94 ~~AF~~ Detention Storage	0,1,2,5 (V_{total} = 380 AF)	1,2,3	2	None	Walnut
F	Improved to 94 ~~AF~~ Detention Storage	0,1,2,5 (V_{total} = 380 AF)	Entire Channel	2	None	None
G	Improved to 94 ~~AF~~ Detention Storage	0,1,2,4 (V_{total} = 295 AF)	1,2,3	2	100 cfs	Gabbert & Walnut
H	Improved to 94 ~~AF~~ Detention Storage	0,1,2,4 (V_{total} = 295 AF)	1,2,3	2	100 cfs	Walnut

The total construction costs for each of the alternative drainage "systems" was estimated including land acquisition requirements. These costs provide the primary basis for selection of the recommended drainage "system", however there are issues related to land acquisition which should be resolved before finalizing the project design. The summary of the various cost elements with and without right-of-way are indicated in the following *Table E.2 Summary of Alternative System Construction Costs*. It appears that of all the eight alternatives that Alternative "B" is the least-cost

1

alternative, subject to more detailed estimates. If land acquisition costs are not included in the total costs then Alternative "E" becomes the recommended solution since the diversion system is replaced by a diversion detention basin that satisfies the same condition. It is tentatively recommended that **Alternative "B" become the selected solution**. This alternative includes (1) relocating the Walnut Canyon Channel outlet while continuing to utilize the existing Gabbert Canyon Channel outlet, (2) only improving one channel reach on both Gabbert and Walnut Canyon channels, (3) an underground diversion system adjacent to Shasta Avenue, and (4) a "offline" detention basin parallel to Poindexter Avenue. This alternative has one of the minimum land acquisition requirements and it appears to have a high degree of feasibility while compatible with the adjacent property owners.

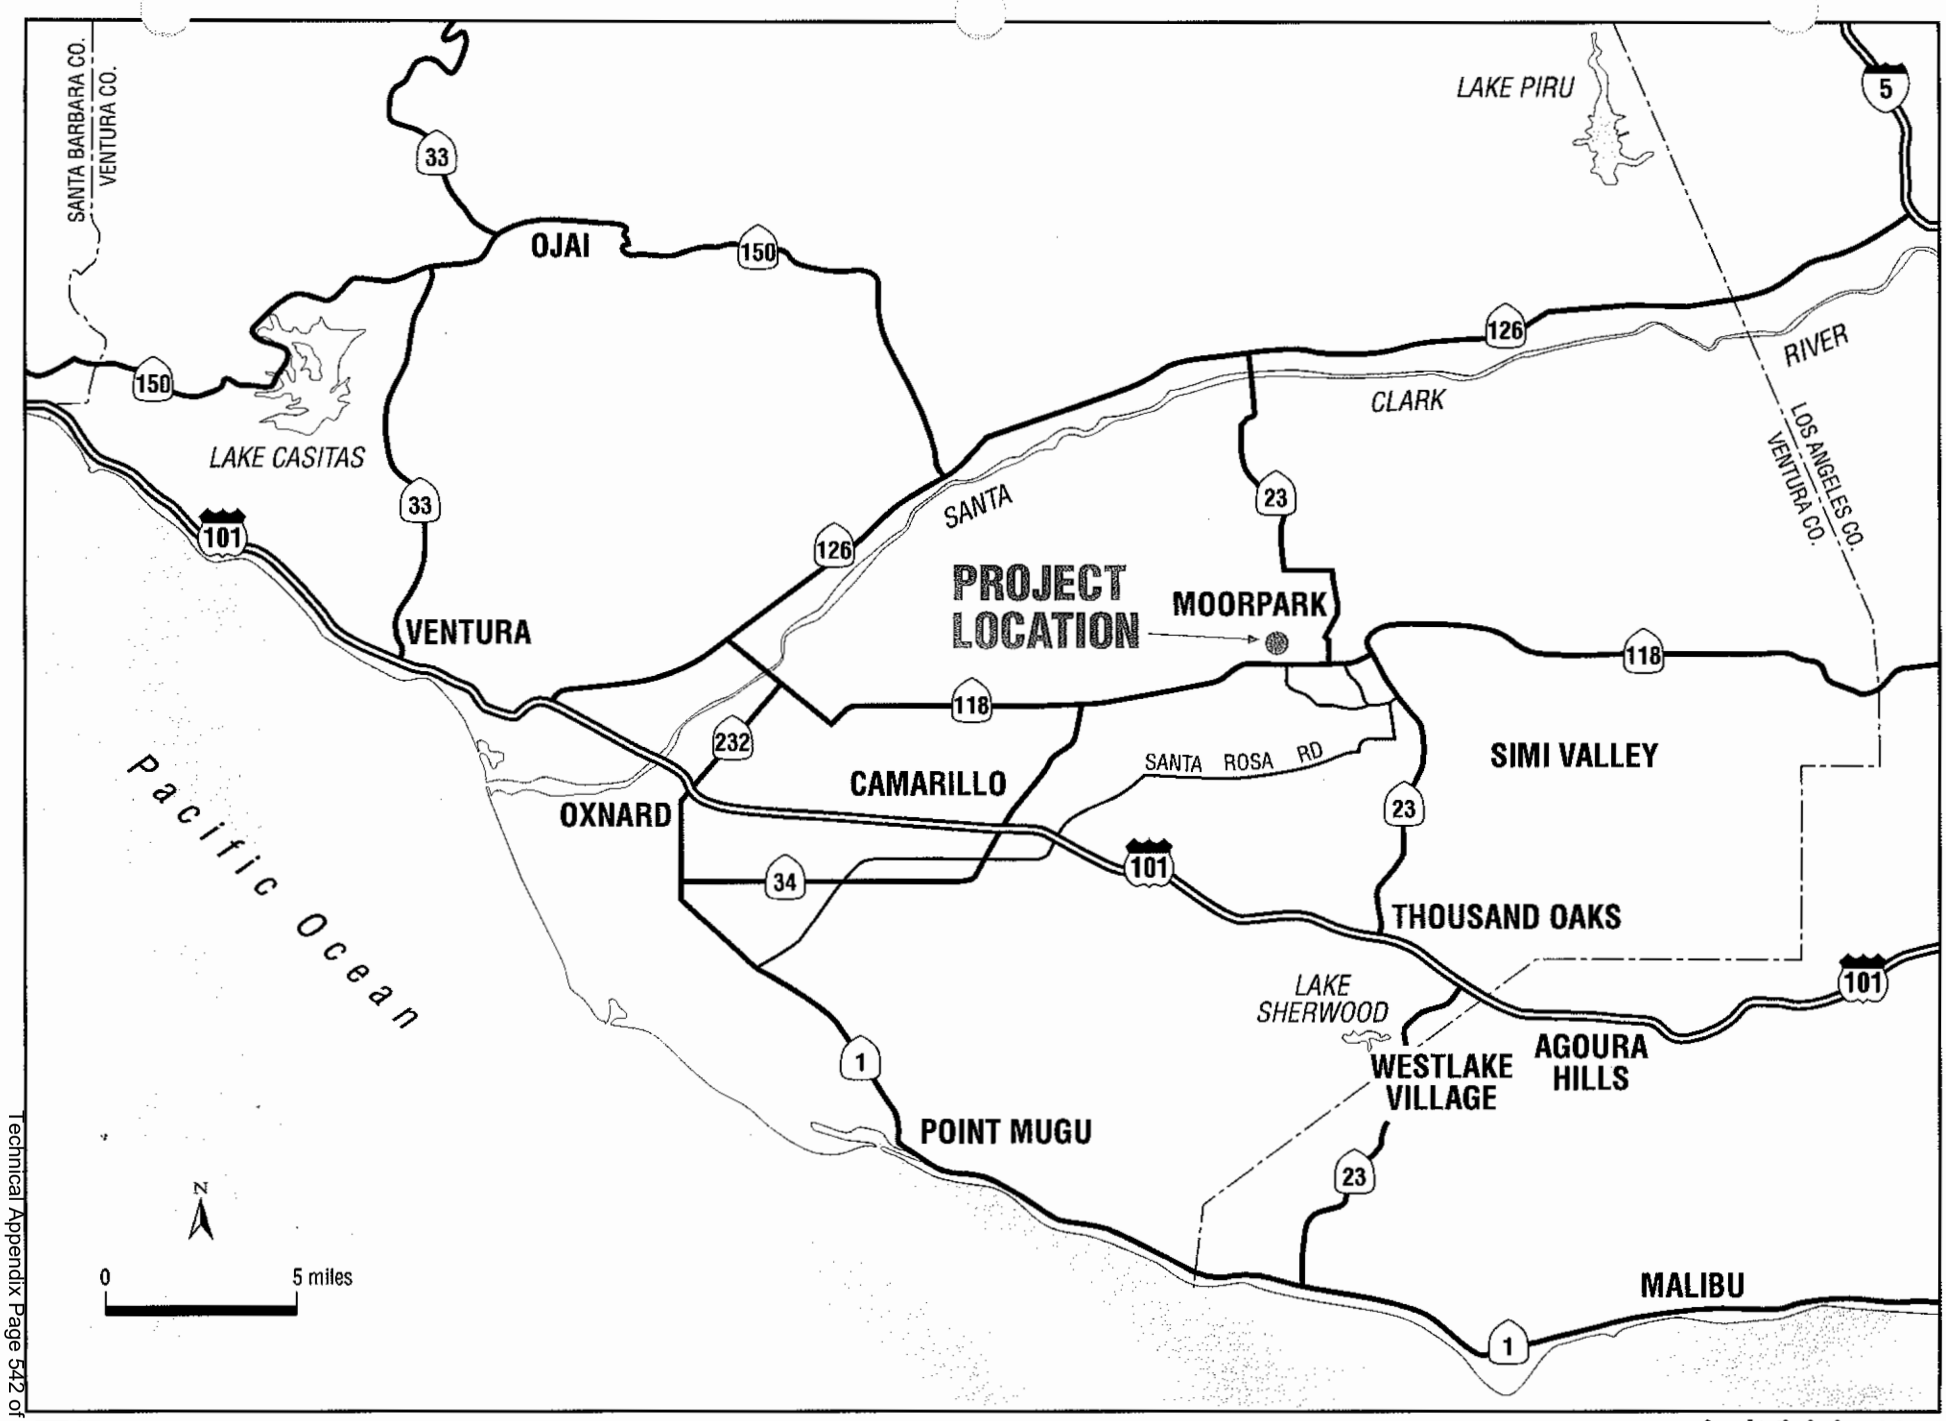
Section 1—Introduction

1.1 Project Description

Gabbert and Walnut Canyon Channels are existing improved concrete flood control channels which provide regional flood protection for the City of Moorpark. The existing 1.5 miles of Gabbert Canyon Channel and 2.5 miles of Walnut Canyon Channel are regional flood control channels or "red line" facilities maintained by the Ventura County Flood Control District which the majority were originally constructed by the Soil Conservation Service (SCS) between 1959 and 1962. These facilities collect and convey storm runoff to the Arroyo Simi from a total tributary watershed drainage of 6.91 square miles which has a significant portion that is not developed. The channel systems provide a significant flood protection benefit through a horizontal alignment which results in intercepting the drainage from the mouth of several large canyons and would have resulted in uncontrolled flooding. Comparison of the existing hydraulic capacities for the flood control channel sections to the estimated runoff quantities indicates that the channels cannot provide the desired level of flood protection. The limited hydraulic conveyance capacity of the existing channel system results in the flood protection deficiency and is documented on the current Flood Insurance Rate Map (FIRM) for the City of Moorpark. The existing hydraulic capacities can only provide conveyance which correspond to equivalent return periods as low as 5-years, depending upon the location.

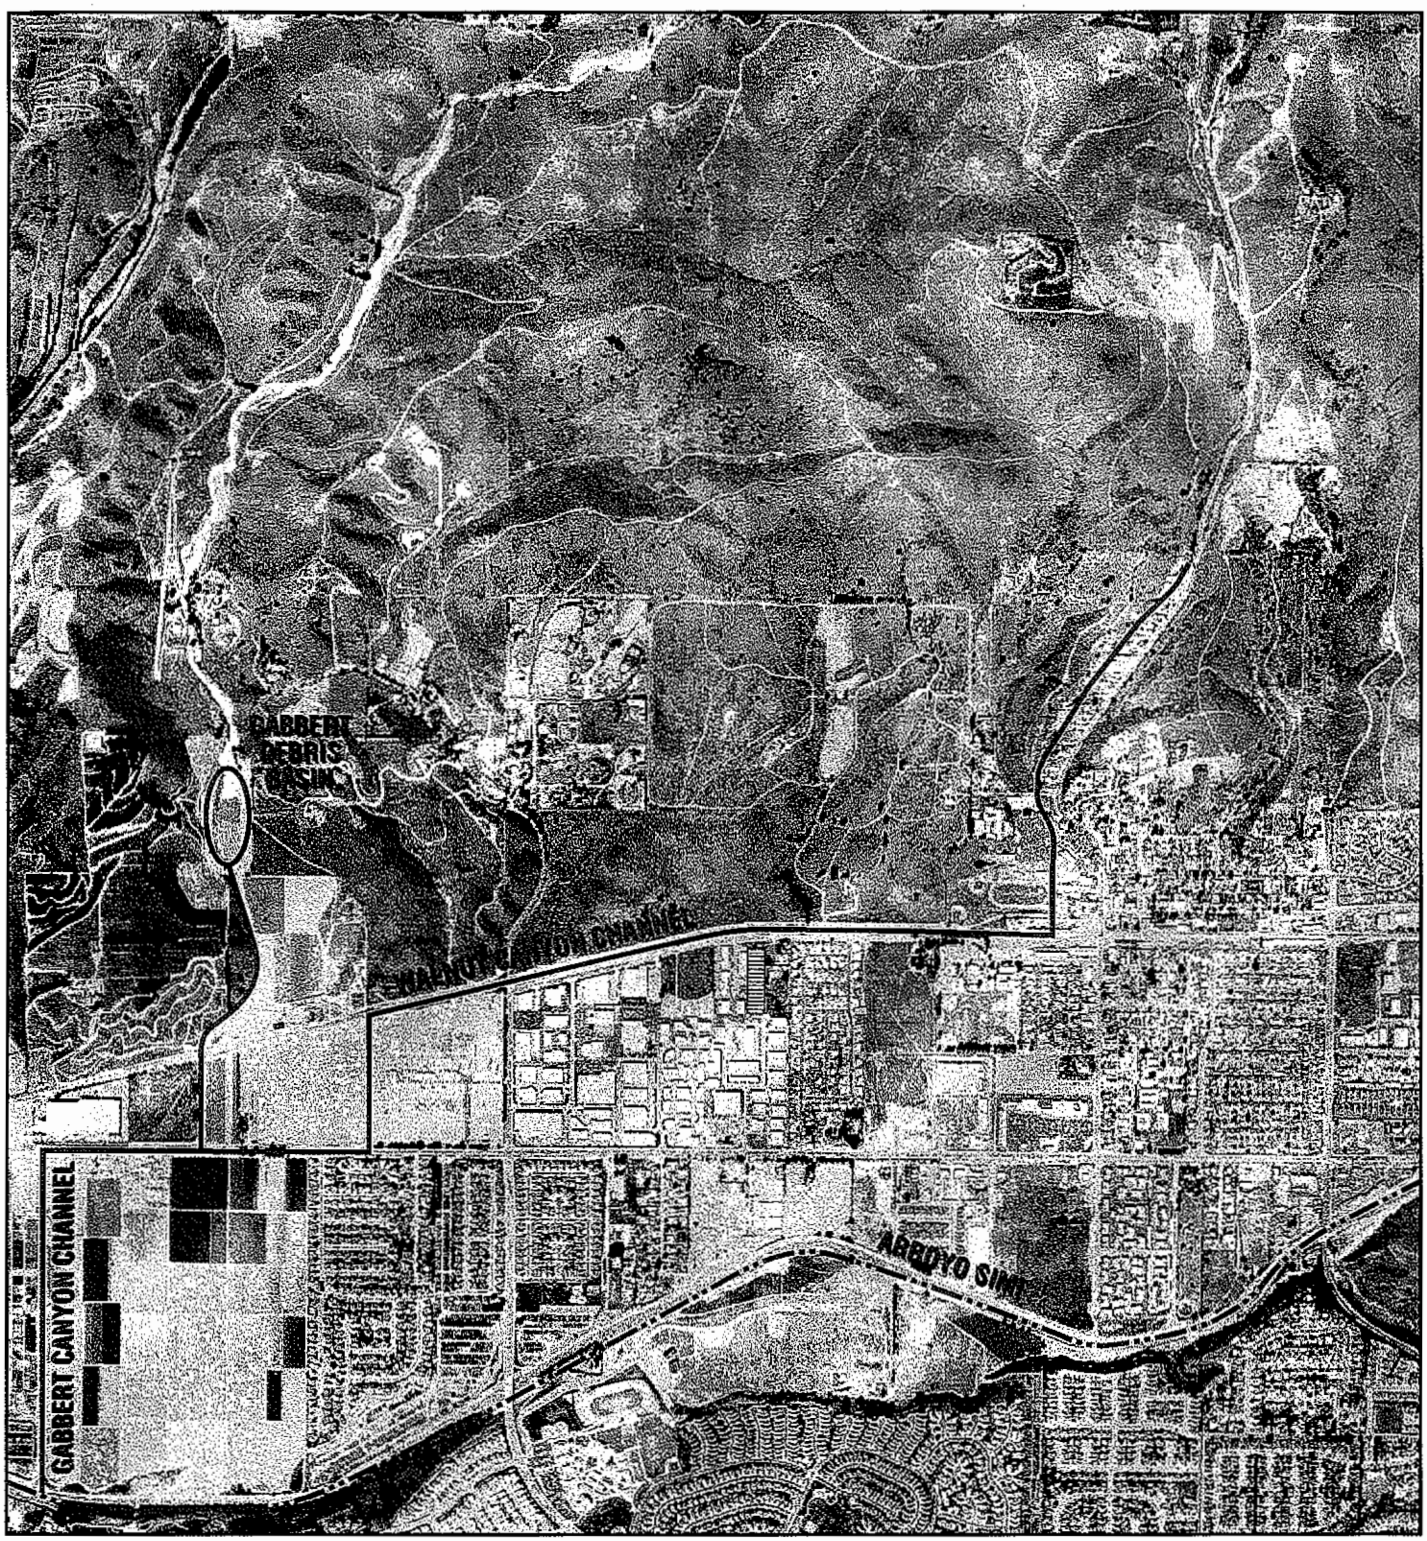


Potential regional drainage improvements to provide the required level of flood protection include combinations of (1) channel reconstruction, (2) detention basins, (3) debris basin, (4) diversion systems, and (5) channel relocation. Future development within the upper watershed and directly adjacent to the channel could limit the possible corrective measures if a comprehensive drainage plan is not provided to assist in the watershed planning.

1.2 Study Objective

The purpose of this investigation is to identify the existing channel hydraulic deficiencies and develop a conceptual recommended "watershed plan" which will provide the desired level of flood protection. This study investigates the feasibility of implementing various combinations of conveyance and storage oriented facilities within the watershed. The recommended drainage "system" improvements must satisfy both the technical and the economic goals of the project. The project has identified the following key objectives in the development of an implementable watershed masterplan:

1. Evaluate the existing hydraulic capacity of the existing channel systems and determine the magnitude of the hydraulic deficiency with respect to the existing watershed peak flowrates.



2. Analyze various "drainage system" alternatives composed of channel improvements or detention storage facilities that will allow the channel to safely convey the project design discharge.

3. Identify major physical constraints such as utilities or roads which are impacted by the recommend improvements

4. Estimate construction costs requirements and land acquisition associated with each alternative.

5. Provide an improvement program which is sensitive to the proposed development projects within the watershed and provide recommendations to ensure that these projects do not have hydrologic impacts.

The information contained in this report is intended to provide preliminary design level information that will facilitate overall planning process within the watershed and provide a foundation for the next level of engineering design. It is intended that this document will facilitate the communication with other agencies and the public during the initial stages of the project development.

1.3 General Design Approach

The plan formulation process for flood control facilities involves a sequential process to identify the magnitude of the problem and then determine the feasibility for the implementing most effective system. A specific work program was developed which outlined the general approach of the analysis. The primary tasks included the following:

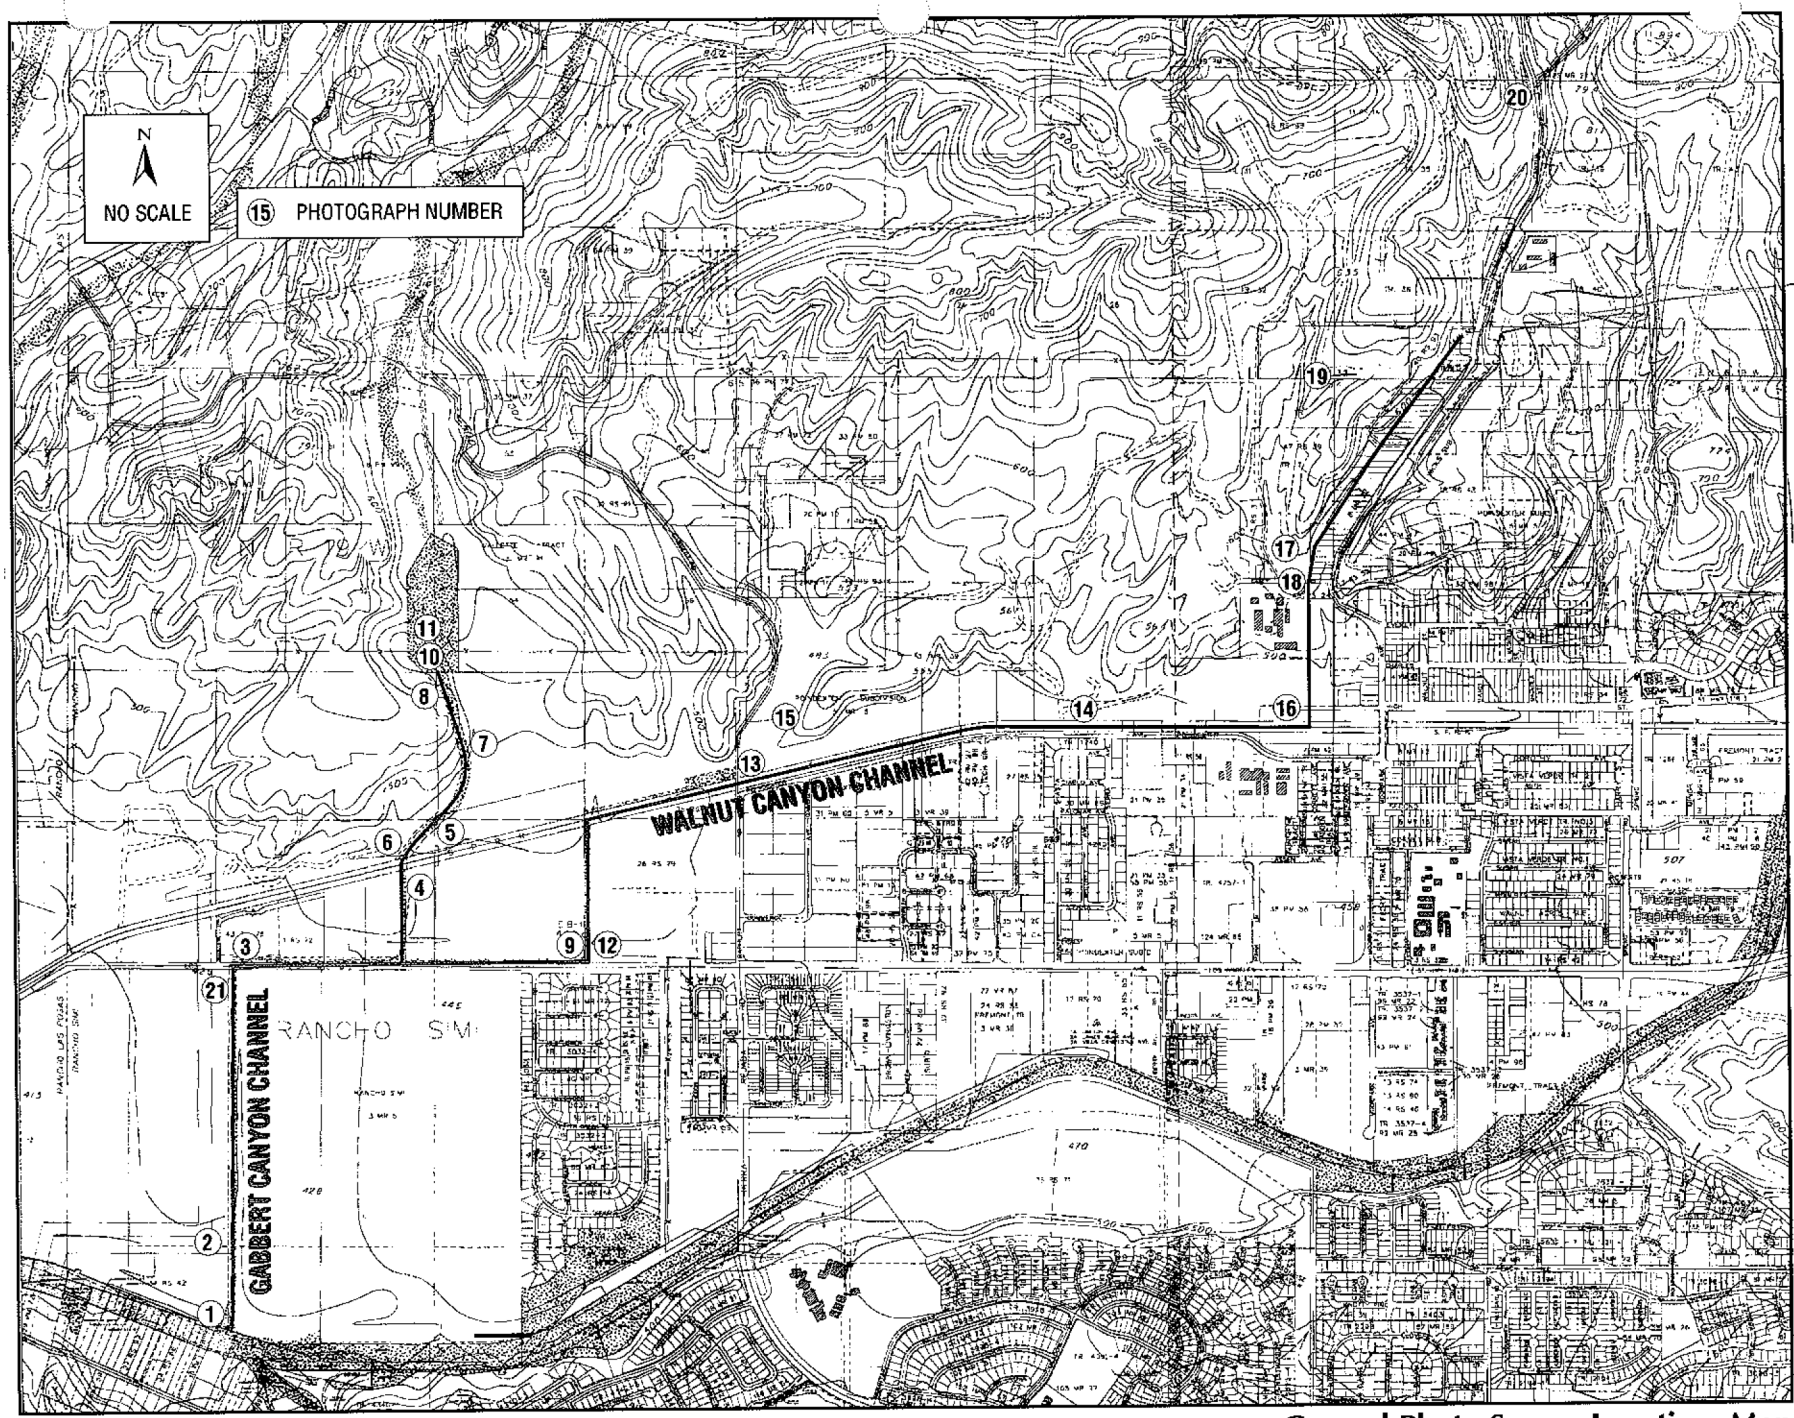
Phase I - Collection and Review of Base Data - Conduct inventory of existing facilities and develop a watershed database which will assist in the plan formulation.

Phase II - Definition of Engineering Criteria - Determine the hydraulic and hydrologic criteria which will be applied for both analysis and design, including the level of flood protection

Phase III- Evaluation of Existing Facilities - Analyze the actual hydraulic capacity of the existing channel system and determine critical locations which define the capacity of the channel system

Phase IV - Alternative Drainage System Formulation and Evaluation - Develop and analyze multiple system alternatives composed of a variety of drainage elements in order to establish a feasible and cost effective approach that provides the desired level of flood protection

Section 2—Background



2.1 Project Understanding and Study Area Description

The approximately 4.0 miles of the Gabbert Canyon and Walnut Canyon Channels, located in the City of Moorpark, consist primarily of improved concrete channels which were originally constructed by the Soil Conservation Service (SCS) between 1959 and 1962. These regional drainage facilities are located in Zone 3 of the Ventura County Flood Control District. The flood control channels intercept drainage from the mouths of four canyons with a total tributary drainage area of 6.9 square miles which discharge into the Arroyo Simi floodplain. The channels provide protection for the main urbanized area of the City of Moorpark from flooding which normally would have occurred without this channel system. Approximately 90% of the watershed area which the channel intercepts from the upstream canyon is primarily undeveloped and their are planning efforts for private development on a significant portion of this area. However, the limited hydraulic conveyance capacity of the existing channel system results in a flood protection deficiency and is documented on the current Flood Insurance Rate Map (FIRM) for the City of Moorpark which indicates shallow flooding occurring from channel overtopping. The existing hydraulic capacities can only provide conveyance which correspond to equivalent return periods as low as 5-years, depending upon the location within the watershed. In addition, approximately 50% of the land directly adjacent to the existing channel is also undeveloped and if channel improvements are required to remove the flood hazards then a planning guidelines should be provided to these landowner.

This report functions to identify existing deficiencies within both the Gabbert and Walnut Canyon Channel system, formulate and evaluate alternative solutions, and determine the most cost effect and feasible watershed program.

2.1.1 Field Investigation

A field reconnaissance of the existing channel facilities was performed as part of the technical investigation, which included field review of potential detention basin locations and verification of existing reference documents. The approximate location of each of the following photographs is identified on *Exhibit - Ground Photo Survey Location Map*.

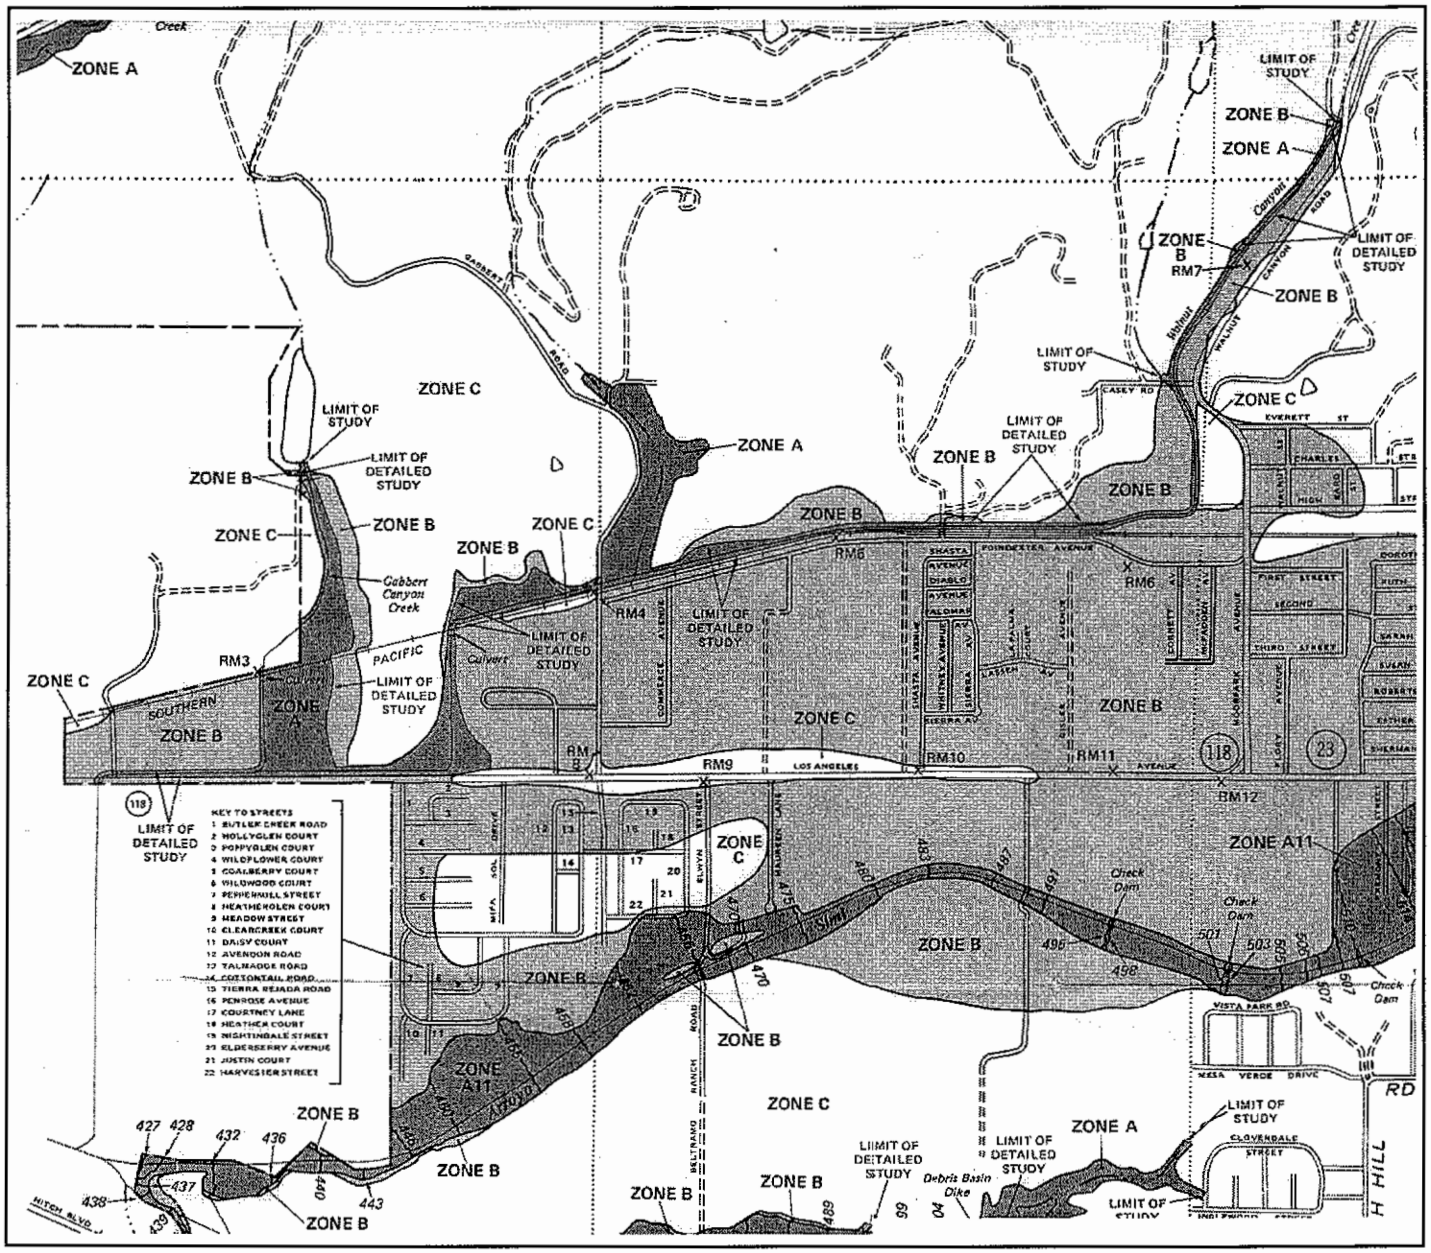
2.2 *Description of Existing Channel Facilities*

The channel system consists of approximately 1.5 miles of improved channel in the Gabbert Canyon and 2.86 miles in Walnut Canyon, all maintained by VCFCD. The existing channel system consists almost entirely of a concrete rectangular channel section except for 495-feet of lined concrete trapezoidal channel section along Gabbert Canyon Channel upstream of the SPRR. The depths of the channel primarily range from 5 to 6 feet for the entire length. The average slopes of the channel vary from the upstream reaches where the canyon is steep to the lower sections within the Arroyo Simi floodplain which is much flatter. The upper or steeper portions of the channel are generally located where the channel alignment is within the canyons and parallel to the regional topography. These slopes 1.5% to 3% in these areas and in the flatter areas where the channel alignment is perpendicular to the regional topography the slopes are approximately 0.5%. The channel base widths in the Walnut Channel range from 7-feet to 12-feet while the widths in the Gabbert Channel range from 8-feet to 14-feet. There are two existing debris basins within the watershed, in addition to several smaller agricultural reservoirs of unknown ownership. The largest and most significant debris collection facility is the VCFCD Gabbert Canyon debris basin which is located at the headworks to Gabbert Canyon Channel and has a maximum debris capacity of 30.4 acre-feet. A smaller debris basin is located at the headworks to the Moorpark Drain No.1.

2.3 *City of Moorpark Municipal Masterplan of Drainage*



A comprehensive *Masterplan of Drainage for the City of Moorpark* was prepared by Hawks and Associated, April 1995. This planning document outlines the minimum infrastructure requirements associated with the local municipal drainage system to provide a 50-year level of flood protection. The recommendations contained in the masterplan provide a framework which facilitates optimum implementation of improvements for the municipal drainage system. A surface hydrology analysis was developed for the municipal watershed which focused on the local drainage systems and evaluated the hydraulic deficiencies associated with these drainage facilities. The hydraulic analysis incorporated by the masterplan only used soffit-normal depth flow for the storm drain pipe hydraulic and is of limited benefit. The masterplan only briefly discussed regional facilities such as the Gabbert and Walnut Canyon Channels and did not evaluate hydraulic deficiencies other than those identified in the FIRM. The primary focus of the masterplan is the municipal drainage systems which are operated by the City of Moorpark, rather the regional or "redline" flood control facilities which are maintained by the Ventura County Flood Control District. In addition, the masterplan did not consider the impacts of water surface elevation in the channel on the hydraulic grade line for the connecting local drainage system. The masterplan assumed that all local drainage systems would be able to freely discharge into the regional channel systems. The masterplan, however, did identify the potential for a future regional detention basin site adjacent to Walnut Canyon Channel adjacent to the SPRR and downstream of the Gabbert Road culvert crossing. No detailed hydrology analysis was performed to quantify preliminary basin sizing requirements associated with the regional detention recommendation. The recommended basin site is similar to Basin No. 5 identified in this current investigation.

The information outlined in the municipal masterplan of drainage is compatible with this regional watershed investigation. This study deficiency supplements the information and recommendations outlined in the city drainage masterplan. The hydrology analysis for the Gabbert/Walnut Canyon Channel watershed assumed that all the local storm drain could deliver the peak flows to the channel system, except for the Moorpark Drain No.1 which was limited to the hydraulic capacity or original design flow of the storm drain which was approximately 125 cfs.

2.4 *Floodplain Mapping*

The potential for flooding directly associated with the limited hydraulic capacity of the Gabbert and Walnut Canyon Channel systems is reflected in the published floodplain mapping (see *Exhibit No. - City of Moorpark Flood Insurance Rate Map*) for the Moorpark area which indicates the 100-year overflow which causes shallow regional flooding through the urbanized portions of the City. Published Flood Insurance Rate Maps (FIRM) identifying flood hazard zones are available for the City of Moorpark since it is a participant in the National Flood Insurance Program (NFIP) administered by the Federal Emergency Management Agency (FEMA). Communities participating in the NFIP must adopt and enforce minimum floodplain management standards, including identification of flood hazards and flooding risks. Participation in the NFIP allows the communities to purchase low cost insurance protecting against losses from flooding and it is mandatory for residents located in designed flood hazard Zone A to purchase this insurance. The current FIRM for the City of Moorpark became effective September 29, 1986 and is shown on the FIRM community panel 067120005A which indicates only the mapped flood hazard boundaries within the municipal boundary.

Although the information contained on the FIRM is not intended for design purposes or necessarily correspond to current design hydrology, it can indicate general characteristics of the floodplain and locations of flooding. The hydraulics of the improved channels appear to have been studied in detail but the shallow overflow flooding was evaluated with approximate methods. The locations on the FIRM which have a mapped flood hazard Zone A adjacent to the channel resulting from the limited hydraulic capacity include: (1) the entire length of Gabbert Channel from the debris basin to the confluence with Walnut Canyon Channel, (2) Walnut Canyon Channel from Los Angeles Avenue to the Southern Pacific Railroad, (3) Walnut Canyon Channel from the Southern Pacific Railroad to upstream of Commerce Avenue, and (4) the small tributary canyon adjacent to Gabbert Road. The areas where the flood hazard Zone A occurs is generally adjacent to undeveloped parcels of land. The hydraulic analysis of the existing channel system performed as this study verifies that these portions of the channel are hydraulically deficient and could potentially result in an overflow condition. The mapped floodplain boundaries along Walnut Canyon Channel indicate that the majority of the flooding from the canyons is confined by the Southern Pacific Railroad embankment adjacent to the channel which functions as a transverse levee. Significant portions of the urbanized areas of the City of Moorpark located downstream of the channel system have been designated Zone B which indicates the potential for shallow flooding of less than one-foot resulting from a 100-year flood. The floodplain in these areas appear to be influenced from flooding sources of both the Gabbert/Walnut Canyon Channels and the Arroyo Simi.

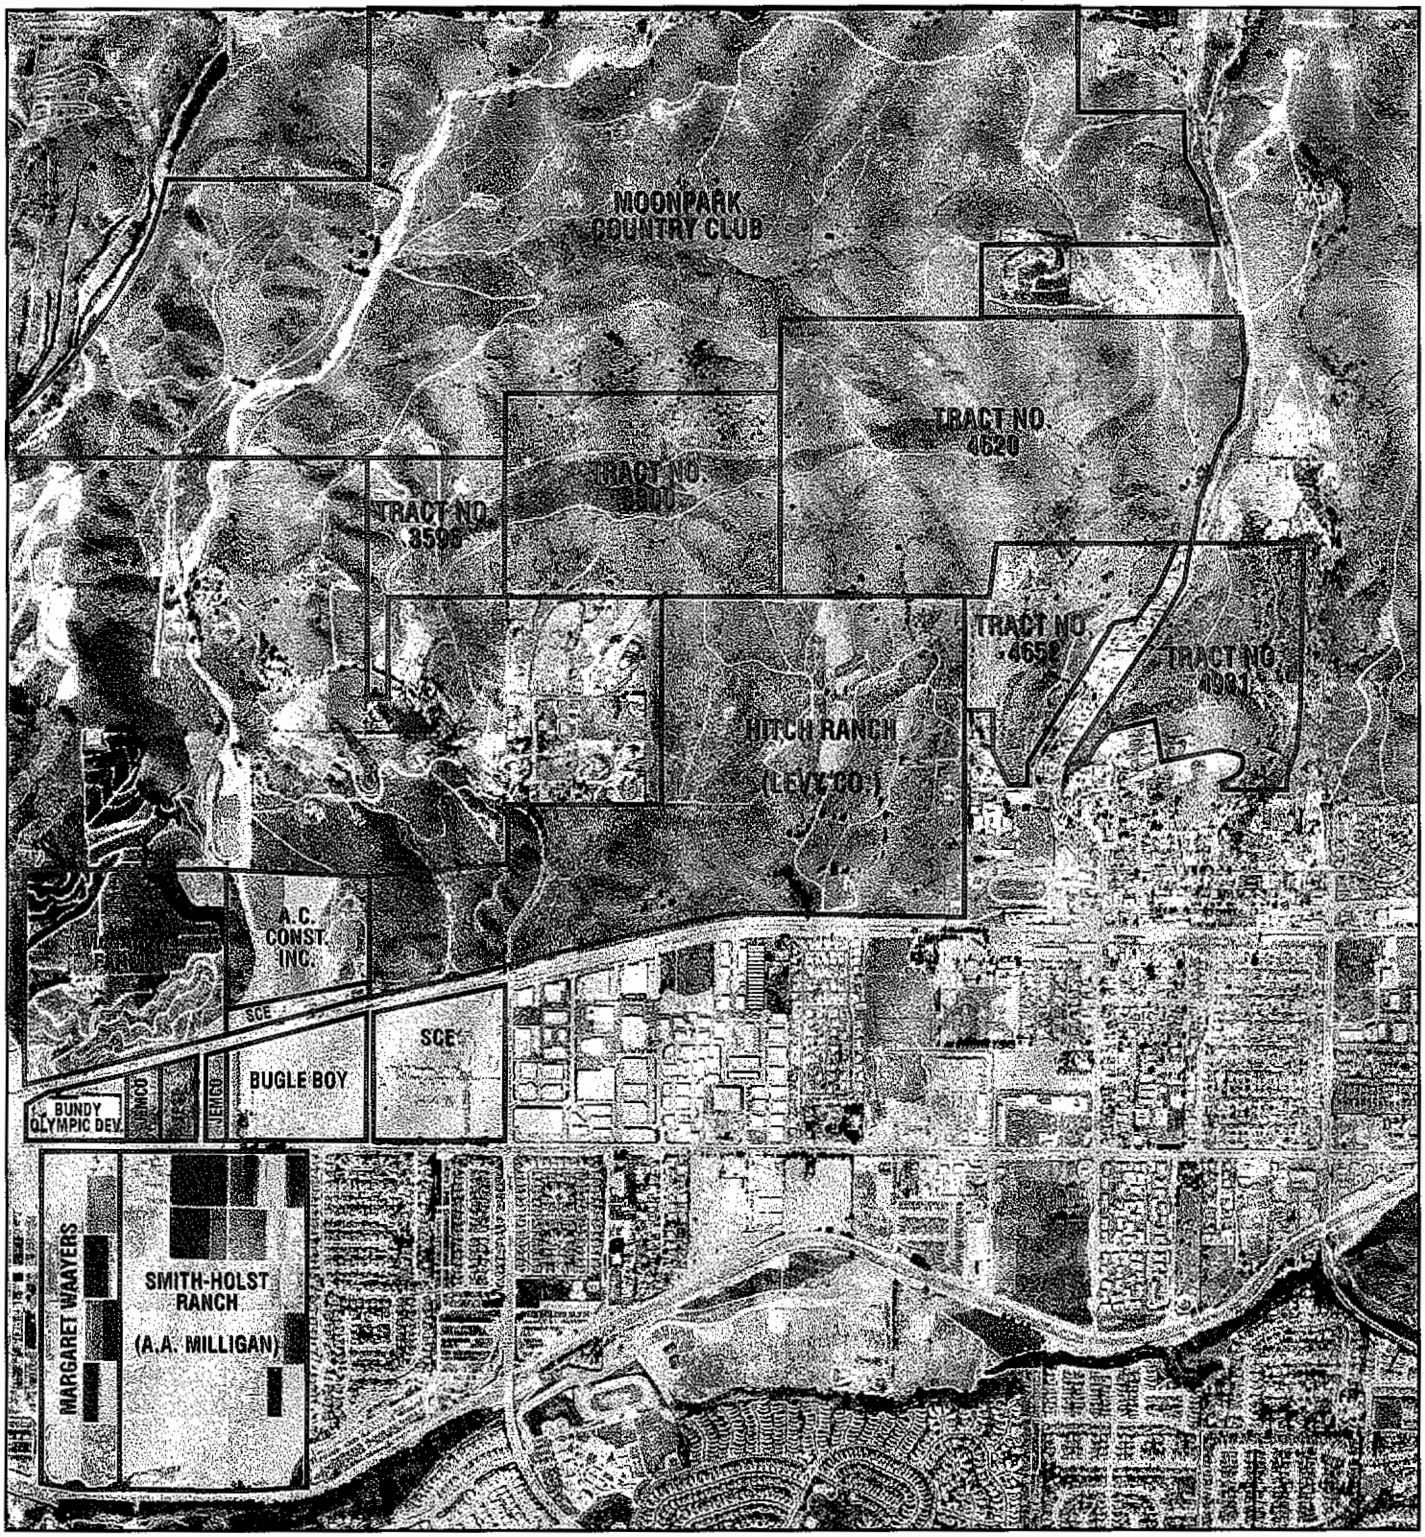
2.5 *Proposed Development within Watershed*

A significant portion of the land within the Gabbert and Walnut Canyon watershed which remains undeveloped, especially in the upper portions of the watershed. In addition, over 50% of the land directly adjacent to the existing improved channels is currently undeveloped. Prior to development of these undeveloped parcels it is important that considerations are incorporated into the planning which assist in removing the hydraulic deficiencies directly adjacent to these parcels. This corresponds to removing flood hazard restrictions which currently encumber portions of these parcels adjacent to the channels. The primary undeveloped land parcels within the watershed have been identified on *Exhibit No. - Watershed Undeveloped Land Ownership*. The potential hydrologic impacts associated with urban development of these parcel must also be mitigated in order to prevent increased runoff from additional impervious area. Increases runoff from the development would increase the corresponding observed storm hydrographs in the flood control channels above the existing runoff values which already exceed the hydraulic capacity of channel system.



Many of the undeveloped parcels are currently in different stages of development planning and the various stakeholders have been contacted during the initial plan formulation of this watershed to solicit input.

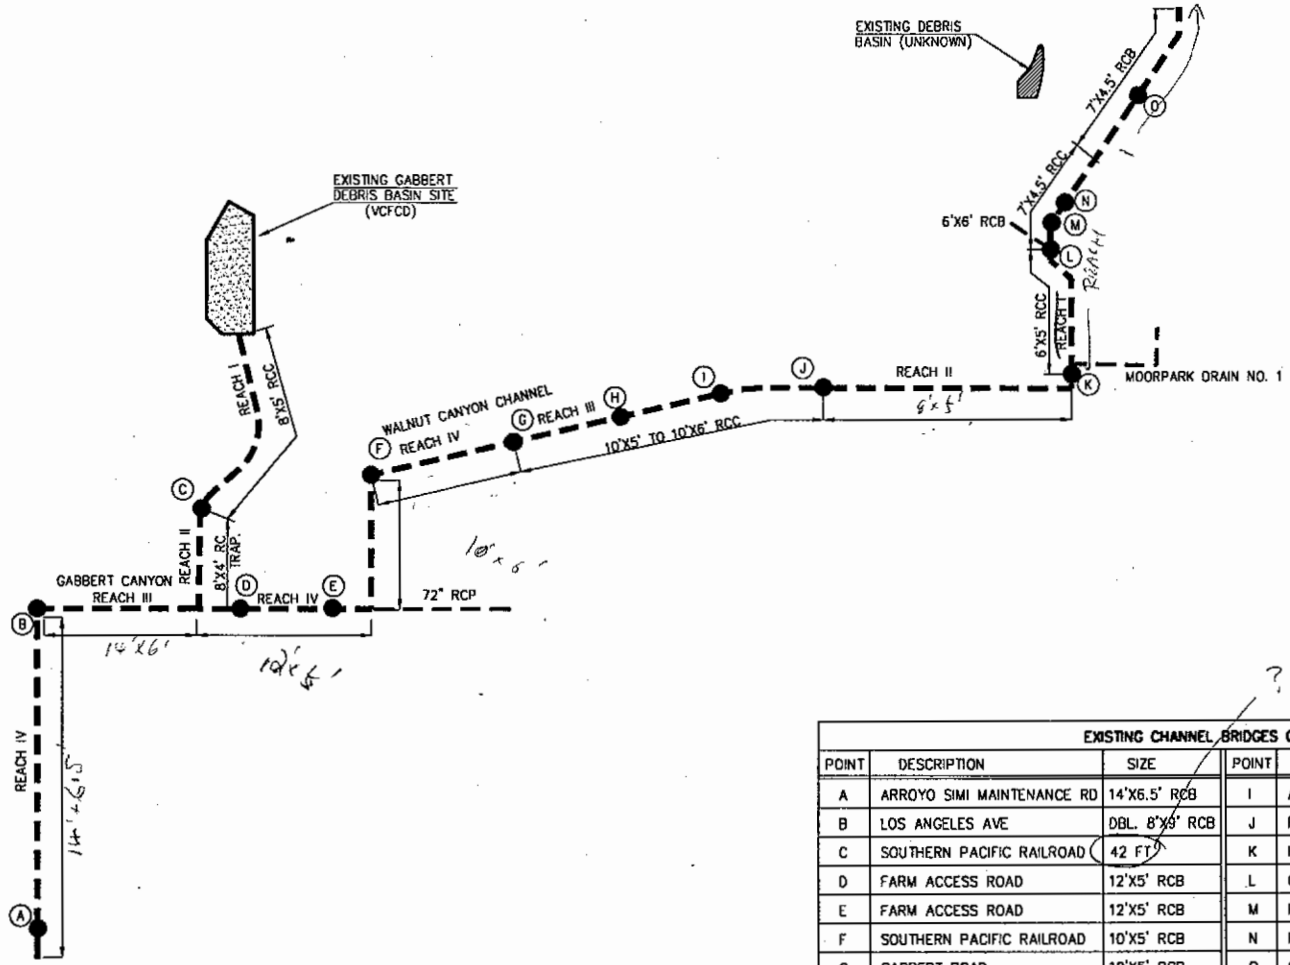
Gabbert and Walnut Canyon Channels

development hydrology reference documents were reviewed as part of this current investigation.

Planning regional public improvements within the watershed are another form of development which must be identified as a potential planning constraint. The primary public improvement which could potentially impact the regional drainage system is the planned Simi Valley Freeway corridor. The proposed freeway corridor traverses the foothills, generally parallel to the SPRR and ultimately connects to the Moorpark Freeway. The potential constraints associated with the freeway is limiting the utility of regional detention basin sites and modification of drainage patterns.



Section 3—Description of Existing Drainage System

3.1 Existing Channel Facilities

The existing 1.5 miles of Gabbert Canyon Channel and 2.5 miles of Walnut Canyon Channel are regional flood control channels or "red line" facilities maintained by the Ventura County Flood Control District which the majority were originally constructed by the Soil Conservation Service (SCS) between 1959 and 1962. These primarily concrete rectangular channel facilities collect and convey storm runoff to the Arroyo Simi from a total tributary watershed drainage of 6.91 square miles which has a significant portion that is not developed. The channel systems provide a significant flood protection benefit through a horizontal alignment which results in intercepting the drainage from the mouth of several large canyons and would have resulted in uncontrolled flooding. The average channel depth ranges from 5 to 6 feet and channel widths ranging from 7 to a maximum of 14 feet. The channel slopes within the canyon areas are relatively steep with slopes ranging from 1.5% to 3% and in the downstream sections the channel flattens to an average slope of 0.5%. The implementation history for the channel improvements within the watershed is indicated in the following table.

Table No. 3.1 - Construction History of Existing Flood Control Improvements

3.1.1 Gabbert Canyon Channel

The existing Gabbert Canyon channel consists primarily of a concrete rectangular section which extends from the outlet into the Arroyo Simi channel, to the spillway from the Gabbert Debris Basin, approximately 7,739 linear feet. The initial 5,600 feet of the channel from the Arroyo Simi outlet to downstream of the Southern Pacific Railroad was originally designed by the Soil Conservation Service in 1958. The physical characteristics of the existing channel geometry associated with the 1.5 miles of the Gabbert Canyon Channel are indicated in the following tables. The information is based upon record drawings for the original construction. The tables summarize information on the geometry and the culvert or bridge crossings.

3.1.3 Gabbert Canyon Debris Basin

The existing Gabbert Canyon Debris Basin is located on an 11.3 acre parcel which is owned in fee by VCFCD. The basin was originally constructed by the SCS in 1963 ~~and is regional flood control facility which is maintained by VCFCD~~. The basin site is located at the mouth of Gabbert Canyon,

approximately 2,000 north or upstream of Los Angeles Avenue. The basin has a total tributary drainage area of 2,350 acres which is primarily undeveloped. The storage volume is generated by an earthen ring levee 800 feet in length, which intercepts the flow from the canyon mouth prior to discharging onto a wide alluvial fan. The surface area of the basin is 4.8 acres. The geometry of the basin generates a maximum level storage of 16,600 cubic yards (10.1 acre-feet) and a maximum debris storage capacity of 49,050 cubic yards (30.4 acre-feet) based upon the formation of a debris cone in the basin. The effective storage height of the embankment measured from the basin floor to the spillway is 11-feet and the distance from the spillway to the top of embankment is 8-feet.

The outlet works for the basin consist of a primary spillway and a slotted metal pipe riser. The spillway is a 40' x 8' section which operates as a broad crested weir. The riser is a 14-inch diameter corrugated steel pipe in the basin with a walkway from the embankment to service the inlet. Historical maintenance records beginning from 1963 to 1990 indicate that **239,000 cubic yards** have been removed from the basin or an equivalent annual amount of 8,800 cubic-yards/year.

3.2 Hydraulic Capacity of Existing Channels

The hydraulic capacity of the existing channel systems were evaluated through developing water surface profiles for each system and iteratively adjusting the flowrate until the maximum allowable flow depth in the channel was achieved. In addition, initial evaluation of the channel system analyzed uniform or "normal" depth in the channel section for the existing system and the requirements for bank-full design. The results are provided in the following tables for comparison purposes. The actual channel capacities were based upon the water surface profile analysis for bank-full conditions with superelevation. The results are also presented in a summary table. The capacity was evaluated for maximum depth with freeboard including superelevation and also with maximum depth with superelevation only which corresponds to the difference between the 50-year and 100-year level of flood protection.

Table No. 3. 6- Existing Walnut Canyon Channel Comparison of Uniform Flow Channel Hydraulics

2. Equivalent revised channel basewidth to provide 100-year bank-full flow depth.
3. Trapezoidal side slope 1.5:1 and mannings coefficient = 0.015

3.2.1 *Summary of Baseline Channel Hydraulic Analysis*

The hydraulic analysis of the existing channel system was based upon developing a water surface profile from the current channel geometry and cross section information. The initial water surface profile analysis was based upon both 50- and 100-year flowrates for the existing watershed. Additional incremental depths were added to these values to account for residual freeboard and superelevation for the 50-year flowrates, only superelevation was applied for the 100-year frequency. The controlling design frequency associated with the drainage systems resulted in the 100-year analysis since detention basins were part of the proposed system. 100-year hydraulic analysis resulted in evaluating the "bank-full" capacity of the channel with the addition of water surface superelevation around curves.

The hydraulic capacity analysis was an iterative process which proceed along one direction of the channel evaluating the flowrate which provided a water surface elevation matching the top-of-bank elevation. Flowrates are adjusted in the water surface profile for a particular channel reach until the correct water surface elevation is achieved. The total water surface elevation at a curve was determined through adding the calculated superelevation from the average hydraulic parameters in the water surface profile model. This iterative process continued along all the channel reaches until a revised water surface profile model had been developed with flowrates corresponding to the "bank-full" capacity analysis. The results of this analysis are summarized in the following table. Generally, the critical section which controlled the hydraulic capacity in all the channel reaches evaluated was located at the curves. The existing 100-year flowrate is provided as a reference point to asses the magnitude of the hydraulic deficiency for each of the reaches.

Table No. 3.8 - Existing Channel System Maximum Bank-Full Capacity Water Surface Profile

Channel	Reach 1	Reach 2	Reach 3	Reach 4
Walnut	440 cfs (Q_{100} 469)	570 cfs (Q_{100} 797)	640 cfs (Q_{100} 1,158)	825 cfs (Q_{100} 1,258)
Gabbert	650 cfs (Q_{100} 1,732)	950 cfs (Q_{100} 1,732)	1,200 cfs (Q_{100} 2,275)	1,450 cfs (Q_{100} 2,275)

3.3 *Summary of Channel Hydraulic Deficiencies and Hydraulic Restrictions*

The hydraulic deficiency portion of this investigation focused identifying the deficiency based on the hydraulic capacity. The difference between the hydraulic capacity and the design flowrate represents the magnitude of the deficiency. Relative approximation of the channel deficiency can be determined from a comparison of the uniform depth channel hydraulics and these are presented in *Table No. 3 -Comparison of Uniform Hydraulics*. A more detailed approach utilized a water surface profile analysis to determine the actual depths of flow in the channel and identify the critical hydraulic

restrictions. "Bank-full" hydraulic analysis included both the actual hydraulic depth and the water surface superelevation where there were horizontal curves in the channel alignment. The results of the hydraulic analysis indicated that the **limiting hydraulic capacity of the channel occurs at the curves** and not at the bridges. However, if the superelevation is neglected from the capacity analysis then the culverts and bridge crossing become the controlling hydraulic restriction. A summary of the superelevation associated with the critical channel curves is indicated in the following table.

Table No. 3.9 - Existing Channel Capacity Analysis
Critical Superelevation Locations

Channel	Station	Radius	Flow (capacity)	Flow Depth (ft)	Superelevation (h)	Channel Depth
Gabbert	58+76	160 ft	840 cfs	4.48 ft	1.02 ft	5.5 ft
Gabbert	48+16	99.4 ft	780 cfs	4.8 ft	1.24 ft	6.0 ft
Gabbert	35+07	99.1 ft	1,300 cfs	4.9 ft	0.95 ft	6.0 ft
Walnut	97+33	97.4 ft	570 cfs	3.86 ft	1.3 ft	5.0 ft
Walnut	18+18	99.4 ft	640 cfs	4.16 ft	0.76 ft	5.0 ft

Comparison of the estimated maximum "bank-full" channel capacity can be compared to determine the estimated flood protection frequency which the channel can provide. The ratio of the channel capacity to the 100-year peak flow can be correlated to an estimated frequency of occurrence with the VCFCD hydrologic multipliers used for planning level estimates. Intermediate values were interpolated from a log-log plot of the hydrologic multipliers. The level of flood protection using this estimate is only an approximation since it assumes that the hydraulics are related to the rainfall/runoff frequency analysis. However, it provides a relative indicator regarding the magnitude of the deficiency.

Table No. 3.10 - Existing Channel System
Estimated Current Level of Flood Protection

Channel	Reach 1	Reach 2	Reach 3	Reach 4
Walnut	70-year	25-year	10-year	20-year
Gabbert	5-year	10-year	10-year	15-year

Section 4—Hydrologic Data

4.1 Watershed Description

The 6.9 square mile Gabbert and Walnut Canyon Channel watershed is a tributary to the Arroyo Simi which ultimately discharges to Mugu Lagoon. Approximately 33 % of the Gabbert and Walnut Canyon watershed is located outside the corporate limits of the City of Moorpark, corresponding to approximately 1,476 acres of offsite tributary drainage area from the upper watershed. The alignment of the channel system results in intercepting the drainage from four canyons areas, two of which are the Gabbert and Walnut Canyons which have tributary areas of **2,571** and **846 acres** respectively. The other two canyons have smaller drainage areas of **475** and **104 acres**, located between Gabbert and Walnut Canyons. The channel alignment is generally located along the canyon mouths and collects the runoff which would have naturally continued across the wide valley floor of the Arroyo Simi floodplain. Gabbert Canyon is the larger of the watersheds and at the confluence of the two channel systems the relative magnitude of the drainage areas is 2,571 acres from the Gabbert Canyon Channel compared to 1,794 acres from the Walnut Canyon channel.

The majority of the watershed is undeveloped with some light residential development, except for two municipal storm drain systems which drain urbanized areas 124 acres (Los Angeles Avenue storm drain) and 112 acres (Moorpark Drain No. 2) to the channel. The topography of the watershed is generally dominated by the canyon areas upstream to Broadway, where the topography is less extreme and are open gradual sloping areas. The representative watershed lengths for the drainage paths are approximately 29,000 feet for Gabbert Canyon and 22,500 on Walnut Canyon, measured to the confluence of the channels. The elevations within the watershed range from a maximum of 2120 in Gabbert Canyon and 1,060 in Walnut Canyon to a minimum value of elevation 450 at the channel confluence. The existing 4.8 acre Gabbert Canyon debris basin is the most significant debris storage facility within the watershed with approximately 2,350 acres of tributary natural area and is operated by VCFCD. In addition, there are at least six small reservoirs within the watershed which may have been constructed for agricultural purposes or by the SCS which would provide some limited storage capabilities. There is one municipal debris basin adjacent to Wicks Road which is tributary to the Moorpark Drain No. 1. Potential debris storage from the smaller reservoirs within the watershed were not evaluated because of their size and unknown ownership.

4.2 Hydrologic Watershed Parameters

The Walnut and Gabbert Canyon Channel watershed is an ungaged watershed and synthetic methods are necessary in order predict the rainfall-runoff response. The baseline hydrology study prepared by VCFCD for the Gabbert and Walnut Canyon Channel watershed developed a series of hydrologic parameters to characterize the watershed subareas and evaluate the runoff.

Watershed Subarea Delineation

VCFCD prepared the delineation of the existing watershed which subdivided the entire 4,425 acre regional watershed into **79 subareas**. The subareas ranged in size from 8 acres to 105 acres with individual time of concentrations less than 30 minutes consistent with VCFCD criteria.

Rainfall

Regional analysis of historical rainfall data throughout the County of Ventura resulted in the development of rainfall zone designations to classify common rainfall regimens as part of the *Ventura County Hydrology Manual*. A **rainfall zone "J"** was used by VCFCD in the watershed analysis which best corresponds to the historical rain gage data for the Moorpark area. The 50-year 24-hour point rainfall isohyetals range from approximately 6.0 inches near the central portion of the City of Moorpark to 9.0 inches near the headworks of the watershed.

Hydrologic Soil Type

General classification of the average soil infiltration rates have been performed throughout the entire County by the SCS. The soils were grouped into seven soil groups of hydrologically similar characteristics which are shown on the Ventura County Hydrologic Maps in the *Ventura County Hydrology Manual*. The soils appear to be primarily type 4, but range from type 1 to 6 as indicated in the VCRAT watershed model subarea characteristics prepared by VCFCD staff. The general regional classification representative of soils for the Moorpark area appears to be the **Rincon-Huerhuero-Azule association** consisting of very fine sand loams to silty clay loams.

Percent Impervious Cover

Impervious surfaces within the watershed reduce rainfall losses associated with soil infiltration rates. Average values which describe the amount of impervious cover have been assigned to different landuses. Representative percentage impervious used by VCFCD to describe single family residential is 23%, 0% for natural areas, and 50% for commercial areas. Area average values of impervious cover were assigned to each watershed subarea resulting in percent impervious primarily ranging from 0% to 37% in the existing watershed landuse hydrology model.

Subarea Time of Concentrations

Subarea time of concentrations for each of the individual subarea are representative of the runoff travel time and are all less than thirty minutes.

Previous Hydrologic Investigations

Previous drainage studies which encompass this area include: City of Moorpark Masterplan of Drainage (1995), Moorpark Central City Drainage Study (1987), and the Walnut Canyon Study (1980).

4.2.1 Estimated Debris Volume Generation

The required storage volume for debris basins or the dead storage allowances for detention basins which drain natural watershed areas is based upon the potential debris production or estimated "yield" from the watershed. VCFCD utilizes the formula developed by Dr. Kevin Scott from the USGS to calculate the estimated debris production rate which is based upon drainage area, 24-hour precipitation, 10-day rainfall, slope failure, fir factor, and watershed shape. The following equation is used to calculate the debris production associated with different storm events:

$$SY = 17.54\ (A)^{0.828}\ (ER)^{1.382}\ (FF)^{0.251}\ (SF)^{0.375}\ K^{0.840}$$

where: SY = Sediment yield (cubic yard)
A = Area of the watershed (square miles)
ER = Elongation ratio (equivalent diameter with watershed area divided by the maximum length of the channel)
FF = Fire factor (value dependent on time after watershed burn, 88 = 6 months after burn)
SF = Slope failure (area of watershed that is prone to landslides, acres per square mile)
K = Dimensionless rainfall factor (product of the square of the 24-hour precipitation and the 10-day precipitation)

VCFCD applied the Scott equation to determine the estimated debris volumes for the potential sediment and debris basin locations, so allowances could be provided in the estimates for either the facility sizes and amount of dead storage. Rainfall gage No. 141 located in the downtown portion of Moorpark and gage No. 191 located in the upper watershed, upstream of Broadway, were used to evaluate the 24-hour and the 10-day precipitation, then a weighted value was used based upon the proposed basin site relative to the gages. The debris production analysis prepared by VCFCD was performed using the following additional assumption or characteristic values: (1) 100% of the watershed burned, (2) slope failure varied from 6 acres/square mile to 20 acres/square mile, (3) both 6-months after the burn and 4.5 years after the burn or pre-burn condition, which provides fire factors of 88 and 20 respectively.

VCFCD prepared the debris production analysis for four potential regional detention basin locations which correspond closely to the four primary canyon watershed areas. The results of the debris production analysis are summarized in the following table and the 100-year debris production values were used in the facility sizing for the alternative drainage systems.

Table No. 4.1 - 100-year Estimated Sediment Yield						
Watershed Conc. Pt.	Description	Area (acres)	Sediment Yield Before Burn	Sediment Yield After Burn	VCFCD Required Debris Storage	Bulking Factor
5A	Walnut Canyon upstream existing improved channel inlet	336	8,427 c.y.	12,223 c.y.	11.4 AF	1.55
13	Canyon tributary to Walnut Channel at Casey Road	276	6,121 c.y.	8,878 c.y.	8.3 AF	1.53
48	Tributary Canyon at Gabbert Canyon Road	474	23,506 c.y.	34,095 c.y.	31.7 AF	1.67
109	Gabbert Canyon Debris Basin	2,350	--------	56,900 c.y.	52.9 AF	-------

4.3 Hydrologic Analysis Procedures

The watershed rainfall-runoff model utilized to evaluate the watershed primarily relied upon the Ventura County Modified Rational Method procedure which is applicable for urban drainage system design. The VCFCD computational procedure involves application of the basic rational method equation which is utilized to develop a runoff hydrograph from each individual ~~the different~~ subarea. The cumulative rainfall mass curve is used to evaluate rainfall intensity over the storm duration and determine intermediate hydrograph ordinates. The individual hydrographs from the subareas are routed through the hydraulic conveyance systems or can be combined to simulate the interconnected components associated with the physical processes occurring in the watershed.

The shape of the unit hydrographs developed using the modified rational method do not necessarily generate the correct effective runoff volume or net rainfall since the cumulative mass rainfall curves are averaged. The expected runoff yield based upon local point or isohyetal rainfall data compared to the computed runoff yield from the modified rational hydrograph will typically need to be adjusted to provide the same effective rainfall. This process is known as "fattening" and the adjustment results in modification to the shape of the calculated runoff hydrograph so the area under the hydrograph provides the desired effective or net rainfall. The correct amount of direct runoff volume is a critical factor for the storage routing analysis of detention basins and this required that the inflow hydrographs to detention basins generated from VCRAT were "fattened" prior to routing.

As the watershed area increases in size the area-averaged point rainfall values used in the design storm pattern should be adjusted so that the volume of rainfall of the area is accurately represented by the point rainfall characteristics. As the spatial extent of the storm increase the depth of rainfall decreases. The reduction is made using a depth-area adjustment factor when selecting point rainfall to apply uniformly over the watershed. The modified rational procedure is calculating runoff hydrographs for the individual subareas with the rainfall associated with the smaller drainage area. A larger watershed composed of numerous interconnected subarea hydrographs results in over

estimating the point rainfall associated with concentration points further downstream in the watershed. Depth-area adjustment factors were applied to the inflow hydrographs for the detention basins. The depth-area adjustment curve was constructed by VCFCD staff specifically for the Gabbert/Walnut canyon watershed as a function of total drainage area. The results are indicated in the following table and the reference data is contained in the *Technical Appendix*.

Table No. 4.2 - Detention Basin Inflow Hydrographs Adjustment Factors

Basin No.	Conc. Point	Drainage Area (acres)	Peak Q_{100} Inflow	Fattening Factor	Area Reduction Factor
Offline Diversion (Basin 3& 4)	35AB	1,014	847 cfs	56% 3.58	0.915 (0.085)
Gabbert Debris Basin	109B	2,433	2,185 cfs	49% 3.3	0.83 (0.17)
Basin 0	6A	382	390 cfs	62% 4.27	0.97 (0.03)
Basin 1	12BC	207	309 cfs	46% 2.92	0.97 (0.03)
Basin 2	41B	475	514 cfs	45% 2.85	0.955 (0.045)

Local Drainage Systems

The hydrology analysis for the Gabbert/Walnut Canyon Channel watershed assumed that all the local storm drain could deliver the peak flows to the channel system, but **limited to the maximum hydraulic capacity of the storm drain**. The Moorpark Drain No. 1 was limited to the hydraulic capacity or original design flow of the storm drain indicated on the improvement drawings which was approximately 125 cfs, but the estimated 100-year discharge from the 137 acre urban watershed area is 243 cfs. The other major local storm drain system is the 72-inch diameter facility joining the Walnut Canyon Channel at Los Angeles Avenue which has an estimated capacity of 195 cfs and the estimated 100-year flow from the 125 acre subareas is 251 cfs.

Discussion of Watershed Model

Several unique features regarding the application of the VCFCD modified rational procedures to this watershed investigation were encountered because of the size of the drainage area and the complexity of the watershed processes. These items included:

• Depth-area reduction factors were applied to the hyrographs at the detention basins, but were not applied to the main channel hydrographs even though the peak runoff based upon the smaller subarea precipitation value.

• The configuration of the watershed involves two large watersheds which confluence and the shape of the hydrographs is extremely important in accurately determining the resulting total flowrate. Using superposition to add the hydrographs relies on accurate ordinates for both limbs of hydrograph and the shape of the main channel hydrographs were not adjusted, only if reservoir routing was involved. If the hydrographs from the two primary streams were "fattened" prior and then combined then this resulted in a different hydrograph from the standard confluence addition.

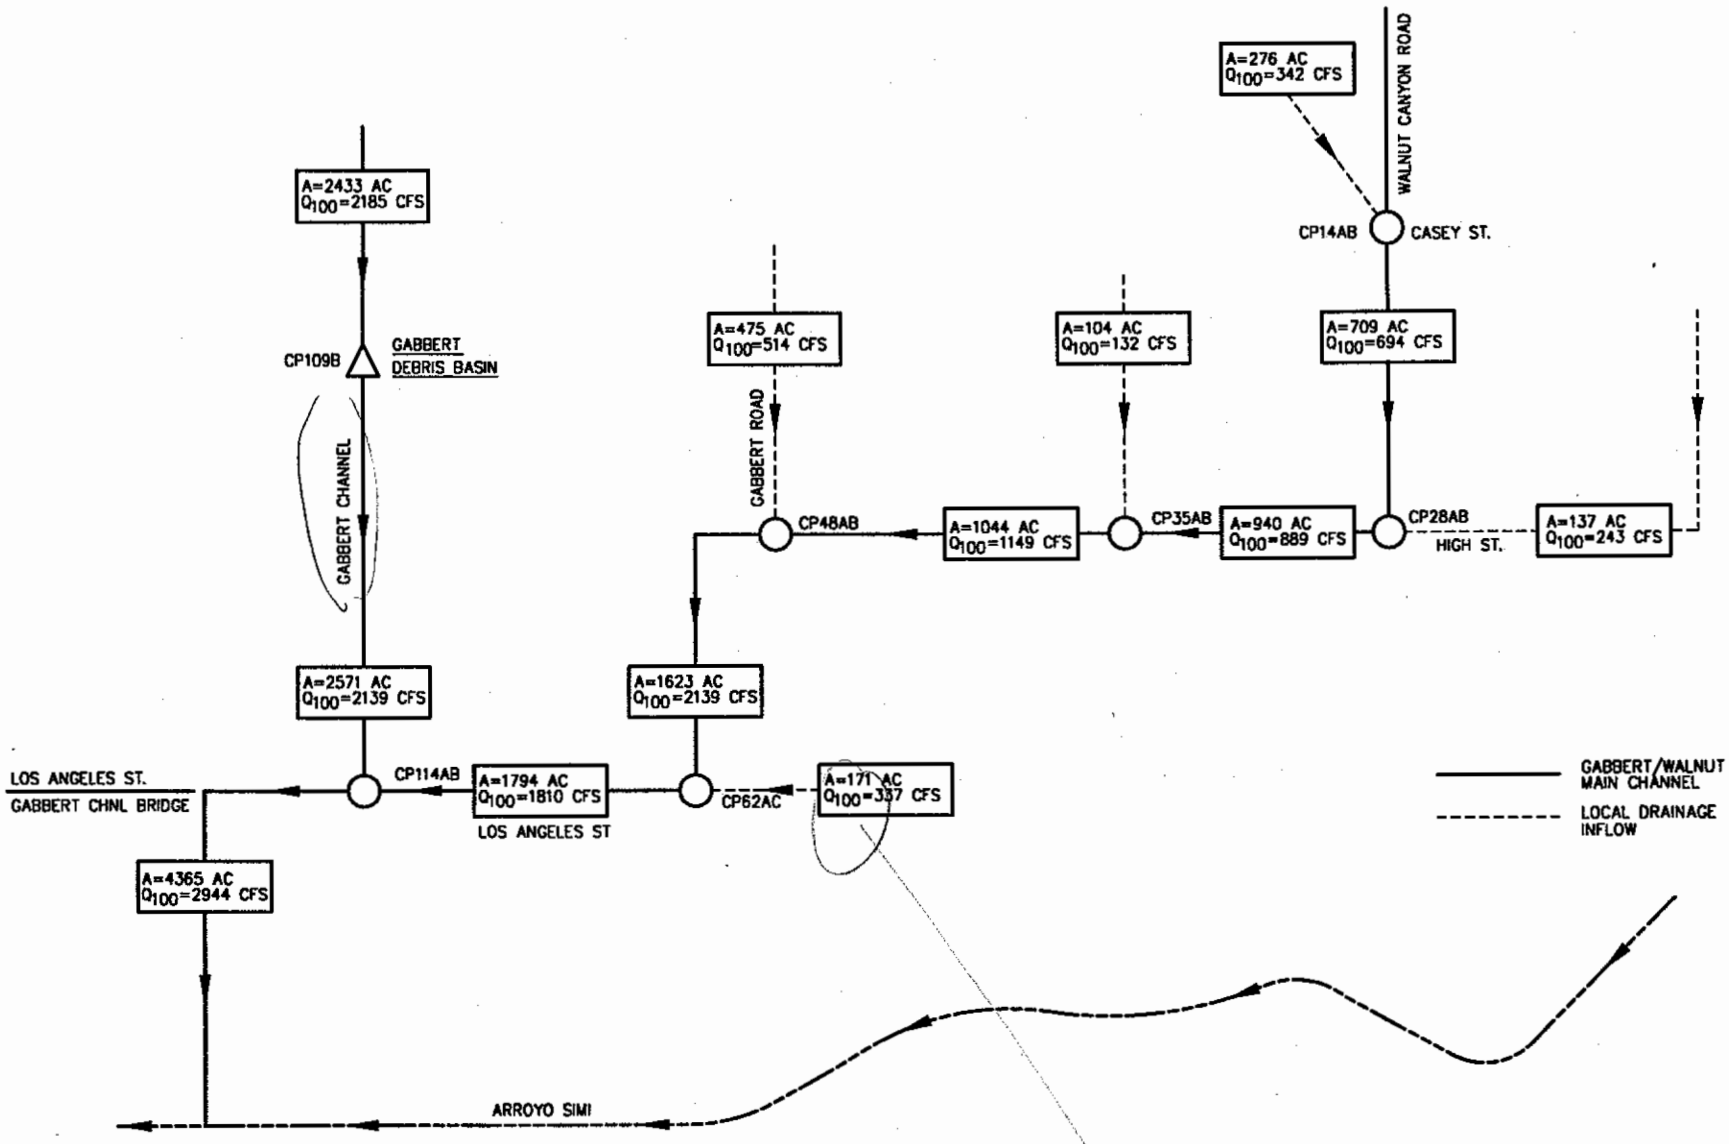
• The outflow hydrographs resulting from the reservoir routing were fattened hydrographs which were input in the remainder of the modified rational watershed model and combined with additional hydrographs which were not "fattened."

• The watershed system involves evaluating the effect of several detention basins operating simultaneously and on different streams. The modified rational method is not particularly suited to effectively simulate the effects of multiple reservoirs where storage volume and timing is critical in accurately determining the cumulative effect.

4.4 VCFCD Baseline Watershed Hydrology Model

VCFCD prepared a synthetic unit hydrograph model of the entire Gabbert and Walnut Canyon Channel watershed, June 1996, specifically evaluating the current landuse conditions within the watershed. The VCFCD watershed model was utilized to establish a baseline condition for predicted flowrate generation from the watershed without any future development. This assumption is applicable since it is assumed that a drainage ordinance will require all future development to maintain the existing or pre-development flows. The current hydrology model was prepared utilizing the VCRAT program which is based on the modified rational method hydrology procedures outlined in the *Ventura County Hydrology Manual* (1978). The hydrology model corresponds to "link-node" model which simulates the physical rainfall-runoff processes occurring in the watershed. The individual subareas are hydrologic nodes and the hydraulic conveyance sections are the links which interconnect the subareas. The watershed delineation subdivided the entire 4,425 acre regional watershed into **79 subareas** which ranged in size from 8 acres to 105 acres and individual time of concentrations less than 30 minutes. Runoff hydrographs are computed within the model for each subarea, routed through the conveyance system, and combined with other subarea hydrographs as the analysis proceeds downstream through the watershed.

4.4.1 Summary of Baseline Design Hydrology



Application of the Ventura County Modified Rational watershed model for the current landuse conditions was evaluated for both the 50-year and 100-year return periods. The hydrograph peak

discharges associated with critical concentration points along the channel system are indicated in *Table No. 4 - Summary of Existing Watershed Hydrology - Clearwater Design Flowrates*. The detailed input and output for the watershed models are contained in the *Technical Appendix*. All discharges generated from the VCFCD baseline watershed model reflect clearwater values. Runoff conveying debris and sediment has an increased total volume which tends to increase or "bulk" the apparent clearwater flowrate. However, it is assumed that the potential for debris production will be reduced through future debris collection facilities and no "bulking factor" was applied to the discharges.

Table No. 4. 3- Summary of Existing Watershed Hydrology
Clearwater Design Flowartes[1]

Channel	Watershed Model Node	Drainage Area (acres)	Design Clearwater Flow		Channel Reach Description
			Q_{50}	Q_{100}	
Gabbert	109B	2,433	1,732 cfs	**2,185 cfs**	Gabbert Debris Basin spillway
Gabbert	114AB	4,365	2,275 cfs	**2,944 cfs**	Downstream of Walnut Canyon confluence
Gabbert	115A	4,388	2,276 cfs	**2,945 cfs**	Los Angeles Avenue Culvert crossing
Gabbert	118AC	4,425	2,279 cfs	**2,947 cfs**	Outlet to the Arroyo Simi
Walnut	6A	382	283 cfs	**382 cfs**	Existing improved channel headworks next to Walnut Canyon Road
Walnut	7A	433	292 cfs	**431 cfs**	Upstream Casey Road culvert
Walnut	14AB	709	469 cfs	**696 cfs**	Confluence at Casey Road culvert with small offsite canyon area
Walnut	28AC	846	603 cfs	**889 cfs**	Downstream of confluence at High Street Drain with Moorpark Drain No. 1
Walnut	35AB	1,044	797 cfs	**1,149 cfs**	Downstream of confluence at Poindexter culvert crossing
Walnut	48AB	1,553	1,123 cfs	**1,619 cfs**	Downstream of confluence at Gabbert Canyon Road
Walnut	49A	1,623	1,176 cfs	**1,688 cfs**	Southern Pacific Railroad culvert crossing
Walnut	62AC	1,794	1,258 cfs	**1,810 cfs**	Downstream of confluence with 54" dia. Los Angeles Avenue city storm drain

4.5 *Hydrologic Modeling of Flood Control Storage Alternatives*

The watershed hydrology model developed on VCRAT for the current landuse conditions was utilized to perform hydrologic routing to evaluate the effect of the different detention basin alternatives. Most of the proposed drainage system alternatives consider the use of multiple detention basins at different locations within the watershed and the cumulative effect on the resulting hydrograph peak attenuation impacts the channel conveyance requirements. A variety of different detention basin combinations were initially investigated in order to maximize the peak flow reduction. The geometry and configuration of each of the individual detention basin sites "optimized" in order to maximize the performance based upon the physical site restrictions and avoiding a jurisdictional dam facility. The optimization procedure involved numerous combinations of basin geometry and outlet configurations until the peak flow attenuation was maximized. The optimized detention basin could then be evaluated in the overall watershed drainage "system" to determine the regional effect.

Three different hydrology software programs were used to perform the reservoir routing analysis based upon the input data which was utilized for the inflow hydrograph and the complexity of the detention basin outflow. The models which were used included: (1) VCHYDRO, (2) Army Corps of Engineers HEC-1, and (3) Advanced Interconnected Channel & Pond Routing Program (ADICPR). In addition, the optimization of the individual detention pond configuration was evaluated through the application of PONDOPT. PONDOPT provides the ability to evaluate several hundred combinations of basin outlet configurations or basin geometries using specified limitation or restrictions on the basin, such as the maximum depth or target outflow. The program will provide the minimum basin storage which will maximize the peak attenuation. VCHYDRO was the primary reservoir routing program utilized since this is the utility program for VCRAT which performs the modified puls routing and the baseline watershed model had been prepared using VCRAT. HEC-1 and ADICPR have unique reservoir routing features which provide flexibility in evaluating complex detention basin configurations which were required.

PONDOPT - Typical detention basin design requires a trial and error analysis of the basin geometry and the outlet in order to generate the maximize flow attenuation within the least area and minimum excavation. This program is a multiple outlet detention pond design program which can evaluate up to two hundred alternatives in a single computer run based upon the design constraints placed on the design such as the maximum depth. The analysis will design the pond and outlet structure to satisfy the given design criteria and optimize the design so the final pond requires the least surface area and storage volume.

VCHYDRO - The utility program for VCRAT which utilizes the synthetic runoff hydrograph developed in the modified rational method and allows performing the runoff yield to the shape of the VCRAT hydrograph in order to ensure the effective rainfall volume matches the volume of the hydrograph. The "fattened" hydrograph can be routed through a reservoir based upon outflow rating curve data and depth-storage relationships for the basin. The resulting outflow hydrograph from the detention basin can be imported back into the VCRAT program to continue the simulation through the remainder of the watershed. An important item for consideration when applying this model to

a watershed with multiple detention basin is that the routed hydrographs which are imported back into the VCRAT model are "fattened", however, the remaining hydrographs generated by VCRAT are not fattened. This effect can potentially modify the effect of different hydrographs within the watershed depending upon the timing and magnitude of the watershed.

HEC-1 - This hydrograph software package is extremely flexible for the evaluation of complex ungaged watersheds and has several procedures for generating synthetic unit hydrographs. HEC-1 reservoir routing features allow rapidly evaluation of different basin configurations and the stage outflow relationship can be determined by the program from weir and orifice configuration.

ADICPR - Most standard hydrology models are not capable of analyzing detention ponds which are hydraulically dependent upon each other, however, ADICPR is a finite element software package which was specifically developed with algorithms to evaluate these effects. The unique application feature which was utilized specifically for this project was the ability to model multiple outlets from a single basin and the outflow hydrograph from each outlet is a separate stream. This feature was useful for the Gabbert Detention Basin which required the initial upstream basin to bypass the initial portion of the hydrograph and the remainder would continue to be routed through the downstream connected basin. The model was applied through inputting the design inflow hydrograph which was generated from HEC-1 and then routed with the complex basin geometry to verify the operation, especially with hydraulics of the diversion systems dependent on the reservoir operation.

4.5.1 Summary of Alternative Drainage System Design Discharges

The baseline watershed VCRAT hydrology model prepared by VCFCD was modified to reflect the proposed storage or diversion elements associated with each of the eight watershed drainage system alternatives which were selected for detailed investigation. Reservoir routing elements and flow splits for diversions were incorporated into the overall watershed hydrology model which resulted in modifying the mainline channel hydrograph. Routing analysis were performed for 100-year return period only since is the VCFCD design criteria associated with detention basin and the resulting hydrographs in the mainline channel were also evaluated for the 100-year return period. The watershed model results for the 100-year discharges of each of the channel system alternatives are summarized in the following table. Representative watershed concentration points are presented which reflect channel system reach lengths utilized to describe the channel for this study.

Section 5—Engineering Design Criteria

5.1 Flood Protection Requirements and Design Criteria

The flood protection requirements were based upon the standard VCFCD design criteria and incorporated both the channel and detention basin requirements. The standard VCFCD detention basin design criteria is based upon the 100-year level of protection. Flood control channels are designed to provide 50-year conveyance with freeboard or 100-year capacity without freeboard.

Freeboard

The VCFCD freeboard requirements for open channels are based upon adding allowance to the actual depth which area calculated for air entrainment, flow in the unstable zone, and superelevation. A minimum residual freeboard must be maintained above the 50-year water surface or the totals for these additional allowances. Freeboard was calculated when evaluating the capacity analysis for the 50-year design condition and the results are provided in the *Technical Appendix*.

Superelevation

Centrifugal effect cause a transverse hydraulic gradient for channel flow around a bend and results in the water surface elevation higher on the outside of the curve. VCFCD design criteria is to design the curves to limit the superelevation to one foot above the normal depth or 10% of the channel width. The amount of superelevation can be calculated for a supercritical rectangular channel, the most common case for this channel system, using the following equation:

$$h = 1.2 \frac{V^2 b}{Rg}$$

5.2 Hydraulic Analysis

Hydraulic analysis associated with the conveyance systems followed the general criteria outlined in the *Ventura County Flood Control Design Manual* (1968) for both the deficiency analysis and the preliminary design of the replacement channel facilities. Water surface profiles for the channel systems were analyzed to determine actual flow depths and evaluate the effects of culverts or junctions. Another hydraulic effect is the potential for surface waves, especially in supercritical channels which can occur from shifts in alignment such as at curves. The primary item which influenced the hydraulic capacity for this channel system was superelevation of the water surface around channel curves of the alignment. The Los Angeles County Flood Control District hydraulic analysis program F0515P or WSPG was utilized to develop the hydraulic model of the channel system. The program computes and plots uniform and non-uniform steady state flow water surface profiles and pressure gradients in open channels or closed conduit with irregular and regular section.

The computation procedure is based on solving Bernoulli's equation for the total energy between the section in a reach. The open channel flow analysis utilizes the standard step procedure while confluences and bridge piers are analyzed using the pressure and momentum theory.

Deficiency Analysis

Water surface profiles for the existing channel system were prepared using the Los Angeles County's Water Surface Pressure Gradient (WSPG) hydraulics program. The actual water depths from the water surface profile were used to evaluate the maximum conveyance capacities in the channel system based upon facility dimensions indicated on the improvement plans. The deficiency analysis was based calculating a conveyance capacity with freeboard and without freeboard, but including superelevation. The results of the analysis indicated that the locations of the channel bends were the severe restriction because of the amount of superelevation.

Hydraulic Design Modified / Replacement Channel

The hydraulic design of replacement channel systems, including diversion systems, were evaluated through the preparation of water surface profile analysis to ensure that all systems provided identical levels of flood protection. The objective of the channel modifications was to provide the minimum amount of improvements that provides the desired level of flood protection. Some of the criteria which was applied to assist in guiding the development of the various alternatives for the channel reconstruction included:

- Wall height extensions to the existing channel were applied to a maximum height of 3-feet and if this did not provide the required addition capacity then the base width was widened using the existing channel depth for the new cross section.

- Splitter walls were applied to different channel curve locations in order to maintain a maximum superelevation below one-foot.

- The reconstructed channel was assumed to follow the same vertical alignment and elevations as the existing channel system

- The modified channel section was designed to convey the main channel 100-year flowrate based upon the implementation of different detention basin alternative. The 100-year conveyance uses "bank full" capacity with superelevation.

Water Surface Control Elevations

The downstream water surface control for the hydraulic analysis of the channel system was based upon the water surface elevations in the Arroyo Simi determined by VCFCD. The backwater influence from the Arroyo Simi generally was limited to downstream of Los Angeles Avenue, since the majority of the channel system is supercritical. Hydraulic analysis of the Walnut Canyon Channel

utilized the water surface calculated from the confluence with Gabbert Channel.

Table No. 5.1 - Arroyo Simi Water Surface Control Elevations			
Location Description	Arroyo Simi Chann. Sta.	Proposed Design W.S. Elev.	FIRM W.S. Elev.
Shasta Diversion System	117+00	481.0	482.0
Relocated Walnut Outlet	62+00	447.8	-----
Existing Gabbert Outlet	37+20	419.9	------

5.3 Detention Basin Requirements

One of the primary requirements applied in the initial planning and evaluation of the stormwater detention facilities was limiting the size of the facilities so these storage basins would not be considered jurisdictional DSOD "dams". The limitation are discussed in more detail in *Section 8.5-Division of Safety of Dams Design Considerations/Criteria* and generally were the governing factor regarding the effectiveness of the stormwater storage attenuating the peak flowrates. Size of the detention facilities were maximized based upon the physical site considerations and the DSOD limitations in order to optimize the effectiveness of each basin. In addition, VCFCD has published minimum guidelines for stormwater detention facilities which focus on the specific design elements for detention basins. These requirements were included in the planning of the individual basins and also addressed in the construction cost estimates.

Debris Storage

Tributary watersheds to a detention basin which is under five square miles must include allowance for debris storage which is equivalent to 125% of the 100-year frequency design debris production (see *Section 4.2.1-Estimated Debris Volume Generation*) placed level in basin before routing of the hydrograph. All the detention basin locations evaluated as part of this investigation had a measured tributary watershed less than five square miles. The largest tributary watershed was the existing Gabbert Debris Basin with a drainage area of 2,433 acres or approximately 3.8 square miles.

Level of Protection

Detention basins are designed to provide 100-year level of flood protection so all hydrologic routing analysis of the detention basins involved 100-year hydrographs. The effects of the peak attenuation of the flows within the channel system associated with the detention basins were based upon applying the 100-year hydrology model for the entire watershed. The flood protection criteria for the flood control channels utilized either 50-year conveyance with freeboard or 100-year conveyance "bank-full" or no freeboard. All the channel system alternative utilized stormwater detention elements so the 100-year criteria was applied to the evaluation of the channel system hydraulics.

Outlet Works

The outlet works must consist of a permanent concrete structure which will reduce the tendency of plugging by floating debris. The outlet works shall also consist of facilities for disposing of stored water in the debris pool portion of the basin.

Emergency Spillway

Emergency spillway designed for the unattenuated peak 100-year flow and will extend beyond the downstream of the embankment toe. one foot above max. w.s. elevation under operational condition.

Earthen Embankment

The crest of the embankment shall be located three-feet above the maximum water surface for the emergency spillway flow. The minimum crest width is twenty feet and a 15-foot wide asphalt paved road shall be centered on the crest. The downstream slope of the embankment shall generally be on a 3:1 slope and downstream face shall be covered with 12-inch blanket of river-run cobble stones.

Access Requirements

Access shall be provided to the embankment crest, emergency spillway, and the outlet works. In addition access will be provided to the bottom of the basin for debris removal.

5.4 Debris Basin Requirements

The specific design requirements associated with the detention basin are applicable to planning the minimum required features for debris storage facilities. The particular requirements include providing an allowance of 125% of the estimated 100-year single event debris production. In addition, VCFCD has prepared *Debris Basin Manual* (1991) which also contains additional design criteria particularly related to existing debris basin facilities. The basis for estimating the debris production rates for various storm events involves applying the Dr. Kevin Scott formula and the analysis for this watershed is described in more detail in *Section 4.2.1 - Estimated Debris Volume Generation*. The available debris storage volume is calculated assume the slope of the debris cone surface will extend from the spillway elevation equal to 0.6 times the original streambed slope

Need to confirm this ?

Section 6—Plan Formulation and Alternative Development

6.1 Design Objective and Criteria

The project alternatives have been developed with the goal of achieving a balance between (1) flood protection objectives, (2) providing the minimum cost for the maximum benefit or economic constraints, and (3) compatibility with existing physical constraints and future development. Numerous alternatives were developed during the initial plan formulation process and then screened through a feasibility evaluation. The alternative must be technically feasible and achieve the desired project objectives to the maximum extent possible. The following key objectives were identified in guiding the development of the alternative formulation:

- Provide a comprehensive flood control program which provides flexibility for the local agencies and facilitates implementation.

- Minimize the hydrologic impacts on the channel system from future urbanized development within watershed.

- Provide a foundation to guide adjacent development within the watershed which will accommodate the regional flood protection requirements and allow development to proceed.

- Provide a regional drainage system which develops the minimum level of flood protection with the least economic impact.

- Identify locations within the watershed for land acquisition or reserve land for flood control facilities.

- Maximize utilization of existing flood control facilities and right-of-way which integrate into the recommended program

The general approach to regional stormwater management involves that application of either conveyance oriented solutions or a storage oriented approach. The conveyance oriented approach is the more traditional design and provides drainage systems for the hydraulic conveyance of the runoff. The storage oriented approach provides temporary storage of stormwater runoff and release at a reduced rate. The conveyance- and storage-oriented approaches are not necessarily mutually exclusive. The two approaches can be compatible and the integrates use of the two approaches generally lead to a more optimum system. The plan formulation process in this investigation attempted to optimize the design for this watershed through the combined application of these approaches

Development of a comprehensive regional flood protection program requires the application of a "systems" approach since implementation individual design features have effects which extend

throughout the watershed. The technique involved identification of individual design elements such as (1) detention basins, (2) debris basins, (3) channel improvements, (4) channel relocations, and (5) diversion systems, which each provide various degrees of enhanced flood protection. The available individual design elements were combined into "alternative drainage systems" to evaluate the collective benefit on the channel system. This technique involved (1) formulation of potential design elements, (2) evaluation of the individual measures, (3) performing a feasibility investigation of the control measure, (4) combining these feasible elements into an implementable watershed drainage system, and (5) screening these alternative "systems" to the most potentially feasible.

The design criteria applied in performing the technical investigation and plan formulation for the recommended flood control system relied on the Ventura County Flood Control District standards design guidelines. Additional criteria related to specific requirements applied in the alternative development and facility requirements is discussed in more detail in *Section No. 5 - Engineering Design Criteria.*

6.2 General Flood Protection Design Approach

The flood protection requirement which governed the plan formulation of each design alternative for the removing the channel deficiency involved either (1) providing 50-year conveyance in the channel plus the appropriate freeboard in the channel as defined in the *VCFCD Design Manual* or (2) 100-year conveyance in the channel without freeboard but including superelevation for curves. All detention basins were designed based upon the 100-year frequency. The various combinations of detention basin storage and amount of channel reconstruction were optimized in order to minimize the capital costs, but provide similar levels of flood protection.

6.3 Alternative System components

The available flood control elements which were utilized to address correcting the hydraulic deficiency can be either classified as conveyance oriented or storage oriented. The individual elements were analyzed to develop a wide range of available tools. The various individual elements were then combined to develop potential watershed "systems" since each of the elements will have a combined effect which must be evaluated.

6.3.1 Flood Control Storage Elements

The flood control storage facilities which were investigated in the plan formulation included both the construction of new basins or the modification of the existing debris basins to provide stormwater attenuation. The type of facilities included both debris and stormwater storage since the watersheds are primarily natural and have debris production potential. The planning process developed nine potential sites which could provide flood control storage capabilities. These were refined to five feasible locations with eight actual alternatives that were selected for detailed evaluation and incorporated into the drainage systems alternatives. The storage facilities included both on-line and off-line detention storage basins that were generated from either embankments or excavated below

the natural ground. All the facilities were developed to be outside the jurisdiction of DSOD. All facilities were provided with adequate storage for debris potential except for the off-line basins 3,4,and 5. These facilities were located downstream of proposed debris collection facilities for basins 0 and 1, also the flow-by nature will reduce the potential of significant bedload from depositing.

Table No. 6.1 - Summary of Proposed Detention Basin Characteristics

Basin Alt. No.	Surface Area (acres)	Max Storage (acre-feet)	Max Depth (feet)	Q_{100} Inflow	Q_{100} Outflow
Gabbert -A Triple Basin	16	138[1]	25 feet	1,316 cfs (900cfs bypass)	811 cfs
Gabbert -B Double Basin	11	94[1]	16 feet	984 cfs (600cfs bypass)	514 cfs
0	1.3	14[3]	10 feet	390 cfs	273 cfs
1	0.65	25[3]	18.5 feet	301 cfs	65 cfs
2	1.7	36[3]	15 feet	514 cfs	141 cfs
3	14	70[2]	5 feet[2]	847 cfs	9 cfs
4	61	305[2]	5 feet[2]	847 cfs	4 cfs
5	42	210[2]	5 feet[2]	847 cfs	14 cfs

1. Total combined storage of all ponds, not DSOD jurisdictional
2. Incised basin below natural ground, not DSOD jurisdictional
3. Maximum limiting volume of 50 AF not available due to site restrictions such as major road relocations or existing residential development within inundation area

6.3.2 Hydraulic Conveyance Elements

The hydraulic conveyance system alternatives focused on new facilities which would assist in providing the desired hydraulic capacity. The conveyance was provided through either improvement of the existing channel section to the desired increased flow capacity or an relief system was provided which could additional capacity to supplement the existing channel system.

6.3.2.1 Channel System Modification

The existing channel system for both Walnut Canyon Channel and Gabbert Canyon Channel was divided into four different homogeneous segments to facilitate analysis and evaluation of system modifications. Modifications to the existing channel assumed that the existing horizontal and vertical alignment of the channel would be utilized, just the cross sectional area increased to maintain the desired capacity. An "all-channelization" alternative which results in the complete reconstruction of

the existing channel was evaluated and the relative size requirements can be determined from *Tables 3.6 and 3.7 Comparison of Uniform Hydraulics* which indicates the required channel dimensions in order to achieve bank-full normal depth capacity. However, the development of the recommended modified channel dimensions was based actual hydraulics from water surface profiles to achieve the desired flood protection requirements, including superelevation.. An iterative design process was performed for the hydraulic analysis and design of the channel sections until satisfying the requirements. **The horizontal curves of the existing channel were maintained in order to avoid property acquisition and other conflicts**. Modification of the existing horizontal curves through increasing the radius would have reduced the superelevation requirements for the channel section since a majority of the existing curves have radius of 99-feet. Pier walls were incorporated at many locations in order to reduce the superelevation to within an acceptable level.

Gabbert Canyon Channel

The alternatives considered either partial reconstruction or complete reconstruction of the existing Gabbert Channel system depending upon the amount of flow attenuation was provided by detention basins. The channel reach upstream of the confluence to the debris basin needs to be reconstructed for all alternatives. The channel section requirements for the various alternatives and channel reaches are indicated in the following table.

Table No. 6. 2- Summary of Gabbert Canyon Rectangular Channel Modifications

Alternate	Reach No.1 (L=2,030')	Reach No. 2 (L=625')	Reach No. 3 (L=1,200')	Reach No. 4 (L=3,310')
Exist	**b=8' / h=4.5'**	**b=8' / h=4'**	**b=14' / h=6'**	**b=14' / h=6.5'**

H	existing	8' x 6' (wall extension)	existing	existing

6.3.2.2 Diversion System

A diversion is designed to function as a hydraulic relief system, which splits a portion of the total main channel flow and conveys the flow along an alternate alignment to the ultimate outlet. Three potential

diversion system were initially developed as part of the plan formulation which diverted flow from Walnut Canyon Channel to the Arroyo Simi. The most cost effective and feasible of these alternates was the diversion which follows an alignment parallel and west of Shasta Avenue along the rear of a commercial area. The primary constraints associated with the diversion system were (1) the limited elevation difference between the Walnut Canyon Channel and Arroyo Simi resulting in a flat friction slope, (2) the water surface elevation in the Arroyo Simi, (3) existing 21-inch diameter trunk sanitary sewer along Los Angeles Avenue, (4) existing 54" and 48" diameter VCFCD storm drains which cross the Los Angeles Avenue sanitary sewer near Shasta Avenue, providing a corridor or "window" to reconstruct with a larger crossing for the diversion system, (5) channel depth at Walnut Canyon Channel results in shallow cover over the buried diversion system.

The limited available energy gradient for the diversion system results in a relatively large conveyance section for a small amount of flow. Two different amounts of flow diversion were evaluated which included 100 cfs and 300 cfs. The diversion conveyance system was a constant size from Walnut Canyon Channel to Los Angeles Avenue, at this location it combined with the local runoff from the existing 54" and 48" diameter storm drains which would be removed into order to utilize the crossing over the sanitary sewer. The dimensions for the conveyance system associated with the diversion are indicated in the following table.

Table No. 6.4 - Diversion Conveyance System Dimensions

Diverted Flow	Reach	Length	Required Section	Q_{100}
100 cfs	Arroyo Simi to LA Ave	815 ft	78" RCP	100 cfs
	LA Ave to Walnut	2,220 ft	60" RCP	100 cfs
300 cfs	Arroyo Simi to LA Ave	815 ft	14' x 5' RCB	493 cfs
	LA Ave to Walnut	2,220 ft	12' x 5' RCB	300 cfs

A conceptual layout has been prepared for the channel diversion structure or bifurcation system which will split the main channel flows. The system is designed to initially bypass all flows up to 100 cfs or 300 cfs depending upon the discharge selected for the split flow. A typical diversion structure involves the installation of a "smart structure" that relies on the hydraulics of the system rather than manual operation to divert the flow. The concept illustrated utilizes an "in-line" structure which diverts all flows up to an initial amount to the new conveyance system. Once this amount is exceeded, then the additional flow will crest a weir at the diversion structure and spill into the adjacent "diversion" detention basin. The diversion detention basins have been designated as basin numbers 3,4,and 5 which all occur in the Hitch Ranch property. The impact of these basins on the proposed landuse increases as the storage volume increases. These basins just reflect different available storage volumes and areal extent. The diversion structure redirects the diverted flow perpendicular to the existing Walnut Canyon channel alignment, which flows down a chute entrance

of a culvert which crosses the SPRR and continues to the Arroyo Simi.

The size of the diversion system is extremely limited because of the existing physical constraints as previously indicated. Increasing the magnitude of the flow diversion will provide greater benefits which are achieved downstream and the system realizes a better cost-benefit.

6.3.2.3 Walnut Canyon Channel Outlet Realignment

This feature involves realignment of either the Walnut Canyon Channel outlet or the combined Gabbert and Walnut Canyon Channels to a new outlet location into the Arroyo Simi. This relocation functions as a diversion. The relocated channel section would follow a horizontal alignment along the eastern boundary of the Smith-Holst Ranch and involves the construction of 1,400 of an earthen trapezoidal channel section with rock rip-rap lined side slopes. The channel section is designed with a maximum average velocity of 8 fps without influence from the downstream tailwater and the required channel size is based upon the tailwater condition. Relocation of the channel requires construction of a new culvert crossing under Los Angeles Avenue since the existing Gabbert and Walnut Canyon Channels are on the north side of Los Angeles Avenue. Relocating just Walnut has the advantage of reducing the flow to Gabbert by almost half and allows the ability to utilize more of the existing Gabbert channel without reconstruction. The outlet channel dimensions for the various conditions are indicated in the following table.

Table No. 6.5 - Relocated Outlet Channel

Description	Flowrate	Section	Systems Alternate
Gabbert & Walnut Relocation	1,889 cfs	trap b=20', d=11' z=2	A,D, G
Walnut Relocation	1,411 cfs	trap b =14', d=10' z=2	B
Walnut	559	trap b= 14', d=15' z=2	E, H

Section 7—Design Considerations

7.1 Agency Agreements, Permits, and Approvals

Implementation of the recommended watershed improvements would involve various regulatory and governmental agencies for approvals and environmental clearances. The regulatory agencies focus primarily on (1) the environmental issues and impacts and/or, (2) public safety. Early involvement of the jurisdictional agencies and stakeholders within the watershed facilitate development of an implementable plan and ensures requirements associated with the agreements or permits are incorporated into the design.

General Environmental

The California Environmental Quality Act applies to all discretionary activities proposed to be carried out or approved by California public agencies, including state, regional, county and local agencies, unless an exemption applies. Generally, the implementation of CEQA entails three (3) separate phases: a) preliminary review of a Aproject@ to determine whether it is subject to CEQA; b) preparation of an Initial Study to determine whether the project may have a significant environmental effect; and c) preparation of an EIR if the project may have a significant environmental effect or of a Negative Declaration if no significant effects will occur. CEQA applies only to government activities that are defined as Aprojects@. A project is defined as Athe whole of an action which has the potential for resulting in a physical change in the environment, directly or ultimately@. [Guidelines Sec. 15378(a)] The effect on the environment must, however, be *reasonably foreseeable* and the effect must be on the *physical* environment. [Pub. Res. Code Sec. 21065]

FEMA

The implementation of the proposed watershed drainage system improvements would result in the elimination of the flood hazard zones in the city associated with overflow from the channel system. In addition, any modifications or encroachment into the published floodplain for communities participating in the National Flood Insurance Program (NFIP) must be approved by FEMA. Communities which participate in the NFIP are responsible for submitting data to FEMA reflecting projects which modify the floodplain or flood hazard zones.

Regulatory Permits

The construction of the detention basins will result initiating environmental regulatory permits since the detention basins are primarily located in natural stream areas with some riparian vegetation. Jurisdictional agencies that have would potentially be involved include (1) Army Corps of Engineers under Section 404 of the Clean Water Act, (2) California Department of Fish and Game for the 1601 Streambed Alteration Agreement, and (3) Regional Water Quality Control Board which administers three permits that may be required, including: NPDES General Construction Activity Stormwater

Permit, NPDES Groundwater Dewatering Permit, and Section 401 Water Quality Certification.

Utilities

Existing utilities adjacent to the proposed drainage facilities or those that potentially interfere should be incorporated into the design to allow relocation or protection. Early coordination with the impacted agencies to determine specific requirements should be performed.

City Of Moorpark

Approval by the local municipal planning agency and the City Engineer should be obtained to ensure that the proposed watershed plan is adopted into the municipal planning documents. Also, the city will be one of the primary agencies to assist in assuring that future developments are conditioned to implement the drainage facilities and provide a municipal drainage ordinance for the watershed which restricts increasing runoff.

Landowners

Agreements and assessments of land value will have to be developed with landowners for the acquisition of land associated with the proposed improvements.

7.2 Geotechnical Constraints

The primary geotechnical considerations are generally associated with the construction of the proposed detention basins. The channel reconstruction will occur along the same horizontal alignment as the existing channel and does not appear to have experienced foundation related maintenance problems, minimizing geotechnical concerns. The primary items of concern related to the detention basin construction include: (1) embankment slope stability and protection, (2) grading engineered fill including material sources, (3) foundation system requirements for the embankment, and (4) settlement. The embankment design is the critical geotechnical factor to ensure stability and protection of the public.

7.3 Utilities

The existing channel system provides a design corridor which limits the interference or conflicts from other utilities. The proposed reconstruction of the existing channel facilities to enlarge the channel section does not generally extend beyond the existing channel right-of-way which minimizes the potential influence of utilities. The areas where the utilities can potentially be a limiting design constraint include: (1) channel relocation crossing of Los Angeles Avenue, and (2) the diversion system crossing Los Angeles Avenue and Poindexter. All proposed detention basin locations occur on undeveloped land which should minimum impact to utilities.

7.3.1 Sewer and Water

The existing sewer system for the central portion of the City of Moorpark is indicated on *Existing Utility Layout Exhibit* based upon the current sewer index map information for the city. The general location and size of existing water facilities are also illustrated on the same exhibit. Sewer systems generally represent a physical constraint since the vertical alignment is difficult to modify because the systems operate by gravity. The largest sanitary sewer which influenced the drainage system alternative is a large 21-inch diameter trunk line located in Los Angeles Avenue which ultimately crosses the Arroyo Simi at Maureen Lane. This sewer was a physical constraint related to the sizing and alignment of the diversion conveyance systems that required crossing of Los Angeles Avenue. The impact was minimized by utilizing a crossing location where two storm drains, 54" RCP and 48" RCP, currently cross the sewer near Shasta Avenue. In addition, there is a sewer trunk line which parallels Gabbert Canyon Channel along the west side of the channel between Los Angeles Avenue and the outlet to the Arroyo Simi.

7.3.2 Local Storm Drains

There are numerous existing local drainage inlets which join both the Gabbert and Walnut Canyon Channels which are associated with both municipal and private drainage systems. The majority of these inlets are small diameter corrugated metal pipes ranging in size generally from 12-inches to 24-inches. Unconfined surface flow from some of the larger undeveloped canyon areas is intercepted by Walnut Canyon Channel with concrete overpour structures or "small canyon side inlets" which provide long weir crests along section of the channel walls. The original construction drawings for the channel improvements indicate that there are approximately 23 local drainage inlets connecting to the Walnut Canyon channel and 9 local storm drains connecting to the Gabbert Canyon Channel which are small diameter facilities. The two primary large local drainage inlets occur along the Walnut Canyon Channel. These facilities include the Moorpark Drain No. 1 at High Street which is **5' x 3.5' RCB** VCFCD maintained facility which was originally designed to convey 125 cfs from a 137-acre watershed area. The other local storm drain is the Los Angeles Avenue municipal storm drain which is a **72-inch diameter RCP** designed to convey 195 cfs from approximately 124-acres of urbanized area and confluences with Walnut Channel where the channel alignment is perpendicular to Los Angeles Avenue.

Table No. 7.1 - Summary of Major Local Drainage Junctions to Channel

Channel	Station	Facility Size	Drainage Area	Original Design Flow	Q_{50}
Walnut	17 +25	72" RCP	124 acres	195 cfs	214 cfs
Walnut	96+62	5' x 3.5' RCB	137 acres	125 cfs	200 cfs

7.3.3 Other Utilities

Additional utilities have been identified from either the field investigation or design data indicated on historical improvement drawings. These utilities may potentially influence limits of channel reconstruction, potentially require reconstruction, or special protective measures during construction.

Telephone - Adjacent to Walnut Canyon a relatively new underground MCI fiber optic cable has been installed which parallels the channel. The cable is located between the SPRR and the channel.

Electric - The Walnut Canyon Channel is adjacent to the SCE electric substation near the intersection of Los Angeles Avenue and Gabbert Road. Regional transmission lines and towers are in the proximity of this area.

Railroad- The Southern Pacific Railroad is located parallel to Walnut Canyon through the central portion of the City of Moorpark. The distance from the center of the railroad tracks to the center of the channel is 49.5 feet and the distance from the edge of channel to the railroad right-of-way is 8.5 feet. Both Gabbert and Walnut Canyon channel each have separate crossing underneath the SPRR, however the Gabbert Canyon Channel crossing is a free span bridge with a skewed 42-foot span which allows adequate clearance for the existing rectangular channel section. Modifications to either facilities would require coordination with the railroad and the Public Utilities Commission. Involving these agencies generally adds considerable processing and review time for the project.

Gas - A high pressure gas line is located parallel to the Gabbert Canyon Channel, directly adjacent to Los Angeles Avenue and the channel.

7.4 Local Drainage Requirements

The final hydraulics associated with the proposed channel alternatives should result in operating water surface elevations similar to the original design flow depths in the main channel systems relative to the local drainage system which join the channel. The actual hydraulic operation of the minor or major local storm drain systems were not investigated as part of this study. It was assumed that if operating water surface elevations are provided which are similar to the original design then this should satisfy the hydraulic control elevation associated with the local drainage system. The proposed design hydraulics to evaluate the channel water surface profile were based upon the 100-year frequency without freeboard and the local storm drains are based upon a 50-year design frequency. If hydraulic analysis are performed to evaluate the local storm drain systems then it should be based upon similar design frequencies.

Alternative drainage systems for the Gabbert/Walnut Canyon Channels will require reconstruction of the local drainage inlets for alternatives which include modifications to the existing channel section geometry. The costs associated with the small diameter local drain inlets are small and have been neglected in this estimate. However, since over 50% of the land directly adjacent to the channel is undeveloped and provisions for future urban development storm drain systems should be incorporated for those portions of the channel which are reconstructed by providing connection locations.

7.5 *Right-of-Way and Property Acquisition*

The right-of-way associated with the existing channel improvements ranges from a maximum of 60-feet to 20-feet, generally including a 12-foot maintenance road on one side of the channel or access from the adjacent parallel public street. The portions of the channels enlarged will require additional right-of-way in order to maintain the same minimum maintenance and access requirements. The detention basin locations will require right-of-way for the surface area encumbered by these facilities including the maximum inundation limits associated with the reservoir pool. Additional right-of-way may be required for access to the detention basins and temporary easements just for construction purposes

Table No. 7.2 - Summary of Minimum Land Acquisition Requirements

Drainage Alternative	Area (acres)			
	Channel Relocation	Detention Basin	Diversion System	Total
A	7.5	28	1.7	37.2
B	6.5	28	1.7	36.7
C	0	28	1.7	29.7
D	7.5	74	0	81.5
E	6.5	74	0	80.5
F	0	74	0	74
G	7.5	46	0.9	54.4
H	6.5	46	0.9	53.4

7.6 *Future Development / Landuse*

A primary consideration in the development of the drainage system alternatives was the relationship to the adjacent undeveloped land within the watershed and the potential landuse impacts. The recommended regional drainage improvements are designed to assist many of the adjacent properties that have flood hazard designations and allow continued development of these areas by ensuring that the planning process incorporates the allowances for these drainage facilities. An important element which is inherently assumed with the proposed drainage alternatives is the implementation of an administrative drainage ordinance for the watershed which requires **future development projects to mitigate hydrologic impacts from their projects to match pre-existing conditions**. All the hydrologic analysis performed for this investigation was based upon the ~~current landuse, not future development.~~ The future development plan formulation process must include both allowances for the regional drainage facilities and the local detention requirements based upon each the individual development project. The allowances for the drainage regional facilities include adequate land for

1996 land use conditions & development

In the determination of the required detention facility capacity & outlet channel size through Smith/Holst Ranch & Hitch Ranch, allowance were made to account for the required mitigation * future project

enlargement of existing channels, regional detention or debris storage facilities, and channel relocation.

The two large undeveloped parcels which are most impacted from the implementation of the proposed drainage facilities include the Smith-Holst Ranch and the Hitch Ranch. These parcel also have the most frontage to the existing channel system. Initial landuse planning documents had been provided by consultants for the Smith-Holst Ranch and the Hitch Ranch which indicated preferred locations for the drainage facilities which would be compatible with their development landuse plans.

Table No. 7.3 - Summary of Undeveloped Land Parcel Impacts

Parcel Description	Proposed Facilities	Impacted Area	Percent of Parcel Impacted
Smith/Holst Ranch	Relocated Outlet Channel	7.5 acres	5%
Hitch-Ranch	Detention Basin	20.5 to 67.5 acres[1]	7% to 24%
Tract No. 4652	Detention Basin	6.0 acres	3%
Tract No. 4520	Detention Basin	5.0 acres	3%

1. Impacted area varies depending upon the size of the offline diversion detention basin which varies from 21.0, 49.0, and 68.0 acres

7.7 *Division of Safety of Dams Design Considerations/Criteria*

The planning of the regional stormwater detention basins focused upon providing facilities which would **not** be under the jurisdiction of the State Division of Safety of Dams (DSOD). The specific requirements associated with jurisdictional dams are defined in the *Statutes and Regulations Pertaining to Supervision of Dams and Reservoirs* (1995) and *Guidelines for the Design and construction of Small Embankment Dams* (1993) published by the State Department of Water Resources, Division of Safety of Dams. The earthwork foundation costs associated with the dam embankment are substantially reduced if the facility in not considered a jurisdictional dam. The embankment of a jurisdictional facility has stringent requirements related to the foundation and must be embedded into competent material which may require major excavations if there are deep alluvial deposits and cutoff trenches. Similar restrictions are associated with the primary spillway which must be constructed in native material and the spillway cannot be located within the embankment. The embankment and excavation are some of the primary cost elements associated with dam construction and the introduction of these requirements will result in major construction cost increases. The basic criteria which is utilized by DSOD to define a jurisdictional "dam" facility includes the following:

- Embankments which are more than 25-feet height measured from the **natural stream bed or lowest point at the downstream toe of the embankment**

- Embankments which impound a **storage volume exceeding 50 acre-feet**

• Embankments which are less than 6-feet in height, regardless of storage capacity, or which have a storage capacity of 15 acre-feet, regardless of height shall **not be considered a "dam"**

The definition of a jurisdictional DSOD facility was applied to define the maximum size limitations for potential detention basins in order to evaluate the effects stormwater storage alternatives and assist in the initial plan formulation. The DSOD facility size limits of storage volume and height present a severe restriction which minimizes the effectiveness of a single stormwater detention basin within a large watershed, especially when considering "flow-through" or "on-line" detention facilities. However, creative techniques are available to maximize the benefit from smaller detention facilities which are not jurisdictional DSOD facilities. The application of these features are particularly important for developing an effective storage alternative for the Gabbert watershed which has a large tributary watershed. Some of these techniques which can be incorporated in the planning of a basin which optimize the effectiveness of the facility are discussed in more details in *Section 8 - Detention Basin Features and Requirements* and include the following:

• Excavating the basin and creating the storage volume below the natural surrounding ground elevation, since an incised basin or pit is not considered a "dam"

• Excavating a portion of the basin below the natural ground elevation measured at the downstream toe of the embankment. The amount of storage volume measured from the embankment toe elevation is not considered in calculating the storage volume associated with the embankment for defining a jurisdictional facility. However, the primary limitation in the excavation depth becomes the ability to provide a gravity outlet to drain the reservoir pool.

• Use several smaller interconnected storage facilities which will operate similar to a single larger facility.

• Incorporate "off-line" or "flow-by" detention basins rather than "in-line" basins, since these facilities provide a more effective reduction in the hydrograph peak with the **minimum storage volume** requirement.

Interconnected Ponds

The application of interconnected ponds was a concept which was applied for several alternatives related to modifying the existing Gabbert Canyon Debris Basin to a stormwater detention basin. Discussions were performed with DSOD staff to verify the applicability of this concept and determine if any special requirements would be associated with this facility. A primary concern was that even though the smaller basins would be below the DSOD jurisdictional facility size requirements that the combination of all the basins might be considered a single basin. The initial indication from the DSOD staff was that the interconnected smaller basins can be utilized and would not be considered a jurisdictional dam if:

• All the embankments of the basins were designed to the same standard, including any

common embankments separating basin pools that would inundate both sides of the embankment.

- Each detention basin had its own spillway system.

Final determination of the jurisdictional nature of these more complex systems would require a review by DSOD of the conceptual designs.

Section 8—Detention Basin Features and Requirements

8.1 Summary of Detention Basin Alternatives

Stormwater detention facilities are the principal elements in a storage oriented approach for flood control, providing peak flow reduction based on temporary storage of the runoff volume. **Six potential retarding basin sites** have been selected for detailed evaluation at various locations within the watershed after performing a feasibility screening of numerous alternatives. The sites were selected based upon (1) physical site constraints and limitations, (2) maximizing drainage area impacted, (3) minimizing inundation areas, (4) embankment size requirements, (5) DSOD limitations, (6) future landuse constraints, and (7) proximity to channel. The initial screening of detention basin sites involved elimination of the drainage area to the detention basin site from the VCRAT hydrology model, or complete retention, and then evaluating the effects on the main channel discharge. This analysis provided an indication of the maximum potential benefit from the basin. Application of combining multiple detention basins within the watershed were evaluated since these will effect the overall timing of the main channel peak flowrate. The detention basin alternatives included both "on-line" or flow-through basins and "off-line" or flow-by basins. The off-line detention basins allow a more efficient use of the available storage through impacting only the critical portion of the storm hydrograph. "On-line" detention basins involve the entire hydrograph routed through the basin which results in the initial volume associated with the rising limb of the hydrograph utilizing a portion of the available storage required to attenuate the peak flowrate.

The detention basin facilities were specifically sized to avoid DSOD jurisdiction, which restricted the maximum attenuation available from certain sites. Lager detention storage volume at a single site above the 50 acre-feet DSOD jurisdictional limit was generated through (1) multiple basins in series, (2) interconnected basins, and (3) providing a portion of the storage volume below the natural ground elevation.

The potential impacts from sediment dead storage requirements were accounted through providing a separate debris facility upstream or adding an allowance for dead storage. The smaller detention basin site utilized sediment storage volume excavated below the natural ground surface. The resulting detention basins which were elements of the drainage system alternatives are indicated in the following table.

Table No. 8.1 - Summary of Proposed Detention Basin Characteristics

Basin Alt. No.	Surface Area (acres)	Max Storage (acre-feet)	Max Depth (feet)	Q_{100} Inflow	Q_{100} Outflow
Gabbert -A Triple Basin	16	138[1]	25 feet	1,316 cfs (900cfs bypass)	811 cfs
Gabbert -B Double Basin	11	94[1]	16 feet	984 cfs (600cfs bypass)	514 cfs

Table No. 8.1 - Summary of Proposed Detention Basin Characteristics					
Basin Alt. No.	Surface Area (acres)	Max Storage (acre-feet)	Max Depth (feet)	Q_{100} Inflow	Q_{100} Outflow
0	1.3	14[3]	10 feet	390 cfs	273 cfs
1	0.65	25[3]	18.5 feet	301 cfs	65 cfs
2	1.7	36[3]	15 feet	514 cfs	141 cfs
3	14	70[2]	5 feet[2]	847 cfs	9 cfs
4	61	305[2]	5 feet[2]	847 cfs	4 cfs
5	42	210[2]	5 feet[2]	847 cfs	14 cfs

1. Total combined storage of all ponds, not DSOD jurisdictional
2. Incised basin below natural ground, not DSOD jurisdictional
3. Maximum limiting volume of 50 AF not available due to site restrictions such as major road relocations or existing residential development within inundation area

Table No. 8.2 - Summary of Detention Basin Costs				
Alternate	R/W area	R/W Costs	Construction Costs	Total Costs
Gabbert - B	14.5 acre (25.8 acres total)	$290,000	$3,258,000	$3,258,000
0	3 acres	$75,000	$263,000	$338,000
1	6 acres	$150,000	$699,000	$849,000
2	4 acres	$100,000	$408,000	$508,000
3	15 acres	$375,000	$618,000	$993,000
4	61 acres	$1,525,000	$2,259,000	$3,784,000
5	46 acres	$1,150,000	$1,668,000	$2,818,000

8.1.1 Gabbert Basin Modification/Expansion

The existing 4.8-acre Gabbert Canyon Debris Basin is a regional sediment/debris collection facility which drains a primarily natural tributary watershed area of 2,350 acres. The regional location of this site within the watershed, plus situated at the headworks of the Gabbert channel, provides an excellent opportunity to modify the facility for flood control storage benefits. The existing basin has an effective storage depth of 11.0-feet to the spillway crest and level storage volume of 16,300 cubic yards (10.1 acre-feet) with a design 100-year sediment yield of 35.3 acre-feet. Geographically the site is located near the mouth of the canyon which spreads onto the apex of a small alluvial fan. This feature provides a wider area for the basin floor than in the canyon and is the last location where the

floodplain is generally confined. The large size of the drainage area requires that a "by-pass" type detention basin be used in order to generate effective attenuation flow rate during the timing of the peak flow, otherwise a flow-through basin only provides a minor influence on the attenuation. Also, the magnitude of the hydraulic deficiencies downstream require that the total storage exceed the 50 acre-feet DSOD maximum limit in order to provide the required minimum hydraulic benefit to the downstream channel. A larger volume effective storage volume was provided through the application of two alternatives which required multiple basins, including debris storage requirements. A portion of the storage can be provided below the natural ground relative downstream embankment toe elevation which allows excluding this additional volume from the storage definition of a jurisdictional "dam."

Alternate-A (Triple Basin) This system preserves the configuration of the existing Gabbert Canyon debris basin and adds two additional reservoir storage ponds adjacent to the existing embankment. The existing basin embankment is used as a separating dike in between the ponds, but the ponds are interconnected with culverts to allow the basin to operate hydraulically as a single unit or a pond system in **parallel**. The two additional ponds rely on the surrounding topography and a strategically placed levee to create the impoundment for the storage volume. The natural topography lends itself to the natural creation of these other ponds adjacent to the existing debris basin. Also the elevation drop along the canyon is adequate to allow excavation of the facilities below the natural ground to provide additional volume and ensure a gravity outlet. The existing embankment will be raised to the maximum height for a non-jurisdictional facility and the combined total available storage volume is 150 acre-feet. A separate debris basin will be located upstream of this location within the canyon and the maximum limit of the basin is constrained by existing upstream residential structures.

Operational Parameters- The system is designed so that the flow from the canyon will initially be intercepted the upstream debris basin which allows removal of a maximum 53 acre-feet of debris volume (125% of 100-year sediment yield). The flow will outlet the debris basin through a rectangular drop spillway, conveyed by a concrete rectangular channel section to the lower three interconnected detention ponds. A minor amount of storage attenuation is associated with this debris basin, but was ignored since it is a flow-through type basin and the benefits are not that significant. The concrete rectangular channel contains two low-height side weirs which allow up to **600 cfs bypass** without entering the basin, continuing downstream to the existing alignment of Gabbert Canyon Channel which must be enlarged from an 8' x 4.5' RCC to a 12' x 7' RCC. Flows at the basin which exceed 600 cfs will discharge over the side weirs located in the rectangular channel section and the excess discharges into either pond. All ponds are interconnected with culverts that are designed to pass the maximum discharge so the three ponds can operate as a single unit. Each pond has an independent operating spillway in order to satisfy DSOD restrictions. The upper two ponds utilize the side weir as the spillway and a separate spillway between the lower pond is provided. A circular outlet tower can be provided in one or all three ponds which functions to assist in providing the controlled the release rate downstream. The primary outlet is a drop spillway section from one basin design for the maximum peak flow rate and continues in a box culvert through the embankment downstream to join the existing Gabbert channel alignment.

Alternate-B (Double Basin) This facility configuration provides two detention **ponds in series** which are located downstream of a proposed debris basin similar to that indicated for Alternate-A. The primary difference between alternates "A" and "B" is that "B" has a larger by-pass flowrate but requires a lower storage volume, which generates almost the same combined downstream peak flowrate in either scenario. This alternate preserves the existing basin geometry but also increases the embankment height to the maximum limiting non-jurisdictional value and provide additional excavated volume below the natural ground. The new detention basin is located in-line between the upstream debris basin and downstream Gabbert Basin.

Operational Parameters- This detention basin configuration results in approximately 11.0 acres of surface area for the basins and utilities a maximum storage volume of **94 acre-feet** of the available 100 acre-feet. The upstream debris basin provides a key function in this alternate by performing the flow split to the by-pass channel and the remainder of the inflow hydrograph spills into the intermediate detention basin. The by-pass channel intercepts all the inflow up to 900 cfs and additional flow above this amount will crest an elevated spillway discharging into the intermediate detention basin. Flow release from the intermediate basin is controlled by an outlet tower connecting to the downstream basin location or another rectangular drop spillway. The downstream has a similar outlet configuration with an outlet tower and rectangular drop spillway. The upstream debris basin is designed to provide 53 acre-feet of debris storage volume and the operating head for the flow split to occur from the by-pass structure.

8.1.2 Basin No. 0 (Walnut Canyon)

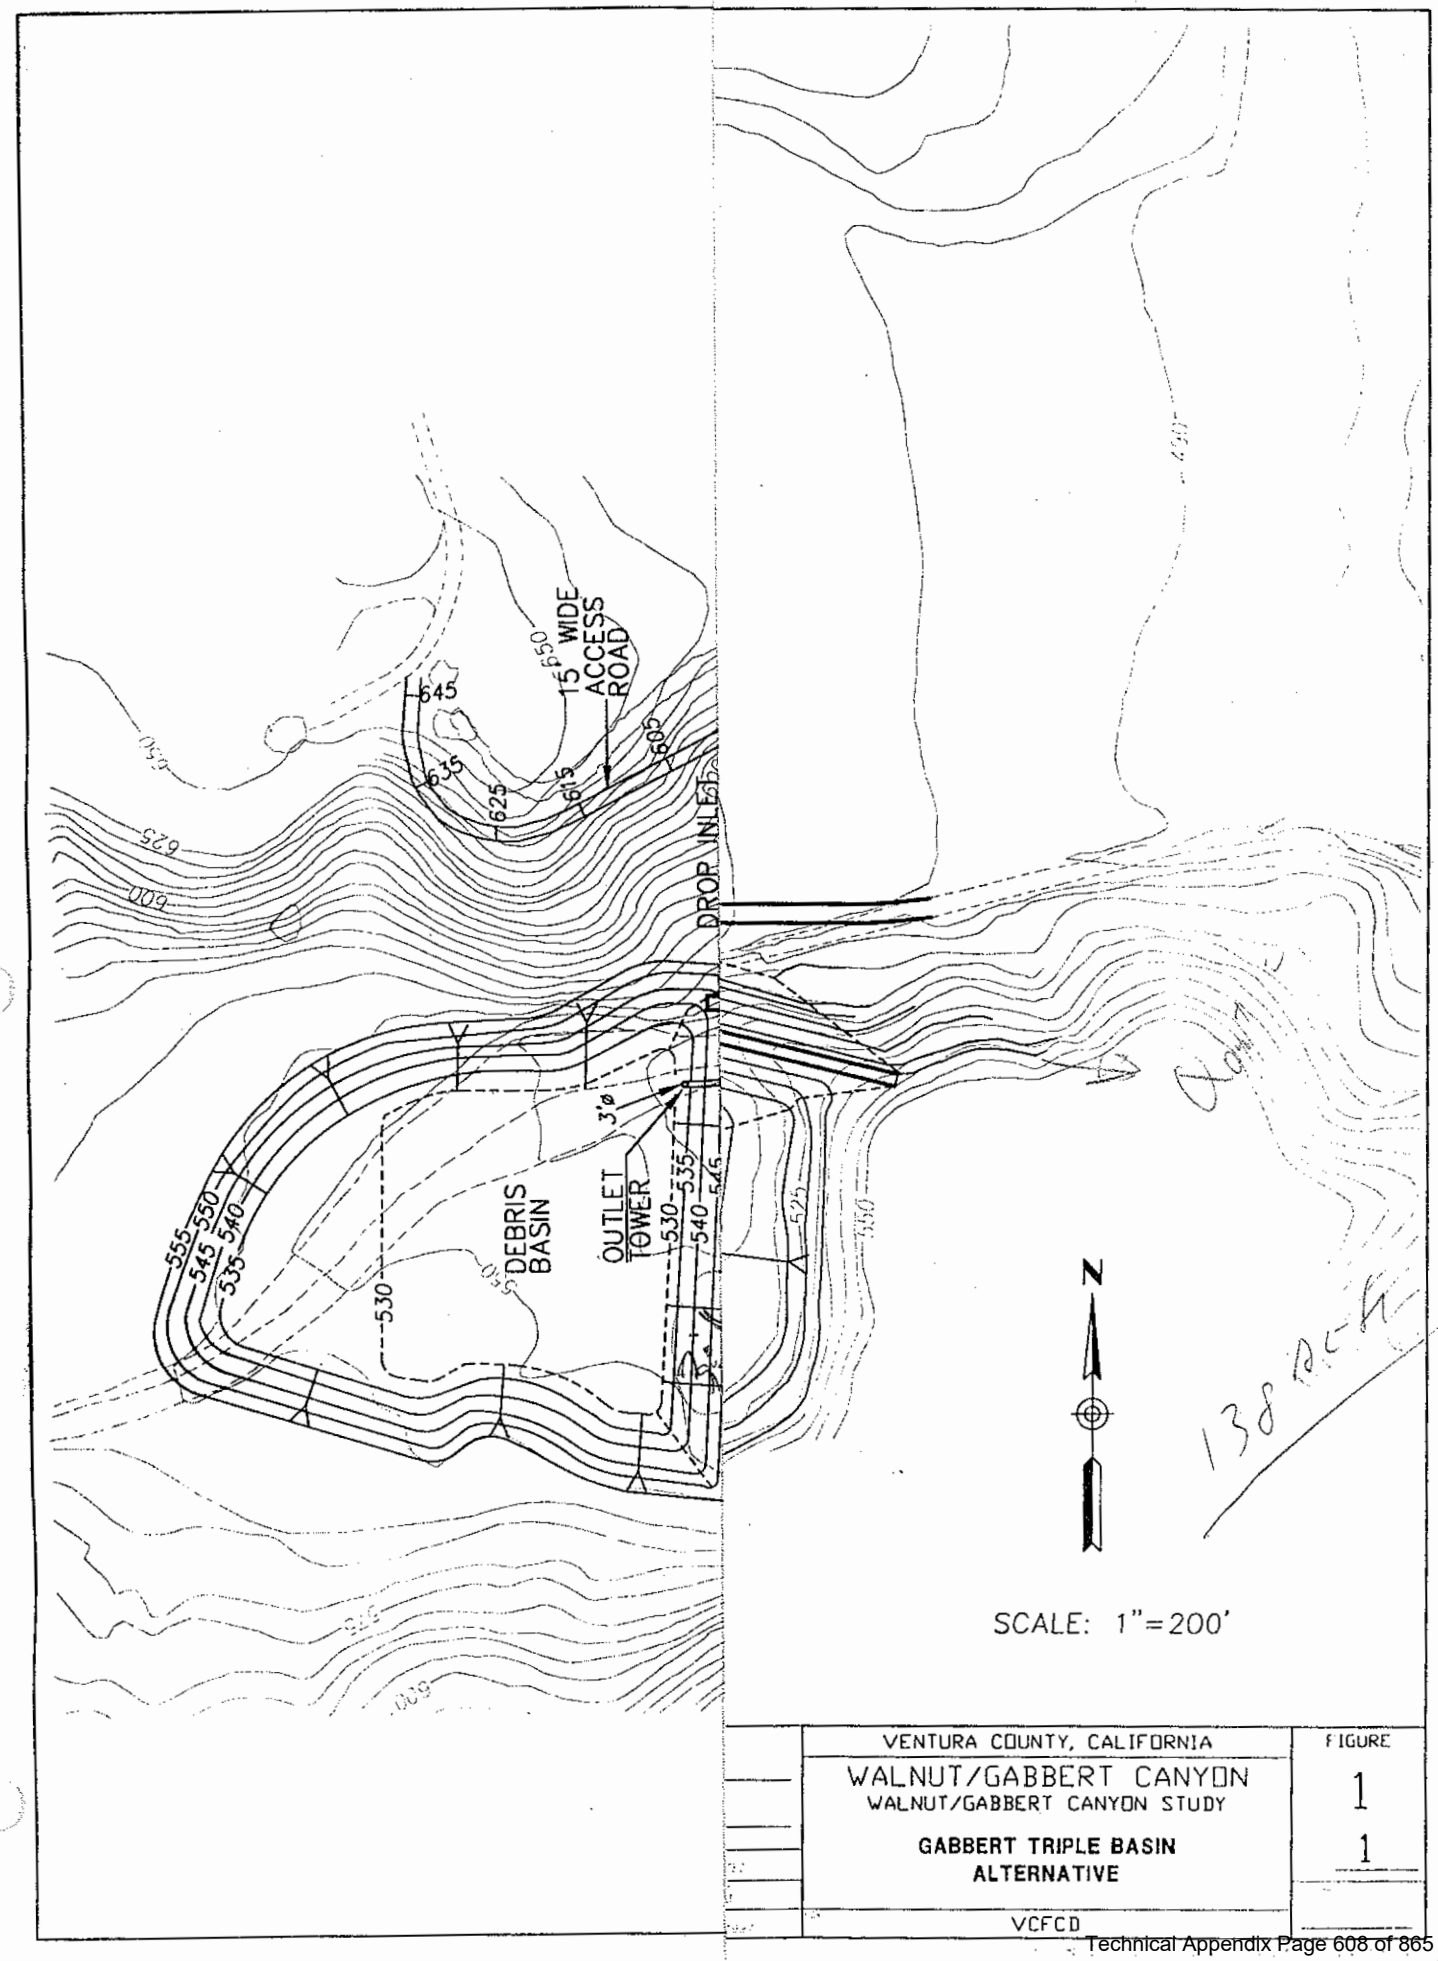
This 1.3 acre basin site is located at the upstream headworks to the existing Walnut Canyon Channel improvements and within the natural creek floodplain. Approximately 382-acres of primarily undeveloped drainage is tributary to this location. The topography within Walnut Canyon limits the available storage from sites in this area since the canyon bottom is relatively narrow. Walnut Canyon Road follows an alignment within the canyon bottom also which further reduces or limits the maximum storage without impacting the roadway. Several locations within the canyon area were identified as potentially feasible detention basin sites since these areas had significantly widened canyon floor areas and the road was elevated above the floodplain. The storage volume would be generated through the construction of an embankment fill within the natural creek floodplain between one canyon wall and the adjacent roadway fill. The maximum effective storage depth was limited to 10 feet without impacting the roadway. The natural creek within Walnut Canyon has riparian vegetation which would be impacted with any construction in this area.

Operational Parameters: The basin will operate as a flow-through or in-line type basin since the embankment fill is placed directly in the natural floodplain. The resulting 100-year effective storage volume provided by this detention basin is 14.0 acre-feet from attenuating the peak inflow from 390 cfs to 273 cfs. The required debris storage for this basin, in addition to the flood control storage, is 11.4 acre-feet. The controlled release from the basin is based upon hydraulic control from a 42-inch diameter vertical riser used for the outlet works.

8.1.3 Basin No. 1 (Casey Road)

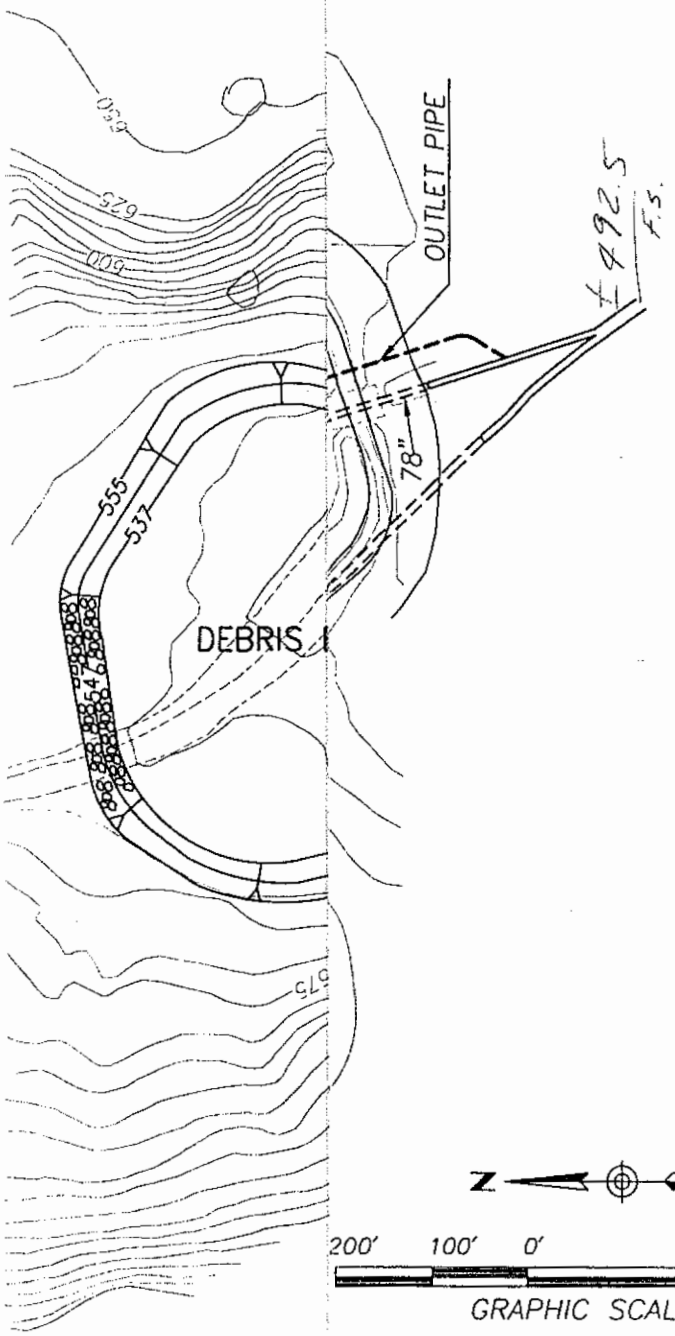
This detention basin utilizes a small existing reservoir located within the natural canyon tributary to Casey Road, adjacent to Walnut Canyon. The existing reservoir was formed from an earthen embankment across a small incised canyon area and has a concrete spillway without a low-level outlet. This reservoir could have been either an agricultural reservoir or a small debris basin constructed by the SCS. This location has a total tributary drainage area of 276-acres which is primarily undeveloped. The proposed detention basin would require removing the existing embankment and reconstructing another embankment downstream where the canyon floor is much wider. The proposed basin would have an effective storage depth of 18.5 feet which is limited by the height of the canyon and the upstream adjacent residential structures which would be inundated. The required sediment storage volume is estimated to be 8.3 acre-feet and would be provided in the total basin volume.

Operational Parameters: The resulting 0.65 acre basin would operate as an in-line basin since it is located directly in the natural floodplain. The 100-year maximum storage volume for the basin in this configuration is 25 acre-feet and results in attenuating the peak inflow from 301 cfs to 65 cfs. The controlled release from the detention basin is based upon a 2-foot diameter outlet pipe.



8.1.4 Basin No. 2 (Gabbert Road)

This 1.7 acre basin is another in-line basin which is located at the mouth of a large canyon which is adjacent to the Walnut Canyon Channel. This location has a total tributary drainage area of 475-acres which is primarily undeveloped and draining a significant portion of the proposed Hitch Ranch area. This basin impacts the largest drainage area of all the basins except for the Gabbert Basin. The basin is located within the proposed Hitch Ranch and in an area that the initial land use planning has designated as institutional. Construction of the basin would require the vertical relocation of Gabbert Road since the road it is close to the canyon floor. This location has the advantage of a wide canyon area and a relatively flat canyon slope. The maximum storage volume is restricted by the inundation limits not to encumber existing upstream structures.



Operational Parameters: This basin is another in-line type basin which would result in blocking the natural floodplain through the construction of an earthen embankment which join either side of the canyon walls. The maximum 100-year effective storage volume for this basin is 36 acre-feet. The required debris dead storage volume allowance at this location 31.7 acre-feet. The controlled release from the basin is based upon the hydraulics of a 3.0 foot diameter riser.

8.1.5 Basin No. 3, 4, and 5 (Diversion Basins)

This basin site is the off-line diversion detention basin located directly adjacent to the Walnut Canyon Channel. The basin is designed to function with the diversion structure which will bypass the initial 100 or 200 cfs around the basin prior to allowing runoff to enter the basin. These basins would be constructed by excavation and generating pits below the natural ground. The maximum depth for the

effective storage corresponds to five feet which is the same depth as the channel in order to provide a gravity outlet. All three of these basin configurations are at the same location, but encompass different surface areas. In addition the basins are completely located on the proposed Hitch Ranch development in area which the landuse planning has designated park and very high density. The basins would potentially interfere with the proposed alignment of Casey Road. The basins would encumber a total surface area which ranges 14 acres to 61 acres depending upon the maximum flowrate desired.

Operational Parameters: The key operational factor associated with this basin is the performance of the diversion or by-pass structure. The difficulties with this structure include: (1) setting a weir crest elevation and length which can adequately deliver the desired flow into the basin, (2) weir performance so that it is not submerged by the storage in the basin, (3) weir elevation high enough to allow bypass around the basin, (4) shallow depth of the basin and if the basin is to drain by gravity is cannot be deeper than the channel. If a small stormwater pump station was used to drain the volume of the basin below the existing channel invert then this may solve many of the diversion structure operation problems.

8.2 Basin Geometry and Grading Requirements

The geometry of the proposed detention basins was primarily governed by the physical constraints of the site location and minimizing the potential land acquisition requirements. The sites were selected at locations which would effect the largest tributary drainage area prior to joining the main channel system and topographic features. The initial screening of the basin sites was performed by studying the effect if the basin operated as retention rather than detention on the hydrology model. The maximum limits of the basin area generally conformed to the topographic constraints. Excavation of an incised pool area was performed if it was still possible to provide a gravity outlet and provide additional storage volume below the jurisdictional requirements. The excavation of storage volume below the natural ground provided additional dead storage volume allowance used in the smaller detention basin facilities. Excavations utilized slopes of 2:1. The embankment utilized a fill prism which was assumed to have a 3:1 slope on the upstream face and 2:1 on the downstream face.

8.3 Spillway Outlet Configurations

The outlets works for the debris and detention basins were generally provided with a minimum of two outlets which included the (1) controlled release outlet structure or primary outlet, which is generally some form of vertical outlet tower and connecting outlet pipe, (2) rectangular drop spillway, and (3) flowrate by-pass facilities. It was assumed that the primary outlet works associated with the detention basin would consist of a box drop inlet design which is a similar configuration that is utilized by VCFCD on other similar regional facilities. This type of facility has several advantages for a spillway design, including, (1) reduces the potential of eroding the embankment material, (2) allows use of an underground culvert to convey the flow through the embankment, (3) allows continuous vehicular access across the dam crest, and (4) reduces the width of the spillway facility.

The preliminary sizing for the outlet spillway utilized the full unattenuated reservoir inflow and the basic relationship for the discharge head over the crest of a flat rectangular weir box, with a weir coefficient of 2.8. The box drop inlet spillway would be connected to an outlet conduit which would extend to the downstream of the embankment. The outlet conduit would either terminate into the improved channel or an energy dissipation structure.

Offline detention basins incorporated hydraulic structures which would by-pass the lower portion of the storm hydrograph and intercept flow during the critical point of the hydrograph to maximize the attenuation. The proposed structures incorporate some form of side-weir or lateral spillway section. The detailed evaluation of the hydraulics associated with the side-weir was not performed at this engineering level since it involves a spatially varied flow problem because of the variable flow and depth along the weir crest.

8.4 Low-level Outlet Requirements

The low-level outlet for the detention basins will provide the controlled release rate and the sizing of the facility is dictated by the required peak attenuation from the reservoir. The hydraulics associated with the outlet works is a critical component which determines the operation of the detention basin and the effectiveness in attenuating the peak flow rate. The preliminary design of the outlet for the basin involved an optimization process to select the most effective outlet configuration based upon achieving the maximum attenuation within the physical constraints of the basin. PONDOPT was applied to each of the individual basins in order to evaluate numerous design alternatives and the resulting basin configuration was incorporated into the overall watershed hydrology model.

The low-level or primary outlet intake configuration would consist of a staged concrete outlet similar to other VCFCD regional detention basin installations. The intake tower would require (1) low-flow riser to prevent debris and sediment from entering the facility and (2) a trash rack at higher stages or elevations. Access to the intake tower would be from an elevated catwalk or footbridge. The intake tower would be connected to an independent outflow pipe system through the dam embankment to the downstream toe of the dam. Selection of the outflow pipe is designed so that the hydraulics of the pipe should be independent of the intake structure.

8.5 Hydrologic Routing Approach and Methodology

The evaluation of the storm hydrograph movement through a detention basin is performed through a reservoir routing analysis. Hydrologic routing using modified puls method was applied through HEC-1, PONDOPT, and VCHYDRO. The final simulation of the reservoir routing was performed in VCHYDRO combined with VCRAT in order to accurately compare the regional watershed impacts. Modified Puls method requires developing the stage-storage and stage-outflow relationships from known information on the basin geometry and outlet condition. Conceptual layout of the basins was prepared in order to develop these rating curves to provide the storage-indication relationship for reservoir routing.

8.5.1 *Basin Stage-Storage Relationships*

Stage-storage relationships for each basin configuration were determined based upon preliminary grading concepts prepared for each of the basins. The minimum basin floor elevation was either determined from (1) maximum height of the required dead storage for sediment, or (2) lowest elevation which would still provide a gravity outlet. Stage-storage volume relationship for each basin site were derived as a discrete function ro series of points. The surface area of each contour interval was determine, with the storage in any increment Δh equal to the product of the average area and the depth of the increment.

8.5.2 *Basin Inflow/Outflow Characteristics*

The outlet works associated with each basin configuration influenced the hydraulic operation of the controlled release downstream of the basin. The hydraulics of the outlet structures were assumed to be operating as inlet control which facilitated development of outlet rating curves for the facilities. The design of the connecting outlet pipe to the outlet tower will be developed to ensure that the tailwater does not influence the outlet structure. The initial outflow relationships were derived through application of PONDOPT.

Section 9—Alternative Drainage Systems Investigated

9.1 Development of Alternative Drainage "Systems"

The **alternative drainage "systems"** represent a composite or combination of various feasible conveyance and storage elements which would achieve equivalent levels of improved flood protection within the main channel system. The effect of regional drainage improvements must be evaluated on a watershed basis or application of a "systems" approach.

Formulation of the alternatives relied on an initial planning process which screened the feasibility of numerous alternatives that were considered. This included evaluation of an "all-channelization" alternative since this provided a benchmark with relationship to the maximum amount of channel improvements and construction costs to gauge of systems which were developed. The different combinations of alternatives were developed in order to evaluate most economic combination of channel reconstruction and detention basin implementation. There is a delicate balance between attempting to preserve the maximum amount of existing channel improvements through construction of stormwater storage facilities and reconstruction of these facilities. The multiple alternatives investigated attempt to define the most economic system for all systems. In addition, the most effective system with regards to providing the maximum storage, or minimum required land acquisition, or minimum capital improvement costs were all investigated to facilitate the selection process of the recommended system.

9.2 Comparison of Alternative System Features

The essential features associated with each of the alternative drainage "systems" are summarized in *Table No. 9.1 - Summary Description of Alternative Channel Systems*. In addition, watershed schematics and watershed facility layouts have been prepared for all eight alternative drainage systems. All the system plans provide the same level of flood protection through different combination of features. Some general descriptive comparisons of the various drainage systems can be developed which assist in understanding operation requirements and potential impacts

• Alternatives E and F which utilize detention basin no. 5 (offline diversion basin) provide the **most area impact to the Hitch Ranch property.**

• Alternatives which did **not relocate the outlet channel system** resulted in the highest construction costs mainly associated with the reconstruction of Gabbert Canyon Channel.

• The **least channel reconstruction** are alternatives B,E and H which preserve the most amount of the existing channel

• The alternatives which have the **most detention storage volume** include alternatives D, E, and F

• Alternatives which have the **largest amount of channel reconstruction** include alternatives C and F since there is no relocation of the channel outlet.

• Relocating only Walnut Channel to the relocated Arroyo Simi channel outlet is more cost effective than relocating both Gabbert and Walnut to the new outlet channel.

• Smaller diversion system is more cost effective.

Table 9.1 - Summary Description of Alternative Channel Systems

Alt. No.	Gabbert Basin Modification	Additional Detention Basins	Gabbert Channel Reaches	Walnut Channel Reaches	Diversion Channel System	Channel Outlet Relocation
A	Improved to 94 AF Detention Storage	0,1,2,3 (V_{total} = 145 AF)	1,2,3	2	300 cfs	Gabbert & Walnut
B	Improved to 94 AF Detention Storage	0,1,2,3 (V_{total} = 145 AF)	1,2,3	2	300 cfs	Walnut
C	Improved to 94 AF Detention Storage	0,1,2,3 (V_{total} = 145 AF)	Entire Channel	2	300 cfs	None
D	Improved to 94 AF Detention Storage	0,1,2,5 (V_{total} = 380 AF)	1,2,3	2	None	Gabbert & Walnut
E	Improved to 94 AF Detention Storage	0,1,2,5 (V_{total} = 380 AF)	1,2,3	2	None	Walnut
F	Improved to 94 AF Detention Storage	0,1,2,5 (V_{total} = 380 AF)	Entire Channel	2	None	None
G	Improved to 94 AF Detention Storage	0,1,2,4 (V_{total} = 295 AF)	1,2,3	2	100 cfs	Gabbert & Walnut
H	Improved to 94 AF Detention Storage	0,1,2,4 (V_{total} = 295 AF)	1,2,3	2	100 cfs	Walnut

9.3 Alternative System No. A

System Description: (Maximum diversion alternative)

This alternative can be described as the maximum diversion since it has the largest channel outlet relocation to the Arroyo Simi and largest flow diversion at Shasta Avenue. This alternate relocates the channel outlet for both Gabbert and Walnut Canyon Channel upstream of its current location at Arroyo Simi and reconstruct this segment of relocated channel with an earthen trapezoidal section. Gabbert will now flow from west to east to the new confluence location. The relocated channel will be constructed on the boundary of the Smith-Holst Ranch. A flow diversion will be used just west

of the existing Shasta Avenue and divert flow from Walnut Channel to the Arroyo Simi. The maximum possible flow diversion was 300 cfs based upon the physical constraints and the diversion system will be a 14.0 foot wide RCB. A offline detention basin is required at the location of the diversion structure in the Walnut Channel. The maximum storage volume associated with the diversion detention basin is 70 acre-feet with an outflow of 9 cfs.

Storage Elements	**Conveyance Elements**
• *Improved Gabbert detention basin 94 acre-feet storage*	• *Gabbert Channel improvement to reaches 1,2,3 (total length = 3,855 feet)*
• *New Gabbert debris basin*	• *Walnut Channel improvements to reaches 2 and part of 3 (total length = 1,900 feet)*
• *3 offline and 1 offline detention basin (total storage 140 acre-feet) Basins 0,1,2,3*	• *300 cfs underground diversion channel adjacent to Shasta Avenue (length=3,035)*
	•*Relocated Channel outlet to Arroyo Simi for both Gabbert and Walnut Channel*

Estimated R.O.M Costs: Total costs of the alternative is $14,476,000 of which construction capital costs are $13,255,000 and land acquisition is $1,221,000

Property Acquisition: Required total amount of right-of-way is 37.2 acres, which includes 7.5 acres for channel relocation, 28 acres for detention basins, and 1.7 acres for diversion systems

9.4 Alternative System No. B

System Description: (Least Total Costs Alternative)

This alternate proposes to relocate only Gabbert Channel to a new outlet at the Arroyo Simi and maintain the existing Gabbert Channel outlet in its current configuration. This proposed system would result in parallel channels on either side of the Smith-Holst Ranch which flow to the Arroyo Simi. The relocated Walnut Channel outlet system from Arroyo Simi to Los Angeles is approximately 1,400 feet and consist of an earthen channel with rock rip-rap side slopes. The channel is designed with velocities less than 8 fps without influence of backwater. The earthen channel is consistent with the landuse planning for this property. An additional flow diversion is proposed in Walnut Canyon Channel near Shasta Avenue which would divert the initial 300 cfs in the channel directly to the Arroyo Simi. The diversion system would consist of a 14-foot wide underground box section that is 3,035 feet in total length. A flowrate of 300 cfs represents the maximum possible flow diversion based upon the conveyance system and the limiting physical constraints. A 48-inch storm drain at Los Angeles Avenue would join the diversion and was accounted in the hydraulics. An off-line detention basin is required at the diversion location which would provide 70 acre-feet of storage with a release rate of 9 cfs. In addition, the Gabbert debris basin will be modified to provide 94 acre-

feet of storage with a separate debris basin which has a debris capacity of 53 acre-feet. Three on-line detention basins are required along the Walnut Canyon Channel or its tributaries which would provide a total storage volume of 140 acre-feet. Gabbert Channel would be reconstructed from the Walnut Channel confluence upstream to the existing debris basin. Approximately 1,900 lineal feet of Walnut Channel would be reconstructed downstream of High Street from the confluence of Moorpark Drain No.1.

Storage Elements	**Conveyance Elements**
• *Improved Gabbert detention basin 94 acre-feet storage*	• *Gabbert Channel improvement to reaches 1,2,3 (total length = 3,855 feet)*
• *New Gabbert debris basin*	• *Walnut Channel improvements to reaches 2 and part of 3 (total length = 1,900 feet)*
• *3 offline and 1 offline detention basin (total storage 140 acre-feet) Basins 0,1,2,3*	• *300 cfs underground diversion channel adjacent to Shasta Avenue (length=3,035)*
	•*Relocated Channel outlet to Arroyo Simi for Walnut Channel*

Estimated R.O.M Costs: Total costs of the alternative is $12,868,000 of which construction capital costs are $11,674,000 and land acquisition is $1,194,00.

Property Acquisition: Required total amount of right-of-way is 36.7 acres, which includes 6.5 acres for channel relocation, 28 acres for detention basins, and 1.7 acres for diversion systems

9.5 Alternative System No. C

System Description: (Minimum R/W Requirement)

This alternative has the least requirement for land acquisition because of the because of the small storage volume and no channel outlet utilized. However, this does make this alternative the **most expensive construction costs** in order to convey the high discharges in the channel compared to the other alternatives and requiring the most extensive channel improvements. This alternative requires that Gabbert Channel be completely reconstructed because of the limited capacity. Approximately 1,900 lineal feet of Walnut Canyon Channel must be reconstructed downstream of High Street from the confluence of Moorpark Drain No.1. The 300 cfs diversion in Walnut Channel at Shasta Avenue would be incorporated and consists of a 14-foot wide underground box section 3,015 feet in length to the Arroyo Simi. The maximum flow diversion is required at Shasta Avenue along with an offline detention basin at this location with a storage volume of 140 acre-feet. In addition, the Gabbert debris basin will be modified to provide 94 acre-feet of storage with a separate debris basin which has a debris capacity of 53 acre-feet. Three on-line detention basins are required along the Walnut Canyon Channel or its tributaries which would provide a total storage volume of 140 acre-feet.

Storage Elements	Conveyance Elements
• *Improved Gabbert detention basin 94 acre-feet storage*	• *Gabbert Channel improvement to reaches 1,2,3 (total length = 3,855 feet)*
• *New Gabbert debris basin*	• *Walnut Channel improvements to reaches 2 and part of 3 (total length = 1,900 feet)*
• *3 offline and 1 offline detention basin (total storage 305 acre-feet) Basins 0,1,2,5*	• *300 cfs underground diversion channel adjacent to Shasta Avenue (length=3,035)*
	•*Relocated Channel outlet to Arroyo Simi for both Gabbert and Walnut Channel*

Estimated R.O.M Costs: Total costs of the alternative is $14,391,000 of which construction capital costs are $13,358,000 and land acquisition is $1,033,000

Property Acquisition: Required total amount of right-of-way is 29.7 acres, which includes 28 acres for detention basins and 1.7 acres for diversion systems

9.6 Alternative System No. D

System Description: (Maximum R/W requirement)

This system requires the maximum land acquisition because of the large offline detention basins which will be used and the channel relocation. This system replaces the use of the diversion system with a very large offline basin at the same diversion basin location which has a storage volume of 300 acre-feet. This basin is envisioned to be actually several interconnected basins in order to maximize the storage volume and satisfy the elevation differential requirements over the long distance. The maximum flow depth of the offline basin corresponds to the depth of the channel in order to provide a gravity outlet. In addition, the Gabbert debris basin will be modified to provide 94 acre-feet of storage with a separate debris basin which has a debris capacity of 53 acre-feet. Three on-line detention basins are required along the Walnut Canyon Channel or its tributaries which would provide a total storage volume of 140 acre-feet. Gabbert Channel would be reconstructed from the Walnut Channel confluence upstream to the existing debris basin. The other elements of the drainage system are similar to those described in other alternatives.

Storage Elements	Conveyance Elements
• *Improved Gabbert detention basin 94 acre-feet storage*	• *Gabbert Channel improvement to reaches 1,2,3 (total length = 3,855 feet)*
• *New Gabbert debris basin*	• *Walnut Channel improvements to reaches 2 and part of 3 (total length = 1,900 feet)*

• 3 offline and 1 offline detention basin (total storage 140 acre-feet) Basins 0,1,2,3	*•Relocated Channel outlet to Arroyo Simi for both Gabbert and Walnut Channel*

Estimated R.O.M Costs: Total costs of the alternative is $14,678,000 of which construction capital costs are $12,349,000 and land acquisition is $2,329,000

Property Acquisition: Required total amount of right-of-way is 81.5 acres, which includes 7.5 acres for channel relocation and 74 acres for detention basins.

9.7 Alternative System No. E

System Description: (Minimum Channel Construction Costs)

This alternative preserves the maximum amount of the existing channel and minimizes the size of the channel facilities which are reconstructed. This alternate relocates only Gabbert Channel to the new outlet for the Arroyo Simi. No diversion channel system is used in this alternate which requires the large offline detention basin with 300 acre-feet of storage in order to maximize the reuse for the downstream portions of Walnut Canyon Channel. The Gabbert Channel reach downstream of the existing Walnut confluence can be salvaged but the remainder of the channel must be reconstructed. In addition, the Gabbert debris basin will be modified to provide 94 acre-feet of storage with a separate debris basin which has a debris capacity of 53 acre-feet. Three on-line detention basins are required along the Walnut Canyon Channel or its tributaries which would provide a total storage volume of 140 acre-feet. Gabbert Channel would be reconstructed from the Walnut Channel confluence upstream to the existing debris basin.

Storage Elements	**Conveyance Elements**
• Improved Gabbert detention basin 94 acre-feet storage	*• Gabbert Channel improvement to reaches 1,2,3,4 (total length = 3,855 feet)*
• New Gabbert debris basin	*• Walnut Channel improvements to reaches 2 and part of 3 (total length = 1,900 feet)*
• 3 offline and 1 offline detention basin (total storage 305 acre-feet) Basins 0,1,2,5	*• Walnut Channel outlet relocated to Arroyo Simi*

Estimated R.O.M Costs: Total costs of the alternative is $13,116,000 of which construction capital costs are $10,815,000 and land acquisition is $2,300,000

Property Acquisition: Required total amount of right-of-way is 80.5 acres, which includes 6.5 acres for channel relocation and 28 acres for detention basins.

9.8 Alternative System No. F

System Description: (No Channel Diversions)

This system does not incorporate any diversions either through diversion structures or relocation of the channel outlet. All flow will be conveyed along the existing channel alignment to the current outlet into the Arroyo Simi. A large offline detention basin with 300 acre-feet was required in order to compensate for the lack of a diversion system and it would be located adjacent to Poindexter Avenue, within the proposed Smith Ranch. The large basin encumbers a considerable amount of developble area along the entire southern boundary for this parcel. The increased flowrate in the channel without the new outlet requires that the entire Gabbert Channel be completely reconstructed. In addition, the Gabbert debris basin will be modified to provide 94 acre-feet of storage with a separate debris basin which has a debris capacity of 53 acre-feet. Three on-line detention basins are required along the Walnut Canyon Channel or its tributaries which would provide a total storage volume of 140 acre-feet.

Storage Elements	**Conveyance Elements**
• *Improved Gabbert detention basin 94 acre-feet storage*	• *Gabbert Channel improvement to reaches 1,2,3,4 (total length = 7,165 feet)*
• *New Gabbert debris basin*	• *Walnut Channel improvements to reaches 2 and part of 3 (total length = 1,900 feet)*
• *3 offline and 1 offline detention basin (total storage 305 acre-feet) Basins 0,1,2,5*	

Estimated R.O.M Costs: Total costs of the alternative is $14,021,00 of which construction capital costs are $11,881,000 and land acquisition is $2,140,000

Property Acquisition: Required total amount of right-of-way is 74 acres and is only required for the detention basins.

9.9 Alternative System No. G

System Description: This alternative is identical to drainage system alternative "A", but the diversion system capacity is reduced to 100 cfs and the offline detention basin at the diversion is reduced to 220 acre-feet.

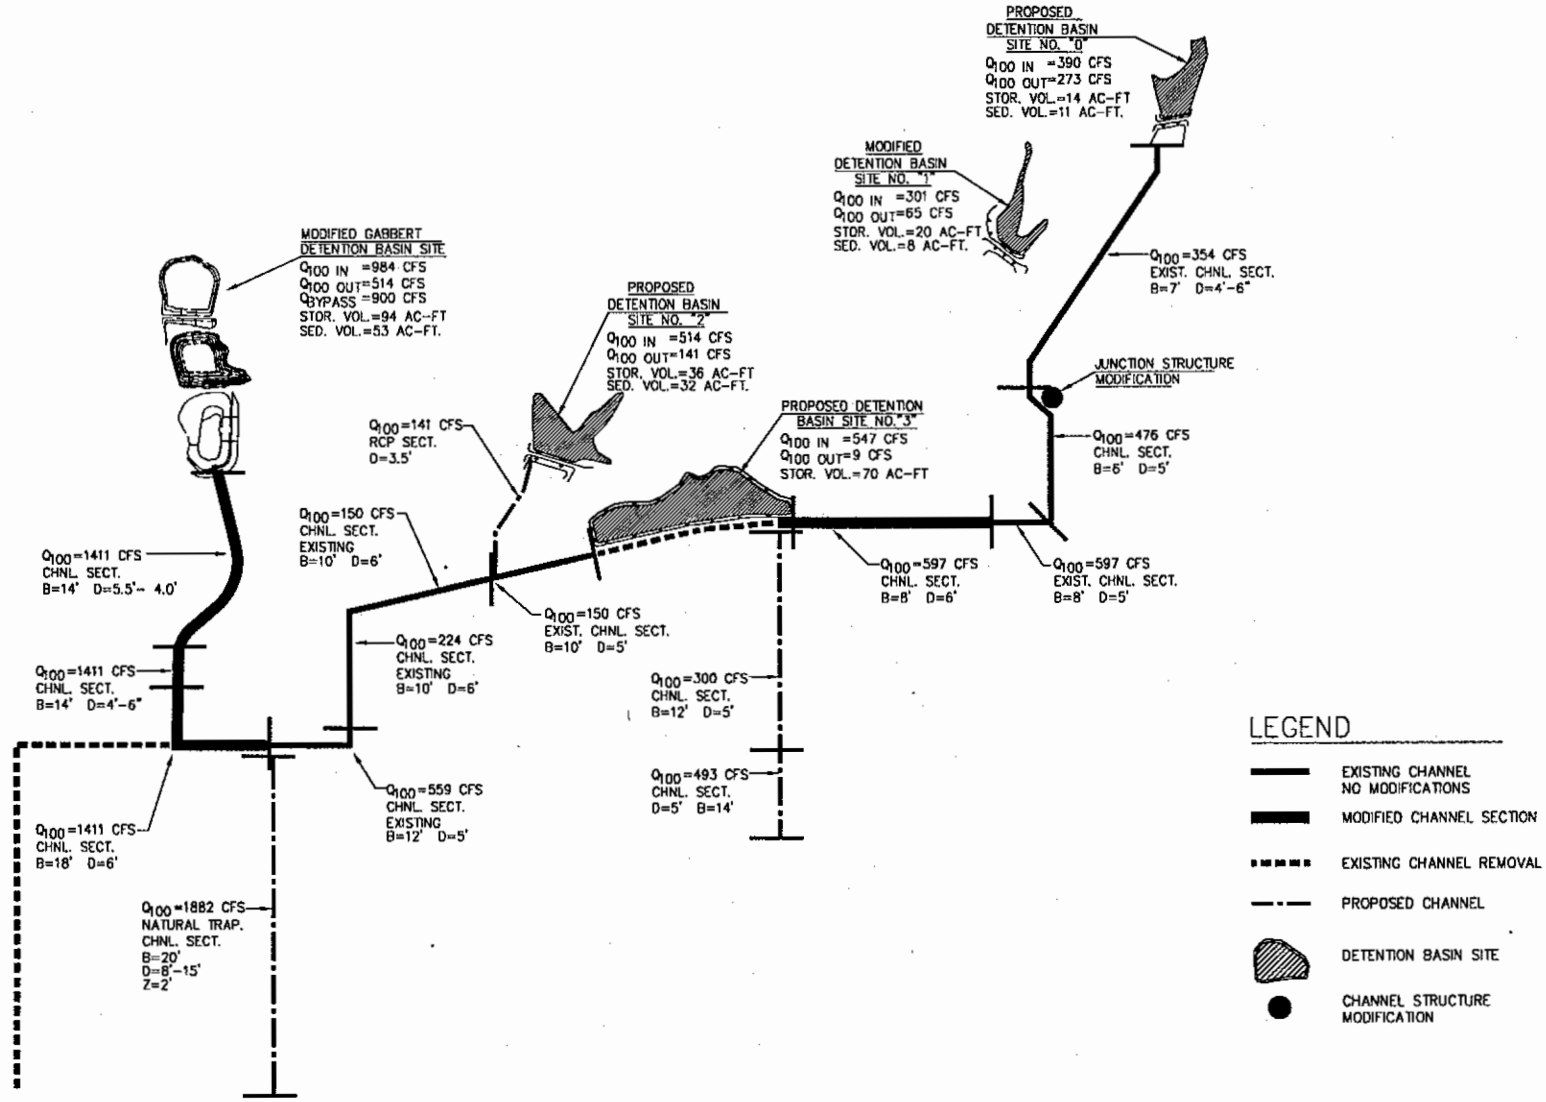
Storage Elements	**Conveyance Elements**
• *Improved Gabbert detention basin 94 acre-feet storage*	• *Gabbert Channel improvement to reaches 1,2,3 (total length = 3,855 feet)*
• *New Gabbert debris basin*	• *Walnut Channel improvements to reaches 2 and part of 3 (total length = 1,900 feet)*

• 3 offline and 1 offline detention basin (total storage 140 acre-feet) Basins 0,1,2,3	*• 100 cfs underground diversion channel adjacent to Shasta Avenue (length=3,035)* *•Relocated Channel outlet to Arroyo Simi for both Gabbert and Walnut Channel*

Estimated R.O.M Costs: Total costs of the alternative is $14,532,000 of which construction capital costs are $12,556,000 and land acquisition is $1,976,000

Property Acquisition: Required total amount of right-of-way is 54.4 acres, which includes 7.5 acres for channel relocation, 46 acres for detention basins, and 0.9 acres for diversion systems

9.10 Alternative System No. H



System Description: (Least Construction Capital Costs)

This alternative represents the least construction costs excluding land acquisition for right-of-way. The system alternative is similar to Alternative "B" except that the off-line diversion detention basin volume is 220 acre-feet and the diversion system flowrate is reduced to 100 cfs.

Storage Elements	Conveyance Elements
• Improved Gabbert detention basin 94 acre-feet storage	*• Gabbert Channel improvement to reaches 1,2,3 (total length = 3,855 feet)*
• New Gabbert debris basin w/ 53 acre-feet of debris storage	*• Walnut Channel improvements to reaches 2 and part of 3 (total length = 1,900 feet)*
• 3 offline and 1 offline detention basin (total storage 210 acre-feet) Basins 0,1,2,4	*• 100 cfs underground diversion channel adjacent to Shasta Avenue (length=3,035)* *•Relocated Channel outlet to Arroyo Simi for Walnut Channel*

Estimated R.O.M Costs: Total costs of the alternative is $12,971,000 of which construction capital costs are $11,023,000 and land acquisition is $1,948,000

Property Acquisition: Required total amount of right-of-way is 53.4 acres, which includes 6.5 acres for channel relocation, 46 acres for detention basins, and 0.9 acres for diversion systems

Section 10—Estimated Construction Costs

10.1 Standard Construction Elements

The various drainage facilities are composed of standard features that are common elements of thee facilities and were included in developing the construction costs estimates. Standard features for the channel reconstruction include the concrete rectangular channel section, channel fencing, and adjacent access roads. The channel reconstruction always required removal and disposal of the existing concrete channel lining. The detention basins include perimeter roads, access ramps, slope and erosion treatment, spillway, outlet tower, and energy dissipators. In addition, if the detention basin volume was based upon an embankment, then this included clearing and grubbing, foundation excavation and preparation, and embankment construction.

10.2 Unit Construction Costs

Construction cost estimates were generated for each of the drainage system alternatives in order to provide an economic comparision of the systems. Standard unit prices for flood control facilities were applied in the preparation construction cost estimates based upon previous regional drainage projects and similar estimates at this level of detail. The costs presented in this study are based upon 1997 dollars and reflect the total capital costs to construct the facilities based upon the current planning level of detail associated with the concept plan. A 20% contingency factor has been applied to provide an allowance for potentially intangible or unknown construction items that cannot be determined at this time. An additional 10% factor was applied for mobilization, engineering, and administration. Consideration was given to the existence of major utilities (see *Section 7.3 Utilities*) in the layout and alignment of the proposed facilities, however, not costs of relocation or special relocation costs have been applied since it would depend on specific location of the facilities. The standard unit costs which were used in the estimate are summarized in the following table

Table No. 10.1 - Construction Unit Cost Database

Item Description	Unit	Price
Excavation - Basin Embankment Foundation	c.y.	$3
Embankment Compacted Fill	c.y.	$6
Channel Excavation	c.y.	$3
Reinforcing Steel	lb.	$0.50
Structural Concrete	c.y.	$450
Access Roadway	s.y.	$5
Rock Rip-Rap	c.y.	$35

Table No. 10.1 - Construction Unit Cost Database		
Item Description	Unit	Price
Concrete Removal	c.y.	$125
Outlet Riser	l.f.	$200
Channel Excavation	c.y.	$3
Clear and Grub	s.f.	$1
Reinforced Concrete Pipe	ft -inch diameter	$3

Table No. 10.2 - Summary of Estimated R/W Costs (Per VCFCD)	
Location Description	Price
Diversion System	$150,000/acre
Upper Walnut Basin	$20,000/acre
Diversion Channel	$25,000/acre
Gabbert Basin Expansion	$20,000/acre

10.3 Preliminary Estimate of Construction Quantities and Costs

Generally four primary types of costs are associated with the implementation of the regional drainage system. These costs include (1) right-of-way or land aquisition, (2) construction or capital costs, (3) engineering and administrative costs, and (4) contingencies. If public financing is used such as bonds or assessment district then these additional costs should be applied. The quantities associated with for the various system elements such as channel reconstruction or detention basins are based upon preliminary design and layout of these facilities. Exhibits illustrating the conceptual design of the facilities have been included and were the basis for preparing the quantity estimates.

A detailed breakdown of the costs for specific design elements which include the detention basin alternatives, Gabbert Detention Basin, outlet channel relocation, and diversion systems are presented in the following tables. A more detailed breakdown of the cost estimates for the individual system alternatives is provided in the *Technical Appendix*.

10.3.1 Comparison of Alternative System Capital Costs

A summary of the major cost elements is provided in *Table 10.3 - Summary of Alternative Systems Construction Costs*. The table provides useful comparisons between the various components of the

drainage systems. A total is also provided with and without right-of-way costs. The summary of the total indicates that Alternative "B" has the lowest overall total costs but Alternative "E" has the lowest capital costs.

Table No. 10.3 - Summary of Alternative Systems Construction Costs
(Cost in thousand of dollars)

Alt	Detention Basins			Divert Chann	Walnut Chann	Gabbert Chann	Outlet Chann	Capital Cost Subtotal	R/W	**Total Costs**
	0,1,2	3,4,5	Gabbert (Alt. B)							
A	$1,369	$618	$3,276	$2,300	$132	$2,179	$558	**$13,255**	$1,221	**$14,476**
*B	$1,369	$618	$3,276	$2,300	$132	$1,079	$350	**$11,674**	$1,194	**$12,868**
C	$1,369	$618	$3,276	$2,300	$132	$2,752	----------	**$13,358**	$1,033	**$14,391**
D	$1,369	$2,259	$3,276	--------	$132	$2,179	$558	**$12,349**	$2,329	**$14,678**
E	$1,369	$2,259	$3,276	--------	$132	$1,079	$350	**$10,815**	$2,300	**$13,116**
F	$1,369	$2,259	$3,276	$751	$132	$2,752	---------	**$11,881**	$2,140	**$14,021**

Section 11—Financing

11.1 Financing Methods Available

The financing of public facilities by local agencies have a variety of financing mechanisms available to fund the infrastructure costs. Many methods cannot be used by private organizations or individuals, but offer great flexibility to public agencies. The two major categories of public work funding include **pay-as-you go** financing and **debt** financing (pay-as-you-use). Pay-as-you-go financing requires governments to pay for infrastructure costs directly from current revenues. These programs for pay-as-you-go include: creation of special assessment district, levying special property taxes, creating a special district, impact fees from new developments, grants or aid from the State and Federal government. Debt financing requires local governments to tap credit markets and raise funds through the issuance of dept obligations. The use of debt financing involves various type of financing tools which include: short term notes, unlimited tax general obligation bonds, limited tax general obligation bonds, and revenue bonds. Another type of financing is **pay-as-you-need** which is defined as a form of pay-as-you-go, which involves impact fees or assessments to support loan or bond payments. In this form of financing, payments collected vary depending upon the benefit received. The benefit in this case is not necessarily one of need, but rather one of forecasted or predicted need based upon potential flood damage. Assessment must be apportioned upon any basis which will reasonably measure these benefits. The advantage of this method is that only users benefitting from the improvements need to pay for them. The following table outlines some of the most common California laws used as authority for levying special assessments which are available and their applicability according to the elements in the implementation of the recommended project. The costs for long term maintenance and monitoring may be a consideration in the selection of the financing mechanism, since many of the procedures do not include maintenance, but only consider capital construction.

Table No. 11.1 - Project Related Allowable Uses of Assessment Laws

Description of Act	Drainage	Flood Control
Improvement Act of 1911	Capital	Capital
Municipal Improvement Act of 1913	Capital	Capital
Benefit Assessment Act of 1982	Capital & Maintenance	Capital & Maintenance
Mello-Roos Community Facilities Act of 1982	Capital & Maintenance	Capital
Improvement Bond Act of 1915	Capital	Capital
Map Act Areas of Benefit	Capital	------

** The table reflects the associated allowable uses based upon the specifics of each Act. The table indicates uses for either *Capital Improvements* or *Capital Improvements and the Operation and Maintenance* of the facility.

Stormwater Utility Fees is a utility approach to financing public drainage facilities. Stormwater utilities are public utilities that are financed by dedicated user charges. User charges for an individual property are based on the contribution of the property to the total volume of stormwater that must be managed. A general approach to developing a utility rate structure involves estimation of a charge per "equivalent runoff unit" (ERU) and then estimating the charge per parcel. In some areas the charge to the parcel is increased if located in a floodplain and the charge can be reduced if on-site detention is provided as part of the development.

Exactions is the practice of requiring developers to provide certain physical facilities is one of the most important and well established means of financing infrastructure. In California subdivision exactions are worth over five times as much as all development-related fees and assessments, and now account for nearly half of the annual public capital formation in the state. Provisions with the State of California Subdivision Map Act include certain sections which provide for the dedication of land related to drainage systems. Section 66478.1 ensures that local agencies must require public easement along banks of rivers and streams and Section 66479 allows local ordinances to require that property be reserved for certain public facilities. There are certain requirements which must be satisfied by the public agencies in order to impose land reservations by local ordinance and the primary issues include: (1) the requirement of land reservation be based upon adopted specific plan or general plan, (2) the amount of land reserved will not make the development of the remaining land economically unfeasible.

Drainage Fee Assessment Programs are possible through state legislation which enables the implementation of a drainage fee program by a public agency. Section 66483, Division 2 of Title 7 of the State of California Government Code (Subdivision Map Act), as amended January 1, 1994, allows the creation of ordinances which require payment of fees for the purposes of defraying costs of constructing planned drainage facilities. Some of the specific requirements associated with the creation of a drainage fee program include the following:

- An ordinance must be adopted to require the payment of a drainage fee as a condition of approval of final subdivision maps.
- The ordinance must particularly refer to a drainage plan adopted for specific areas.
- Prepare a drainage plan which includes (1) a map of the drainage area or areas showing the boundaries and locations, type and size of planned drainage facilities, and (2)an estimate of construction costs of the drainage facilities for each area.
- The government entity must adopt the drainage plan with a finding by resolution that the development of property within the planned drainage areas will require construction of the described drainage facilities, and a finding that the fees proposed are fairly apportioned on the basis of wither the benefits of, or the need for, drainage facilities created by proposed development
- A "Planned Drainage Facilities Fund" is created for the various drainage area and funds are maintained separately. The basic source of funds are drainage fees collected on a per-acre basis.

VCFCD Land Development Fee is a program in which all cities within the Ventura County Flood Control District, through their Building and Safety Departments, are required to collect a land development fee for flood control when approving a new building permit and transmit the fee to the District for deposit and administration. This fee was initially established in 1967 at $400 per acres and is updated annually based on the Engineering New Record Construction Cost Index for the Los Angeles Area. The VCFCD policy indicates that these monies can be utilized three ways, preferably to finance construction of VCFCD *red line* facilities, which include: (1) financing of storm drains within a city, (2) finance construction of storm drain outside the city that will be of benefit to the city, and (3) use all or part of the "local share" money required to finance a federally funded storm drain.

Two popular financing mechanisms which have been primarily utilized to development special assessment districts based upon the benefit from public improvements are the Mello-Roos Community Facilities Act of 1982 and the Municipal Improvement Act of 1913/1915. The Mello-Roos Community Facilities Act of 1982 was enacted as an alternative method for local governments to provide facilities to serve their communities. It provides an alternative to making dedication and paying in-lieu fees as the method of satisfying requirements to provide certain public capital facilities and services. While not a true assessment, the "special tax" upon land offered by this Act provides a financing tool that is treated in part like an assessment.

The **Mello-Roos Act** allows the formation of "community facilities districts" in specified areas within their jurisdictions. A community facilities district is a special financing entity through which a local government is empowered to levy special taxes and issue bonds authorized by a **two-thirds vote** of the qualified elector of such district. In areas with less than twelve registered voters, the qualified electors are the landowners. Prior to initiation of proceeding to form a community facilities district, the developer may be required to enter into an agreement with the Issuer which will set out term under which the legislative body of the Issuer will form the community facilities district. Usually the developer will be required to advance all costs incurred by the public agency to form the community facilities district. The costs may include estimated engineering, planning, inspection, and administrative costs and expenses. These costs will be repaid to the developer from bond proceeds. Generally, with the cooperation of all parties involved, the proceedings to form a community facilities district may be completed and bond proceeds received in **five to six months** after the proceeding are initiated.

The **Municipal Improvement Act of 1913/1915**, currently the most frequently used Assessment Act in California, allowed local agencies to impose assessment on benefitted property to finance the construction of various public improvements, the acquisition of real property rights, and the maintenance and repair of improvements constructed with this Act.

Another funding mechanism which specifically focuses on flood control projects is the **Benefit Assessment Act of 1982**. This Act authorizes local agencies to impose assessments on benefitted property to finance the operation and maintenance of drainage, flood control services, and the

installation and improvement of drainage and flood control facilities. In the case of an assessment for flood control services, the Act provides that the benefit may be determined on the basis of the proportionate storm water runoff from each parcel.

Special assessment districts are a common funding program using a convenient designation for properties that receive a special benefit and are subject to the special assessment. The special assessment is designed to recover the costs of an improvement that directly benefits an individual property and these assessment are based on formulas that relate the charge against a parcel to the benefits. The capital is generated for the construction of the improvements through the sale of general obligation bonds.

Tax Increment Financing (TIF) uses increases in property values attributed to a capital project to recover the project's costs. Under this approach, a special tax increment district is created by the adoption of a plan for development of the infrastructure of a particular geographic area. Although the use of tax increment financing in rural area is not uncommon, this method is usually used to finance redevelopment in deteriorated areas characterized by declining property values.

A more detailed description of the process associated with the 1913/1915 Act have been provided, however, most of the other special assessment acts previously indicated follow similar procedures. Logic diagrams have been developed for the Special Assessment District and the Mello-Roos Community Facilities District proceedings which graphically illustrate the process for the major elements associated with each funding mechanism (See Exhibit 58 - Special Assessment District Flow Chart, and Exhibit 59 - Mello-Roos CFD Flow Chart). The general process for the 1915 Act when used in conjunction with the 1913 Act are generally as follows:

- The public agency adopts the Resolution to order the improvement, briefly describing the proposed improvement, specify the exterior boundaries of the assessment district, providing for issuance of improvement bonds, declaring its intention to levy assessments to maintain, repair or improve the facility.

- The agency directs preparation of an *Engineers Report* which contains: plans and specifications of the proposed improvements, description of lands and easements to be acquired, an estimate of the cost of the improvement and costs of lands and easements. The report is filed with the public agency. A preliminary approval is adopted and a public hearing is set for not less than thirty days after passage of the resolution. Bids for the construction of the improvements and sale of the bonds can be called for before the hearing. The notice inviting construction bids must be first published at least fourteen day days before the date set for receipt of the bids.

- Prior to public hearing on the assessment district the public agency shall adopt a resolution describing the boundaries of the district. Notice of adoption of the resolution and of the public hearing are published and posted at least twenty days prior to date set for

the public hearing.

- After the public agency passes on the report and any interested person may object to the proposed improvement by filing a written protest before the hearing. If a majority of the owners protest the formation of the district or the levy of the assessment at or before the hearing, then no further proceedings may proceed for a period of one year from the date of the hearing.

- The assessments cannot be increased unless consent from the owner is obtained or an additional noticed hearing is conducted.

- After confirmation by the public agency, the clerk files the final diagram and notice of assessment the county recorder, and the assessment and diagram with the appropriate local agency official

A 1915 Act assessment district format was assumed for the purpose of developing an evaluation of the estimated assessment district bonded costs for the recommended drainage system construction costs, excluding land acquisition costs. This differs from an alternative of using a 1911 Act district which would have less administrative costs, but also less flexibility. Generally, the 1915 Act district is the more common format utilized to finance public improvements.

Table No. 11.2 - Estimated Flood Control Assessment District Bonded Costs

Cost Item	Estimated Cost	Description
Estimated Construction Costs*	**$8,979,000**	Construction costs for flood control improvements
Contingency & Engineering	$2,693,000	30% of construction costs
Cost of Issuance	$179,000	2% costs for underwriter & administration
Formation Costs	$90,000	1% cost for bond counsel
Assessment District Engineering	$45,000	0.5% costs for assessment district engineer
Capitalized Interest (18 months at 6%)	$1,067,000	Finance costs or carry during construction period
Bond Reserve	$591,000	Ranges from 5-10% determined by issuing agency and depends on risk.
Total Amount Assessed	**$13,644,000**	

** Assumes the recommended project drainage system alternative and includes only capital construction costs, excludes R/W or land acquisition. The estimated construction costs reflect **Drainage System Alt. "B"**

An estimate of the bond issuance costs is presented in Table No. 11.1 and these costs generally include **bond counsel, underwriter discount, special tax consultant, debt service reserve fund, capitalized interest (1-2 years), official statement and bond printing, trustee/paying agent, letter of credit or insurance premium, and other miscellaneous costs.**

The determination of the funding for the maintenance of these facilities is important during the initial development of the special assessment district since many procedures do not allow maintenance costs to be included. An example is general obligation bonds are generally issued by public entities only for the purpose of acquisition and construction and may not be used to finance ongoing maintenance and operation costs. Additional limitations may be provided by the statutes of the local agencies and these should be investigated during the initial planning process.

11.1.1 Financing Issues and Policy Considerations

Several issues must be considered when evaluating public financing and these include (1) allocation of costs by benefit, (2) economic feasibility, (3) County policies, and (4) specific types of charges and implementation measures. Assessment fees can either be distributed based upon actual benefits received from implementation of the drainage improvement or based upon considering the negative impacts which result from development of property. The most obvious benefit received from construction of drainage improvements is the reduction or elimination of potential flood damage which could occur to property. The problem with assessing specific benefits is that of determining the value of an individual property is difficult and subjective. The negative impact basis is based on the concept that charges should be based on the contribution to the problem of flooding and proportional cost of a system designed to alleviate that problem. This is a superior approach both on the basis of reasonableness as well as simplicity in determining assessment.

An important aspect to consider in setting fees is legal constraints and statutory restriction on impact fees and assessments. Statutes (Section 66483 of the California State Government Code) governing the assessment of fees and charges to cover both operation and improvement or construction of new facilities state that "...fees should be reasonable, fair and equitable..." or "...fees should be fairly apportioned...on the basis of benefits conferred on the property..." Other restrictions limit charges on individual properties to a prorata basis according to the acreage, and limit charges to cover only the cost of facilities which are not in existence at the adoption of any master plan for the area.

Another key element is the economic feasibility of development-related financing based upon the relationships of the financial burden to the underlying land values. If the burden is large, relative to land value for a particular use, the that use may be rendered uneconomic.

11.1.2 Allocation of Financial Burden to Land Uses

Establishes a fee structure within the watershed requires that the infrastructure costs outlined for the proposed drainage system be apportioned by some fair and reasonable method. In addition there

must be a **nexus** to establish an assessment which provides a relationship between the land and the proposed infrastructure improvements. A Dwelling Unit Equivalent (DUE) can be utilized to determine the relative responsibility of an acre of land in each landuse category compared to an acre of land in the single family residential category. Generally the DUE procedure are based on a "causes or uses" test : the cost of the drainage facilities are sized to accommodate the peak runoff were allocated in proportion to the extent to which each land use category contributes to the peak runoff amount. Application of a DUE cost schedule provides the basis for a valid development impact fee.

11.2 Selection of the Financing Technique

The decision regarding the financing method depends on several considerations which include: (1) cash flow, (2) landowner preferences, (3) adopted County policy. The time at which a particular drainage improvement must be implemented is compared to the amount of development impact fees that would have been collected up to that time. If the total collections are adequate or if an imbalance can be corrected over relatively few years, then impact fees are useable. It has been increasingly common in California for a comprehensive financing plan to include a mix of development impact fees and bonded debt. Bonded debt, is authorized to pay for those major improvements that are required immediately to implement the master plan of drainage. Development impact fees are used to pay for improvements that can be staged over the planning period.

Impact fees would appear to provide the least cost, most effective and simplest form of financing. Impact fees may be charges at the time the property is subdivided, at the time building permits are issued or a combination of both. If these drainage facilities are to be implemented prior to the development occurring in the upper watershed then some form of debt financing must be considered and drainage fees can be used to repay the debt. Exactions in the form of land reservations for stormwater storage detention basins or additional channel right-of-way will fulfill the land requirements in order to implement the drainage systems.

Section 12—Recommended Drainage System

12.1 Recommended System Components

Based upon the costs and feasibility of implementation, drainage system **Alternative "B"** is the least-cost alternative and is the recommended alternative. The R.O.M. costs for this system include $11,674,00 in capital construction costs and $1,194,000 for land acquisition. The total right-of-way required for this alternative is approximately 36.7 acres. The different project alternatives were developed with the goal of achieving a balance achieving the flood protection goal and providing the most economic solution. The primary system components associated Alternative "B" include: (1) reconstruction of Gabbert Debris Basin to provide detention storage through modification of the existing basin and construction of another storage reservoir upstream as well as a separate debris basin at the headworks which will provide 94 acre-feet of flood control storage and 53 acre-feet of debris storage, (2) a 14 acre-foot detention basin at the headworks to the Walnut Canyon Channel, (3) a 25 acre-foot detention basin at the location of an existing reservoir site in a tributary canyon at Casey Road, (4) a 36 acre-foot detention basin located in the tributary canyon adjacent to Gabbert Road, (5) constructing a 300-cfs diversion system from Walnut Canyon Channel along Shasta Avenue to the Arroyo Simi, (6) relocation of the channel outlet for Walnut Canyon Channel along 3,850 feet on earthen trapezoidal channel from Los Angeles Avenue to the Arroyo Simi, (7) reconstruction of the Gabbert Channel from the debris basin to Los Angeles Avenue, and (8) construction of an 70 acre-foot off-line detention basin at the channel diversion location on Walnut Canyon Channel. There are the potential for additional alternatives to be evaluated through refinement of the proposed system. The storage capacity within the Gabbert Canyon detention basin can be further optimized if a portion of the storage is utilized in the proposed upstream debris basin. Further study of the grading design and relative elevations of the interconnected ponds will assist in refining the hydraulic operation for the basin. However, the current analysis provides a conservative evaluation of the system while maximizing the flood control benefits.

Recommended Detention Requirements for Future Development Projects

General recommendations and guidelines are provided for future private development projects to ensure that hydrologic impacts are mitigated. The objective of this program attempts to maintain the existing hydrology on a watershed basis similar to current conditions studied as part of this investigation. A drainage ordinance should be implemented on a watershed basis which outlines the specific requirements that can be used in planning the development projects. General guidelines include the following:

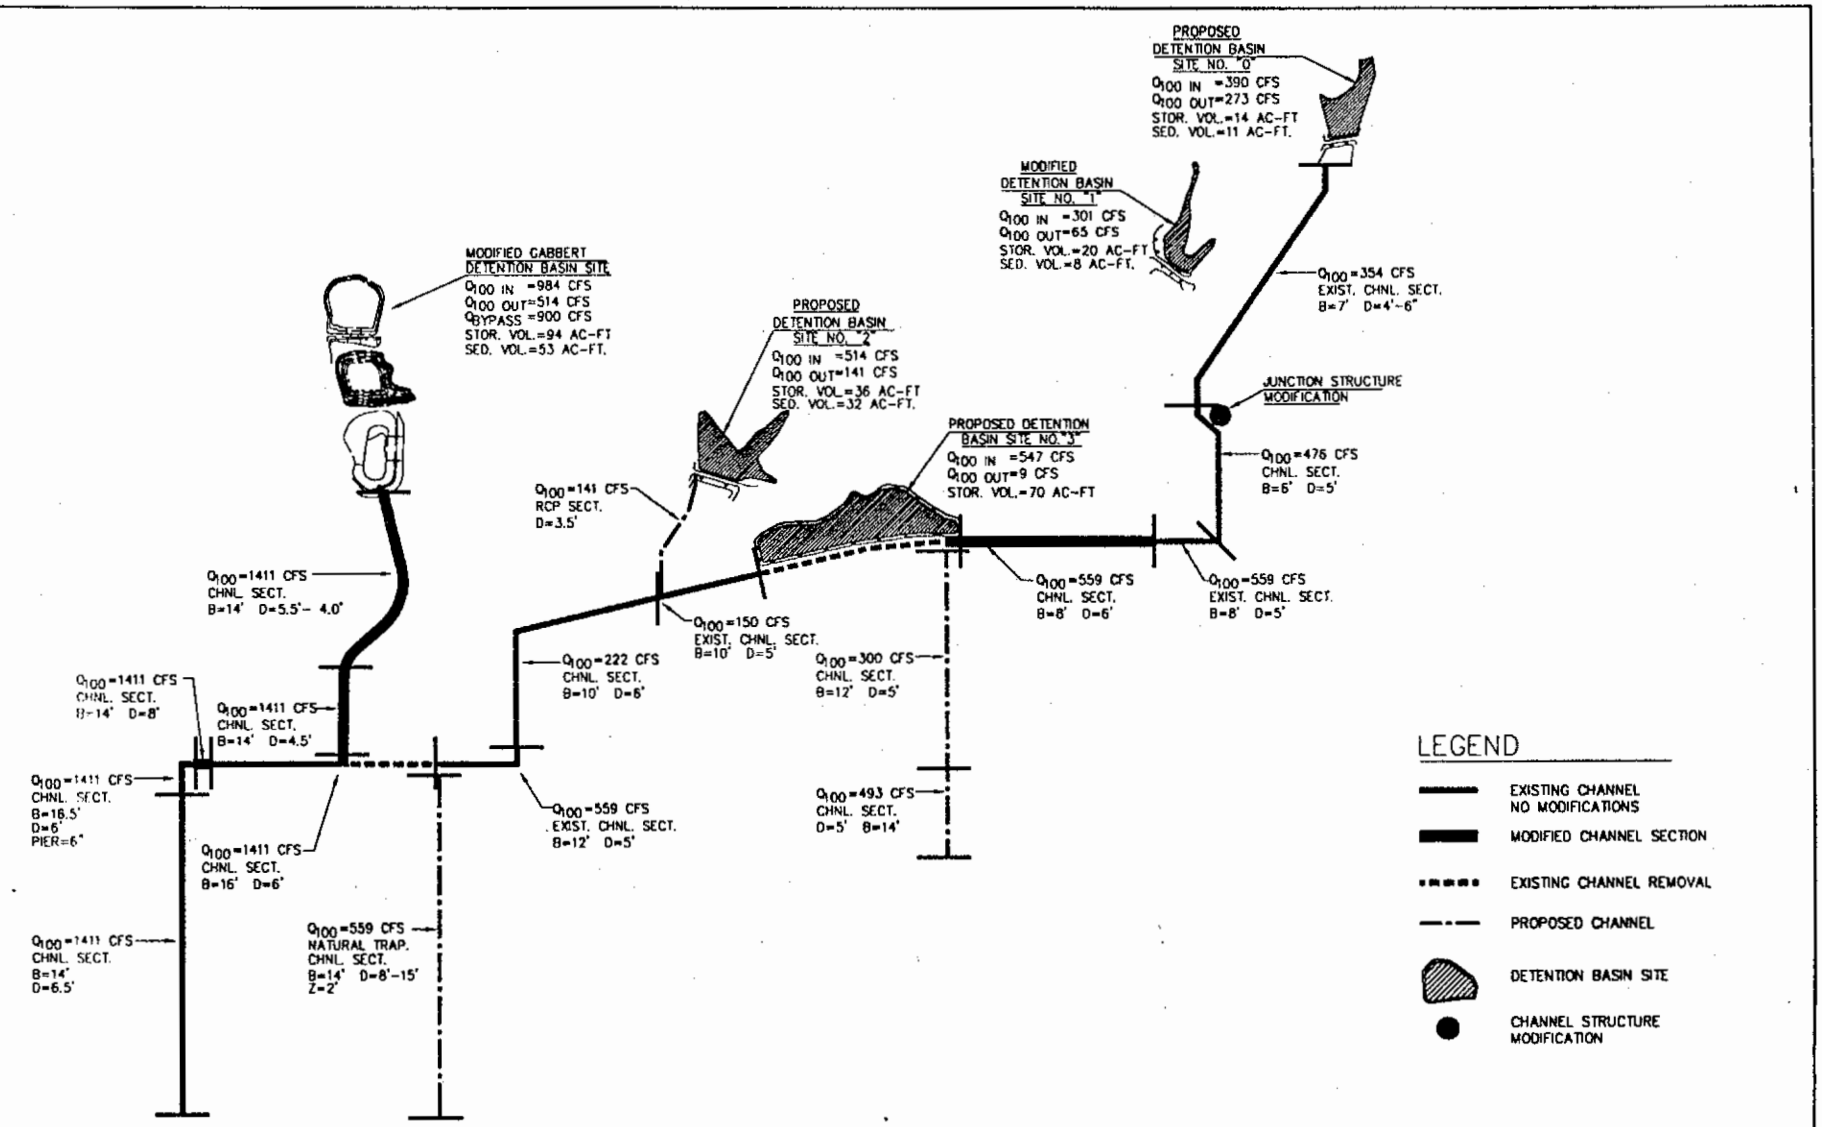
1. The peak outflow from one or more detention basins within a development project area under fully developed conditions should not exceed 90 percent of the peak flow under the existing pre-development conditions for **all storm frequencies up to and including the 100-year frequency** and a single storm duration of up to 24-hours.

2. Follow the minimum requirements outlined by VCFCD for detention basin design.

3. Provide an ungated outlet large enough to permit the complete draining of each basin within 24 hours following a storm.

4. Multi-use detention basins are acceptable and encouraged, including meeting the stormwater quality requirements for the project.

5. The regional effect of the local development project detention basin on the watershed must be evaluated to ensure that it does not have a negative effect on downstream flowrates in the main channel. The potential for increasing the peak flowrate at other downstream locations within the watershed must be avoided in the design of the basin.



12.1.1 Operation and Maintenance

Implementation of the recommended watershed drainage system improvements will generally result in higher annual maintenance costs primarily associated with the addition of the detention basins. The basins will require the periodic removal of sediment trapped to maintain the require minimum flood control storage volume. Long term development within the upper portions of the watershed will result in reducing the sediment production and in turn lowering some of the maintenance costs. The relocated outlet for Walnut Canyon will require maintenance since the proposed section is an earthen trapezoidal section with rock rip-rap side slopes. The total overall amount of channel does not increase from the length that VCFCD currently maintains, however, detention/debris basins are a significant feature requiring additional maintenance. Additional typical maintenance requirements associated with detention basins include: (1) periodic inspection, (2) weed removal, (3) debris /sediment removal, (4) rodent control, (5) vector control, (6) outlet structure and spillway inspection or repair for cracking, movement, seepage, and piping, and (7) inspection or repair of embankment and slopes for seepage, piping, and instability.

There are a variety of elements which will be incorporated into the flood improvements to facilitate maintaining and provide access to the drainage facilities. Many of these items are standard features for flood control facilities.

Top-of-Bank Maintenance Roads: Maintenance roads would follow the standards outlined by VCFCD for their facilities. The roads would be either six inches of CMB or 3 inches of asphalt over 6 inches of CMB.

Maintenance Road Turnout: The VCFCD maintenance staff has design requirements regarding turnouts at specified interval of long sections of channel maintenance roads. These turnout are generally double wide maintenance road locations which allow passing for vehicles or temporary parking.

ALTERNATIVE NO. B SCHEMATIC MAP

EXHIBIT

Vehicle Turnarounds: Areas to allow maintenance vehicles to turn-around at locations where the maintenance or road dead-ends without access to a major thoroughfare. The turn-around areas would generally consist of an unencumbered 50 foot square area.

Basin Access Ramps and Perimeter Roads: Direct access for maintenance vehicles to the detention or debris basin locations and the ability for heavy equipment to clean out the basin floor, also accessing the basin outlet works.

12.2 Summary

The hydraulic analysis of the existing Walnut and Gabbert Canyon Channel systems has confirmed that in its present condition that it does not meet the desired level of flood protection and there are hydraulic deficiencies which would cause flooding. Further development of this watershed without restrictions to limit the hydrologic impacts will worsen the condition. In order to alleviate the existing flood hazard potential it is recommended that the drainage system be improved to the extent necessary to provide the desired flood protection. The recommended improvement program outlined in this regional drainage system masterplan have been formulated and evaluated on a watershed basis, but it must be implemented on a local basis.

Executive Summary

The existing Gabbert Canyon Channel and Walnut Canyon Channel, located in the City of Moorpark (see *Regional Vicinity Map*), consist primarily of improved concrete channels which were originally constructed by the Soil Conservation Service (SCS) between 1959 and 1962. These facilities collect and convey storm runoff to the Arroyo Simi from a total tributary watershed of 6.91 square miles. Comparison of the existing hydraulic capacities for the flood control channel sections to the estimated runoff quantities indicates that the channels cannot provide the desired level of flood protection. The limited hydraulic conveyance capacity of the existing channel system results in a flood protection deficiency and is documented on the current Flood Insurance Rate Map (FIRM) for the City of Moorpark. The existing hydraulic capacities can only provide conveyance which correspond to equivalent return periods as low as 5-years, depending upon the location in the channel.

Pacific Advanced Civil Engineering, Inc. (PACE) has contracted with Triliad Development Incorporated to update the Ventura County Water Protection District (VCWPD) the ***Gabbert and Walnut Canyon Channels Flood Control Deficiency Study*** prepared in 1997; herein after referred to as "the original study." The recommended alternative, Alternative-B, presented in the original study provided a 70-acre/ft Detention Basin No. 3 with a 300-cfs diversion to the Arroyo Simi occurring at Shasta Avenue. This plan was adopted by VCWPD as the regional masterplan for Walnut and Gabbert Canyon watersheds. This current study updates the original study to incorporate the improvements proposed in the flood control study prepared for Triliad Development Incorporated, titled ***Moorpark West Corporate Center Flood Protection Project – Walnut Canyon Regional Detention Basin***; dated March, 2003, and prepared by RBF Consulting. The study prepared by RBF Consulting was conducted to provide preliminary design of the regional flood control improvements proposed in the original study that would be implemented in order to eliminate or decrease the flood hazard at the Moorpark West Corporate Center project site. The proposed improvements followed the adopted regional plan but also introduced some variations from the original basin configuration proposed for Detention Basin No. 3. This current study will update the adopted Regional Masterplan to include the basin configuration proposed in the 2003 RBF study with an additional modification proposed by VCWPD in a letter dated October 6, 2003. That additional modification is that the Shasta Avenue diversion to the Arroyo Simi is not feasible and will not be implemented. In its place, there will be a 100-cfs, in-channel detention basin bypass. This bypass provision results in an efficient use of the proposed detention basin storage area by allowing the base of the inflow hydrograph which contains the majority of the storm runoff volume to bypass the basin. So the detention volume provided by the basin is preserved to attenuate the peak of the storm hydrograph. This watershed study focused exclusively on the design and analysis of Detention Basin No.3 and its affects on the downstream watershed hydrology and channel hydraulics. The proposed detention basin site is bounded along the east by the Walnut Canyon High School property, the proposed Casey Road alignment along the west, the proposed High Street extension along the south, and steep hillsides long the north. The vicinity map in the enclosed exhibit map pocket, indicates the proposed detention basin site and adjacent properties (see Exhibit-1).

The primary objective of this study is to develop and evaluate modifications recommended by VCPWA to the previously selected alternative flood control plan, Alternative-B. This study

evaluates the drainage improvements and stormwater management measures that provide: (1) the necessary level of flood protection, (2) compatibility with existing and future landuse, (3) provide the maximum public benefit for least costs, (4) minimize impact to existing facilities, (5) eliminate hydraulic deficiencies, and (6) identify minimum drainage requirements for future development within the watershed. The intent of this document is to develop a conceptual design for the revision of the previously selected recommended system of comprehensive stormwater management measures which will provide the watershed planning framework to allow implementation of the regional flood control improvements and continued development within the watershed.

Various combinations of individual storage and conveyance oriented flood control elements were integrated into comprehensive system which would provide the required level of flood protection. The conveyance system improvements included: (1) increasing the hydraulic capacity of the existing channel section through either reconstruction to enlarge the section or extending wall heights, (2) construction of a channel diversion systems to split a portion of the flow, (3) removal of hydraulic restrictions, and (4) channel outlet relocation and reconstruction. The conveyance oriented improvements primarily involved modifications to the existing channel sections in order to maximize the overall drainage system capacity with minimum acquisition of additional right-of-way. The flood control storage alternatives included both on-line and off-line gravity operated stormwater detention basins. The detention basins also incorporated requirements for debris storage. Detention basin configurations and locations were developed to maximize available storage volume while minimizing impact to property. Another primary consideration which limited the size of the flood control storage facilities was to ensure that the detention were not within the jurisdiction of the California Division of Safety of Dams (DSOD).

The proposed correction of the flood control deficiency must be evaluated on a watershed basis through the application of a systematic approach since the various drainage elements have a combined impact on the channel. The feasibility evaluation resulted in screening the available channel "system" alternatives to a maximum of eight for detailed consideration, from a total of ninety-eight which were developed in the plan formulation. The objective was to optimize the effectiveness of the system through incorporating the existing facilities into the recommended program to the maximum extent possible. The primary components associated with each of the eight channel "system" alternatives are indicated in the *Table E.1 - Summary Description of Alternative Channel Systems*. All alternatives have some similar required construction elements which include: (1) modification of Gabbert Canyon Debris Basin to provide detention storage, (2) additional detention basins located upstream at the headworks of Walnut Canyon, adjacent to Gabbert Road, and upstream of Casey Road, (3) channel reconstruction for the 1,900-foot portion of Walnut Canyon Channel downstream of High Street, and (4) all systems require improvement of 2,655- feet Gabbert Canyon Channel between the Walnut Canyon Channel confluence and the existing Gabbert Debris Basin (See Exhibit 1, Alt. B, for relative locations). In addition to these elements, the alternatives evaluated various combinations of additional detention basins, diversion systems, or relocated channel outlets to the Arroyo Simi.

Table E.1 - Summary Description of Alternative Channel Systems						
Alt. No.	Gabbert Basin Modification	Additional Detention Basins	Gabbert Channel Reaches	Walnut Channel Reaches	Diversion Channel System	Channel Outlet Relocation
B-Revised	Improved to 145 AF Detention Storage	0,1,2,3 (V_{total} = 140 AF)	2	2,4	100 cfs in channel basin diversion	Walnut

The total construction costs for each of the alternative drainage "systems" was previously estimated including land acquisition requirements. These costs were the primary basis for selection of the recommended drainage "system". The cost of the revised recommended alternative was calculated using updated unit costs for the portion of the system that has been updated and revised for this alternative; i.e., detention basin-3. The remainder of the cost elements were updated to reflect the 2005 estimation of costs using the California Construction Cost Index (CCCI) developed and published by the State of California to reflect the escalation of construction costs month to month since 1995. The CCCI is based upon the Building Cost Index (BCI) cost indices produced by Engineering News Record (ENR). The CCCI for March 1997 was 3488 and the CCCI for June 2005 is 4421. Therefore, taking a ration of the indexes yields a construction cost escalation of 26.75% from March 1997 to June 2005. A factor of 1.2675 has been applied to the construction costs as estimated in March 1997 to yield a 2005 estimate of construction costs. A detailed preliminary engineering cost estimate is provided in Section-9. Alternative-B was previously recommended as the selected solution. That alternative included (1) relocating the Walnut Canyon Channel outlet while continuing to utilize the existing Gabbert Canyon Channel outlet, (2) only improving one channel reach on both Gabbert and Walnut Canyon channels, (3) an underground diversion system adjacent to Shasta Avenue, and (4) an "offline" detention basin parallel to Poindexter Avenue. The revision to Alternative-B resulted in 1) the elimination of the Shasta Avenue underground diversion and 2) the addition of an in channel low flow bypass/ side weir structure. Alternative-B and the revision to alternative-B have one of the lesser land acquisition requirements and it appears to have a high degree of feasibility while compatible with the adjacent property owners. The configuration of the various recommended channel and watershed facilities is on *Exhibit - Alternative No. B - Schematic Map* located on the following page.

Table No. E.2 - Summary of Alternative Systems Construction Costs
(Cost in thousand of dollars)

Alt	Detention Basins			*Divert Chann*	Walnut Chann	Gabbert Chann	Outlet Chann*	Capital Cost Subtotal	R/W	**Total Costs**
	0,1,2	3	Gabbert (Alt. B)							
B-Rev*	$1,768	$2,811	$3,179	$0	$531	$378	$2,344	**$11,011**	$2,626	**$13,637**

* - note this cost is based upon the March 1997 preliminary estimate of construction and was adjusted to reflect the escalation of construction costs since March 1997 to June 2005. The basis of the escalation is the California Construction Cost Index developed by the State of California using the Building Cost Index (BCI) cost indices produced by Engineering News Record (ENR). The land value is based upon the 1997 preliminary estimate of R/W acquisition costs of $25,000 per acre and was adjusted for inflation of 10% per year for 8-years for a total increase of 114% to reflect an updated cost more indicative of the current real estate value escalation.

1 Introduction

1.1 Project Description

The existing 1.57 miles of Gabbert Canyon Channel and 2.5 miles of Walnut Canyon Channel (see *Exhibit - Watershed Regional Aerial Photograph*) are improved regional flood control channels or "red line" facilities maintained by the Ventura County Flood Control District. The majority of these channels were originally constructed by the Soil Conservation Service (SCS) between 1959 and 1962. The Gabbert and Walnut Canyon facilities collect and convey storm runoff to the Arroyo Simi from a total tributary watershed drainage of 6.91 square miles of which a significant portion is not developed. The channel systems provide a significant flood protection benefit through a horizontal alignment which results in intercepting the drainage from the mouth of several large canyons. Had the channels not been situated in such a manner the result may have been uncontrolled flooding. Comparison of the existing hydraulic capacities for the flood control channel sections to the estimated runoff quantities indicates that the channels cannot provide the desired level of flood protection. The limited hydraulic conveyance capacity of the existing channel system results in a flood protection deficiency and is documented on the current Flood Insurance Rate Map (FIRM) for the City of Moorpark (see *Exhibit - Existing FEMA FIRM*). The existing hydraulic capacities can only provide conveyance which correspond to return periods as low as 5-years, depending upon the location.

Potential regional drainage improvements to provide the required level of flood protection include combinations of (1) channel reconstruction, (2) detention basins, (3) debris basin, (4) diversion systems, and (5) channel relocation. Future development within the upper watershed and directly adjacent to the channel could limit the possible corrective measures if a comprehensive drainage plan is not provided to assist in the watershed planning.

1.2 Study Objective

The purpose of this investigation is to create an addendum study of the Gabbert and Walnut Canyon Channels Flood Control Deficiency Study created in March 1997. This addendum study will modify the selected alternative identified in the previous study. The requested modifications were formulated by Ventura County Water Protection Agency (VCWPA). This addendum study builds upon the previously identified existing channel hydraulic deficiencies and develops a conceptual recommended "watershed plan" based upon the original selected alternative, Alternative-B, which will provide the desired level of flood protection. This study investigates the feasibility of implementing various combinations of conveyance and storage oriented facilities within the watershed. The project has identified the following key objectives in the development of an implementable watershed master plan:

1. Evaluate the hydraulic capacity of the existing channel systems and determine the magnitude of the hydraulic deficiency with respect to the existing watershed peak flowrates.

2. Analyze the selected "drainage system" alternative composed of channel improvement, detention storage facilities that will allow the channel to safely convey the project design discharge.

3. Identify major physical constraints such as utilities or roads which are impacted by the recommend improvements

4. Estimate construction costs requirements and land acquisition associated with each alternative.

5. Provide an improvement program which is sensitive to the proposed development projects within the watershed and provide recommendations to ensure that these projects do not have hydrologic impacts.

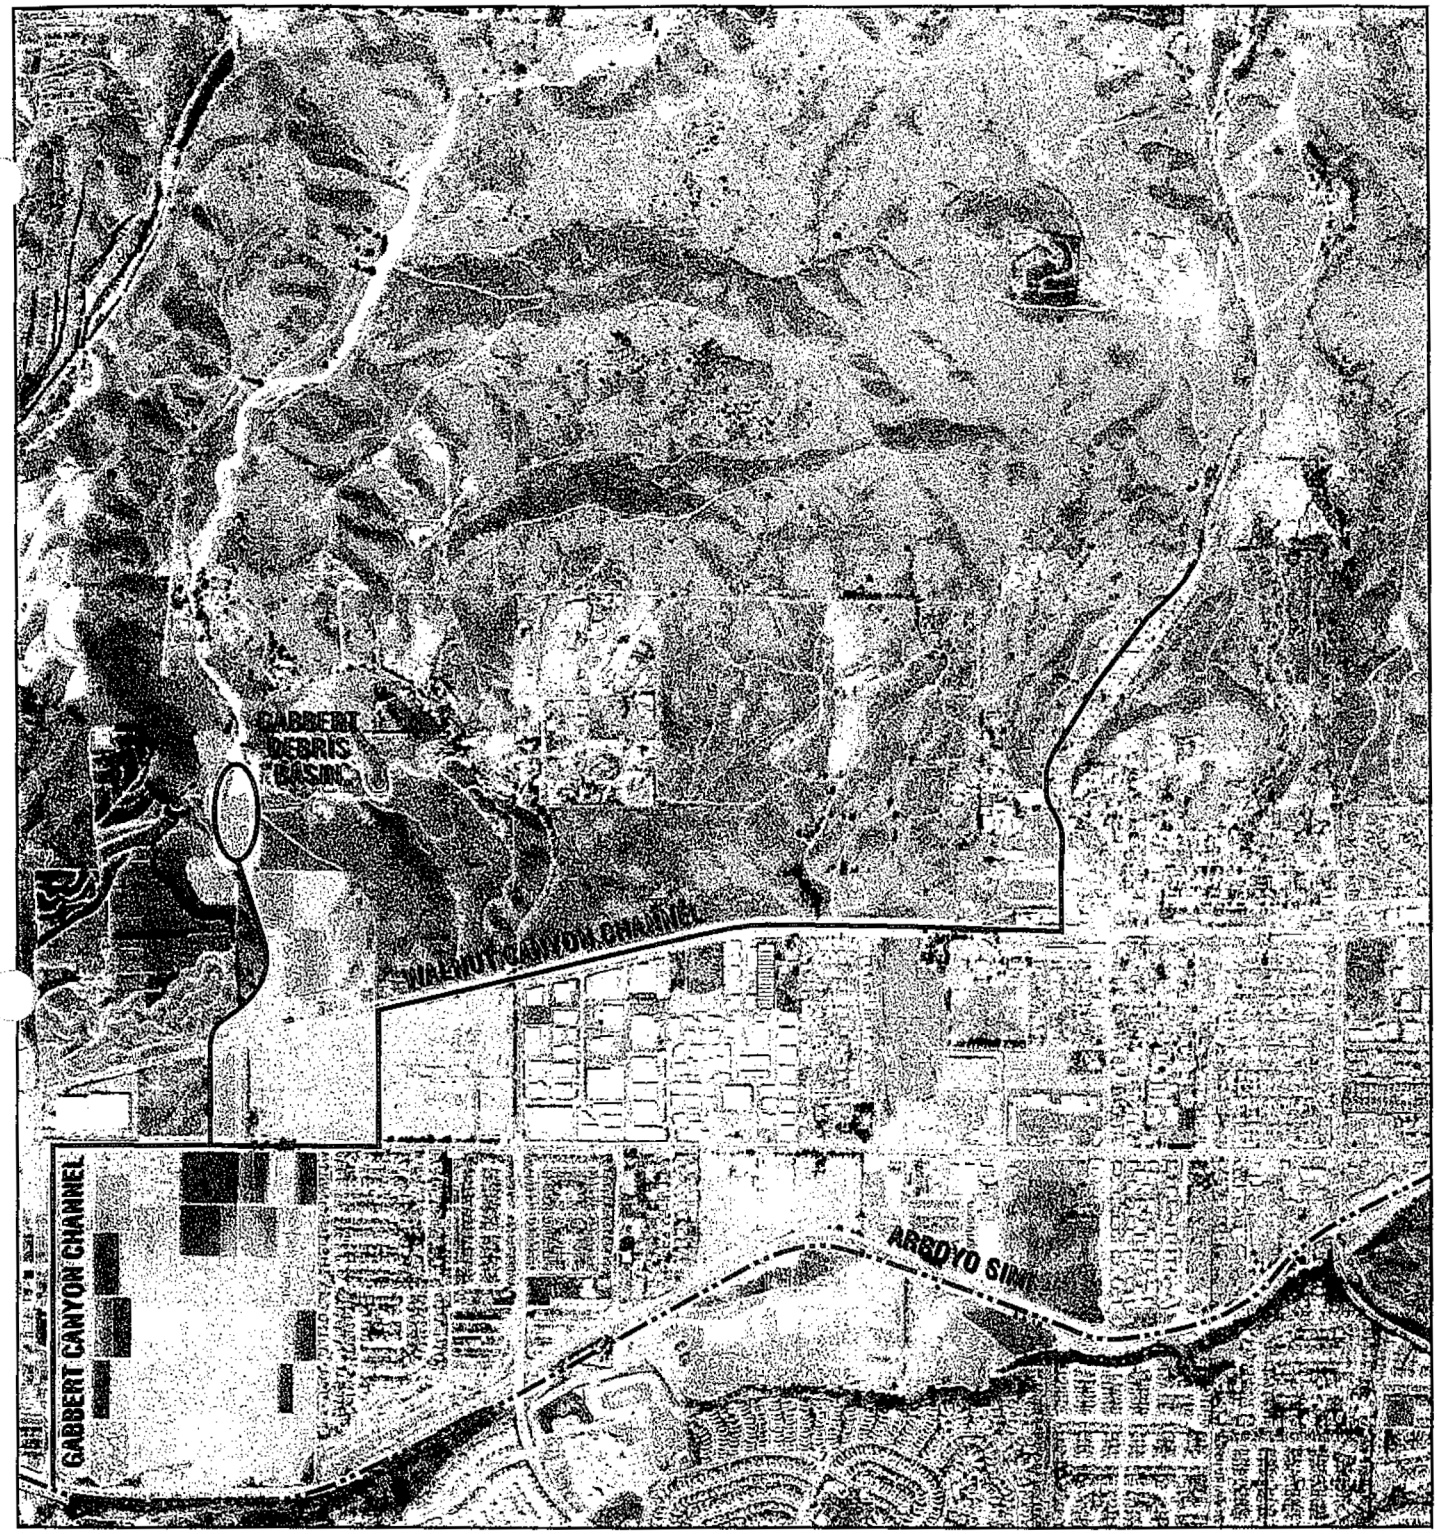
6. Identify potential financing alternatives available for public improvements in order to implement the recommended flood control facilities.

The information contained in this report is intended to provide preliminary design level information that will facilitate overall planning process within the watershed and provide a foundation for the next level of engineering design. It is intended that this document will facilitate the communication with other agencies and the public during the initial stages of the project development.

2 Background

2.1 Project Understanding and Study Area Description

Gabbert Canyon and Walnut Canyon Channels consist primarily of approximately 4.0 miles of improved concrete channels which were originally constructed by the Soil Conservation Service (SCS) between 1959 and 1962. These regional drainage facilities are located in Zone-3 of the Ventura County Flood Control District. The flood control channels intercept drainage from the mouths of four canyons with a total tributary drainage area of 6.9 square miles which discharge into the Arroyo Simi floodplain. Approximately 90% of the watershed area which the channels intercept is primarily undeveloped. There are planning efforts for private development on a significant portion of this area. However, the limited hydraulic conveyance capacity of the existing channel system results in a flood protection deficiency and is documented on the current Flood Insurance Rate Map (FIRM) for the City of Moorpark which indicates shallow flooding occurring from channel overtopping. The existing hydraulic capacities can only provide conveyance which correspond to equivalent return periods as low as 5-years, depending upon the location within the watershed. In addition, approximately 50% of the land directly adjacent to the existing channel is also undeveloped and if channel improvements are to be to remove the flood hazards then alternatives need to be provided to these landowners.



This report functions to identify existing deficiencies within both the Gabbert and Walnut Canyon Channel system, formulate and evaluate alternative solutions, and determine the most cost effective and feasible watershed program.

2.1.1 Field Investigation

A field reconnaissance of the existing channel facilities was performed as part of the original technical investigation, which included field review of potential detention basin locations and verification of existing reference documents. No additional field investigation has been provided for this addendum study.

2.2 Description of Existing Channel Facilities

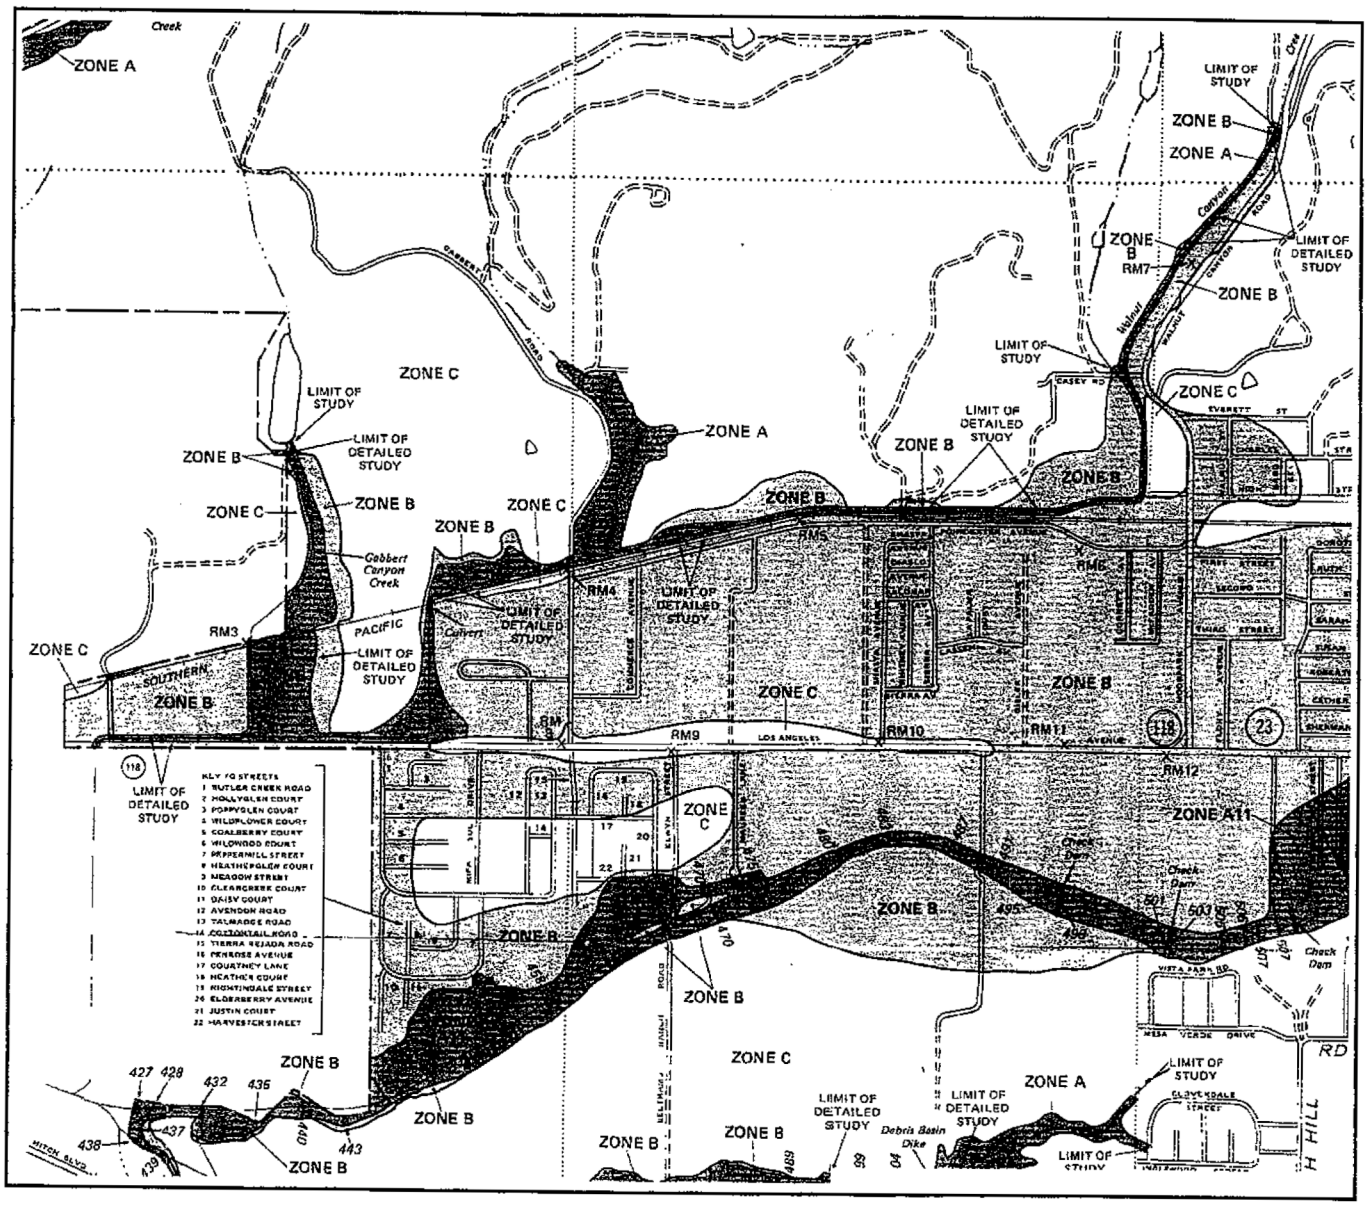
The channel system consists of approximately 1.57 miles of improved channel in the Gabbert Canyon and 2.5 miles in Walnut Canyon, all maintained by VCFCD. The existing channel system consists almost entirely of a concrete rectangular channel section except for 495-feet of lined concrete trapezoidal channel section on Gabbert Canyon Channel downstream of the SPRR. The depths of the channel primarily range from 4 to 6 feet for the entire length. The average slopes of the channel vary from 1.5% to 3% in the upstream reaches where the canyon is steep to approximately 0.5% in the lower sections within the Arroyo Simi floodplain which is much flatter. The channel base widths in the Walnut Canyon Channel range from 7-feet to 12-feet while the widths in the Gabbert Canyon Channel range from 7.8-feet to 14-feet. There are two existing debris basins within the watershed, in addition to several smaller agricultural reservoirs of unknown ownership. The largest and most significant debris collection facility is the Gabbert Canyon debris basin which is located at the headworks of the improved Gabbert Canyon Channel and has

N

NO SCALE

Watershed Regional Aerial Photograph

Gabbert and Walnut Canyon Channels



a maximum debris capacity of 30.4 acre-feet. A smaller debris basin is located at the headworks to the Moorpark Drain No.1.

2.3 Floodplain Mapping

The potential for flooding directly associated with the limited hydraulic capacity of the Gabbert and Walnut Canyon Channel systems is reflected in the published floodplain mapping (see following *Exhibit - City of Moorpark Flood Insurance Rate Map*) for the Moorpark area which indicates the 100-year flooding through the urbanized portions of the city. Published Flood Insurance Rate Maps (FIRM) identifying flood hazard zones are available for the City of Moorpark since it is a participant in the National Flood Insurance Program (NFIP) administered by the Federal Emergency Management Agency (FEMA). Communities participating in the NFIP must adopt and enforce minimum floodplain management standards, including identification of flood hazards and flooding risks. Participation in the NFIP allows the communities to purchase low cost insurance protecting against losses from flooding and it is mandatory for residents located in designed flood hazard Zone A to purchase this insurance. The current FIRM for the City of Moorpark became effective September 29, 1986 and is shown on the FIRM community panel 067120005A which indicates only the mapped flood hazard boundaries within the municipal boundary.

Although the information contained on the FIRM is not intended for design purposes or necessarily correspond to current design hydrology, it can indicate general characteristics of the floodplain and locations of flooding. The hydraulics of the improved channels appear to have been studied in detail but the shallow overflow flooding was evaluated with approximate methods. The locations on the FIRM which have a mapped flood hazard Zone A adjacent to the channel resulting from the limited hydraulic capacity include: (1) the entire length of Gabbert Canyon Channel from the debris basin to the confluence with Walnut Canyon Channel, (2) Walnut Canyon Channel from Los Angeles Avenue to the Southern Pacific Railroad, (3) Walnut Canyon Channel from the Southern Pacific Railroad to upstream of Commerce Avenue, and (4) the small tributary canyon adjacent to Gabbert Road. The areas where the flood hazard Zone A occurs is generally adjacent to undeveloped parcels of land. The hydraulic analysis of the existing channel system performed as this study verifies that these portions of the channel are hydraulically deficient and could potentially result in an overflow condition. The mapped floodplain boundaries along Walnut Canyon Channel indicate that the majority of the flooding from the canyons is confined by the Southern Pacific Railroad embankment adjacent to the channel which functions as a transverse levee. Significant portions of the urbanized areas of the City of Moorpark located downstream of the channel system have been designated Zone B which indicates the potential for shallow flooding of less than one-foot resulting from a 100-year flood. The floodplain in these areas appear to be influenced from flooding sources of both the Gabbert/Walnut Canyon Channels and the Arroyo Simi.

* Length and area of parcels are approximate based upon map measurements

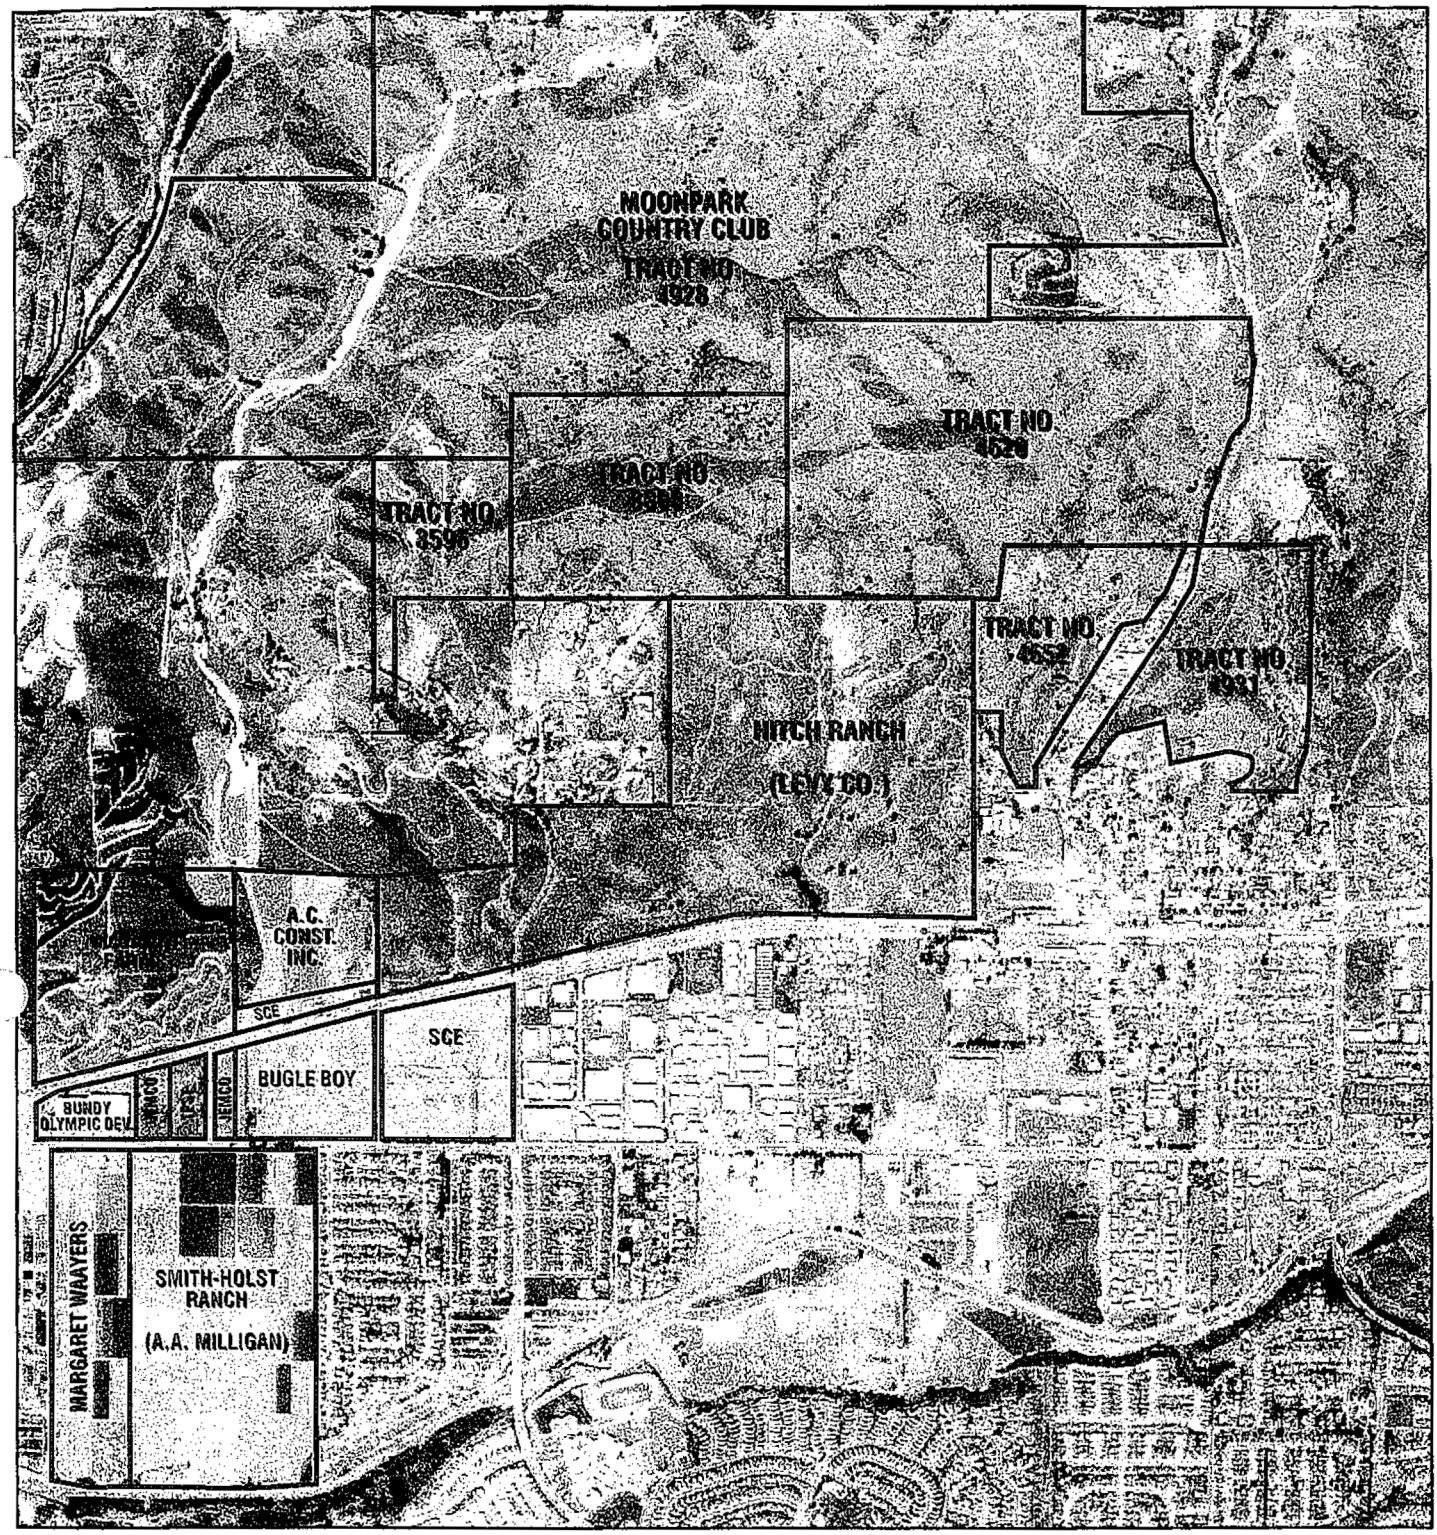
P:\7753E\Engineering\GlobalExhibits\7753 Revised Alternative B.dwg - Tab: FIRM By: ddrahn on Jul. 01, 2005 at 06:42 pm

The Moorpark Country Club project, Tract 4928, prepared a preliminary hydrology investigation which evaluated the potential drainage impacts from the development and analyzed recommendations for onsite detention basins in order to mitigate the changes in runoff. The information contained in the development hydrology reference documents were reviewed as part of the original investigation.

Planning regional public improvements within the watershed are another form of development which must be identified as a potential planning constraint. The primary public improvement which could potentially impact the regional drainage system are the planned Simi Valley Freeway corridor. The proposed freeway corridor traverses the foothills, generally parallel to the SPRR and ultimately connects to the Moorpark Freeway. The proposed alignment is graphically depicted on the exhibits illustrating the watershed alternatives. The potential physical constraints associated with the freeway limit the utility of regional detention basin sites and modify the drainage patterns.



The procedures utilized by FEMA in the development of the floodplain analysis for the FIRM incorporate a hydrologic evaluation of the watershed to develop the 100-year discharge. The hydrology analysis for 100-year discharge reflects the watershed conditions at the time of the study or an "existing condition" flowrate. The current published FIRM may not necessarily reflect up-to-date floodplain boundaries due to urbanization within the watershed since the effective date of the map. Typically, flood control and drainage design are based upon hydrology for "ultimate" land use conditions within the watershed to minimize replacement of facilities.

2.4 Proposed Development within Watershed

A significant portion of the land within the Gabbert and Walnut Canyon watershed remains undeveloped, especially in the upper portions of the watershed. In addition, over 50% of the land directly adjacent to the existing improved channels is currently undeveloped. Prior to development of these undeveloped parcels it is important that considerations be incorporated into the planning which assist in eliminating the hydraulic deficiencies. This corresponds to removing flood hazard restrictions which currently encumber portions of the parcels adjacent to the channels. The primary undeveloped land parcels within the watershed have been identified on the following page in the *Exhibit - Watershed Undeveloped Large Parcel Ownership*. The potential hydrologic impacts associated with urban development of these parcel must also be mitigated in order to prevent increased runoff from additional impervious area. Increases runoff from the development would increase the corresponding observed storm hydrographs in the flood control channels above the existing runoff values which already exceed the hydraulic capacity of channel system.

Many of the undeveloped parcels are currently in different stages of planning and the various stakeholders have been solicited during the initial plan formulation for the original study of this watershed to offer their input.

Gabbert and Walnut Canyon Channels

3 Description of Existing Drainage System

3.1 Existing Channel Facilities

The existing 1.57 miles of Gabbert Canyon Channel and 2.5 miles of Walnut Canyon Channel are regional flood control channels maintained by the Ventura County Flood Control District which were primarily constructed by the Soil Conservation Service (SCS) between 1959 and 1962. These primarily concrete rectangular channel facilities collect and convey storm runoff to the Arroyo Simi from a total tributary watershed drainage of 6.91 square miles which has a significant portion that is not developed. The channel systems provide a significant flood protection benefit through a horizontal alignment which results in intercepting the drainage from the mouth of several large canyons and would have resulted in uncontrolled flooding. The average channel depth ranges from 5 to 6 feet and channel widths ranging from 7 to a maximum of 14 feet. The channel slopes within the canyon areas are relatively steep with slopes ranging from 1.5% to 3% and in the downstream sections the channel flattens to an average slope of 0.5%. There have been no improvements or modifications to the Walnut Canyon channel or the Gabbert Canyon channel since the original 1997 study.

3.1.1 Gabbert Canyon Channel

The existing Gabbert Canyon channel consists primarily of a concrete rectangular section which extends approximately 7,739 linear feet from the Arroyo Simi channel confluence, to the spillway from the Gabbert Debris Basin. The initial 5,600 feet of the channel from the Arroyo Simi outlet to downstream of the Southern Pacific Railroad was originally designed by the Soil Conservation Service in 1958 (construction date approximately in same period). The physical characteristics of the existing channel geometry of the Gabbert Canyon Channel are indicated in the following tables. The information is based upon record drawings for the original construction. The tables summarize information on the geometry and the culvert or bridge crossings.

3.1.2 Summary of Baseline Channel Hydraulic Analysis

The hydraulic analysis of the existing channel system was based upon developing a water surface profile from the current channel geometry and cross section information. The initial water surface profile analysis was based upon both 50- and 100-year flowrates for the existing watershed. Additional incremental depths were added to these values to account for residual freeboard and superelevation for the 50-year flowrates, while none was applied for the 100-year frequency. The controlling design frequency associated with the drainage systems resulted in the 100-year analysis since detention basins were part of the proposed system. The 100-year hydraulic analysis resulted in evaluating the "bank-full" capacity of the channel which excluded the addition of water surface superelevation around curves, since this hydraulic control could be eliminated by construction of wall extensions along the outside radius of the curve.

The hydraulic capacity analysis was an iterative process which proceeded along one direction of the channel evaluating the flowrate which provided a water surface elevation matching the top-of-bank elevation. The flowrates were adjusted in the water surface profile for a particular channel reach until the correct water surface elevation was achieved. The total water surface elevation at a curve was determined through adding the calculated superelevation from the average hydraulic parameters in the water surface profile model. This superelevated water surface was not used in the hydraulic capacity calculation, but determined to verify the height of the wall extension. This iterative process continued along all the channel reaches until a revised water surface profile model had been developed with flowrates corresponding to the "bank-full" capacity analysis. The results of this analysis are summarized in the following table. The existing 100-year flowrate is provided as a reference point to assess the magnitude of the hydraulic deficiency for each of the channel reaches.

Table No. 3.8 - Existing Channel System Maximum Bank-Full Capacity Water Surface Profile

Channel	Reach 1	Reach 2	Reach 3	Reach 4
Walnut	440 cfs (Q_{100} 469)	570 cfs (Q_{100} 797)	640 cfs (Q_{100} 1,158)	825 cfs (Q_{100} 1,258)
Gabbert	920 cfs (Q_{100} 1,732)	900 cfs (Q_{100} 1,732)	1,100 cfs (Q_{100} 2,275)	1,450 cfs (Q_{100} 2,275)

Note: "bank-full" refers to the maximum channel hydraulic conveyance capacity measured at the concrete top of wall

3.2 Summary of Channel Hydraulic Deficiencies and Hydraulic Restrictions

The hydraulic deficiency portion of this investigation focused on identifying the channel deficiency based on the hydraulic capacity. The difference between the hydraulic capacity and the design flowrate represents the magnitude of the deficiency. Relative approximation of the channel deficiency can be determined from a comparison of the uniform depth channel hydraulics and these are presented in *Table No. 3 -Comparison of Uniform Hydraulics*. A more detailed approach utilized a water surface profile analysis to determine the actual depths of flow in the channel and identify the critical hydraulic restrictions. The results of the hydraulic analysis indicated that the **limiting hydraulic capacity of the channel occurs at the curves**, but this initial deficiency location can corrected through relatively low cost wall extensions along the outside wall of the curve. It was assumed that the correction for superelevation at the curves could be implemented, then it can be neglected from the capacity analysis. The culverts and bridge crossings become the controlling hydraulic restriction as a function of the channel geometry and slope. A summary of the superelevation associated with the critical channel curves is indicated in the following table.

4 Hydrologic Data

4.1 Watershed Description

The 6.9 square mile Gabbert and Walnut Canyon Channel watershed is a tributary to the Arroyo Simi which ultimately discharges to Mugu Lagoon. Approximately 33 % of the Gabbert and Walnut Canyon watershed is located outside the corporate limits of the City of Moorpark, corresponding to approximately 1,476 acres of offsite tributary drainage area from the upper watershed. The alignment of the channel system intercepts the drainage from four canyons areas, two of which are the Gabbert and Walnut Canyons which have tributary areas of **2,571** and **846 acres** respectively. The other two canyons have smaller drainage areas of **475** and **104 acres**, located between Gabbert and Walnut Canyons. The channel alignment is generally located along the canyon mouths and collects the runoff which would have naturally continued across the wide valley floor of the Arroyo Simi floodplain. Gabbert Canyon is the larger of the watersheds. At the confluence of the two channel systems the relative magnitude of the drainage areas is 2,571 acres from the Gabbert Canyon Channel and 1,794 acres from the Walnut Canyon channel (see *Exhibit - Regional Watershed Map*).

The majority of the watershed is undeveloped with some light residential development. There are two municipal storm drain systems which drain urbanized areas to the channel; 124 acres from the Los Angeles Avenue storm drain and 112 acres from the Moorpark Drain No. 2. The topography of the watershed is generally dominated by the canyon areas upstream to Broadway Ave., where the topography is less extreme and consist of open gradual sloping areas. The representative watershed lengths for the drainage paths are approximately 29,000 feet for Gabbert Canyon and 22,500 on Walnut Canyon, measured to the confluence of the channels. The elevations within the watershed range from a maximum of 2,120 in Gabbert Canyon and 1,060 in Walnut Canyon to a minimum value of elevation 450 at the channel confluence. The existing 4.8 acre Gabbert Canyon debris basin is the most significant debris storage facility within the watershed with approximately 2,350 acres of tributary natural area and is operated by VCFCD. In addition, there are at least six small reservoirs within the watershed which may have been constructed for agricultural purposes or by the SCS which would provide some limited storage capabilities. There is one municipal debris basin adjacent to Wicks Road which is tributary to the Moorpark Drain No. 1. Potential debris storage from the smaller reservoirs within the watershed were not evaluated because of their size and unknown ownership.

4.2 Hydrologic Watershed Parameters

The Walnut and Gabbert Canyon Channel watershed is an ungaged watershed and synthetic methods are necessary in order to predict the rainfall-runoff response. The baseline hydrology study prepared by VCFCD for the Gabbert and Walnut Canyon Channel watershed developed a series of hydrologic parameters to characterize the watershed subareas and evaluate the runoff.

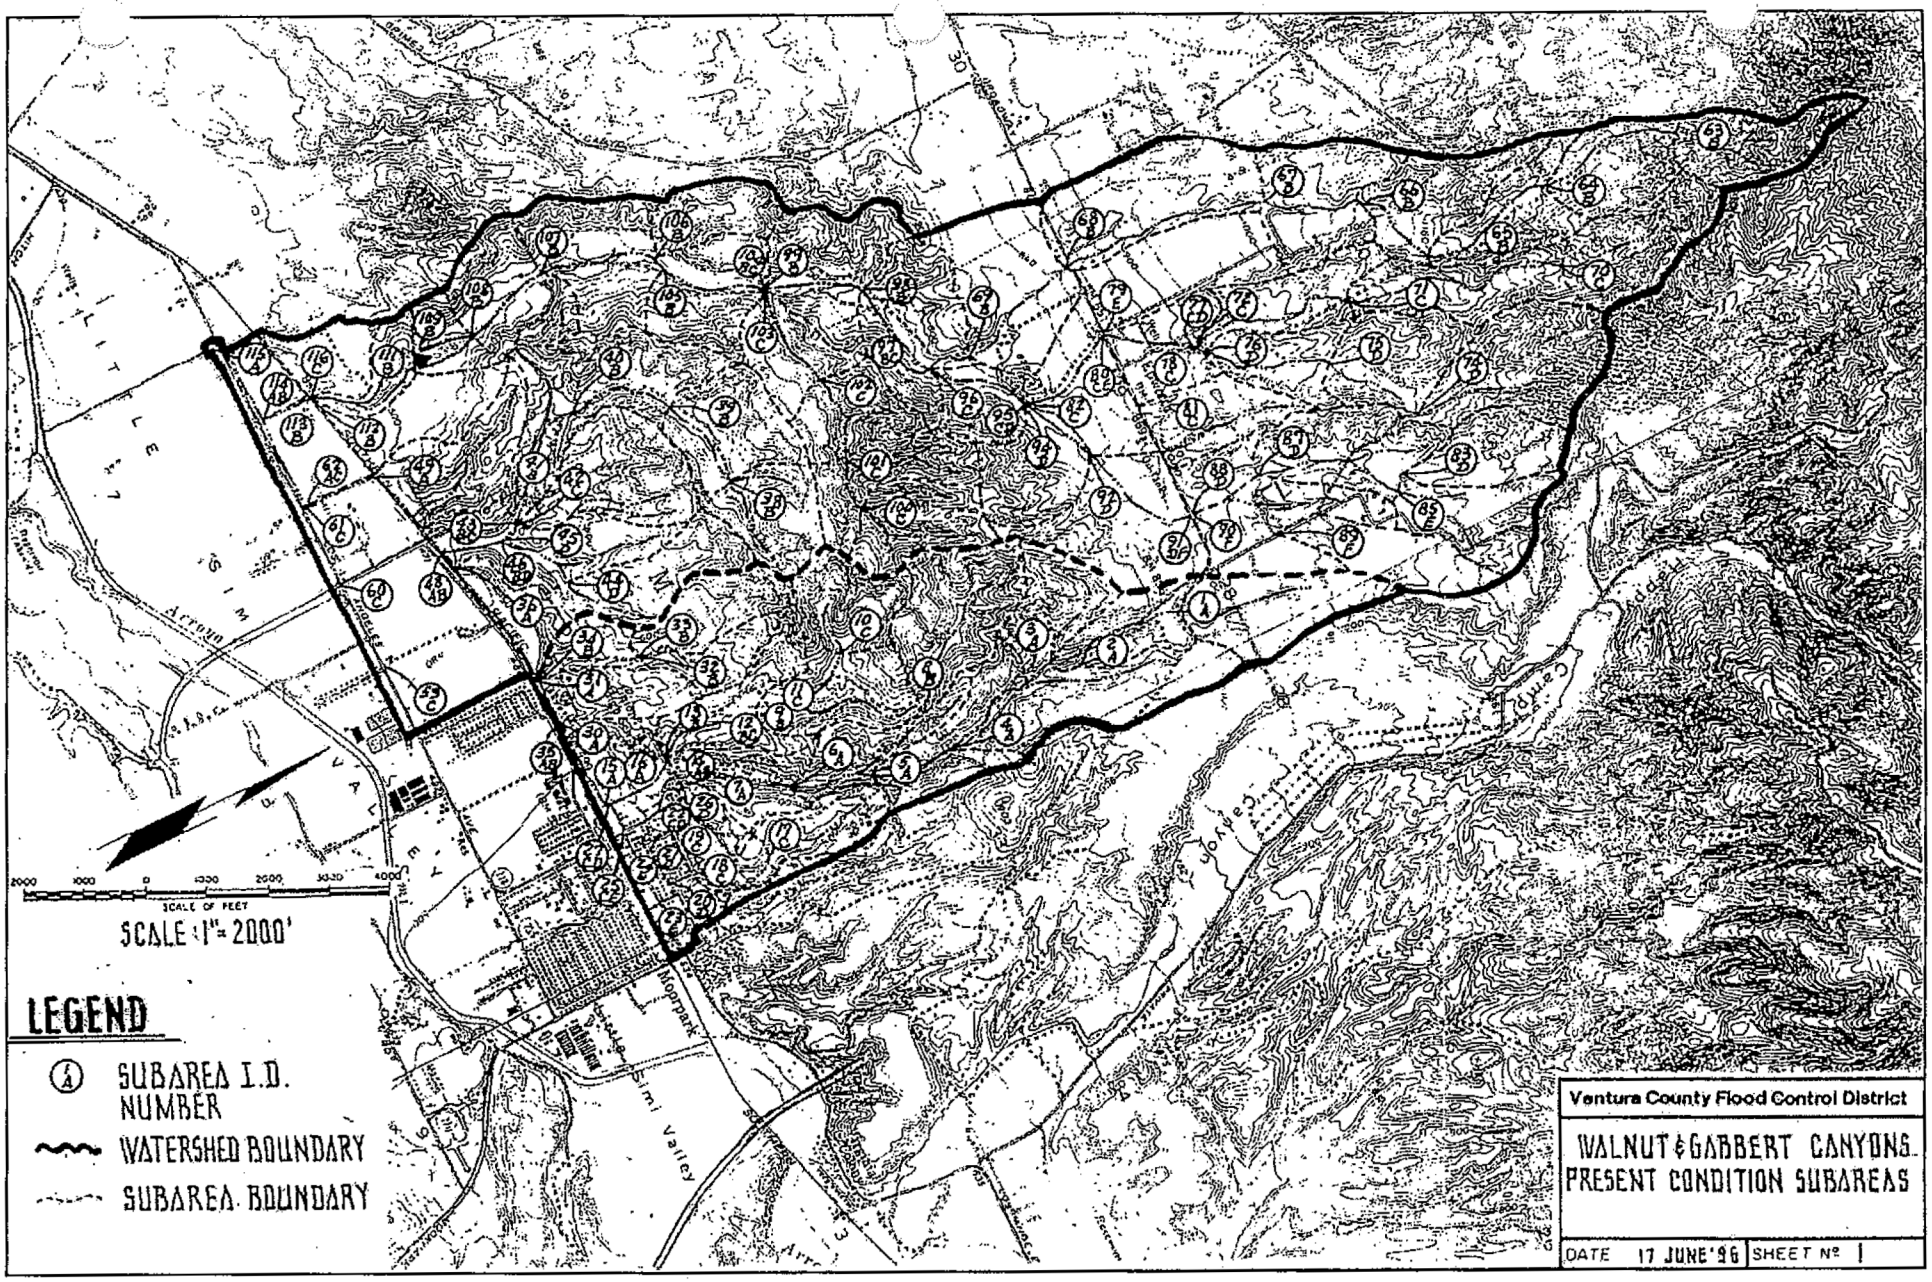
Watershed Subarea Delineation

VCFCD prepared the delineation of the existing watershed which subdivided the entire 4,425 acre regional watershed into **79 subareas**. The subareas ranged in size from 8 acres to 105 acres with individual time of concentrations less than 30 minutes consistent with VCFCD criteria.

Rainfall

Regional analysis of historical rainfall data throughout the Ventura County resulted in the development of rainfall zone designations to classify common rainfall regimens as part of the *Ventura County Hydrology Manual*. A **rainfall zone "J"** was used by VCFCD in the watershed analysis which best corresponds to the historical rain gage data for the Moorpark area. The 50-year 24-hour point rainfall isohyetals range from approximately 6.0 inches near the central portion of the City of Moorpark to 9.0 inches near the headwaters of the watershed.

Hydrologic Soil Type



General classification of the average soil infiltration rates have been performed throughout the entire County by the SCS. The soils were grouped into seven soil groups of hydrologically similar characteristics which are shown on the Ventura County Hydrologic Maps in the *Ventura County Hydrology Manual*. The soils appear to be primarily type 4, but range from type 1 to 6 as indicated in the VCRAT watershed model subarea characteristics prepared by VCFCD staff. The general regional classification representative of soils for the Moorpark area appears to be the **Rincon-Huerhuero-Azule Association** consisting of very fine sand loams to silty clay loams.

Percent Impervious Cover

Impervious surfaces within the watershed reduce rainfall losses associated with soil infiltration rates. Average values which describe the amount of impervious cover have been assigned to different landuses. Representative percentage impervious used by VCFCD to describe single family residential is 23%, 0% for natural areas, and 50% for commercial areas. Area average values of impervious cover were assigned to each watershed subarea resulting in percent impervious primarily ranging from 0% to 37% in the existing watershed landuse hydrology model.

Subarea Time of Concentrations

Subarea time of concentrations for each of the individual subarea are representative of the runoff travel time and are all less than thirty minutes.

Regional Watershed Exhibit

Gabbert and Walnut Canyon Channels

Previous Hydrologic Investigations

The 1997 Gabbert and Walnut Canyon Channels Watershed Flood Control Deficency Study thoroughly investigated the Walnut and Gabbert watersheds in order to determine the most feasible flood control solution to resolve the existing deficiencies. This study was accepted by VCPWA and the recommended alternative plan was selected as the flood control masterplan for the Gabbert and Walnut watersheds. This study was the basis for the Moorpark West Corporate Center Flood Protection Project study prepared by RBF in 2000. The 2000 study further refined the selected alternative identified in the 1997 report. The 2000 report modified the proposed detention basin-3 and utilized a larger detention basin flow diversion to the Arroyo Simi. Since then it was determined that the proposed detention basin-3 Arroyo Simi diversion would not be feasible to construct. VCPWA then recommended an inline detention basin-3 bypass as an additional modification to the selected watershed flood control master plan.

Estimated Debris Volume Generation

The required storage volume for debris basins or the dead storage allowances for detention basins which drain natural watershed areas is based upon the potential debris production or estimated "yield" from the watershed. VCFCD utilizes the formula developed by Dr. Kevin Scott from the USGS to calculate the estimated debris production rate which is based upon drainage area, 24-hour precipitation, 10-day rainfall, slope failure, fire factor, and watershed shape. The following equation is used to calculate the debris production associated with different storm events:

$$SY = 17.54\,(A)^{0.828}\,(ER)^{1.382}\,(FF)^{0.251}\,(SF)^{0.375}\,K^{0.840}$$

where: SY = Sediment yield (cubic yard)
A = Area of the watershed (square miles)
ER = Elongation ratio (equivalent diameter with watershed area divided by the maximum length of the channel)
FF = Fire factor (value dependent on time after watershed burn, 88 = 6 months after burn)
SF = Slope failure (area of watershed that is prone to landslides, acres per square mile)
K = Dimensionless rainfall factor (product of the square of the 24-hour precipitation and the 10-day precipitation)

VCFCD applied this sediment yield equation to determine the estimated debris volumes for the potential sediment and debris basin locations, so allowances could be provided in the estimates for either the facility sizes and amount of dead storage. Rainfall gage No. 141 located in the downtown portion of Moorpark and gage No. 191 located in the upper watershed, upstream of Broadway, were used to evaluate the 24-hour and the 10-day precipitation, then a weighted value was used based upon the proposed basin site relative to the gages. The debris production analysis prepared by VCFCD was performed using the following additional assumption or characteristic values: (1) 100% of the watershed burned, (2) slope failure varied from 6 acres/square mile to 20 acres/square mile, (3) both

6-months after the burn and 4.5 years after the burn or pre-burn condition, which provides fire factors of 88 and 20 respectively.

VCFCD prepared the debris production analysis for four potential regional detention basin locations which correspond closely to the four primary canyon watershed areas. The results of the debris production analysis are summarized in the following table and the 100-year debris production values were used in the facility sizing for the alternative drainage systems.

4.3 Hydrologic Analysis Procedures

The watershed rainfall-runoff model utilized to evaluate the watershed primarily relied upon the Ventura County Modified Rational Method procedure which is applicable for urban drainage system design. The VCFCD computational procedure involves application of the basic rational method equation which is utilized to develop a runoff hydrograph from each individual subarea. The cumulative rainfall mass curve is used to evaluate rainfall intensity over the storm duration and determine intermediate hydrograph ordinates. The individual hydrographs from the subareas are routed through the hydraulic conveyance systems or can be combined to simulate the interconnected components associated with the physical processes occurring in the watershed.

The shape of the unit hydrographs developed using the modified rational method do not necessarily generate the correct effective runoff volume or net rainfall since the cumulative mass rainfall curves are averaged. The expected runoff yield based upon local point or isohyetal rainfall data compared to the computed runoff yield from the modified rational hydrograph will typically need to be adjusted to provide the same effective rainfall. This process is known as "fattening" and the adjustment results in modification to the shape of the calculated runoff hydrograph so the area under the hydrograph provides the desired effective or net rainfall. The correct amount of direct runoff volume is a critical factor for the storage routing analysis of detention basins and this required that the inflow hydrographs to detention basins generated from VCRAT were "fattened" prior to routing.As the watershed area increases in size the area-averaged point rainfall values used in the design storm pattern should be adjusted so that the volume of rainfall of the area is accurately represented by the point rainfall characteristics. As the spatial extent of the storm increase the depth of rainfall decreases. The reduction is made using a depth-area adjustment factor when selecting point rainfall to apply uniformly over the watershed. The modified rational procedure is calculating runoff hydrographs for the individual subareas with the rainfall associated with the smaller drainage area. A larger watershed composed of numerous interconnected subarea hydrographs results in over estimating the point rainfall associated with concentration points further downstream in the watershed. Depth-area adjustment factors were applied to the inflow hydrographs for the detention basins. The depth-area adjustment curve was constructed by VCFCD staff specifically for the Gabbert/Walnut canyon watershed as a function of total drainage area. The results are indicated in the following table and the reference data is contained in the *Technical Appendix*.

Table No. 4.2 - Detention Basin Inflow Hydrographs Adjustment Factors						
Basin No.	Conc. Point	100-yr. Precip (in.).	Drainage Area (acres)	Peak Q_{100} Inflow	Effective Rainfall (% to inches total)	Area Reduction Factor
Inline Bypass (Basin 3)	35AB	6.37	1,014	847 cfs	56%	0.915 (0.085)
Gabbert Debris Basin	109B	6.79	2,433	2,188 cfs	49%	0.86 (0.14)
Basin 0	6A	6.79	382	390 cfs	67%	0.97 (0.03)
Basin 1	12BC	6.40	207	309 cfs	46%	0.97 (0.03)
Basin 2	47B	6.37	475	514 cfs	45%	0.955 (0.045)

Local Drainage Systems

The hydrology analysis for the Gabbert/Walnut Canyon Channel watershed assumed that all the local storm drain could deliver the peak flows to the channel system, but **limited to the maximum hydraulic capacity of the storm drain**. The Moorpark Drain No. 1 was limited to the hydraulic capacity or original design flow of the storm drain indicated on the improvement drawings which was approximately **125 cfs**, although the estimated 100-year discharge from the 137 acre urban watershed area is 243 cfs based upon the VCRAT model. The other major local storm drain system is the 72-inch diameter facility joining the Walnut Canyon Channel at Los Angeles Avenue which has an estimated capacity of 195 cfs and the estimated 100-year flow from the 125 acre subareas is 251 cfs.

Discussion of Watershed Model

Several unique features regarding the application of the VCFCD modified rational procedures to this watershed investigation were encountered because of the size of the drainage area and the complexity of the watershed processes. These items included:

- Depth-area reduction factors were applied to the hydrographs at the detention basins, but were not applied to the main channel hydrographs even though the peak runoff was based upon the smaller subarea precipitation value.

The configuration of the watershed involves two large watersheds which confluence and the shape of the hydrographs is extremely important in accurately determining the resulting total flowrate. Using superposition to add the hydrographs relies on accurate

ordinates for both limbs of hydrograph and the shape of the main channel hydrographs were not adjusted, only if reservoir routing was involved. If the hydrographs from the two primary streams were "fattened" prior and then combined then this resulted in a different hydrograph from the standard confluence addition.

- The outflow hydrographs resulting from the reservoir routing were fattened hydrographs which were input in the remainder of the modified rational watershed model and combined with additional hydrographs which were not "fattened."

- The watershed system involves evaluating the effect of several detention basins operating simultaneously and on different streams. The modified rational method is not particularly suited to effectively simulate the effects of multiple reservoirs where storage volume and timing is critical in accurately determining the cumulative effect.

4.4 VCFCD Baseline Watershed Hydrology Model

VCFCD prepared a synthetic unit hydrograph model of the entire Gabbert and Walnut Canyon Channel watershed, June 1996, specifically evaluating the current landuse conditions within the watershed. The VCFCD watershed model was utilized to establish a baseline condition for predicted flowrate generation from the watershed without any future development. A "modified" baseline watershed model was utilized to evaluate the effect of different flood control alternatives which included the application of multiple detention basins. The "modified" watershed model was adjusted to include the Hitch Ranch (Levy Co. property) as completely developed for all alternatives. This parcel was assumed to be developed since many of the proposed regional detention basin alternatives considered as part of this study were located on the property, and the storage volume of the regional basins were sized so that it could accommodate the hydrologic mitigation of the development. This assumption regarding the remainder of the watershed is applicable since it is assumed that a drainage ordinance will require all future development to maintain the existing or pre-development flows.

The current hydrology model was prepared utilizing the VCRAT program which is based on the modified rational method hydrology procedures outlined in the *Ventura County Hydrology Manual* (1978). The hydrology model corresponds to "link-node" model which simulates the physical rainfall-runoff processes occurring in the watershed. The individual subareas are hydrologic nodes and the hydraulic conveyance sections are the links which interconnect the subareas. The watershed delineation subdivided the entire 4,425 acre regional watershed into **79 subareas** which ranged in size from 8 acres to 105 acres and individual time of concentrations less than 30 minutes (see *Exhibit - Regional Watershed Map*). Runoff hydrographs are computed within the model for each subarea, routed through the conveyance system, and combined with other subarea hydrographs as the analysis proceeds downstream through the watershed. *Summary of Baseline Design Hydrology*

Application of the Ventura County Modified Rational watershed model for the current landuse (baseline watershed) conditions was evaluated for both the 50-year and 100-year return periods. The hydrograph peak discharges associated with critical concentration points along the channel system are indicated in *Table No. 4 - Summary of Existing Watershed Hydrology - Clearwater Design Flowrates.* The detailed input and output for the watershed models are contained in the *Technical Appendix.* All discharges generated from the VCFCD baseline watershed model reflect clearwater values. Runoff conveying debris and sediment has an increased total volume which tends to increase or "bulk" the apparent clearwater flowrate. However, it is assumed that the potential for debris production will be reduced through future development and debris collection facilities and no "bulking factor" was applied to the discharges.

Table No. 4. 3- Summary of Existing Watershed Hydrology
Clearwater Design Flowrates

Channel	Watershed Model Node	Drainage Area (acres)	Design Clearwater Flow		Channel Reach Description
			Q_{50}	Q_{100}	
Gabbert	109B	2,433	1,732 cfs	**2,185 cfs**	Gabbert Debris Basin spillway
Gabbert	114AB	4,365	2,275 cfs	**2,944 cfs**	Downstream of Walnut Canyon confluence
Gabbert	115A	4,388	2,276 cfs	**2,945 cfs**	Los Angeles Avenue Culvert crossing
Gabbert	118AC	4,425	2,279 cfs	**2,947 cfs**	Outlet to the Arroyo Simi
Walnut	6A	382	283 cfs	**382 cfs**	Existing improved channel headworks next to Walnut Canyon Road
Walnut	7A	433	292 cfs	**431 cfs**	Upstream Casey Road culvert
Walnut	14AB	709	469 cfs	**696 cfs**	Confluence at Casey Road culvert with small offsite canyon area
Walnut	28AC	846	603 cfs	**889 cfs**	Downstream of confluence at High Street Drain with Moorpark Drain No. 1
Walnut	35AB	1,044	797 cfs	**1,149 cfs**	Downstream of confluence at Poindexter culvert crossing
Walnut	48AB	1,553	1,123 cfs	**1,619 cfs**	Downstream of confluence at Gabbert Canyon Road
Walnut	49A	1,623	1,176 cfs	**1,688 cfs**	Southern Pacific Railroad culvert crossing
Walnut	62AC	1,794	1,258 cfs	**1,810 cfs**	Downstream of confluence with 54" dia. Los Angeles Avenue city storm drain

4.5 Hydrologic Modeling of Flood Control Storage Alternatives

The watershed hydrology model developed on VCRAT for the current landuse conditions was utilized to perform hydrologic routing to evaluate the effect of the different detention basin alternatives. Most of the proposed drainage system alternatives consider the use of multiple detention basins at different locations within the watershed and the cumulative effect on the resulting hydrograph peak attenuation impacts the channel conveyance requirements. A variety of different detention basin combinations were initially investigated in order to maximize the peak flow reduction. The geometry and configuration of each of the individual detention basin sites "optimized" in order to maximize the performance based upon the physical site restrictions without coming under the jurisdiction of the Division of Safety of Dams. The optimization procedure involved numerous combinations of basin geometry and outlet configurations until the peak flow attenuation was maximized. The optimized detention basin could then be evaluated in the overall watershed drainage "system" to determine the regional effect.

VCHYDRO was the primary reservoir routing program utilized since this is the utility program for VCRAT which performs the modified pulse routing and the baseline watershed model had been prepared using VCRAT.

VCHYDRO - The utility program for VCRAT which utilizes the synthetic runoff hydrograph developed in the modified rational method and allows performing the runoff yield to the shape of the VCRAT hydrograph in order to ensure the effective rainfall volume matches the volume of the hydrograph. The "fattened" hydrograph can be routed through a reservoir based upon outflow rating curve data and depth-storage relationships for the basin. The resulting outflow hydrograph from the detention basin can be imported back into the VCRAT program to continue the simulation through the remainder of the watershed. An important item for consideration when applying this model to a watershed with multiple detention basin is that the routed hydrographs which are imported back into the VCRAT model are "fattened", however, the remaining hydrographs generated by VCRAT are not fattened. This effect can potentially modify the effect of different hydrographs within the watershed depending upon the timing and magnitude of the watershed.

4.5.1 Summary of Alternative Drainage System Design Discharges

The baseline watershed VCRAT hydrology model prepared by VCFCD was modified to reflect the proposed storage or diversion elements associated with each of the eight watershed drainage system alternatives which were selected for detailed investigation. Reservoir routing elements and flow splits for diversions were incorporated into the overall watershed hydrology model which resulted in modifying the mainline channel hydrograph. Routing analysis were performed for 100-year return period only since the VCFCD design criteria associated with detention basin and the resulting hydrographs in the mainline channel were also evaluated for the 100-year return

period. The watershed model results for the 100-year discharges of each of the channel system alternatives are summarized in the following tables for both Walnut and Gabbert Canyon Channels. Representative watershed concentration points are presented which reflect channel system reach lengths utilized to describe the channel for this study.

Table No. 4.4 - Summary Drainage Systems Alternative Hydrology
Walnut Canyon Channel 100-year Peak Discharges

Conc. Pt.	Chann Reach	Exist Q_{100} (cfs)	Drainage System Alternate - Q_{100} (cfs)	
			B	B-Revised
6A	1	390	273	273
14AB	1	696	476	476
28AC	2	889	597	597
36A	Split	1,112	847	847
48AB	3	1,619	156	***
62AC	4	1,810	564	***

5 Engineering Design Criteria

5.1 Flood Protection Requirements and Design Criteria

The flood protection requirements were based upon the standard VCFCD design criteria and incorporated both the channel and detention basin requirements. The standard VCFCD detention basin design criteria is based upon the 100-year level of protection. Flood control channels are designed to provide 50-year conveyance with freeboard or 100-year capacity without freeboard.

Freeboard

The VCFCD freeboard requirements for open channels are based upon adding allowance to the actual depth with area calculated for air entrainment, flow in the unstable zone, and superelevation. A minimum residual freeboard must be maintained above the 50-year water surface or the totals for these additional allowances. Freeboard was calculated when evaluating the capacity analysis for the 50-year design condition and the results are provided in the *Technical Appendix*.

Superelevation

Centrifugal effects cause a transverse hydraulic gradient for channel flow around a bend and results in the water surface elevation higher on the outside of the curve. VCFCD design criteria is to design the curves to limit the superelevation to one foot above the normal depth or 10% of the channel width. The amount of superelevation can be calculated for a supercritical rectangular channel, the most common case for this channel system, using the following equation:

$$h = 1.2\frac{V^2 b}{Rg}$$

5.2 Hydraulic Analysis

Hydraulic analysis associated with the conveyance systems followed the general criteria outlined in the *Ventura County Flood Control District Design Manual* (1968) for both the deficiency analysis and the preliminary design of the replacement channel facilities. Water surface profiles for the channel systems were analyzed to determine actual flow depths and evaluate the effects of culverts or junctions. Another hydraulic effect is the potential for surface waves, especially in supercritical channels which can occur from shifts in alignment such as at curves. The Los Angeles County Flood Control District hydraulic analysis program F0515P or Water Surface Pressure Gradient (WSPG) was utilized to develop the hydraulic model of the channel system. The program computes and plots uniform and non-uniform steady state flow water surface profiles and pressure gradients in open channels or closed conduit with irregular and regular section. The computation

procedure is based on solving Bernoulli's equation for the total energy between the section in a reach. The open channel flow analysis utilizes the standard step procedure while confluences and bridge piers are analyzed using the pressure and momentum theory.

Hydraulic Design Modified / Replacement Channel

The hydraulic design of replacement channel systems, including diversion systems, were evaluated through the preparation of water surface profile analysis to ensure that all systems provided identical levels of flood protection. The objective of the channel modifications was to provide the minimum amount of improvements that provides the desired level of flood protection. Some of the criteria which was applied to assist in guiding the development of the various alternatives for the channel reconstruction included:

- Wall height extensions to the existing channel were applied to a maximum height of 3-feet and if this did not provide the required addition capacity then the base width was widened using the existing channel depth for the new cross section.

- Splitter walls were applied to different channel curve locations in order to maintain a maximum superelevation less than one-foot.

- The reconstructed channel was assumed to follow the same vertical alignment and elevations as the existing channel system

- The modified channel section was designed to convey the main channel 100-year flowrate based upon the implementation of different detention basin alternatives. The hydraulic conveyance capacity uses "bank full" capacity, neglecting superelevation or freeboard.

Water Surface Control Elevations

The downstream water surface control for the hydraulic analysis of the channel system was based upon the water surface elevations in the Arroyo Simi determined by VCFCD. The backwater influence from the Arroyo Simi generally was limited to downstream of Los Angeles Avenue, since the majority of the channel system is supercritical. Hydraulic analysis of the Walnut Canyon Channel utilized the water surface calculated from the confluence with Gabbert Canyon Channel.

Table No. 5.1 - Arroyo Simi Water Surface Control Elevations

Location Description	Arroyo Simi Chann. Sta.	Proposed Design W.S. Elev.	FIRM W.S. Elev.
Relocated Walnut Outlet	62+00	447.8	-----

5.3 Detention Basin Requirements

One of the primary requirements applied in the initial planning and evaluation of the stormwater detention facilities was limiting the size of the facilities so these storage basins would not be considered jurisdictional DSOD "dams". The limitation are discussed in more detail in *Section 8.5-Division of Safety of Dams Design Considerations/Criteria* and generally were the governing factor regarding the effectiveness of the stormwater storage attenuating the peak flowrates. Size of the detention facilities were maximized based upon the physical site considerations and the DSOD limitations in order to optimize the effectiveness of each basin. In addition, VCFCD has published minimum guidelines for stormwater detention facilities which focus on the specific design elements for detention basins. These requirements were included in the planning of the individual basins and also addressed in the construction cost estimates.

Debris Storage

Tributary watersheds to a detention basin which is under five square miles must include allowance for debris storage which is equivalent to 125% of the 100-year frequency design debris production (see *Section 4.2.1-Estimated Debris Volume Generation*) placed level in basin before routing of the hydrograph. All the detention basin locations evaluated as part of this investigation had a measured tributary watershed less than five square miles. The largest tributary watershed was the existing Gabbert Debris Basin with a drainage area of 2,433 acres or approximately 3.8 square miles.

Level of Protection

Detention basins are designed to provide 100-year level of flood protection so all hydrologic routing analysis of the detention basins involved 100-year hydrographs. The effects of the peak attenuation of the flows within the channel system associated with the detention basins were based upon applying the 100-year hydrology model for the entire watershed. The flood protection criteria for the flood control channels utilized either 50-year conveyance with freeboard or 100-year conveyance "bank-full" or no freeboard. All the channel system alternative utilized stormwater detention elements so the 100-year criteria was applied to the evaluation of the channel system hydraulics.

Outlet Works

The outlet works must consist of a permanent concrete structure which will reduce the tendency of plugging by floating debris. The outlet works shall also consist of facilities for disposing of stored water in the debris pool portion of the basin.

Emergency Spillway

Emergency spillway designed for the unattenuated peak 100-year flow and will extend beyond the downstream of the embankment toe. Emergency spillway crest elevation should be one foot above the maximum operation water surface elevation.

Earthen Embankment

The crest of the embankment shall be located three-feet above the maximum water surface for the emergency spillway flow. The minimum crest width is twenty feet and a 15-foot wide asphalt paved road shall be centered on the crest. The downstream slope of the embankment shall generally be on a 3:1 slope and downstream face shall be covered with 12-inch blanket of river-run cobble stones.

Access Requirements

Access shall be provided to the embankment crest, emergency spillway, and the outlet works. In addition access will be provided to the bottom of the basin for debris removal.

5.4 Debris Basin Requirements

The specific design requirements associated with the detention basin are applicable to planning the minimum required features for debris storage facilities. The particular requirements include providing an allowance of 125% of the estimated 100-year single event debris production. In addition, VCFCD has prepared *Debris Basin Manual* (1991) which also contains additional design criteria particularly related to existing debris basin facilities. The basis for estimating the debris production rates for various storm events involves applying the Dr. Kevin Scott sediment yield formula. The analysis for this watershed is described in more detail in *Section 4.2.1 - Estimated Debris Volume Generation.* The available debris storage volume is calculated assuming the slope of the debris cone surface will extend from the spillway elevation equal to 0.6 times the original streambed slope

6 Plan Formulation and Alternative Development

6.1 Design Objective and Criteria

The project alternatives that were developed in the original study were created with the goal of achieving a balance between (1) flood protection objectives, (2) providing the minimum cost for the maximum benefit or economic constraints, and (3) compatibility with existing physical constraints and future development. Numerous alternatives were developed during the initial plan formulation process and then screened through a feasibility evaluation. This current study is a further refinement of the recommended alternative, Alternative-B. This refinement is intended to make the flood control improvements more technically feasible while reaching the desired project objectives. The following key objectives were identified in guiding the development of the refinement of Alternative-B:

- Provide a comprehensive flood control program which provides flexibility for the local agencies and facilitates implementation.

- Minimize the hydrologic impacts on the channel system from future urbanized development within watershed through the introduction of watershed drainage ordinance which requires development projects mitigate increases in runoff.

- Provide a foundation to guide adjacent development within the watershed which will accommodate the regional flood protection requirements and allow development to proceed.

- Provide a regional drainage system which develops the required level of flood protection with the least economic impact.

- Identify locations within the watershed for land acquisition or reserve land for flood control facilities.

- Maximize utilization of existing flood control facilities and right-of-way which integrate into the recommended program

The general approach to regional stormwater management involves that application of either conveyance oriented solutions or a storage oriented approach. The conveyance oriented approach is the more traditional design and provides drainage systems for the hydraulic conveyance of the runoff. The storage oriented approach provides temporary storage of stormwater runoff and release at a reduced rate. The conveyance- and storage-oriented approaches are not necessarily mutually exclusive. The two approaches can be compatible and the use of the two approaches generally lead to a more optimum system. The plan formulation process in this investigation attempted to optimize the design for this watershed through the combined application of these approaches

Development of a comprehensive regional flood protection program requires the application of a "systems" approach since implementation of specific design features have effects which extend throughout the watershed. The technique involved identification of individual design elements such as (1) detention basins, (2) debris basins, (3) channel improvements, (4) channel relocations, and (5) diversion systems, which provide various degrees of enhanced flood protection. The available design elements were combined into "alternative drainage systems" to evaluate the collective benefit on the channel system. This technique involved (1) formulation of potential design elements, (2) evaluation of the measures, (3) performing a feasibility investigation of the control measure, (4) combining these feasible elements into an implementable watershed drainage system, and (5) screening these alternative "systems" to the most potentially feasible.

The design criteria applied in performing the technical investigation and plan formulation for the revised recommended flood control system relied on the Ventura County Flood Control District standards design guidelines. Additional criteria related to specific requirements applied in the alternative development and facility requirements is discussed in more detail in *Section No. 5 - Engineering Design Criteria.*

6.2 General Flood Protection Design Approach

The flood protection requirement which governed the plan formulation of the revised recommended alternative for the removing the channel deficiency involved either (1) providing 50-year conveyance in the channel plus the appropriate freeboard in the channel as defined in the *VCFCD Design Manual* or (2) 100-year conveyance in the channel without freeboard or superelevation in curves. All detention basins were designed based upon the 100-year frequency. The various combinations of detention basin storage and amount of channel reconstruction were optimized in order to minimize the capital costs, but provide similar levels of flood protection.

6.3 Flood Protection System components

The available flood control elements which were utilized to address correcting the hydraulic deficiency can be either classified as conveyance oriented or storage oriented. The individual elements were analyzed to develop a wide range of available tools. In the original study, the various individual elements were then combined to develop potential watershed "systems" since each of the elements will have a combined effect which must be evaluated. This same approach was utilized in the evaluation of the revised recommended alternative.

6.3.1 Flood Storage Elements

The flood storage facilities which were investigated in the revised recommended plan formulation included both the construction of new basins and the modification of the existing debris basins to provide stormwater attenuation. The planning process developed nine potential sites which could provide flood control storage capabilities. These were refined to five feasible locations with eight actual alternatives that were selected for detailed evaluation and incorporated into the drainage systems alternatives. The storage facilities included both on-line and off-line detention basins

that were constructed from either embankments or excavated below the natural ground. All the facilities were developed to be outside the jurisdiction of DSOD. All facilities were provided with adequate storage for debris potential except for the off-line basins 3, 4, and 5. These facilities were located downstream of proposed debris collection facilities for basins 0 and 1, also the by-passing of the flow will reduce the potential of significant bedload from depositing.

Table No. 6.1 - Summary of Proposed Detention Basin Characteristics

Basin Alt. No.	Surface Area (acres)	Max Storage (acre-feet)	Max Basin Depth (feet)	Q_{100} Inflow	Q_{100} Outflow
Gabbert -B Double Basin	11	145[1]	10.6 feet	982 cfs (902cfs bypass)	0 cfs
0	1.3	14[3]	10 feet	390 cfs	273 cfs
1	0.65	25[3]	18.5 feet	301 cfs	65 cfs
2	3.6	36[3]	15 feet	536 cfs	143 cfs
3	14	70[2]	5 feet[2]	847 cfs	9 cfs
4	61	305[2]	5 feet[2]	847 cfs	4 cfs
5	42	210[2]	5 feet[2]	847 cfs	14 cfs

1. Total combined storage of all ponds, not DSOD jurisdictional
2. Incised basin below natural ground, not DSOD jurisdictional
3. Maximum limiting volume of 50 AF not available due to site restrictions such as major road relocations or existing residential development within inundation area

6.3.2 Hydraulic Conveyance Elements

The hydraulic conveyance system focused on new facilities which would assist in providing the desired hydraulic capacity. The conveyance was provided through either improvement of the existing channel section to the desired increased flow capacity or a relief system was provided which could provide additional capacity to supplement the existing channel system.

6.3.2.1 Channel System Modification

The existing channels system for both Walnut Canyon Channel and Gabbert Canyon Channel was divided into four different homogeneous segments to facilitate analysis and evaluation of system modifications. Modifications to the existing channel assumed that the existing horizontal and vertical alignment of the channel would be utilized, just the cross sectional area increased to maintain the desired capacity. An "all-channelization" alternative which results in the complete reconstruction of the existing channel was evaluated and the relative size requirements can be determined from *Tables*

3.6 and 3.7 Comparison of Uniform Hydraulics which indicates the required channel dimensions in order to achieve bank-full normal depth capacity. However, the development of the recommended modified channel dimensions was based on actual hydraulics from water surface profiles to achieve the desired flood protection requirements. An iterative design process was performed for the hydraulic analysis and design of the channel sections until it satisfied the requirements. **The horizontal curves of the existing channel were maintained in order to avoid property acquisition and other conflicts**. Modification of the existing horizontal curves through increasing the radius would have reduced the superelevation requirements for the channel section since a majority of the existing curves are small radius curves with radii of 99-feet. Pier walls/splitter walls were incorporated at many locations in order to reduce the superelevation to within an acceptable level. Also wall extensions can be constructed in those areas where the existing channel reaches were adequate with the reduced flow from detention basins.

Gabbert Canyon Channel

The alternatives considered either partial reconstruction or complete reconstruction of the existing Gabbert Canyon Channel system depending upon the amount of flow attenuation provided by detention basins. The channel reach from the Walnut Canyon Channel confluence upstream to the debris basin needs to be reconstructed for all alternatives. The channel section requirements for the various alternatives and channel reaches are indicated in the following table.

Table No. 6. 2- Summary of Gabbert Canyon Rectangular Channel Modifications

Alternate	Reach No.1 (L=2,030')	Reach No. 2 (L=625')	Reach No. 3 (L=1,200')	Reach No. 4 (L=3,310')
Exist	**b=8' / h=4.5'**	**b=8' / h=4'**	**b=14' / h=6' (3' wall extension)**	**b=14' / h=6.5'**
B	Existing	10' x 5'	Existing	existing
B-Revised	Existing	10' x 5'	Existing	existing

Walnut Canyon Channel

All the alternatives only required that Reach No. 2 and a portion of Reach No. 3 be reconstructed, approximately 1,900 lineal feet. The channel section requirements for the various alternatives and channel reaches are indicated in the following table.

Table No. 6.3 - Summary of Walnut Canyon Channel Modifications				
Alternate	Reach No.1 (L=1,280')	Reach No. 2 (L=1,300')	Reach No. 3 (L=3,900')	Reach No. 4 (L=4,400')
Exist	**b=7' / h=5'**	**b=8' / h=5'**	**b=10' / h=5'**	**b=12' / h=5'**
B	existing	8' x 6' (wall extension)	existing	existing
B-Revised	existing	8' x 6' (wall extension)	existing	b=14' / h=5'

6.3.2.2 Walnut Canyon Channel Outlet Realignment

The selected alternative flood control plan recommended realignment of the Walnut Canyon Channel outlet to a new outlet location into the Arroyo Simi. This relocation functions as a diversion. The relocated channel section would follow a horizontal alignment along the eastern boundary of the Smith-Holst Ranch and involves the construction of approximately 3,000-feet of earthen trapezoidal channel section with rock rip-rap lined side slopes. The channel section is designed with a maximum average velocity of 8 fps without influence from the downstream tailwater and the required channel size is based upon the tailwater condition. Relocation of the channel requires construction of a new culvert crossing under Los Angeles Avenue since the existing Gabbert and Walnut Canyon Channels are on the north side of Los Angeles Avenue. Relocating just Walnut has the advantage of reducing the flow to Gabbert by almost half and allows the ability to utilize more of the existing Gabbert Canyon Channel without reconstruction. The outlet channel dimensions for the various conditions are indicated in the following table.

Table No. 6.5 - Relocated Outlet Channel			
Description	Flowrate	Section	Systems Alternate
Walnut Relocation	830 cfs	trap b= 21', d=varies 6'min to 15'max z=2	Revised -B

7 Design Considerations

7.1 Agency Agreements, Permits, and Approvals

Implementation of the recommended watershed improvements would involve various regulatory and governmental agencies for approvals and environmental clearances. The regulatory agencies focus primarily on (1) the environmental issues and impacts and/or, (2) public safety. Early involvement of the jurisdictional agencies and stakeholders within the watershed facilitate development of an implementable plan and ensures requirements associated with the agreements or permits are incorporated into the design.

General Environmental

The California Environmental Quality Act applies to all discretionary activities proposed to be carried out or approved by California public agencies, including state, regional, county and local agencies, unless an exemption applies. Generally, the implementation of CEQA entails three (3) separate phases: a) preliminary review of a project to determine whether it is subject to CEQA; b) preparation of an Initial Study to determine whether the project may have a significant environmental effect; and c) preparation of an EIR if the project may have a significant environmental effect or of a Negative Declaration if no significant effects will occur. CEQA applies only to government activities that are defined as a project. A project is defined as the whole of an action which has the potential for resulting in a physical change in the environment, directly or ultimately. [Guidelines Sec. 15378(a)] The effect on the environment must, however, be *reasonably foreseeable* and the effect must be on the *physical* environment. [Pub. Res. Code Sec. 21065]

FEMA

The implementation of the proposed watershed drainage system improvements would result in the elimination of the flood hazard zones in the city associated with overflow from the channel system. In addition, any modifications or encroachment into the published floodplain for communities participating in the National Flood Insurance Program (NFIP) must be approved by FEMA. Communities which participate in the NFIP are responsible for submitting data to FEMA reflecting projects which modify the floodplain or flood hazard zones.

Regulatory Permits

The construction of the detention basins will require environmental regulatory permits since the detention basins are primarily located in natural stream areas with some riparian vegetation. Jurisdictional agencies that would potentially be involved include (1) Army Corps of Engineers under Section 404 of the Clean Water Act, (2) California Department of Fish and Game for the 1601 Streambed Alteration Agreement, and (3) Regional Water Quality Control Board which administers Section 401 Water Quality requirement.

Utilities

Existing utilities adjacent to the proposed drainage facilities or those that potentially interfere should be incorporated into the design to allow relocation or protection. Early coordination with the impacted agencies to determine specific requirements should be performed.

City Of Moorpark

Concurrence by the local municipal planning agency and the City Engineer should be obtained to ensure that the proposed watershed plan is adopted into the municipal planning documents. Also, the city will be one of the primary agencies to assist in assuring that future developments are conditioned to implement the drainage facilities and provide a municipal drainage ordinance for the watershed which restricts increasing runoff.

7.2 Geotechnical Constraints

The primary geotechnical considerations are generally associated with the construction of the proposed detention basins. The channel reconstruction will occur along the same horizontal alignment as the existing channel and does not appear to have experienced foundation related maintenance problems, minimizing geotechnical concerns. The primary items of concern related to the detention basin construction include: (1) embankment slope stability and protection, (2) grading engineered fill including material sources, (3) foundation system requirements for the embankment, and (4) settlement. The embankment design is the critical geotechnical factor to ensure stability and protection of the public.

7.3 Utilities

The existing channel system provides a design corridor which limits the interference or conflicts from other utilities. The proposed reconstruction of the existing channel facilities to enlarge the channel section does not generally extend beyond the existing channel right-of-way which minimizes the potential influence of utilities. The areas where the utilities can potentially be a limiting design constraint include: (1) channel relocation crossing of Los Angeles Avenue, and (2) the diversion system crossing Los Angeles Avenue and Poindexter. All proposed detention basin locations occur on undeveloped land which should minimum impact to utilities.

7.3.1 Sewer and Water

The existing sewer system for the central portion of the City of Moorpark is indicated on *Existing Utility Layout Exhibit* based upon the current sewer index map information for the city. The general location and size of existing water facilities are also illustrated on the same exhibit. Sewer systems generally represent a physical constraint since the vertical alignment is difficult to modify because the systems operate by gravity. The largest sanitary sewer which influenced the drainage system alternative is a large 21-inch diameter trunk line located in Los Angeles Avenue which ultimately crosses the Arroyo Simi at Maureen Lane. This sewer was a physical constraint related to the sizing and alignment of the diversion conveyance

Alternative drainage systems for the Gabbert/Walnut Canyon Channels will require reconstruction of the local drainage inlets for alternatives which include modifications to the existing channel section geometry. The costs associated with the small diameter local drain inlets are small and have been neglected in this estimate. However, since over 50% of the land directly adjacent to the channel is undeveloped and provisions for future urban development storm drain systems should be incorporated for those portions of the channel which are reconstructed by providing connection locations.

7.5 Right-of-Way and Property Acquisition

The right-of-way associated with the existing channel improvements ranges from a maximum of 60-feet to 20-feet, generally including a 12-foot maintenance road on one side of the channel or access from the adjacent parallel public street. The portions of the channels enlarged will require additional right-of-way in order to maintain the same minimum maintenance and access requirements. The detention basin locations will require right-of-way for the surface area encumbered by these facilities including the maximum inundation limits associated with the reservoir pool. Additional right-of-way may be required for access to the detention basins and temporary easements just for construction purposes

Table No. 7.2 - Summary of Minimum Land Acquisition Requirements

Drainage Alternative	Area (acres)			
	Channel Relocation	Detention Basin	Diversion System	Total
B	6.5	28	2.2	36.7
Revised-B	6.5	28	0	34.5

7.6 Future Development / Landuse

A primary consideration in the development of the drainage system alternatives was the relationship to the adjacent undeveloped land within the watershed and the potential landuse impacts. The recommended regional drainage improvements are designed to assist many of the adjacent properties that have flood hazard designations and allow continued development of these areas by ensuring that the planning process incorporates the allowances for these drainage facilities. An important element which is inherently assumed with the proposed drainage alternatives is the implementation of an administrative drainage ordinance for the watershed which requires **future development projects to mitigate hydrologic impacts from their projects to match pre-existing conditions**. All the hydrologic analysis performed for this investigation was based upon the 1996 landuse and development condition, except for the development of the Hitch Ranch. The future development plan formulation process must include both allowances for the regional drainage facilities and the local detention requirements based upon each the individual

development project. The allowances for the regional drainage facilities include adequate land for enlargement of existing channels, regional detention or debris storage facilities, and channel relocation.

The two large undeveloped parcels which are most impacted from the implementation of the proposed drainage facilities include the Smith-Holst Ranch and the Hitch Ranch. These parcel also have the most frontage to the existing channel system. Initial landuse planning documents had been provided by consultants for the Smith-Holst Ranch and the Hitch Ranch which indicated preferred locations for the drainage facilities which would be compatible with their development landuse plans.

Table No. 7.3 - Summary of Undeveloped Land Parcel Impacts

Parcel Description	Proposed Facilities	Impacted Area	Percent of Parcel Impacted
Smith/Holst Ranch	Relocated Outlet Channel	7.5 acres	5%
Hitch-Ranch	Detention Basin	20.5 to 67.5 acres[1]	7% to 24%
Tract No. 4652	Detention Basin	6.0 acres	3%
Tract No. 4520	Detention Basin	5.0 acres	3%

Impacted area varies depending upon the size of the offline diversion detention basin which varies from 21.0, 49.0, and 68.0 acres

2. Note that in the determination of detention capacity and channel size through Smith/Holst Ranch and Hitch Ranch, allowances were made to account for required future project mitigation.

Evaluation of the detention basin size requirements assumed the future development within the watershed would be required to mitigate onsite the increase in peak flowrates and the detention basins provided peak flow reduction to satisfy the hydraulic deficiencies. The sizing of the regional detention basins, however, included the proposed development of the Hitch Ranch which would be mitigated in the required storage volume.

7.7 Division of Safety of Dams Design Considerations/Criteria

The planning of the regional stormwater detention basins focused upon providing facilities which would **not** be under the jurisdiction of the State Division of Safety of Dams (DSOD). The specific requirements associated with jurisdictional dams are defined in the *Statutes and Regulations Pertaining to Supervision of Dams and Reservoirs* (1995) and *Guidelines for the Design and construction of Small Embankment Dams* (1993) published by the State Department of Water Resources, Division of Safety of Dams. The earthwork foundation costs associated with the dam embankment are substantially reduced if the facility in not considered a jurisdictional dam. The embankment of a jurisdictional facility has stringent requirements related to the foundation and must be embedded into competent material which may require major excavations if there are deep alluvial deposits and cutoff trenches. Similar restrictions are associated with the primary spillway which must be constructed in native material and the spillway cannot be located within the embankment.

The embankment and excavation are some of the primary cost elements associated with dam construction and the introduction of these requirements will result in major construction cost increases. The basic criteria which is utilized by DSOD to define a jurisdictional "dam" facility includes the following:

- Embankments which are more than 25-feet height measured from the **natural stream bed or lowest point at the downstream toe of the embankment**

- Embankments which impound a **storage volume exceeding 50 acre-feet**

- Embankments which are less than 6-feet in height, regardless of storage capacity, or which have a storage capacity of 15 acre-feet, regardless of height shall **not be considered a "dam"**

The definition of a jurisdictional DSOD facility was applied to define the maximum size limitations for potential detention basins in order to evaluate the effects stormwater storage alternatives and assist in the initial plan formulation. The DSOD facility size limits of storage volume and height present a severe restriction which minimizes the effectiveness of a single stormwater detention basin within a large watershed, especially when considering "flow-through" or "on-line" detention facilities. However, creative techniques are available to maximize the benefit from smaller detention facilities which are not jurisdictional DSOD facilities. The application of these features are particularly important for developing an effective storage alternative for the Gabbert watershed which has a large tributary watershed. Some of these techniques which can be incorporated in the planning of a basin which optimize the effectiveness of the facility are discussed in more details in *Section 8 - Detention Basin Features and Requirements* and include the following:

- Excavating the basin and creating the storage volume below the natural surrounding ground elevation, since an incised basin or pit is not considered a "dam"

- Excavating a portion of the basin below the natural ground elevation measured at the downstream toe of the embankment. The amount of storage volume measured from the embankment toe elevation is not considered in calculating the storage volume associated with the embankment for defining a jurisdictional facility. However, the primary limitation in the excavation depth becomes the ability to provide a gravity outlet to drain the reservoir pool.

- Use several smaller interconnected storage facilities which will operate similar to a single larger facility.

- Incorporate "off-line" or "by-pass" detention basins rather than "in-line" or "flow through" basins, since these facilities provide a more effective reduction in the hydrograph peak with **reduced storage volume** requirement.

Interconnected Ponds

The application of interconnected ponds was a concept which was applied for several alternatives related to modifying the existing Gabbert Canyon Debris Basin to a stormwater detention basin. Discussions were performed with DSOD staff to verify the applicability of this concept and determine if any special requirements would be associated with this facility. A primary concern was that even though the smaller basins would be below the DSOD jurisdictional facility size requirements that the combination of all the basins might be considered a single basin. The initial indication from the DSOD staff was that the interconnected smaller basins can be utilized and would not be considered a jurisdictional dam if:

- All the embankments of the basins were designed to the same standard, including any common embankments separating basin pools that would inundate both sides of the embankment.

- Each detention basin had its own spillway system.

Final determination of the jurisdictional nature of these more complex systems would require a review by DSOD of the conceptual designs.

8 Detention Basin Features and Requirements

8.1 Summary of Detention Basin Alternatives

Stormwater detention facilities are the principal elements in a storage oriented approach for flood control, providing peak flow reduction based on temporary storage of the runoff volume. **Six potential detention basin sites** have been selected for detailed evaluation at various locations within the watershed after performing a feasibility screening of numerous alternatives. The sites were selected based upon (1) physical site constraints and limitations, (2) maximizing drainage area impacted, (3) minimizing inundation areas, (4) embankment size requirements, (5) DSOD limitations, (6) future landuse constraints, and (7) proximity to a channel. The initial screening of detention basin sites involved elimination of the drainage area to the detention basin site from the VCRAT hydrology model, or complete retention, and then evaluating the effects on the main channel discharge. This analysis provided an indication of the maximum potential benefit from the basin. The application of multiple detention basins within the watershed were evaluated since these will effect the overall timing of the main channel peak flowrate. The detention basin alternatives included both "on-line" or flow-through basins and "off-line" or by-pass basins. The off-line detention basins allow a more efficient use of the available storage through impacting only the critical portion of the storm hydrograph. "On-line" detention basins involve the entire hydrograph routed through the basin which results in the initial volume associated with the rising limb of the hydrograph utilizing a portion of the available storage required to attenuate the peak flowrate.

The detention basin facilities were specifically sized to avoid DSOD jurisdiction, which restricted the maximum attenuation available from certain sites. A larger detention storage volume at a single site above the 50 acre-feet DSOD jurisdictional limit was generated through (1) multiple basins in series, (2) interconnected basins, and (3) providing a portion of the storage volume below the natural ground elevation.

The potential impacts from sediment dead storage requirements were accounted through providing a separate debris facility upstream or adding an allowance for debris storage. The smaller detention basin site utilized sediment storage volume excavated below the natural ground surface. The resulting detention basins which were elements of the drainage system alternatives are indicated in the following table.

Table No. 8.1 - Summary of Proposed Detention Basin Characteristics

Basin Alt. No.	Surface Area (acres)	Max Storage (acre-feet)	Max Basin Depth (feet)	Q_{100} Inflow	Q_{100} Outflow
Gabbert -B Double Basin	11	145[1]	16 feet	982 cfs (902cfs bypass)	0 cfs
0	1.3	14[3]	10 feet	390 cfs	273 cfs

Table No. 8.1 - Summary of Proposed Detention Basin Characteristics					
Basin Alt. No.	Surface Area (acres)	Max Storage (acre-feet)	Max Basin Depth (feet)	Q_{100} Inflow	Q_{100} Outflow
1	0.65	20[3]	18.5 feet	301 cfs	65 cfs
2	1.7	38[3]	15 feet	536 cfs	143 cfs
3	14	90	5 feet[2]	764 cfs	241 cfs

1. Total combined storage of all ponds, not DSOD jurisdictional
2. Incised basin below natural ground, not DSOD jurisdictional
3. Maximum limiting volume of 50 AF not available due to site restrictions such as major road relocations or existing residential development within inundation area

Table No. 8.2 - Summary of Detention Basin Costs				
Alternate	R/W area	R/W Costs**	Construction Costs*	Total Costs
Gabbert - B	14.5 acre (25.8 acres total)	$777,200 @ $53,600/ac	$3,178,890	$3,956,090
0	3 acres	$160,800 @ $53,600/ac	$320,678	$481,478
1	6 acres	$900,000 @ $53,600/ac	$765,570	$1,665,570
2	4 acres	$214,400 @ $53,600/ac	$680,648	$895,048
3	15 acres	$804,000 @ $53,600/ac	$920,205	$1,724,205

* - note this cost is based upon the March 1997 preliminary estimate of construction and was adjusted to reflect the escalation of construction costs since March 1997 to June 2005. The basis of the escalation is the California Construction Cost Index developed by the State of California using the Building Cost Index (BCI) cost indices produced by Engineering News Record (ENR).

** -note-this cost is based upon the 1997 preliminary estimate of R/W acquisition costs of $25,000 per acre and was adjusted for inflation of 10% per year for 8-years for a total increase of 114% to reflect an updated cost more indicative of the current real estate value escalation.

8.1.1 Gabbert Basin Modification/Expansion

The existing 4.8-acre Gabbert Canyon Debris Basin is a regional sediment/debris collection facility which drains a primarily natural tributary watershed area of 2,350 acres. The location of this site at the headworks of the Gabbert Canyon Channel provides an excellent opportunity to modify the facility for flood storage. The existing basin has an effective storage depth of 11.0-feet to the spillway crest and level storage volume of 16,300 cubic yards (10.1 acre-feet) with a design 100-year sediment yield of 35.3 acre-feet. Geographically the site is located near the mouth of the canyon which spreads onto the apex of a small alluvial fan. This feature provides

a wider area for the basin floor than in the canyon and is the last location where the floodplain is generally confined. The large size of the drainage area requires that a "by-pass" type detention basin be used in order to generate effective attenuation flow rate during the timing of the peak flow, otherwise a flow-through basin only provides a minor influence on the attenuation. Also, the magnitude of the hydraulic deficiencies downstream require that the total storage exceed the 50 acre-feet DSOD maximum limit in order to provide the required minimum hydraulic benefit to the downstream channel. A larger volume effective storage volume was provided through the application of two alternatives which required multiple basins, including debris storage requirements. A portion of the storage can be provided below the natural ground relative downstream embankment toe elevation which allows excluding this additional volume from the storage definition of a jurisdictional "dam."

Alternate-B (Double Basin) This facility configuration provides two detention **ponds in series** which are located downstream of a proposed debris basin similar to that indicated for Alternate-A. The primary difference between alternates "A" and "B" is that "B" has a larger by-pass flowrate, but requires a lower storage volume. Alternative "B" has the advantage of reducing the total flow downstream of the Gabbert Basin to a value which minimizes the amount of reconstruction upstream of Los Angeles Avenue to only a small segment of existing trapezoidal channel. This alternative preserves the existing basin geometry, but also increases the embankment height to the maximum limiting non-jurisdictional value and provide additional excavated volume below the natural ground. The new detention basin is located in-line between the upstream debris basin and downstream Gabbert Basin.

Operational Parameters- This detention basin configuration results in approximately 11.0 acres of surface area for the basins and utilities with a maximum storage volume of **145 acre-feet**. This storage volume is accomplished without being a jurisdictional dam through excavating a portion of the storage volume below the elevation of the embankment toe elevation. The upstream debris basin provides a key function in this alternate by performing the flow split to the by-pass channel and the remainder of the inflow hydrograph spills into the intermediate detention basin. The by-pass channel intercepts all the inflow up to 902 cfs and additional flow above this amount will crest an elevated spillway discharging into the intermediate detention basin. Flow release from the intermediate basin is controlled by an outlet tower connecting to the downstream basin location or another rectangular drop spillway. The downstream has a similar outlet configuration with an outlet tower and rectangular drop spillway. The flood control storage basins are designed with adequate volume to completely retain this portion of the storm hydrograph and requiring only a minimal return flow to drain the detention basin. The upstream debris basin is designed to provide 53 acre-feet of debris storage volume and the operating head for the flow split to occur from the by-pass structure.

The by-pass structure consist of a 96-inch diameter "two-staged covered riser" following the SCS design procedures and was selected since it is considered to be the

best drop inlet spillway riser for use under a wide variety of conditions. Flows entering the debris basin would initially be intercepted by the riser until the water surface in the basin corresponded to the maximum bypass flowrate. When the water surface reaches the higher level it would then spillway over another rectangular drop spillway which would convey this portion of the hydrograph into the first detention basin.

8.1.2 Basin No. 0 (Walnut Canyon)

This 1.3 acre basin site is located at the upstream headworks to the existing Walnut Canyon Channel improvements and within the natural creek floodplain. Approximately 382-acres of primarily undeveloped drainage is tributary to this location. The topography within Walnut Canyon limits the available storage from sites in this area since the canyon bottom is relatively narrow. Walnut Canyon Road follows an alignment within the canyon bottom also which further reduces or limits the maximum storage without impacting the roadway. Several locations within the canyon area were identified as potentially feasible detention basin sites since these areas had significantly widened canyon floor areas and the road was elevated above the floodplain. The storage volume would be generated through the construction of an embankment fill within the natural creek floodplain between one canyon wall and the adjacent roadway fill. The maximum effective storage depth was limited to 10 feet without impacting the roadway. The natural creek within Walnut Canyon has riparian vegetation which would be impacted with any construction in this area.

Operational Parameters: The basin will operate as a flow-through or in-line type basin since the embankment fill is placed directly in the natural floodplain. The resulting 100-year effective storage volume provided by this detention basin is 14.0 acre-feet from attenuating the peak inflow from 390 cfs to 273 cfs. The required debris storage for this basin, in addition to the flood storage, is 11.4 acre-feet. The controlled release from the basin is based upon hydraulic control from a 42-inch diameter vertical riser used for the outlet works.

8.1.3 Basin No. 1 (Casey Road)

This detention basin utilizes a small existing reservoir located within the natural canyon tributary to Casey Road, adjacent to Walnut Canyon. The existing reservoir was formed from an earthen embankment across a small incised canyon area and has a concrete spillway without a low-level outlet. This reservoir could have been either an agricultural reservoir or a small debris basin constructed by the SCS. This location has a total tributary drainage area of 276-acres which is primarily undeveloped. The proposed detention basin would require removing the existing embankment and reconstructing another embankment downstream where the canyon floor is much wider. The proposed basin would have an effective storage depth of 18.5 feet which is limited by the height of the canyon and the upstream adjacent residential structures which would be inundated. The required sediment storage volume is estimated to be 8.3 acre-feet and would be provided in the total basin volume.

Operational Parameters: The resulting 0.65 acre basin would operate as an in-line basin since it is located directly in the natural floodplain. The 100-year maximum storage volume for the basin in this configuration is 25 acre-feet and results in attenuating the peak inflow from 301 cfs to 65 cfs. The controlled release from the detention basin is based upon a 2-foot diameter outlet pipe.

8.1.4 Basin No. 2 (Gabbert Road)

This 3.8-acre basin is another in-line basin which is located at the mouth of a large canyon which is adjacent to the Walnut Canyon Channel. The geometry of this basin has been configured to accommodate the future 118 freeway and freeway ramp system in this canyon area. A conceptual layout of this basin is provided on the following exhibit for the basin. This location has a total tributary drainage area of 475-acres which is primarily undeveloped and draining a significant portion of the proposed Hitch Ranch area. This basin impacts the largest drainage area of all the basins except for the Gabbert Basin. The basin is located within the proposed Hitch Ranch and in an area that the initial land use planning has designated as institutional. Construction of the basin would require the vertical relocation of Gabbert Road since the road it is close to the canyon floor. This location has the advantage of a wide canyon area and a relatively flat canyon slope. The maximum storage volume is restricted by the inundation limits not to encumber existing upstream structures.

Operational Parameters: This basin is another in-line type basin which would result in blocking the natural floodplain through the construction of an earthen embankment which join either side of the canyon walls. The maximum 100-year effective storage volume for this basin is 36 acre-feet. The required debris dead storage volume allowance at this location 31.7 acre-feet. The controlled release from the basin is based upon the hydraulics of a 3.0 foot diameter riser.

8.1.5 Basin No. 3 (Bypass Basin)

This basin site was the off-line diversion detention basin located directly adjacent to the Walnut Canyon Channel in the original study. In this current update/revision to the original study detention basin-3 is proposed to be in the same place as the original study but the function of the basin is altered. In the original study the basin was designed to function with the diversion structure which would divert the initial 300 cfs away from the Walnut Channel to a proposed diversion channel which was called the Shasta Ave. Diversion. The current study provides a 100 cfs bypass to the basin. The bypass will allow up to 100cfs to remain in the Walnut channel and bypass detention basin-3. Any flowrate in excess of 100cfs would be captured and routed in detention basin-3. The basin would be constructed by excavation and generating a pit below the natural ground. The maximum depth for the effective storage corresponds to five feet which is the same depth as the channel in order to provide a gravity outlet. The basin configuration is encompasses a larger surface areas than the previously proposed basin-3. In addition the basin is completely located on the proposed Hitch Ranch development in area which the landuse planning has designated park and very high density. The basin would potentially interfere with the proposed alignment of

Casey Road. The basins would encumber a total surface area of approximately 15 acres.

Operational Parameters: The key operational factor associated with this basin is the performance of the diversion or by-pass structure. The difficulties with this structure include: (1) setting a weir crest elevation and length which can adequately deliver the desired flow into the basin, (2) weir performance so that it is not submerged by the storage in the basin, (3) weir elevation high enough to allow bypass around the basin, (4) shallow depth of the basin and if the basin is to drain by gravity it cannot be deeper than the channel. If a small stormwater pump station was used to drain the volume of the basin below the existing channel invert then this may solve many of the diversion structure operation problems.

8.1.6 Basin Geometry and Grading Requirements

The geometry of the proposed detention basins was primarily governed by the physical constraints of the site location and minimizing the potential land acquisition requirements. The sites were selected at locations which would affect the largest tributary drainage area prior to joining the main channel system and topographic features. The initial screening of the basin sites was performed by studying the effect if the basin operated as retention rather than detention on the hydrology model. The maximum limits of the basin area generally conformed to the topographic constraints. Excavation of an incised pool area was performed if it was still possible to provide a gravity outlet and provide additional storage volume below the jurisdictional requirements. The excavation of storage volume below the natural ground provided additional dead storage volume allowance used in the smaller detention basin facilities. Excavations utilized slopes of 2:1. The embankment utilized a fill prism which was assumed to have a 2:1 slope on the upstream face and 3:1 on the downstream face.

8.2 Spillway Outlet Configurations

The outlets works for the debris and detention basins were generally provided with a minimum of two outlets which included the (1) controlled release outlet structure or primary outlet, which is generally some form of vertical outlet tower and connecting outlet pipe, (2) rectangular drop spillway, and (3) flowrate by-pass facilities. It was assumed that the primary outlet works associated with the detention basin would consist of a box drop inlet design which is a similar configuration that is utilized by VCFCD on other similar regional facilities. This type of facility has several advantages for a spillway design, including, (1) reduces the potential of eroding the embankment material, (2) allows use of an underground culvert to convey the flow through the embankment, (3) allows continuous vehicular access across the dam crest, and (4) reduces the width of the spillway facility. The preliminary sizing for the outlet spillway utilized the full unattenuated reservoir inflow and the basic relationship for the discharge head over the crest of a flat rectangular weir box, with a weir coefficient of 3.2. The box drop inlet spillway would be connected to an outlet conduit which would extend to the downstream of the embankment. The outlet

conduit would either terminate into the improved channel or an energy dissipation structure.
