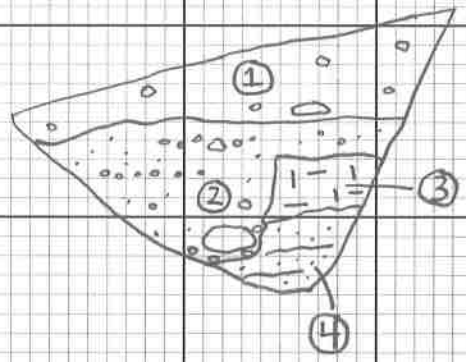
	5.0-8.0		Sandy Claystone: Reddish brown, damp to moist, medium stiff, fine grained sand, abundant carbonate filaments, some pores and krotovinas, weathered.
	8.0-10.0		Sandy Siltstone: Light brown, damp, medium stiff, fine grained sand, some carbonate filaments, some pores and rootlets.
			@ 10ft, decreased pores, slightly sandier.
			Total Depth: 10.0 feet No groundwater Backfilled w/spoils

LOG OF EXPLORATORY TRENCH

Project Name: Hitch Ranch
Logged By: BJP



TRENCH NO. 38

J.N.: 2677.00
Date: 9/21/2018

Geologic Unit	Description	Attitudes / Misc Info
1	**COLLUVIUM (Qcol):** Silty Sand with Gravel (SM), Light brown, damp, loose, fine to coarse grained sand, some cobbles up to 8 inches in size, porous, some roots, local sand pockets.	
2	**ALLUVIUM (Qal):** Sandy Clay with Gravel (CL), Brown, damp, medium stiff, fine grained sand, some cobbles up to 12 inches in size, some pores.	
3	**SAUGUS FORMATION (Qs):** Sandy Claystone, Reddish brown, damp, stiff, fine grained sand, blocky ped development with clay films on ped surfaces, trace pores.	
4	Silty Sandstone: Light reddish brown, damp to moist, medium dense, fine to medium grained sand, some clay rich "Bt" lams measuring up to 1 inch in thickness.	

Scale: 1" = 5'

APPENDIX A-2

FAULT INVESTIGATION
DATED APRIL 3, 2019 (Revise dated June 3, 2019)

FAULT TRENCH LOG EXPLANATION

FT-1

Artificial Fill (Af)

①

Clayey Sand and Sandy Clay (SC/CL), fine- to coarse-grained, very dark grayish brown (10YR 3/2), damp to moist, trace gravel and cobbles, some roots and intermixed clods of Saugus Formation.

Top Soil (No Map Symbol)

②

Silty Sand and Clayey Sand (SM/SC), fine-grained, very dark brown (10YR 2/2) to dark brown (10YR 3/3), damp to moist, trace gravel and small cobbles, moderately porous, some roots and rootlets, scattered krotovinas. Locally very dark gray (5YR 3/1) sandy clay with poorly developed blocky ped structure and clay films on ped surfaces. Contact at base is gradational in nature.

Colluvium (Qcol)

③

Sandy Clay (CL), fine-grained, very dark brown (10YR 2/2), moist, trace gravel, moderately porous, local poorly developed blocky ped structure, trace roots and krotovinas.

④

Sandy Clay (CL), fine-grained, strong brown (7.5YR 5/6), damp to moist, trace gravel, moderately porous, local moderately developed blocky ped structure with clay films, carbonate development, and manganese oxide staining on ped surfaces, trace roots and krotovinas.

Saugus Formation (Qs)

⑤

Clayey Sand and Sandy Clay (SC/CL), fine-grained, dark yellowish brown (10YR 3/6), yellowish brown (10YR 5/8), and strong brown (7.5YR 4/6), damp to moist, trace gravel moderately porous, local moderately developed blocky ped structure with clay films, carbonate filaments, and manganese oxide staining on ped surfaces, some roots and rootlets. Between stations 0 and 2+80, unit is olive brown (2.5YR 4/3) to dark brown (10YR 3/3) in color. Unit is moderately to extremely weathered throughout with scattered krotovinas and no visible bedrock structure. Contact at base is gradational in nature.

⑥

Clayey Sandstone to Sandstone, fine- to coarse-grained, strong brown (7.5YR 4/6 to 5/6), damp to moist, scattered granitic gravels, slightly friable, brown (7.5YR 4/4) 1/4- to 1-inch thick clay rich “BT lams”. Local channel fills with increased gravels and minor seepage.

⑦

Silty Sandstone to Sandstone, fine- to medium-grained, yellowish brown (10YR 5/4 to 5/6) and dark yellowish brown (10YR 4/4), damp to moist, well indurated, strong brown (7.5YR 4/6) 1/2- to 1-inch thick clay rich “BT lams”, faint iron oxidation staining. Upper 2- to 3-feet is silica-cemented, dark yellowish brown (10YR 3/4 and 3/6), and very hard with pinhole pores and manganese oxide staining. Between stations 12+00 and 12+58, unit becomes very well indurated and very difficult to excavate.

⑧

Silty Sandstone and Sandstone, fine-grained and fine- to medium-grained, yellowish brown (10YR 5/4 5/6), dry to damp, scattered granitic gravels, trace shale fragments, locally friable, some very irregular and discontinuous silt beds, abundant channel fills with increased gravel and cobbles up to 6 inches. Upper 3 to 5 feet of unit appears re-worked and is predominately a sandy claystone, fine-grained, dark yellowish brown (10YR 4/6), damp, trace coarse grained sand and gravel, moderately porous, local carbonate filaments and manganese oxide staining.

⑨

Siltstone to Sandy Siltstone, fine-grained, dark yellowish brown (10YR 4/6 to 3/6) to yellowish brown (10YR 5/4), dry to damp, slightly to moderately porous, very irregular desiccation cracks with carbonate development (particularly between Stations 0 and 2+10), occasional thin silty sand lenses, local faint laminations, trace roots. Local blocky ped structures with clay films and manganese oxide staining on ped surfaces. Between Stations 9+48 and 10+73 the upper 2 to 3 feet is silica-cemented and very hard.

⑩

Silty Sandstone to Sandstone, fine-grained and fine- to medium-grained, yellowish brown (10YR 5/4 to 5/6), brown (10YR 5/3) and pale brown (10YR 6/3), dry to damp, slightly friable to friable, some sand and magnetite layering, manganese specs, interbedded 2- to 3-inch thick olive brown (2.5Y 4/4) silt beds with abundant decomposed rootlets and carbonate development. Unit generally coarsens downward to light olive brown (2.5Y 5/3), fine-coarse grained sandstone with strong brown (7.5 YR 4/6), dark yellowish brown (10YR 4/6) and yellowish brown (10YR 5/8) 1/4- to 2 1/2 -inch thick clay rich “BT lams”, cross-bedding, gravel layering, and channel fills with increased granitic gravels and cobbles up to 10 inches in size. Contact at base is erosional in nature and sharp.

⑪

Clayey Siltstone to Siltstone, brownish yellow (10YR 6/6), damp to moist, well indurated, slightly porous, massive, thin discontinuous internal shears (very dark grayish brown 2.5Y 3/2), trace decomposed rootlets, some iron oxidation staining. Local moderately developed blocky ped structure with clay films, carbonate filaments, and manganese oxide staining on ped surfaces. At Station 7+95, unit gradually grades to the south into yellowish brown (10YR 5/6) Sandy Siltstone with some fine-grained silty sand lenses.

⑫

Sandstone and Gravelly Sandstone, fine- to medium-grained and fine- to coarse-grained, yellowish brown (10YR 5/4) to light olive brown (2.5Y 5/3), dry, trace shale fragments, friable, local sand and gravel layering, scattered granitic cobbles, dark yellowish brown (10YR 4/4) 1/4- to 2 1/2 -inch thick clay rich “BT lams”.

FT-2

Top Soil (No Map Symbol)

Ⓐ

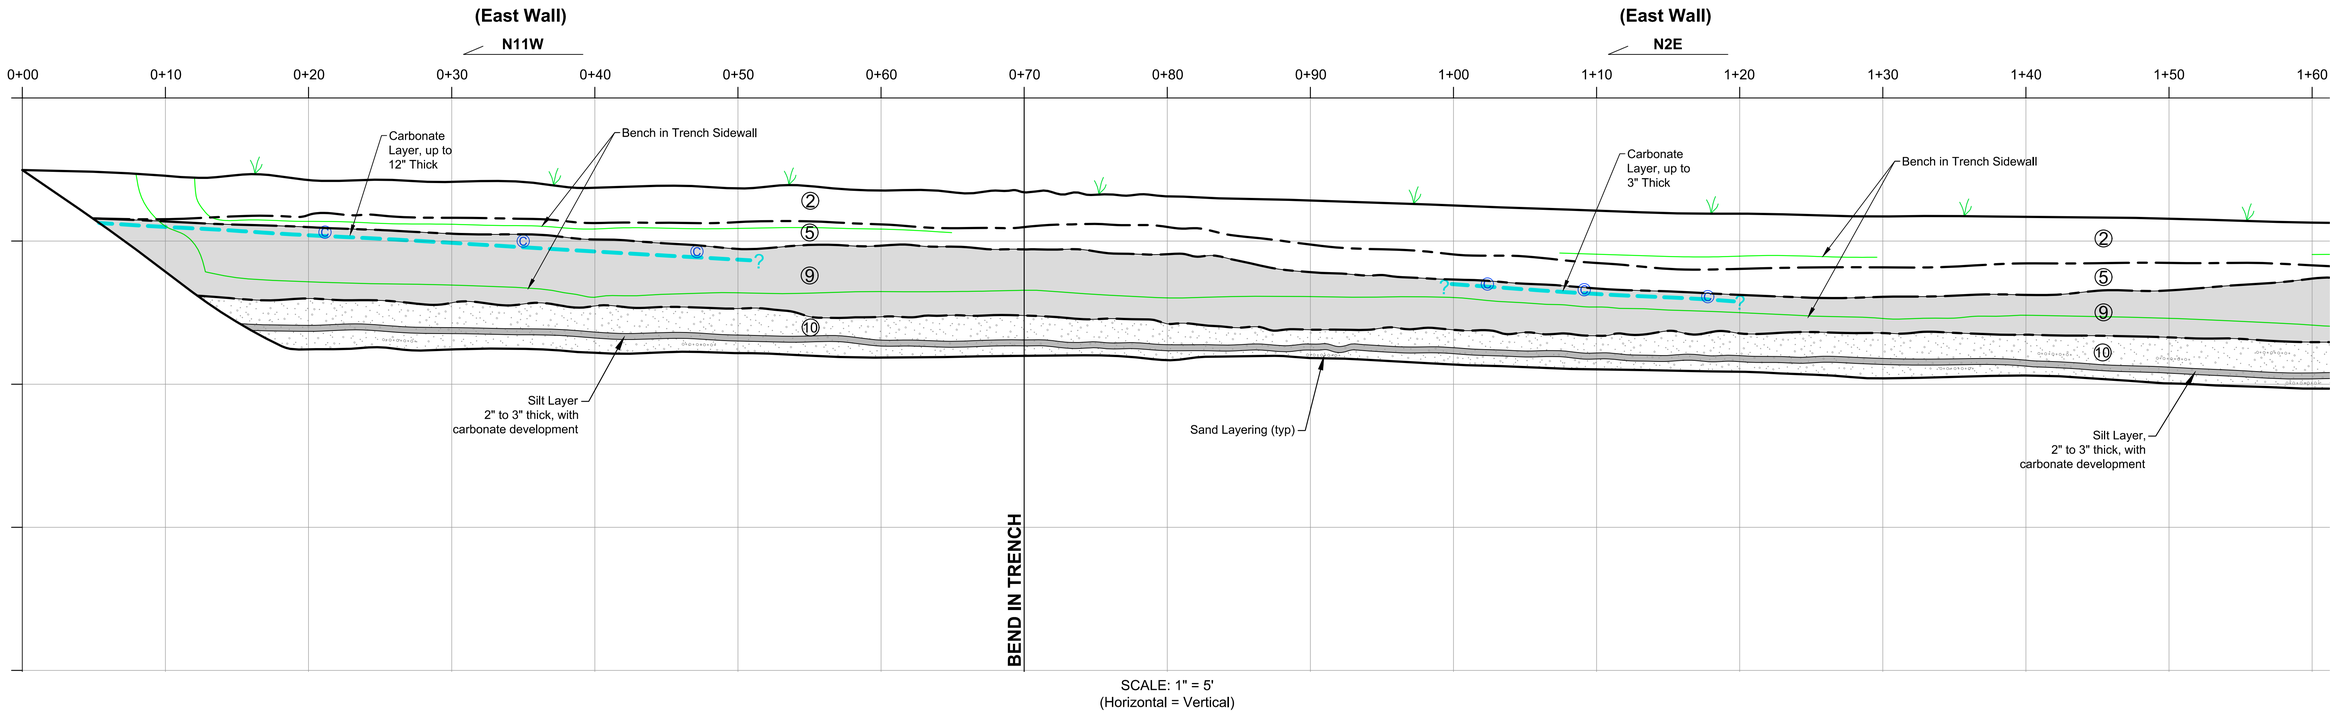
Silty Sand (SM), fine-grained, dark brown (10YR 3/3), damp to moist, trace gravel, moderately porous, some roots and rootlets, scattered krotovinas.

Saugus Formation (Qs)

Ⓑ

Clayey Sand (SC), fine-grained, yellowish brown (10YR 5/6), damp to moist, trace gravel moderately porous, local moderately developed blocky ped structure with clay films, carbonate filaments, and manganese oxide staining on ped surfaces, some roots and rootlets. Unit is moderately to extremely weathered throughout with scattered krotovinas and no visible bedrock structure. Contact at base is gradational.

Ⓒ



Sandstone, fine- to medium-grained, light yellowish brown (10YR 6/4), damp to moist, trace gravel, locally well indurated, strong brown (7.5YR 4/6) 1/2- to 1-inch thick clay rich “BT lams”, some sand and gravel layering, local fine- to coarse-grained channel fills with increased granitic gravels. Interbedded Silty Sandstone, fine-grained, dark yellowish brown (3/6), damp, well indurated, local moderately developed blocky ped structure with clay films and manganese oxide staining,. Silty Sandstone beds are typically very irregular and silica-cemented with pinhole pores and faint iron oxidation staining.

Note: Color of geologic units described when moist.

APPENDIX B

LABORATORY TEST PROGRAM

LABORATORY TESTING PROGRAM

Soil Classification

Soils encountered within the exploratory borings and trenches were initially classified in the field in general accordance with the visual-manual procedures of the Unified Soil Classification System (ASTM D 2488). The samples were re-examined in the laboratory and classifications reviewed and then revised where appropriate. The assigned group symbols are presented in the Exploration Logs provided in Appendix A.

In-Situ Moisture Content and Dry Density

Moisture content and dry density tests of in-place soil materials were determined in representative strata. Test data for samples collected from our exploratory borings are summarized in the Exploration Boring Logs provided in Appendix A.

Maximum Dry Density and Optimum Moisture Content

Maximum dry density and optimum moisture content were performed on a representative sample of the site materials obtained from our field explorations. The test was performed in accordance with Method C of ASTM D 1557. Pertinent test values are given in Table B-1.

Percent Passing the No. 200 Sieve

Percent of material passing the No. 200 sieve was determined on selected samples to verify visual classifications performed in the field. These tests were performed in accordance with ASTM D1140-00. Test results are presented on Table B-1.

Consolidation

Consolidation tests were performed for selected soil samples in general conformance with ASTM D 2435. Axial loads were applied in several increments to a laterally restrained 1-inch-high sample. Loads were applied in geometric progression by doubling the previous load, and the resulting deformations were recorded at selected time intervals. The test samples were inundated at a selected load to evaluate the effects of a sudden increase in moisture content (hydro-consolidation potential). Results of the tests are graphically presented on Plates B-1 through B-9.

Direct Shear

The Coulomb shear strength parameters, angle of internal friction and cohesion, were determined for undisturbed samples, as well as for samples remolded to 90 percent of maximum dry density. The test was performed in general accordance with ASTM D 3080. Three specimens were prepared for each test. The test specimens were artificially saturated, and then sheared under varied normal loads at a maximum constant rate of strain of 0.005 or 0.01 inches per minute. Results are graphically presented on Plates B-10 through B-15.

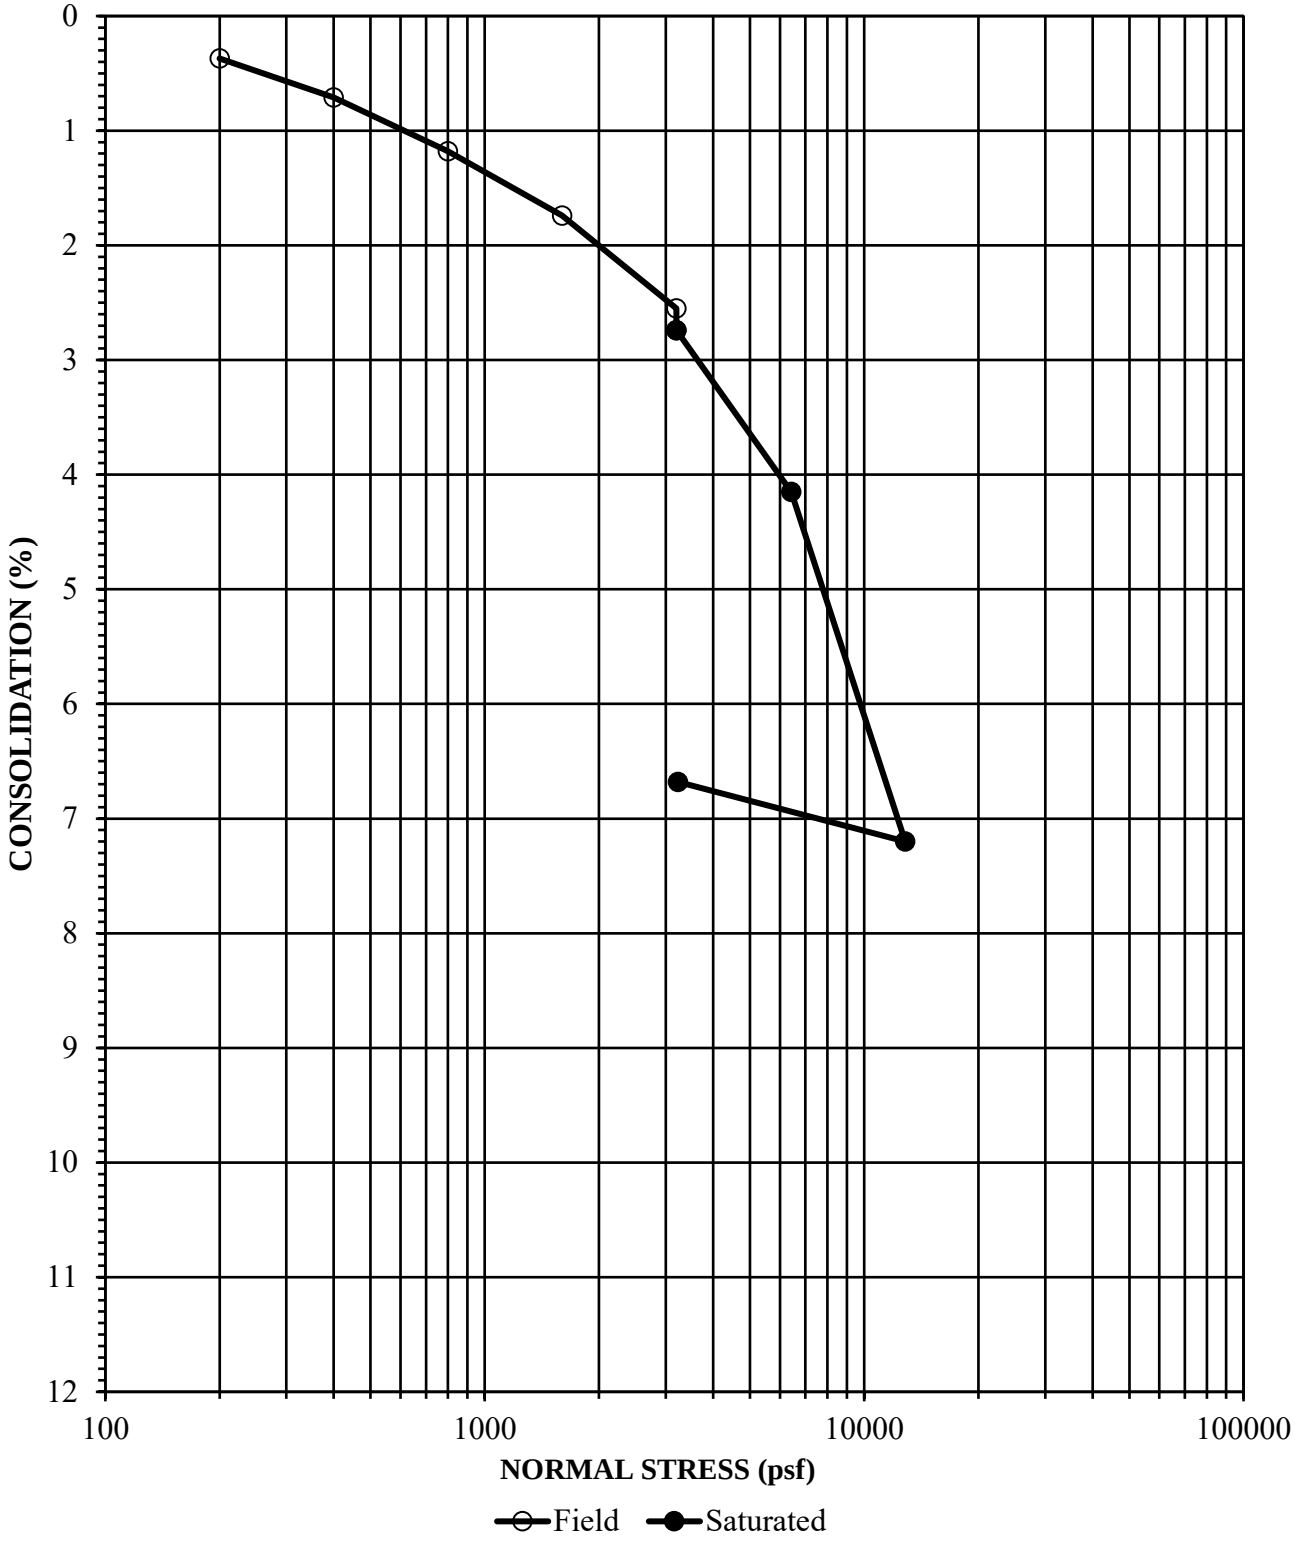
Expansion Potential

Expansion Index tests were performed on selected samples in accordance with ASTM D 4829. The test results and corresponding expansion potentials are presented on Table B-1.

Atterberg Limits

Atterberg limit tests (Liquid Limit, Plastic Limit and Plasticity Index) were performed on selected samples to verify visual classifications. The test was performed in general conformance with ASTM D 4318. Test results are presented on Table B-1.

Soluble Sulfate Content



A chemical analysis was performed on a selected sample to determine soluble sulfate content. This test was performed in accordance with California Test Method No. 417. The test result is included on Table B-1.

TABLE B-1
SUMMARY OF LABORATORY TEST RESULTS

Boring No.	Sample Depth (ft.)	Soil Description	Test Results	
B-1	35	Sandy Silt (ML)	Liquid Limit: Plasticity Index:	Non-Plastic Non-Plastic
B-3	35	Sandy Lean Clay (CL)	Liquid Limit: Plasticity Index: Passing No. 200:	30.5 15.5 38.6%
B-3	40	Sandy Lean Clay (CL)	Liquid Limit: Plasticity Index:	23.1 8.7
B-12	37.5	Fat Clay (CH)	Liquid Limit: Plasticity Index:	83.2 50.5

APPENDIX C

LABORATORY TESTING

General

A program of soil testing was performed on the obtained soil samples to evaluate their geotechnical properties. Tests consisted of evaluations of in situ moisture content and density, optimum moisture-maximum dry density relationships, consolidation/collapse tests, direct shear tests, and expansion potential. Test procedures and results are presented below.

Field Density and Moisture Content

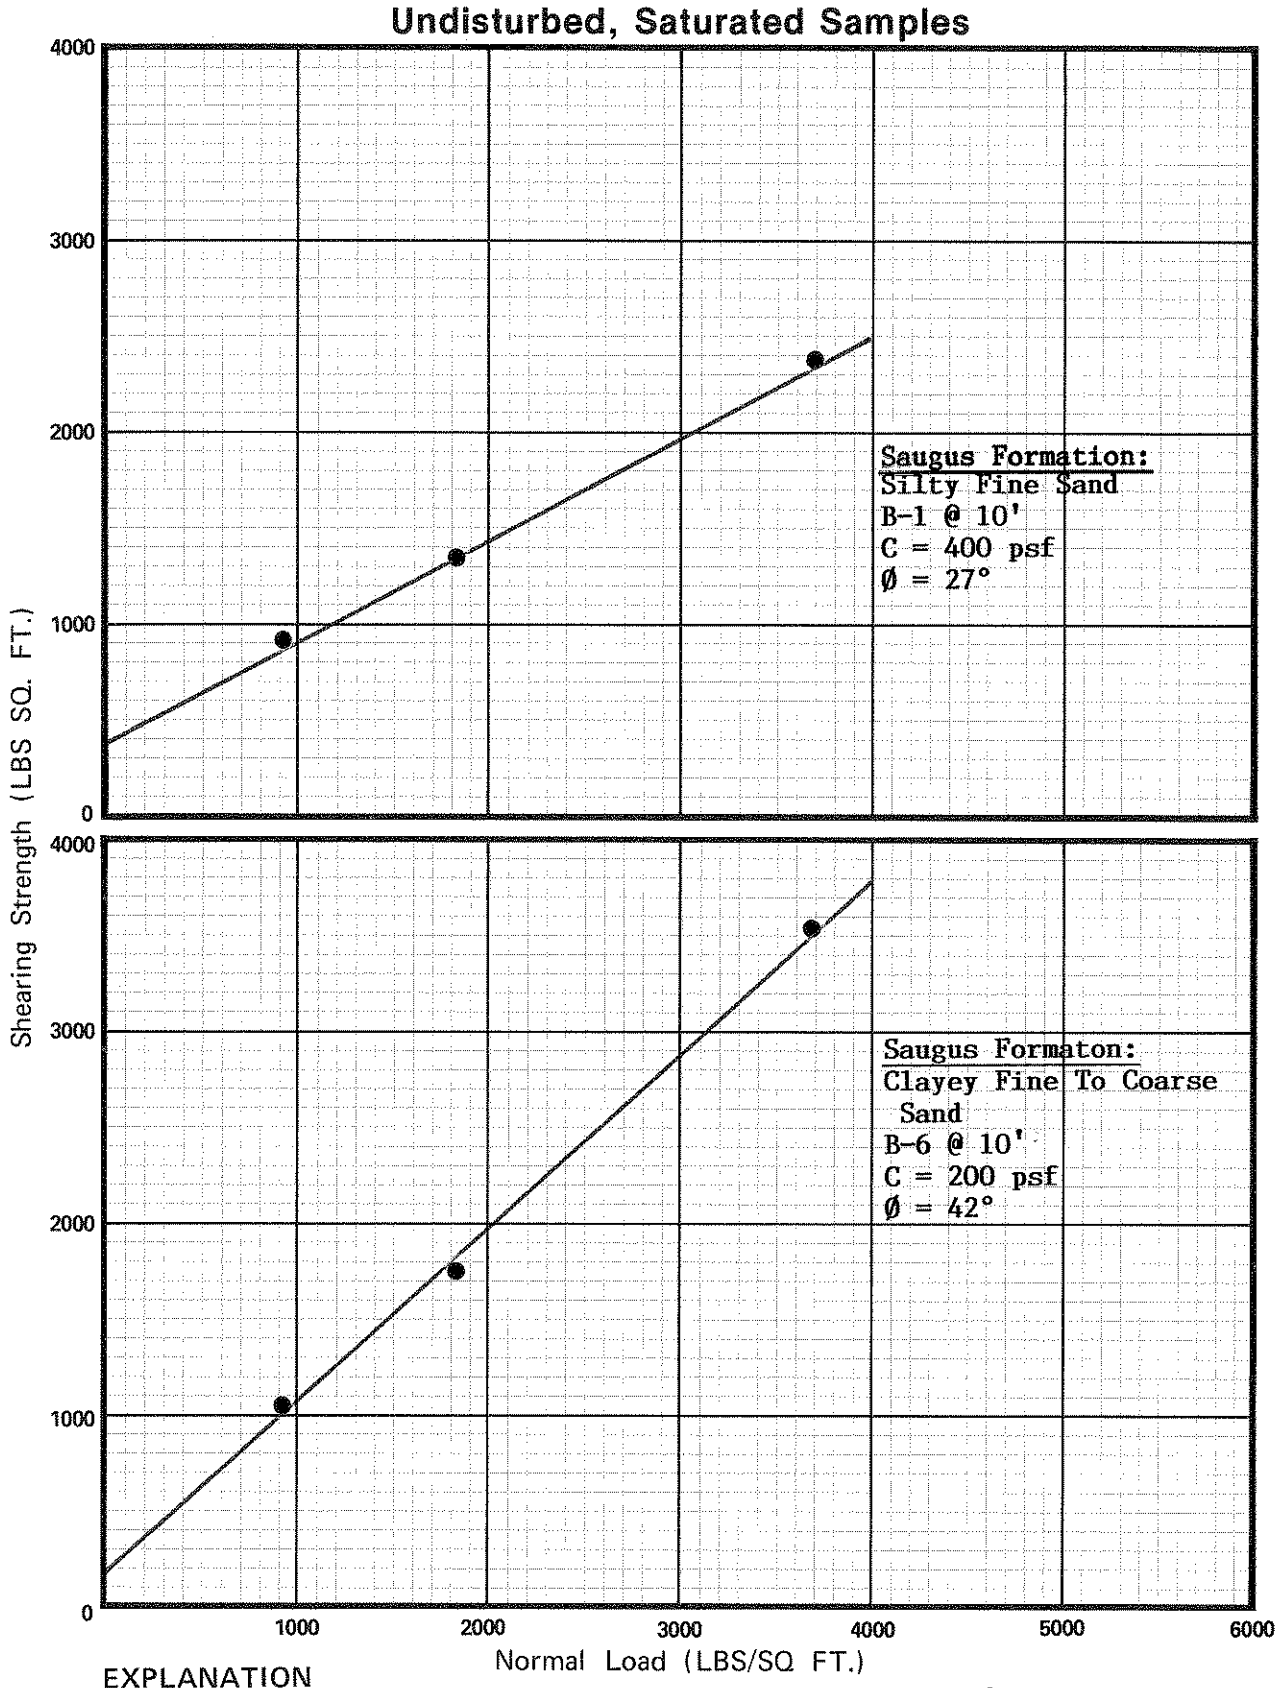
The relatively undisturbed soil samples were used to evaluate the field density and moisture content. Test results are indicated on the attached boring logs, Figures A1-A15.

Maximum Density-Optimum Moisture

Maximum dry density and optimum moisture content tests (compaction characteristics) were performed on selected bulk samples of the earth materials encountered. The tests were performed in accordance with ASTM D 1557. The results are as follows:

Boring Number	Depth(ft)	Visual Soil Classification	Maximum Dry Density(pcf)	Optimum Moisture Content %
B-9	3	Brown silty fine to coarse sand	130	8.5
B-9	11	Brown silty sand	128	8.5
B-9	18	Brown silty sand	131	8.0
B-10	3	Dark brown slightly clayey silty sand	120	11.5
B-10	13	Light brown silty fine to coarse sand with some gravel	132	8.5
B-11	4	Brown silty fine to coarse sand.	129	9.5
B-11	14	Brown silty fine to coarse sand.	132	7.5
B-12	6	Brown clayey silty sand	121	11.0

GORIAN & ASSOCIATES INC



Direct Shear Tests

Direct shear tests were performed on selected relatively undisturbed samples obtained at various depths of the underlying bedrock. The sample sets were saturated prior to being sheared under normal pressure ranging from 920 to 3680 psf at a rate of 0.05 inches per minute. The ultimate shearing strength results are attached as graphic summaries in Figure C-1.

Consolidation Tests

Load consolidation tests were conducted on ten relatively undisturbed samples obtained at depths ranging between 4 to 20 feet below the ground surface. Test loads were added in increments with water added at normal pressures of 1000 and 2000 psf, to study the effects of moisture infiltration on potential foundation behavior. The results are presented as graphic summaries, Figures C-2 through C-11.

RESULTS OF SHEARING STRENGTH TESTS

EXPLANATION

B-9 @ 12' = Sample taken from Boring 9 at 12 Feet in Depth.

TOPSOIL

(1) DARK GRAYISH BROWN (10YR 4/2) SANDY CLAY (HARD, DRY TO DAMP). DESSICATED. SCATTERED ROOTS TO ROOTHAIRS. FEW GRAVEL. GRADATIONAL CONTACT OVER 6" WITH UNIT (2). HACKLY FRACTURES.

OLDER ALLUVIUM

(2) YELLOWISH BROWN (10 YR 5/4) SILTY CLAY, TRACE FINE SAND (HARD, DAMP TO MOIST). BLOCKY PEDS TYPICAL (STATION 4+15 TO 4+29 AND 0+00 TO 0+15), EXTENDING 2 FEET BELOW CONTACT WITH UNIT (1). BELOW BLOCKY PEDS, SCATTERED STAGE II CARBONATE, THEN UNIT GRADES TO YELLOWISH BROWN (10 YR 5/4) SANDY SILTY CLAY (HARD, MOIST) MOTTLED WITH LIGHT BROWNISH GRAY (10 YR 6/2) SANDY CLAY. FEW GRAVEL. SCATTERED MANGANESE STAINING. SLIGHTLY POROUS. STATION 0+35, UNIT GRADES DOWNWARD TO LIGHT YELLOWISH BROWN (10YR 6/4) SILTY FINE TO COARSE SAND WITH SOME GRAVEL (DENSE, DAMP). GRADATIONAL CONTACT WITH SANDY CLAY ABOVE OVER 18." UNIT (2), SHARP EROSIONAL CONTACT WITH UNIT (3); STATION 0+80 TO 0+85, UNIT YELLOWISH BROWN (10 YR 5/4) SILTY CLAY, TRACE FINE SAND (HARD, DAMP). SCATTERED STAGE II CARBONATE JUST BELOW SHARP CONTACT WITH UNIT (3). GRADES DOWNWARD OVER 12" TO LIGHT YELOWISH BROWN (10 YR 6/4) SILTY FINE TO MEDIUM SAND, SOME COARSE SAND, FEW GRAVEL. STATION 0+70 TO 0+76, SCATTERED STAGE II CARBONATE WITHIN YELLOWISH BROWN (10 YR 5/4) SILTY CLAY, TRACE FINE SAND. STATION 1+90 TO SOUTH, UPPER PORTION OF UNIT MOTTLED WITH LIGHT BROWNISH GRAY (10 YR 6/2) SANDY CLAY. STATION 3+05 TO 3+28 UPPER PORTION OF UNIT NEAR CONTACT WITH UNIT (3) BLOCKY PEDS.

(2A) STATION 3+90 TO 4+20, LOWEST PORTION OF UNIT BECOMES LIGHT YELLOWISH BROWN (2.5 Y 6/4) SILTY FINE TO COARSE SAND.

OLDER ALLUVIUM

(3) NEAR EDGE OF CONTACT WITH UNIT (2), LIGHT YELLOWISH BROWN (10 YR 6/4) CLAYEY FINE TO COARSE SAND WITH GRAVEL (MEDIUM DENSE, DAMP). UNIT INTERBEDDED WITH BROWNISH YELLOW (10YR 6/6) FINE TO MEDIUM SAND, FEW GRAVEL. STATION 0+44, 0+60, 0+63, 0+88 AND 1+70, CONTAINS RIP-UP CLASTS OF LIGHT YELLOWISH BROWN (2.5 Y 6/4) SANDY SILT. UNIT GRADES HORIZONTALLY TO PALE YELLOW (2.5 Y 7/4) FINE TO COARSE SAND AND GRAVEL, SOME COBBLES. TYPICALLY, FRIABLE WITH HIGH AND LOW ANGLE CROSS-BEDDING. CLASTS INCLUDE MODELO FORMATION CHERT AND SILTSTONE, GRANODIORITE, QUARTZITE, ANORTHOSITE AND SANDSTONE. WELL-ROUNDED TO SUBANGULAR. UNIT LOCALLY CONTAINS ARGILLACEOUS HORIZONS. STATION 1+80 TO 1+90, LIGHT YELLOWISH BROWN (10 YR 6/4) CLAYEY FINE TO COARSE SAND WITH GRAVEL JUST ABOVE SHARP EROSIONAL CONTACT WITH UNIT (2) AND AGAIN AT STATION 2+15. STATION 3+28 TO 3+82, LIGHTLY YELLOWISH BROWN (10 YR 6/4) SLIGHTLY CLAYEY FINE TO COARSE SAND WITH GRAVEL, FEW COBBLES. SHARP EROSIONAL CONTACT WITH UNIT (2). GRADES UPWARD TO YELLOWISH BROWN (10 YR 5/4) SILTY FINE SAND (VERY DENSE, DAMP) MOTTLED WITH PALE YELLOW (5Y 7/3) SILTY FINE SAND.

(3A) YELLOWISH BROWN (10 YR 5/4) CLAYEY SILT (HARD, DAMP) SLIGHTLY POROUS. TYPICALLY LENSES, GRADATIONAL CONTACT WITH UNIT (3) OVER 3" AT BASE OF UNIT (2A), SHARP CONTACT AT TOP OF UNIT (3A)

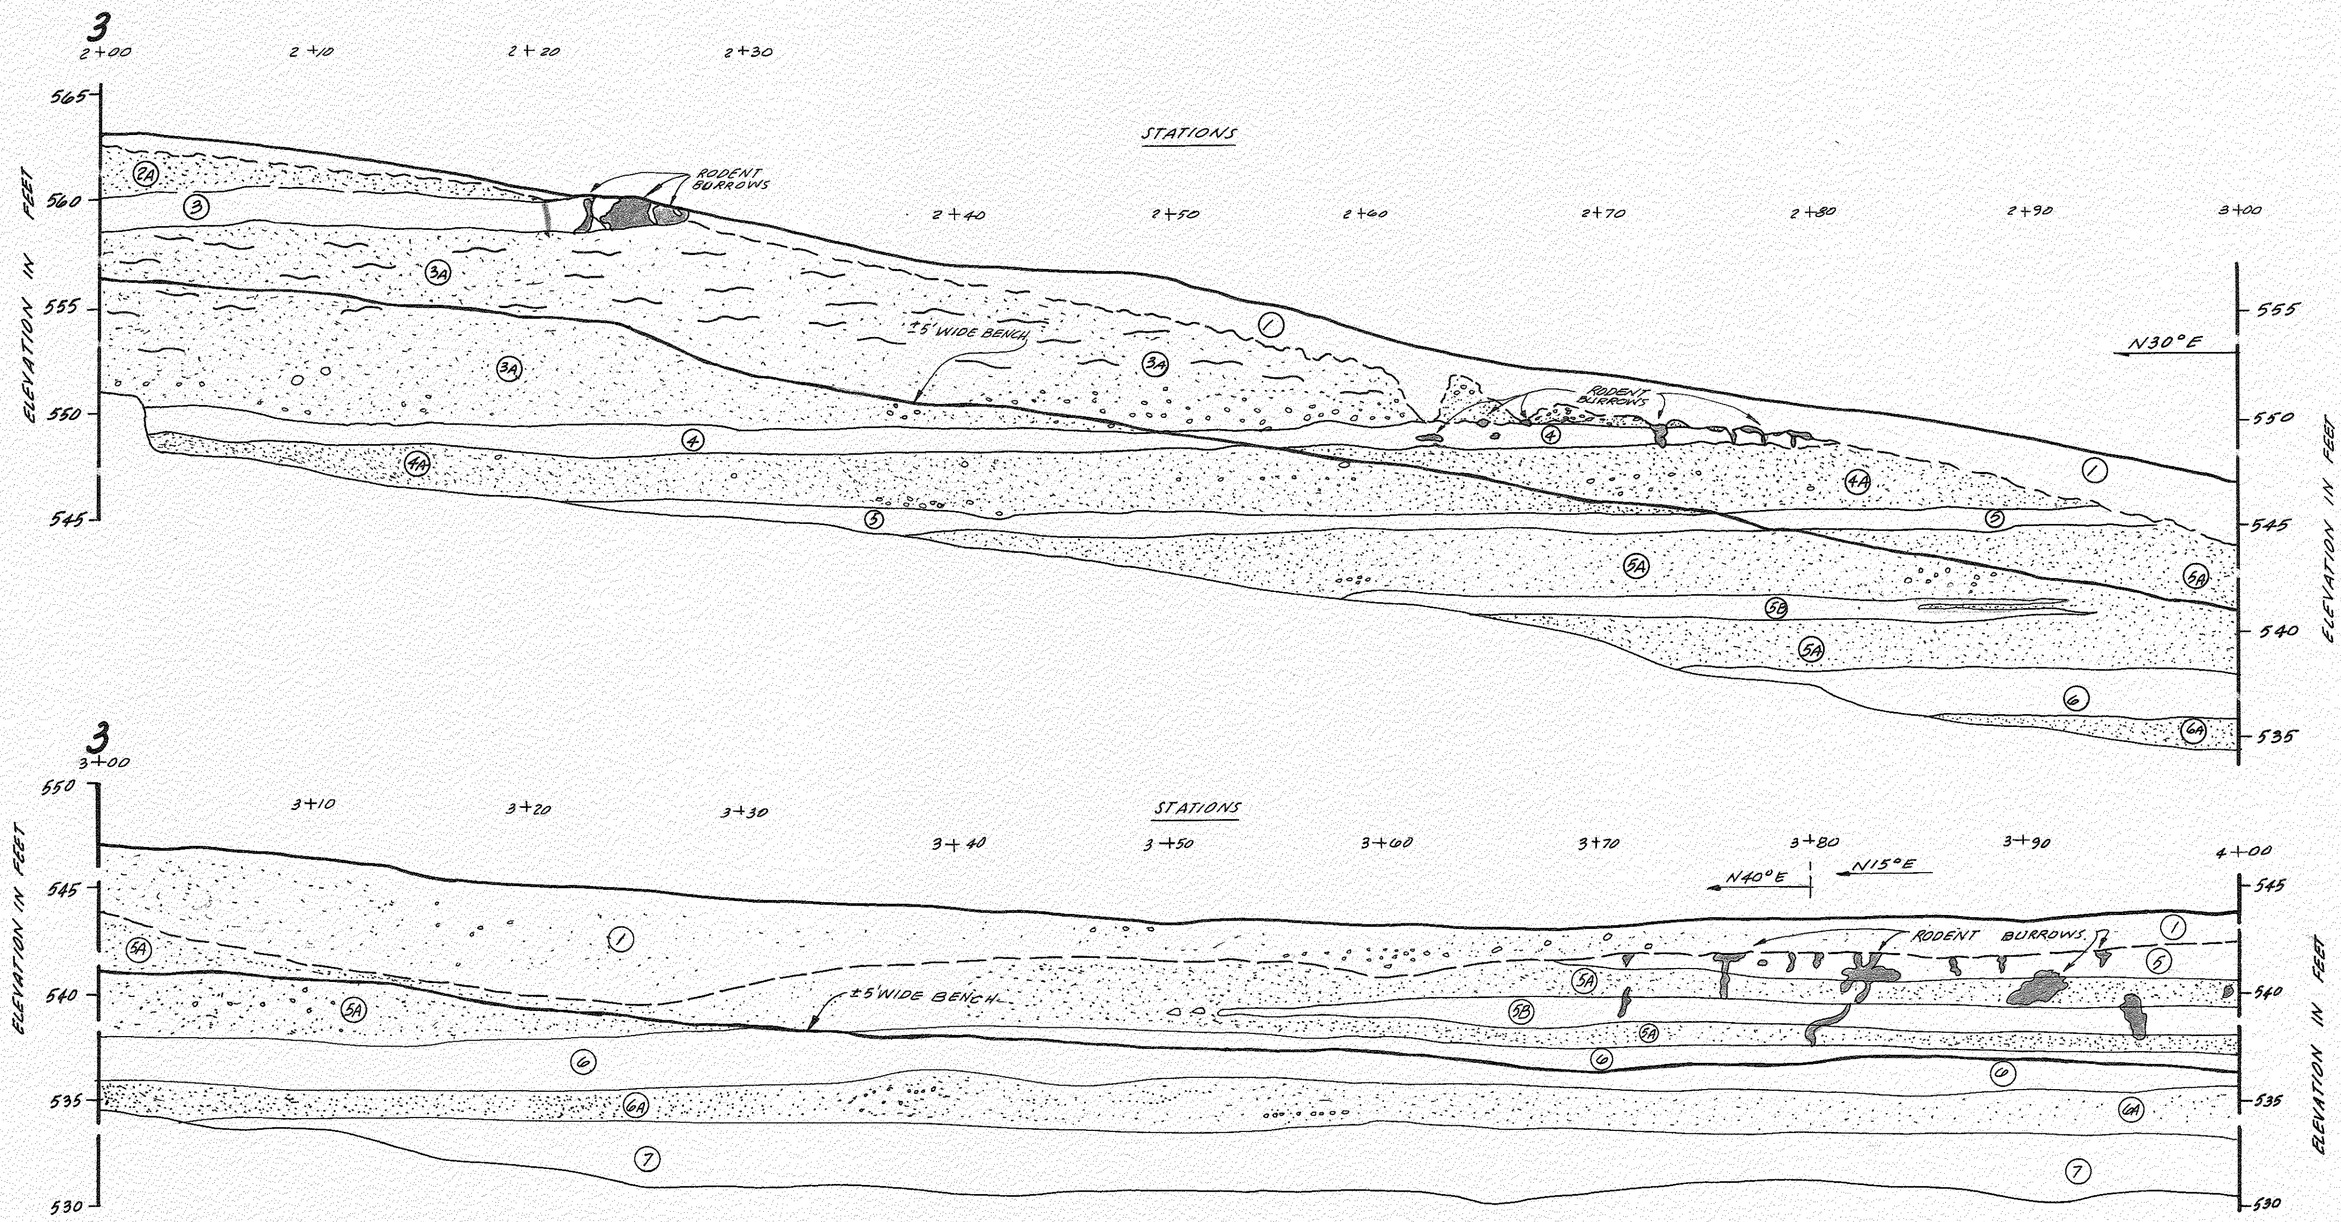
(1) BROWN (10YR 5/3) CLAYEY FINE SAND (MEDIUM DENSE, DRY TO DAMP). DESSICATED. SCATTERED ROOTS TO ROOTHAIRS. GRADATIONAL CONTACT OVER 6" WITH UNITS BELOW. SOME BLOCKY PEDS ABOVE UNIT (2) & (2A) WITH STAGE II CARBONATE AT CONTACT. STATION 3+00 TO 3+40, UNIT THICKENS, BECOMING DARK GRAYISH BROWN (10 YR 4/2) SILTY FINE TO COARSE SAND, TRACE CLAY (DENSE, DRY TO DAMP) GRADATIONAL CONTACT OVER 12" WITH UNITS (3A) & (4A). LOCALLY POROUS. SOME GRAVEL, FEW COBBLES.

OLDER ALLUVIUM

(2) YELLOWISH BROWN (10 YR 5/4) CLAYEY FINE SAND (DENSE, DAMP). FEW COARSE SAND, RARE GRAVELS. SLIGHTLY POROUS. SCATTERED MANGANESE STAINING. STATION 0+00 TO 0+92, UNIT CONTAINS LENSES IN UPPER PORTION OF YELLOWISH BROWN (10 YR 5/4) SILTY FINE TO COARSE SAND WITH SOME GRAVEL (MEDIUM DENSE, DRY TO DAMP). SLIGHTLY POROUS. FEW COBBLES. UPPER PORTION OF UNIT LOCALLY EXHIBITS BLOCKY PEDS WITH STAGE II CARBONATE.

(2A) GRADATIONAL CONTACT OVER 12" WITH UNIT (2). BROWNISH YELLOW (10 YR 6/6) SILTY FINE TO COARSE SAND. FEW GRAVEL. RARE COBBLES, (DENSE, DRY TO DAMP). MINOR CROSSBEDDING FROM STATION 1+30 TO 1+35. GRADITIONAL CONTACT OVER 6" WITH UNIT (3).

OLDER ALLUVIUM



(3) LIGHT YELLOWISH BROWN (2.5 Y 6/4) SILTY FINE SAND, FEW COARSE SAND AND GRAVEL. (DENSE, DAMP) SLIGHTLY POROUS. GRADING DOWNWARD OVER 3" TO LIGHT YELLOWISH BROWN (2.5Y 6/4) VERY SILTY, VERY FINE SAND (DENSE, MOIST TO WET). RARE GRAVEL. GRADATIONAL CONTACT OVER 3" WITH UNIT (3A).

(3A) PALE YELLOW (2.5Y 7/3 TO 7/4) SLIGHTLY SILTY FINE TO COARSE SAND WITH SOME GRAVEL AND COBBLES. (DENSE, DRY) FRIABLE. NEARLY HORIZONTALLY STRATIFIED. GRADATIONAL CONTACT OVER 3" WITH UNIT (3). CONTAINS CLASTS FROM MODELO FORMATION (CHERT AND SILTSTONE), QUARTZITE AND GRANITE. CLASTS ARE SUB ANGULAR TO WELL ROUNDED. LOCALLY EXHIBITS ARGILLACEOUS HORIZONS. SHARP CONTACT WITH UNIT (4). STATION 2+10 CONTAINS WELL ROUNDED RIP UP CLASTS OF LIGHT YELLOWISH BROWN (10YR 6/4) CLAYEY FINE SAND.

OLDER ALLUVIUM

(2) YELLOWISH BROWN (10YR 5/4) SILT, WITH A TRACE OF FINE SAND (HARD, DRY). POROUS. SCATTERED STAGE II CARBONATE. GRADATIONAL CONTACT OVER 6" WITH UNIT (1) AND 3" WITH UNIT (3).

(3) PALE YELLOW (2.5 Y 7/3) FINE TO COARSE SAND, SOME GRAVEL. (MEDIUM DENSE, DRY). FRIABLE. GENERALLY HORIZONTALLY BEDDED, SOME LOW ANGLE CROSS BEDDING. GRADATIONAL CONTACT OVER 3" WITH UNIT (2). SHARP EROSIONAL CONTACT WITH UNIT (4).

(4) YELLOWISH BROWN (10YR 5/4). CLAYEY FINE SAND (VERY DENSE, DAMP). SCATTERED STAGE II CARBONATE IN UPPER PORTION OF UNIT. GRADATIONAL CONTACT OVER 6" WITH UNIT (3), SHARP EROSIONAL CONTACT WITH UNIT (3).

(5) PALE YELLOW (2.5 Y 7/3) FINE TO COARSE SAND AND GRAVEL (MEDIUM DENSE, DAMP). FRIABLE. GENERALLY HORIZONTALLY BEDDED, LOCALLY LOW ANGLE CROSS BEDDING. ARGILLACEOUS HORIZONS COMMON STATION 1+25 TO 1+65. COMMONLY CONTAINS RIP-UP-CLASTS FROM UNIT (6). THIN SILTY FINE SAND LENSE STATION 1+05 TO 1+17. COMMONLY CUTS THROUGH UNIT (6) WHERE SURROUNDED BY GRAVEL. GRADATIONAL CONTACT OVER 3" ON BOTTOM OF UNIT (6). SHARP EROSIONAL CONTACT ON THE TOP OF UNIT (6). ARGILLACEOUS HORIZONS TYPICALLY YELLOWISH BROWN (10YR 5/4) SLIGHTLY SILTY FINE TO COARSE SAND AND GRAVEL. CLASTS ARE SUB-ROUNDED TO WELL ROUNDED. MODELO FORMATION CHERT AND SILTSTONE, QUARTZITE AND GRANITE.

(6) YELLOWISH BROWN (10YR 5/4) CLAYEY FINE SAND (DENSE, DAMP) TO YELLOWISH BROWN (10 YR 5/4) SILTY CLAY WITH A TRACE OF FINE SAND (VERY STIFF, DAMP TO MOIST). SCATTERED II CARBONATE SOME MANGANESE STAINING. LOCALLY, SLIGHTLY POROUS. STATION 0+70, BECOMING LIGHT YELLOWISH BROWN (10YR 6/4) CLAYEY SILT (VERY STIFF, MOIST). SCATTERED STAGE II CARBONATE. STATION 0+85, BECOMING MOTTLED WITH LIGHT YELLOWISH BROWN (10YR 6/4) CLAY (VERY STIFF, MOIST). ALSO CONTAINS A CLAST OF LIGHT GREENISH GRAY (7/1 5GY) COARSE GRAINED MICACEOUS SILTSTONE (SESPE FORMATION) STATION 1+10, MOTTLED WITH BROWN (7.5 YR 5/3) CLAY. POLISHED PED FACES COMMON. SOME CARBONATE. UNIT IS HIGHLY IRREGULAR AND NON-CONTINUOUS DUE TO HIGH VELOCITY EROSION DURING DEPOSITION OF UNIT (5). STATION 1+68, WELL ROUNDED CLAST OF LIGHT YELLOWISH BROWN (10YR 6/4) CLAYEY SILT. UNIT (6) ENDS AT STATION 1+66.5 IN BOTTOM OF TRENCH.

APPENDIX C

RESULTS OF LABORATORY TESTING

General

Recent laboratory test results on selected relatively undisturbed and bulk samples are presented below. Tests were performed to evaluate the physical and engineering properties of the encountered earth materials, including field moisture and density, compaction characteristics, expansion/consolidation potential, shear strength, hydroconsolidation potential, and grain size distribution.

Field Density and Moisture Tests

In-situ dry density and moisture content were determined for relative undisturbed samples obtained from the exploratory excavations. The test results and a detailed description of the soils encountered are shown on the attached logs.

Optimum Moisture-Maximum Density Curve

Maximum density/optimum moisture tests (compaction characteristics) were performed on selected samples of the encountered materials. The tests were performed per ASTM D 1557 test method. The results are as follows:

BORING	Depth – feet	Visual Soil Classification	Maximum Dry Density – pcf	Optimum Moisture Content - %
B-19	5	Brown clayey fine to coarse sand	119.5	11.5
B-20	15	Yellowish brown silty fine to coarse sand	129.5	8.5
B-22	11	Pale brown silty fine sand	121.0	10.5
B-23	2	Grayish brown silty fine sand	117.0	14.0
B-26	10	Brown clayey fine to coarse sand	130.0	7.0
B-26	18	Yellowish brown sandy silty clay	125.0	11.0
B-27	3	Brown silty fine to coarse sand	132.5	8.5
B-28	9	Pale yellow sandy clay	131.0	7.5
B-30	5	Brown silty fine to coarse sand	123.5	9
B-31	17	Brown silty fine to coarse sand	131.5	7.0
B-A	7	Light brown fine sand	125.0	9.5
B-A	23	Medium brown fine to coarse sand	129.5	7.0
B-B	4	Gray brown silty fine to coarse sand	127.5	9.0

Expansion Test

Selected samples of the encountered soil was tested for expansiveness using the Expansion Index Test method (UBC 29-2). The results are as follows:

Sample	Depth – feet	Expansion Index	Expansion Index Range
B-19	5	32	21-50
B-26	10	21	21-50
B-28	6	88	51-90
B-31	17	0	0-20
B-B	25	94	91-130

Additional expansion tests were performed in previous investigations of this and the adjacent site. Test results indicate that the area is predominantly underlain by materials in the low expansion range.

Direct Shear Tests

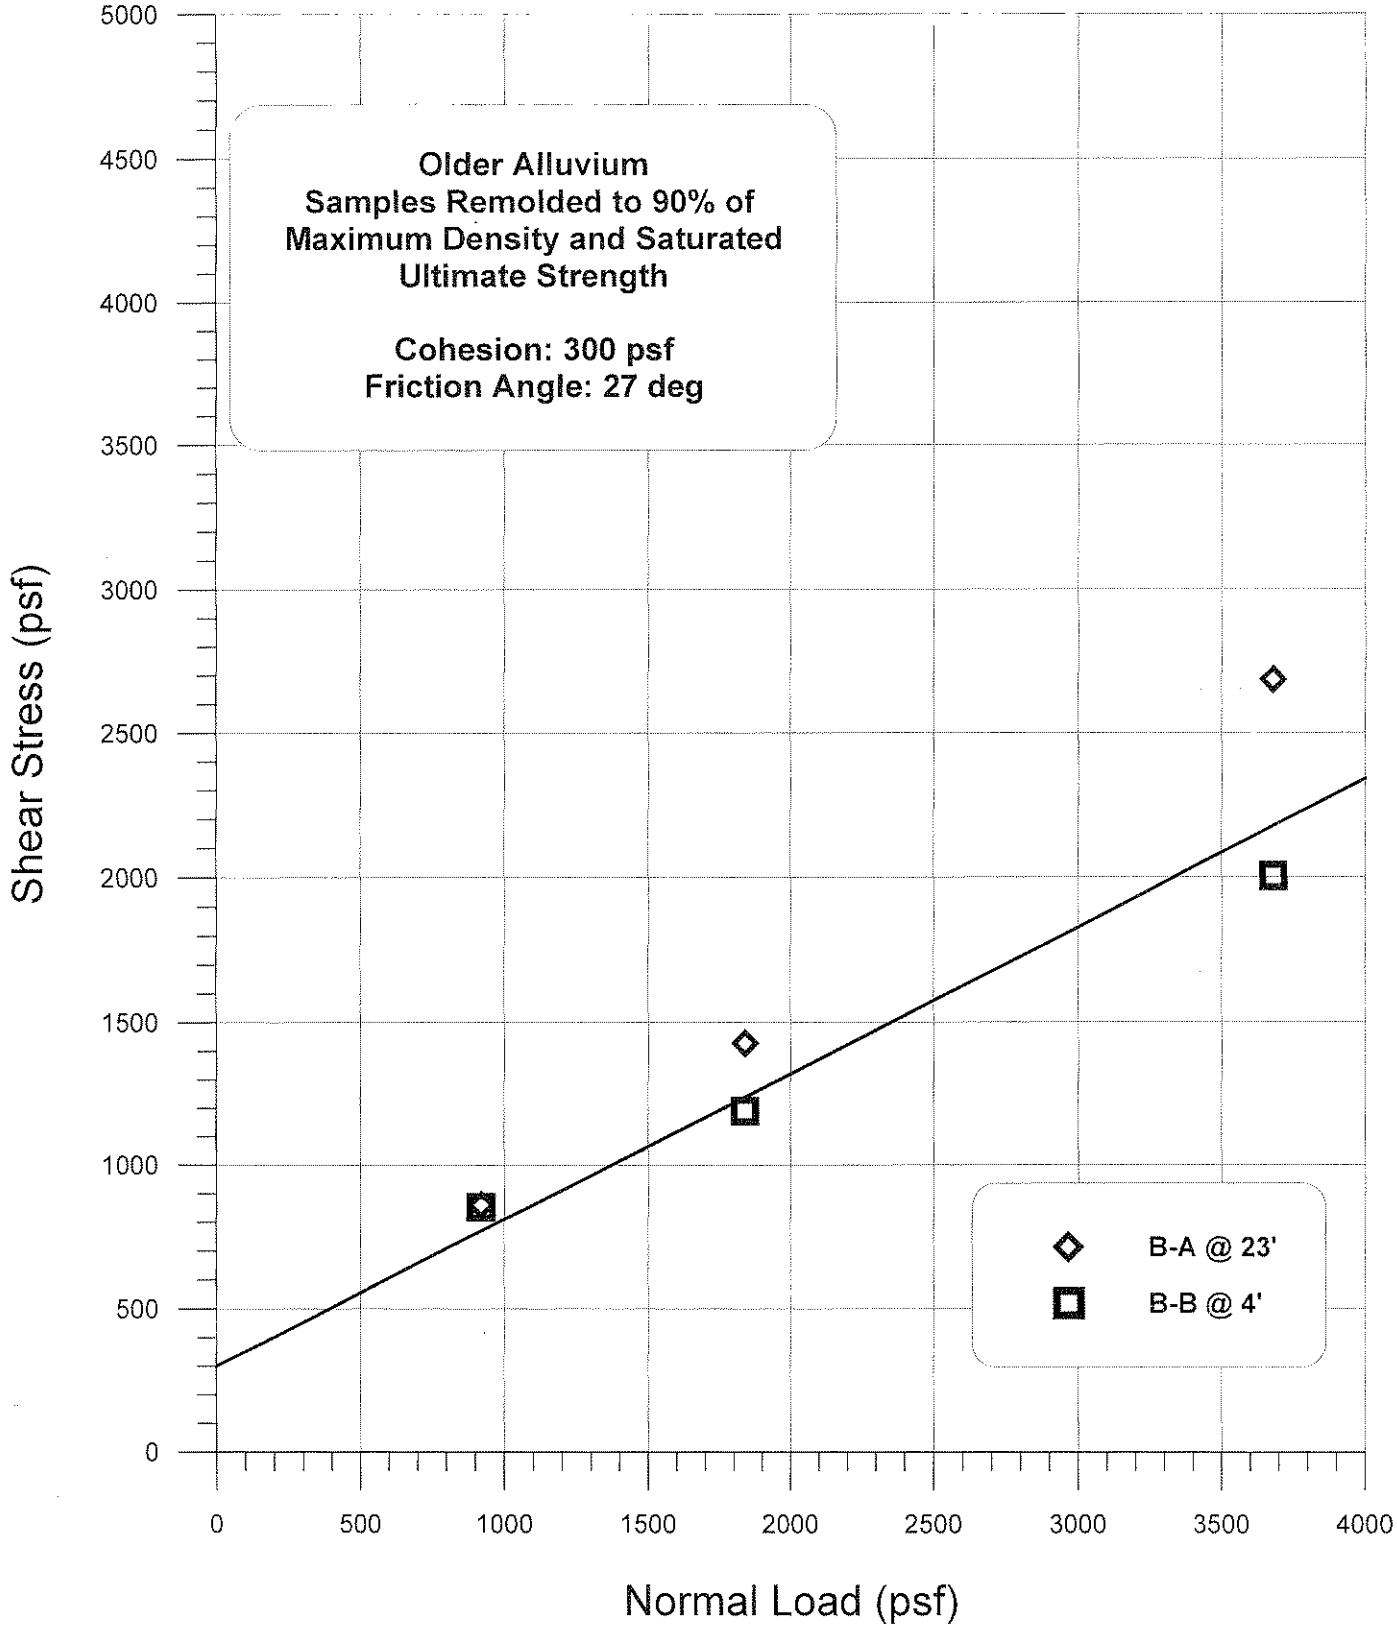
Direct shear testing was performed on relatively undisturbed samples and remolded samples of the earth materials encountered during our exploratory program. The sample sets were saturated prior to shearing under axial loads ranging from 920 to 3,680 psf at a rate of 0.05 inches per minute. The shear strength results are attached as a graphic summaries.

Load Consolidation/Hydroconsolidation Tests

Load consolidation tests were conducted on seventeen (17) relatively undisturbed soil samples. Test loads were added in increments to a maximum of 8,000 or 9,400 psf. Water was added to the sample when loaded to the approximate existing overburden pressure to study the effect of moisture infiltration on potential consolidation behavior. The results are attached as graphic summaries.

Grain-Size Distribution

Grain size distribution analyses were performed on several bulk samples. The analyses were performed using the procedures set forth in ASTM-422. The results are presented below.



Boring	Depth (ft)	% Sand	% Silt	% Clay
17	12.5	59	23	18
18	15	65	21	14
18	20	10	40	50
18	25	23	32	65
18	35	2	37	61
21	47	54	23	23
23	37	31	39	30
23	45	35	51	14
24	17	40	37	23
26	10	63	19	18
26	17	24	32	44
26	25	24	42	34
26	40	13	52	35
27	42	13	50	37

490 / 2			30	6.6	98	SC		Dark brown clayey fine to coarse SAND (damp, medium dense). Porous. Few roots.	
488 / 4			27	7.6	99			At 4'; slightly porous.	
486 / 6			45	5.3	107	SM		OLDER ALLUVUIM: Yellowish brown very silty fine SAND (damp, medium dense to dense).	
484 / 8								Total Depth 7' No caving, No groundwater	
482 / 10									
480 / 12									
478 / 14									

APPENDIX B

LABORATORY TESTING

General
Laboratory test results on selected relatively undisturbed and bulk samples are presented below. Test were performed to evaluate the physical and engineering properties of the encountered earth materials, including in-situ moisture and density, maximum dry density/optimum moisture content relationships, expansion potential, consolidation characteristics, and shear strength parameters.

Field Density and Moisture Content Tests
In-situ dry density and moisture content were evaluated from the relatively undisturbed samples obtained during exploratory operations. The results and a detailed description of the soils encountered are shown on the attached Logs of Subsurface data (Appendix A).

Classification
Soils were classified in general accordance with the Unified Soil Classification System.

Maximum Density-Optimum Moisture
Maximum Dry Density/Optimum Moisture Content relationships (compaction Characteristics) were performed on selected samples of the encountered materials. The tests were performed per ASTM D1557 test method. The results are as follows:

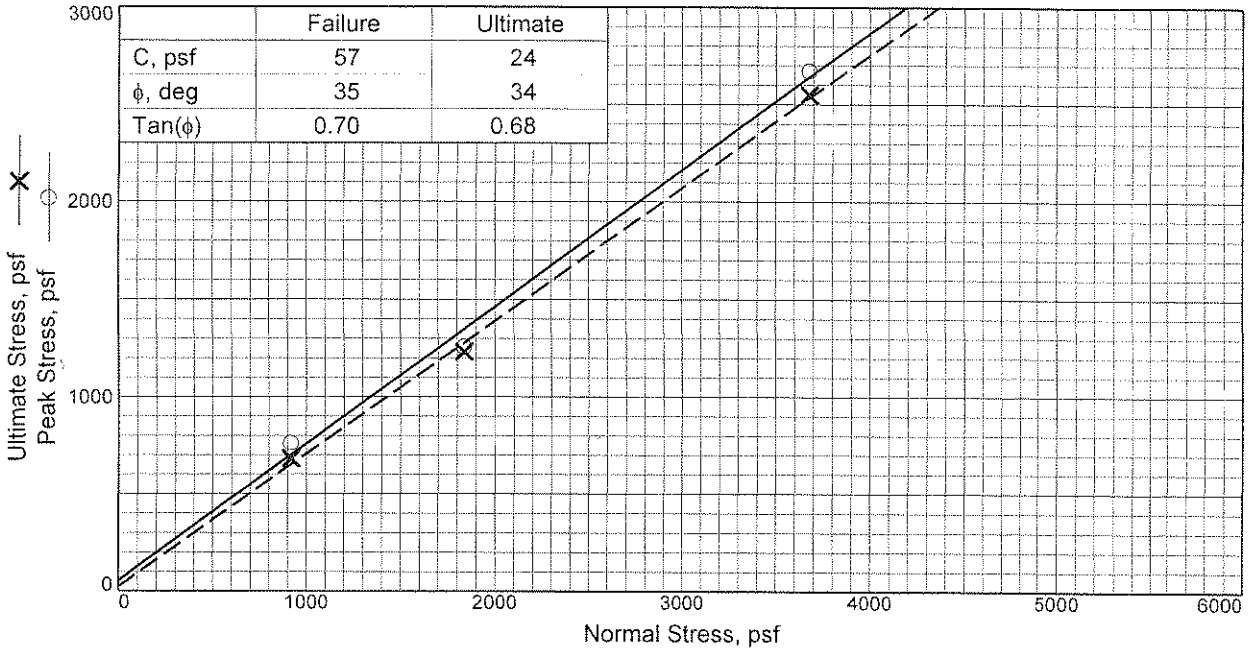
Sample	Visual Soil Classification	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
B-1 @ 3'	Brown clayey sand	124.5	9.0
B-3 @ 14'	Yellowish brown sandy silt	128.5	9.0
B-4 @ 11'	Brown silty fine sand	120.0	11.5
T-11 @ 2'	Dark brown clayey sand	128.5	8.5

Soil Expansion Tests
An Expansion Index test was performed on a selected bulk sample of the encountered materials. The results are as follows:

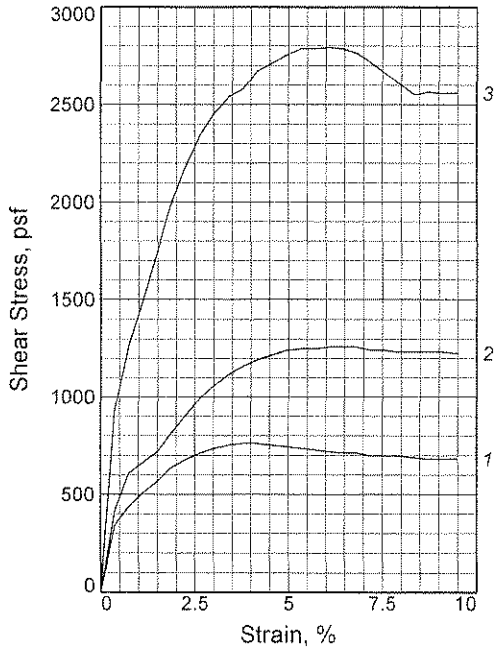
Sample	Expansion Index	Expansion Index Range	Expansion Potential
B-4 @ 14'	19	0 - 20	Very Low

Direct Shear Test
Strain controlled direct shear testing was performed on twenty relatively undisturbed samples and three remolded samples. The sample sets were saturated prior to shearing under axial loads ranging from 920 to 3680 psf. The shear strength results are presented on Plates B-1 through B-21, B-26 and B-27 as graphic summaries.

Load Consolidation Tests
Load consolidation tests were performed on four relatively undisturbed samples. Test loads were added in increments to a maximum of 8,000 or 9,400 psf. Water was added at a load approximating existing overburden stresses to study the effect of moisture infiltration on potential consolidation behavior. The results are presented on Plates B-22 through B-25 as graphic summaries.



Particle Size Analyses



Particle size analyses were performed on several bulk samples. The grain size was evaluated by drying out each sample and passing it through the #200 sieve with an apparent opening size of 0.075 mm. Results of the sieve analyses are limited to evaluating the percentage of sand only. The remaining percentage is referred to as the "percent fines". A table summarizing the results is presented below.

Sample	% Sand	% Fines (silt and clay)	Classification
B -1 @ 3'	79	21	Clayey sand
B -1 @ 20'	36	64	Silty Sandy Clay
B -2 @ 60'	18	82	Silt

Corrosion Testing

Representative soil samples were sent out under separate contract to be tested for corrosive properties. The test results are attached.

Thousand Oaks, CA 91320

MAY - 5 2004

CME Job No.: 1S04127

Subject: Soil Chemistry Analysis for Gorian Job # 2556-0-0-10
(LA Ave, LLC – Lot 59, Tract 3318-Hitch Ranch Area, Moorpark)

Sample Number	As Rec'd Resistivity (ohm-cm)	[1]Minimum Resistivity (ohm-cm)	[2]pH	[3]Sulfate %	[3]Chloride %	[4]Ammonia %	[5] Keldahl Nitrogen %	(As Rec'd) Description
B-4	1,080	400	6.78	0.0014	0.0074	0.0032	0.0620	Medium brown - moist

NOTE: SAMPLES WERE ANALYZED IN ACCORDANCE WITH THE FOLLOWING METHODS.
1. MINIMUM RESISTIVITY DETERMINED BY SOIL BOX METHOD, (PER ASTM G-57)
2. PH MEASURED BY POTENTIOMETRIC METHOD USING STANDARD ELECTRODES. (PER CAL TRANS. #643)
3. CHLORIDE AND SULFATE WERE ANALYZED IN ACCORDANCE WITH EPA METHODS FOR CHEMICAL ANALYSIS FOR WATER AND WASTE, NO. 300 EPA-600/4-79-020. CONCENTRATION BY WEIGHT OF DRY SOIL.
4. AMMONIA WAS ANALYZED IN ACCORDANCE WITH EPA METHOD 350.2
5. KELDAHL NITROGEN WAS ANALYZED IN ACCORDANCE WITH EPA METHOD 351.2

CONCLUSIONS:

Material	Corrosion Class
Concrete	Negligible for Sulfate and Chloride exposure (UBC Table 19-A-4)
Steel Cast/Ductile Iron Mortar Coated Steel	Very Corrosive
Copper Piping	Corrosive due to the presence of nitrogen and ammonia in soils.

The test results and corrosion classifications are based on the sample submitted, which may not be representative of overall site conditions. Additional sampling may be required to more fully characterize soil conditions. If recommendations, based upon the results of the testing are required, please feel free to contact our office.

Sincerely,

CONCECO/MATCOR Engineering, Inc.

Atlantic Job No.: 2008-074

Subject: Soil Chemistry Analysis for Gorian Job # 2556-0-0-10
1 Sample: Trilian, Moorpark Detention Basin (T-11 @2')

Sample Number	As Rec'd Resistivity (ohm-cm)	[1]Minimum Resistivity (ohm-cm)	[2]pH	[3]Sulfate %	[3]Chloride %	[4]Ammonia %	[5]Keldahl Nitrogen %	(As Rec'd) Description
T-11	11,600	3,600	6.68	0.0015	0.0017	0.0014	0.0620	Dark Brown, moist

NOTE: SAMPLES WERE ANALYZED IN ACCORDANCE WITH THE FOLLOWING METHODS.
1. MINIMUM RESISTIVITY DETERMINED BY SOIL BOX METHOD, (PER ASTM G-57)
2. PH MEASURED BY POTENTIOMETRIC METHOD USING STANDARD ELECTRODES. (PER CAL TRANS. #643)
3. CHLORIDE AND SULFATE WERE ANALYZED IN ACCORDANCE WITH EPA METHODS FOR CHEMICAL ANALYSIS FOR WATER AND WASTE, NO. 300 EPA-600/4-79-020. CONCENTRATION BY WEIGHT OF DRY SOIL.
4. AMMONIA WAS ANALYZED IN ACCORDANCE WITH EPA METHOD 350.2
5. KELDAHL NITROGEN WAS ANALYZED IN ACCORDANCE WITH EPA METHOD 351.2

CONCLUSIONS:

Material	Corrosion Class	Recommendation
Concrete	Negligible for sulfate and chloride exposure. pH is neutral to slightly acidic. (UBC Table 19-A-4)	- Type II Portland cement concrete, with a maximum water/cement ratio of 0.50 and a minimum of 3 inches of cover over steel reinforcement. - To reduce penetration of moisture through concrete slabs, it is recommended that a 6 mil polyethylene barrier be placed between concrete slabs and soil.
Steel Cast/Ductile Iron Mortar Coated Steel	Mildly Corrosive	- Install corrosion monitoring and consider cathodic protection for buried ferrous metal piping. - Electrically isolate underground metal piping from above grade piping and other metallic structures. - Provide bonding of non-welded joints and apply dielectric coating to steel and ductile iron pipe and appurtenances to facilitate corrosion monitoring and installation of cathodic protection. - Use separate groundrods for grounding interior piping.
Copper Piping	Corrosive due to the presence of nitrogen and ammonia.	- Overhead plumbing is the most effective method of corrosion control. - Where copper pipe will be installed in soils which contain ammonia, the copper piping should be cathodically protected. - Apply dielectric coating or sleeve and cathodic protection for buried copper piping. - Electrical isolation between hot and cold water lines and between structural steel or ferrous metal piping should be maintained.

ANALYSIS OF LIQUEFACTION POTENTIAL
BORING: B-21 (Gorian) (2%PE in 50 yrs; FS=1.3)

SM

Client: Comstock

J.N. 2677.00

Site: Hitch Ranch, Moorpark

Hammer Type (D,S,A)	A				
Boring Diameter, ID (in)	4				
Site Acceleration (g)	1.055				
for a Magnitude (Mw) of	6.95				
and MSF of	1.25				
Depth to High GW	28.5	ft.	FS for Liquefaction:	1.3	
Depth to GW during invest.	41	ft.	FS for Liqu. Settlement:	1.3	
Hammer Efficiency	72	%	PI Threshold for Liquefaction:	12	
Sublayer Thickness	1	ft.	Moisture Cnt Threshold for Liqu. (%LL)	85	
Depth of Boring	51	ft.			

Notes: Underlined numbers are estimated values.

(1) Based on current groundwater conditions at the time of investigation.

(2) Based on assumed/proposed high groundwater conditions.

(3) Kσ=1.0

(4) A Layer is located above historically high groundwater
B Factor of Saftey is greater than the specified value of FS=1.3
C The $(N_1)_{60\text{-}cs}$ is greater than 30 blows per foot
D PI > 12 or the in situ moisture content (M%) < 85% LL

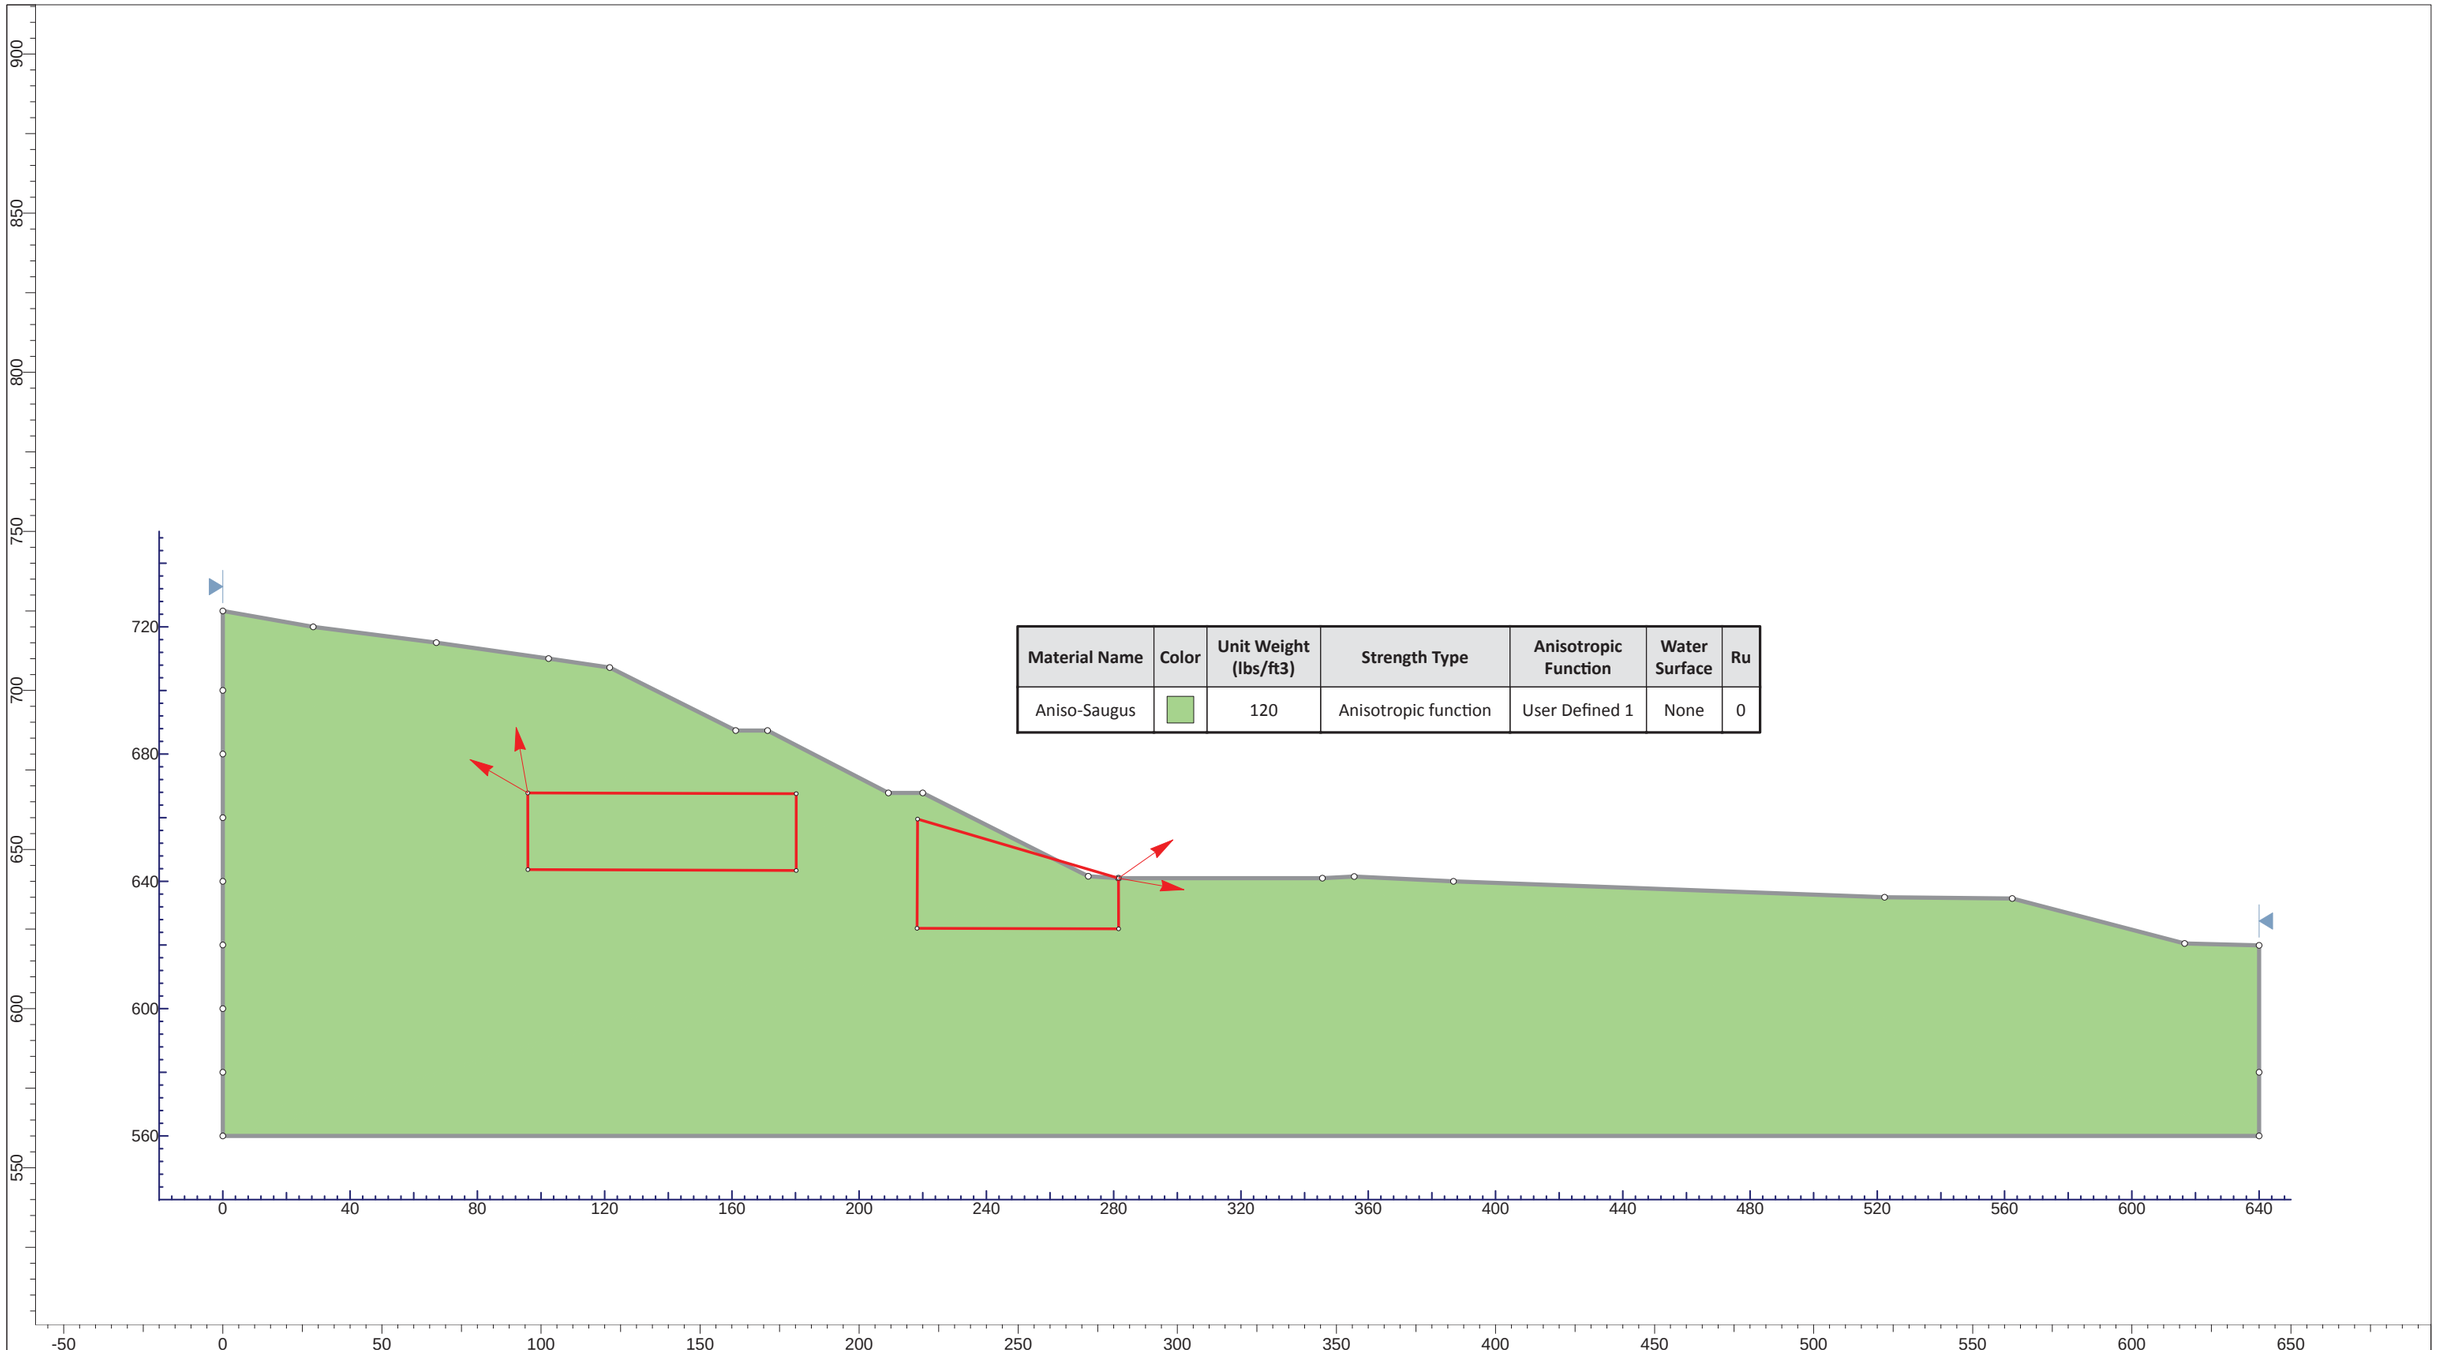
TABLE C-2
ANALYSIS OF LIQUEFACTION POTENTIAL
BORING: B-23 (Gorian) (2%PE in 50 yrs; FS=1.3)

SM

Client: Comstock
J.N. 2677.00
Site: Hitch Ranch, Moorpark

Hammer Type (D,S,A)	A			
Boring Diameter, ID (in)	4			
Site Acceleration (g)	1.055			
for a Magnitude (Mw) of	6.95			
and MSF of	1.25			
Depth to High GW	22	ft.	FS for Liquefaction:	1.3
Depth to GW during invest.	22	ft.	FS for Liqu. Settlement:	1.3
Hammer Efficiency	72	%	PI Threshold for Liquefaction:	12
Sublayer Thickness	1	ft.	Moisture Cnt Threshold for Liqu. (%LL)	85
Depth of Boring	50	ft.		

Notes: Underlined numbers are estimated values.
(1) Based on current groundwater conditions at the time of investigation.
(2) Based on assumed/proposed high groundwater conditions.
(3) Kσ=1.0



(4) A Layer is located above historically high groundwater
B Factor of Saftey is greater than the specified value of FS=1.3
C The $(N_1)_{60\text{-}cs}$ is greater than 30 blows per foot
D PI > 12 or the in situ moisture content (M%) < 85% LL

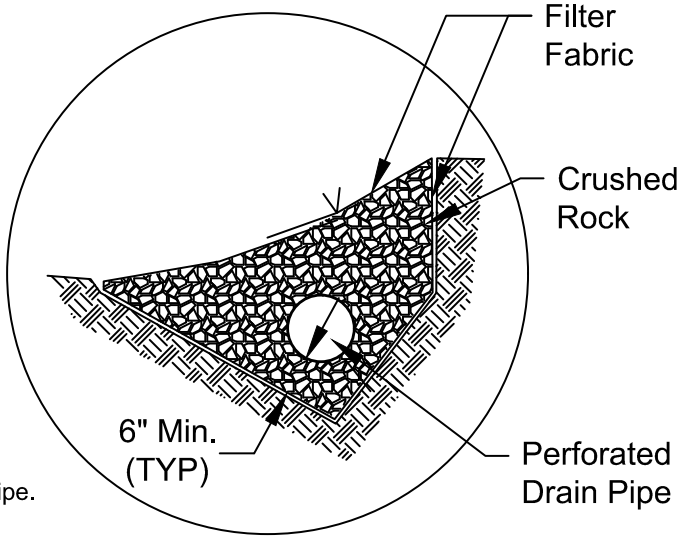
NOTES:



Perforated Drain Pipe should be at least 6 inches in diameter, or 8 inches for runs of more than 500 feet, consisting of either Shedule 40 PVC or SDR 35.
A min. of 8 perforations per linear foot should be provided along the bottom of pipe. The perforations should be in two rows 120 degrees apart, and have diameters of 3/8".
Upstream ends should be provided with a cap. The pipe should slope at a min. 1% gradient toward Outlet Pipes.
Glue all joints.

Outlet Pipe should equal the diameter of the perforated pipe, consisting of either shedule 40 PVC or SDR 35. The pipe should slope at a min. 1% gradient toward the Discharge Point.
Backfill around Outlet Pipe should consist of onsite soils.
Glue all joints.

Crushed Rock should conform to the Standard Specifications for Public Works Construction, Section 200-1.2, for 3/4".
Provide at least 9 cubic feet per lineal foot of Perforated Drain Pipe.
Provide at least 6 inches of gravel below Perforated Pipe.

Filter Fabric should consist of Mirafi 140N or equivelent.
Ends should overlap at least 12 inches.

CALTRANS Class II Permeable Filter Material can be used in lieu of Crushed Rock encased in Filter Fabric

VIEW NORMAL TO SLOPE FACE

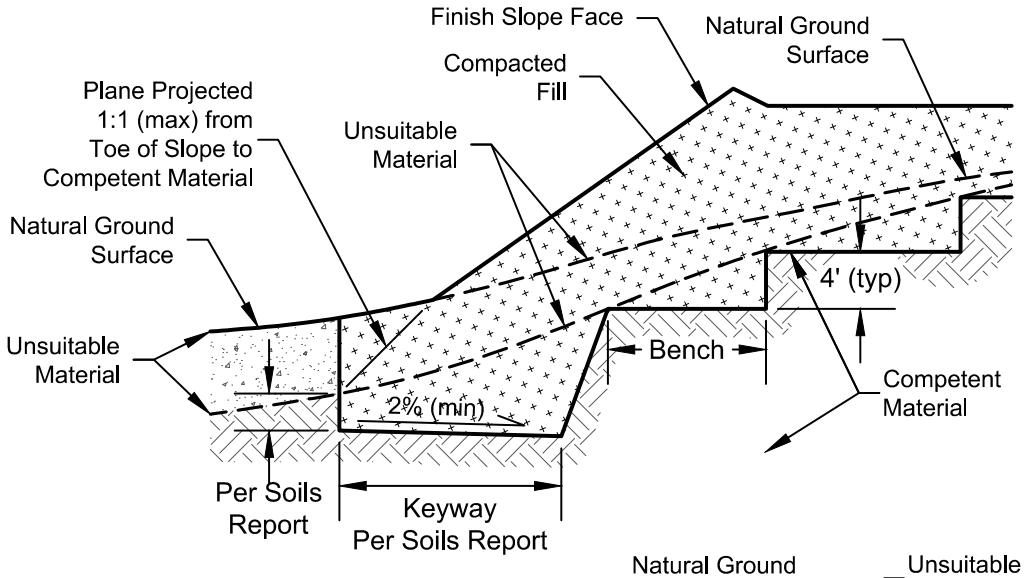
VIEW PARALLEL TO SLOPE FACE

NOTES:

A. Oversize Rock should be placed within troughs created in the General Fill (windrows).

B. Oversize Rocks should be placed to avoid nesting.

C. A layer of Granular Fill (soil material having a maximum particle size of 3 inches or less, and with a Sand Equivalent of 30 or more) should be placed over the Oversize Rock windrow and flooded. This process should be repeated until all voids have been filled.



D. After the voids are filled with Granular Fill, the windrow should be track-walked with a dozer prior to placing General Fill over the windrow.

E. Oversize Rock, suitable for disposal by these methods, is defined rock as larger than 12 inches but not more than 36 inches in smallest dimension.

Response to Geotechnical Review

ALBUS-KEEFE & ASSOCIATES, INC.
GEOTECHNICAL CONSULTANTS

January 8, 2020
J.N. 2677.00

Ms. Harriet Rapista
Comstock Homes
2301 Rosecrans Avenue, Ste. 1150
El Segundo, CA 90245

Subject: **Response to Geotechnical Review by the City of Moorpark, Hitch Ranch Fault Study, Tentative Tract 5708, City of Moorpark, California.**

Reference: "Updated" Geotechnical Feasibility Investigation for Proposed Residential Development, Tentative Tract 5708 (Hitch Ranch Project), City of Moorpark, California, prepared by Albus-Keefe & Associates Inc., dated September 20, 2019 (J.N. 2677.00).

Dear Ms. Rapista,

At your request, we have prepared this response to the comments prepared by the city of Moorpark pertaining to a review of our referenced report. The comments were provided in a spreadsheet and a print of the comments are attached herein for reference.

Item 1:

Cover Letter: We note that the study is provided for preliminary recommendations, and that further studies may be needed for grading or foundation plans. If further studies are needed, this should be a requirement listed in the CEQA document for final project design.

We concur. Because the project plans are not developed in detail and subject to change, we have pointed out in our report that additional studies may be warranted, depending on the degree that project plans change. These additional studies could be limited to office analyses or they could include additional site exploration. However, we believe sufficient work has been completed at this time to make the determination that site development as generally proposed is feasible and this should satisfy CEQA requirements. We believe the CEQA document can state that any recommendations of our report and subsequent addendums as approved by the governing agency should be implemented in site development prior to granting construction permits.

Item 2:

Section 3.4: Second paragraph states that there are minor faults. However the previous statement says that there are no active faults. Provide a clear definition between the two. Are these minor faults inactive faults?

The first paragraph is correct in stating there are no active faults within or immediately adjacent the site. This statement does not preclude the possibility that the site has faults, as many sites in southern California have faults, that are not active as defined by the state of California. The second paragraph indicates there are faults (minor) present within the site. However, these faults (minor) are not active

as defined by the state of California. No mitigation is necessary regarding active faulting within the site.

Item 3:

Section 3.5: What are the referenced publications were used to determine that no landslides have been identified?

The publications used were Dibblee, T.W., and Ehrenspeck, H.E., ed., 1992 Geologic Map; and the Department of Conservation, Division of Mines and Geology, 2000 Seismic Hazard Zone Report.

Item 4:

Section 4.1: Briefly define PGA as this is the first mention of it (Peak Ground Acceleration?).

PGA stands for Peak Ground Acceleration. We should have defined the acronym the first time it was used in our report.

Item 5:

Section 4.3: Provide a brief introduction/discussion on the factors of safety and the meaning of the safety value in terms of liquefaction (as provided in Table 4.1).

The factor of safety as used in the evaluation of liquefaction is the ratio of the Cyclic Resistance Ratio (CRR) over the Cyclic Stress Ratio (CSR). The CRR is a measure of the soil's resistance to liquefaction while the CSR is a measure of the force causing liquefaction. If the soil has greater resistance (CRR) compared to the force causing liquefaction (CSR), then the factor of safety is greater than 1. In theory, the soil does not liquefy until the factor of safety drops below a value of 1. To account for uncertainties in geotechnical data, a minimum factor of safety equal to 1.3 is prescribed by statutory requirements.

Item 6:

Section 4.4: Same as previous comment, discuss meaning of the factor of safety value for slope stability (as provided in Table 4.1).

The factor of safety as used in the evaluation of slope stability is the ratio of the resisting forces along a potential slide surface over the forces causing instability. The resisting forces come from the soil cohesion and friction that occur at the potential failure surface. The driving forces come from the weight of soil above the potential failure surface (gravity) and earthquake forces (if included). If the resisting forces are greater than the driving forces, the factor of safety is greater than 1. In theory, a slope will not fail until the factor of safety drops below a value of 1. To account for uncertainties in geotechnical data, minimum factors of safety equal to 1.5 for static (non-earthquake) conditions and 1.1 for earthquake conditions is prescribed by statutory requirements.

Item 7:

Section 5.1: States that final geotechnical investigation report should be prepared. This should be a requirement of the CEQA document, or a requirement for obtaining permits, so that the CEQA document fully analyzed potential geotechnical impacts.

We believe sufficient work has been completed at this time to make the determination that site development as generally proposed is feasible and this should satisfy CEQA requirements. We concur that the CEQA document should state that additional studies as deemed necessary by the geotechnical consultant should be completed, reviewed, and approved by the governing agencies prior to granting of construction permits.

Item 8:

Section 5.2.1: This states that there is no evidence of an 'active' fault. However, previous discussions states that there are minor faults. Clearly define or revise this paragraph or the paragraph in Section 3.4 for consistency. See comment for 3.4.

Please refer to our response to Item 2. The content of Section 5.2.1 is correct as presented and in our opinion, is clear in meaning and intent.

Item 9:

Section 5.2.3: "…in close proximity to active faults". In Section 5.2.1, it states that none are located adjacent to the site. Revise the statement or provide information of the proximity of these 'active faults' to the project area.

The term "in relative close proximity" as used in our report is intended to indicate that the subject matter is sufficiently close enough to require consideration. Our report is clear that no active faults occur within or directly adjacent to the site and therefore, no mitigation is required with respect to ***ground rupture***. This conclusion is not meant to indicate the site is not at risk of experiencing strong ***ground shaking***. We have concluded the site could be subjected to strong ground shaking but this condition can be mitigated through design and construction in accordance with the California Building Code. We have stated in Section 3.4 that the closest known ***active*** fault is the Simi-Santa Rosa fault located approximately 1.5 to 2 miles southeast of the site.

Item 10:

Section 5.2 4: The statement says that some terrains supporting the development are within a landslide zone. However, in Section 3.5, the information provided says that no landslides have been identified within or adjacent to the site. Please revise either section to be consistent with each other.

The state of California has identified zones throughout the state considered "at risk" to landsliding. The inclusion of a site within one of these zones does not mean the location has a known or suspected landside feature. The intent of the zoning by the state was to draw attention to the need to evaluate the potential for landsliding in higher risk areas. Section 5.2.4 of our report as presented in correct and in our opinion, is clear in meaning and intent.

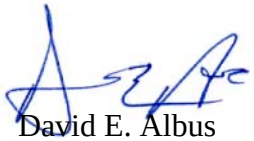
Item 11:

Section 5.7: This section outlines the safety values for static and seismic conditions. An explanation of what these factors would mean for development would be helpful. In addition, if these setbacks are needed to reduce potential impacts to less than significant, this either needs to be part of the project description/project design or a mitigation measure.

Please refer to our response to Item 6. In addition, statutory requirements will dictate that develop be located such a distance from slopes that the calculated factors of safety for static and seismic conditions exceed values of 1.5 and 1.1, respectively, for ground supporting the development. This requirement does not mean that portions of the site cannot have lesser factors of safety as long as those portions do not negatively impact development. We have identified a slope within the site that has calculated factors of safety for stability that are less than statutory requirements. We have recommended a mitigation for this condition. Our mitigation consists of providing a setback of proposed development from the top of this slope and have estimated this setback will be a horizontal distance of approximately 2/3^{rds} of the total slope height. We have recommended that more detailed analyses be performed during the development of project plans to finalize recommended setbacks for mitigation of this condition. We concur that the requirement for setbacks and further detailed analyses prior to granting construction permits be included in the CEQA document as a mitigation measure.

Item 12:

Section 6.0: All recommendations made here should be addressed somewhere in the CEQA document - minimization measures, project design features, or mitigation measures, etc. ***as appropriate for CEQA****.*



We concur with the reviewer. We suggest a draft of the CEQA document be reviewed by our office to confirm that any and all appropriate mitigation measures we have recommended are identified and addressed.

Closing

We hope this response addresses the issues raised by the city reviewer. If there is need for any further clarification, we are happy to address those concerns.

Respectfully submitted,

Albus-Keefe & Associates, Inc.

Subject: **"Updated" Geologic Assessment of Surface Fault Rupture Potential, Hitch Ranch, Tentative Tract 5708, City of Moorpark, California.**

Dear Ms. Rapista,

Albus-Keefe & Associates Inc. is pleased to present to you our "updated" fault evaluation report for the subject property located in the City of Moorpark, California. This report was updated to address review comments of our final fault report, revised dated June 3, 2019. These comments were provided on November 11, 2019 and we understand they were prepared by the Chambers Group on behalf of the city of Moorpark. The review comments were largely editorial in nature and did not alter our overall conclusions and recommendations relevant to our geologic assessment of surface fault rupture potential within the subject property.

We appreciate this opportunity to be of service to you. If you should have any questions regarding the contents of this report, please do not hesitate to call.

Respectfully submitted,

Albus-Keefe & Associates, Inc.

Michael O. Spira, C.E.G. 1976
Principal Engineering Geologist

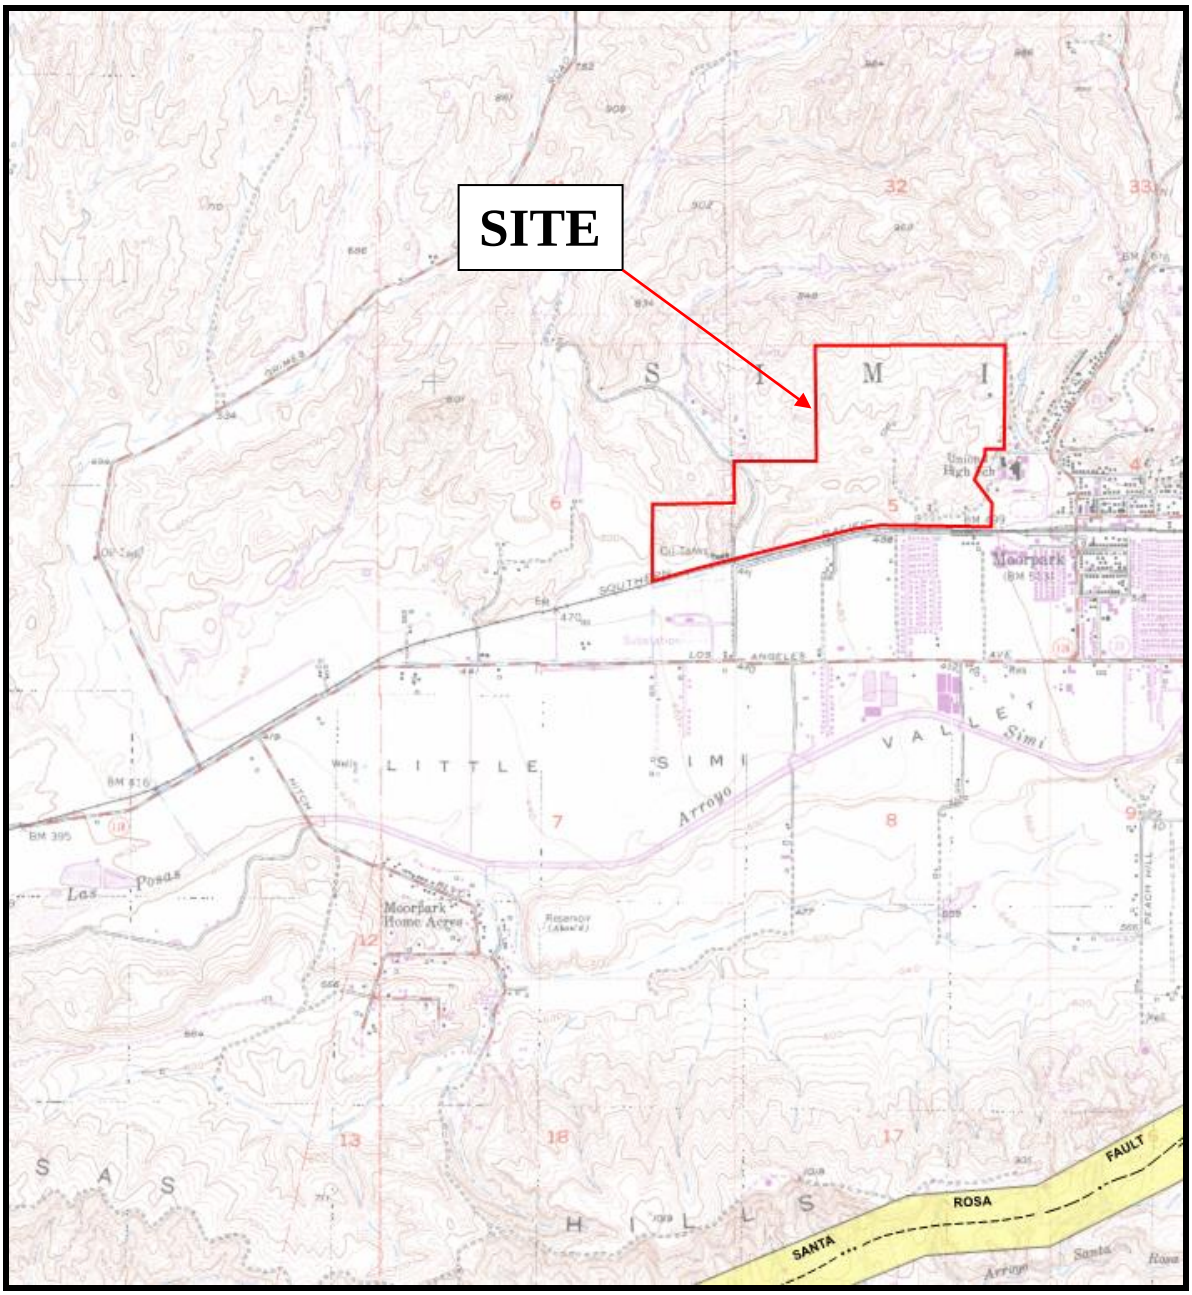
APPENDIX A – Previous Trench Logs by Gorian for the Site
APPENDIX B – Supporting Soil Stratigraphic Assessment Report by Earth Consultants International. dated March 29, 2019 (Revised January 14, 2020)

1.0 INTRODUCTION

1.1 PURPOSE AND SCOPE OF WORK

The purpose of this investigation was to perform a geologic assessment of surface fault rupture potential within the subject property, referred herein as the Site, and to provide mitigation recommendations, if required, for future Site planning and development. As indicated on Figure 1, the Site is not located within the boundaries of a State of California Earthquake Fault Zone (EFZ). The Site is also not located within a City of Moorpark or County of Ventura hazard zone related to faulting. However, the Site is located between two Holocene-active fault zones, the Oak Ridge fault to the north and the Simi-Sana Rosa fault to the south, and previous geotechnical studies in the Moorpark area have reported deformation of late Quaternary sediments near the ground surface in the form of faulting and fault-related folding in association with thrust faulting. Hence, we recommended that this fault study be conducted prior to site development, as discussed further below.



As summarized in detail in a later section of this report, Gorian and Associates, Inc. (Gorian) initially addressed surface fault rupture potential within the Site as part of their geotechnical studies of the property for proposed site development back in the mid-1990's and 2000's. Gorian's studies focused their fault trenching within the central and southerly portions of the Site along and adjacent to a prominent westerly- to southwesterly-trending geomorphic lineament consisting of aligned tributary draws. Geotechnical studies east of Walnut Canyon Road (ECI 1997) reported evidence of faulting and fault-related folding in late Quaternary deposits adjacent to this same lineament associated with a thrust fault referred to in these studies as the Southern Area Thrust fault. Gorian reportedly found no evidence of faulting or folding of the sediments exposed in their trenches within the Site and concluded there was no evidence of active faulting and deformation within the entire Site. However, Gorian did not perform trenching the northerly portion of the Site. Gorian reportedly did not investigate the northerly portion of the Site because they did not identify geomorphic evidence associated with active faulting within this area and claimed there were no faults found in previous studies to the north and east that project through the northern portion of the Site. Bing Yen and Associates, Inc. (BYA), the City of Moorpark reviewer at the time, reportedly observed Gorian's fault trenches within the Site and concurred with their findings from their fault trenches. However, in a review letter that posed several other comments, BYA questioned Gorian's lack of trenching in the northerly portion the Site. Gorian responded to BYA's comments but no additional trenching was performed. An approval letter from BYA was not found in the city files and we do not know if BYA accepted their response.

Considering the geologic structure in the region is complex and that fault trenching was not previously performed in the northerly portion of the Site, the focus of this study was to investigate the northern unexplored portion of the Site to look for evidence of Holocene-active faults. We also looked for evidence of Holocene-active fault-related folding that could also potentially impact future development. The data from this study, combined with the previous work conducted by Gorian for the Site, would then be utilized to create a comprehensive fault investigation report for the entire Site.

This fault investigation was performed in general conformance with the guidelines in the California Geological Survey Special Publication 42, revised 2018 (SP-42; CGS, 2018). These guidelines are for sites regulated by the Alquist-Priolo Earthquake Fault Zoning Act (A-P Act). Projects located outside of an EFZ are still regulated by the A-P Act if a Holocene-active fault (a fault with surface displacement within the last 11,700 years) is found at that site during an investigation. As such, if a Holocene-active fault were found during this fault investigation, structures for human occupancy would not be allowed to be built across that fault. A structure for human occupancy is defined in the A-P Act is as "any structure used or intended for supporting or sheltering any use or occupancy, which is expected to have a human occupancy rate of more than 2,000 person-hours per year."

Our investigation included the following scope of work:

- Review of previous geotechnical and fault reports for the Site
- Review of previous fault investigation reports performed within nearby properties
- Review of published and unpublished geologic literature and maps, reports, and other readily available documents
- Review of historical aerial photographs for the Site and vicinity
- Compilation of geologic information acquired through our research
- Excavation and logging of exploratory fault trenches
- Soil stratigraphic assessment by Earth Consultants International, Inc. (ECI)
- Geologic and paleoseismic evaluation of data
- Preparation of this report

EARTHQUAKE FAULT ZONE MAP

Hitch Ranch
City of Moorpark, California

From: California Geologic Survey, Earthquake Zones of Required Investigation, Moorpark Quadrangle, released May 1, 1999.

FIGURE 1

1.2 SITE LOCATION AND PHYSICAL SETTING

1.2.1 Site Location

The Site is irregular in shaped and occupies 277.3 acres in the city of Moorpark, California. The Site is located north of Poindexter Avenue and approximately 1,500 feet west of Moorpark Avenue The Site is generally bordered by undeveloped hillside property on the north, a new single-family housing tract on the northeast, rural single-family residences and Walnut Canyon Elementary School on the east, undeveloped hillside property on the west, rural single-family residences on the northwest, and Southern Pacific Railroad tracks, Walnut Canyon Channel, and Poindexter Avenue on the south. The location of the Site and its relationship to the surrounding area are shown on Figure 2, Site Location Map.

1.2.2 Physiography

The Site is located on the southern piedmont slopes of Oak Ridge. Topographically, the Site consists of moderately sloping south- to southwest-trending ridge spurs with intervening south- to southwest-draining canyons. At the southern margins of the Site, the hillside terrain transitions to the broad west-draining flood plain of the Arroyo Simi. Surface elevations within the Site vary from 722 feet above mean sea level (MSL) within the upper northern margin of the Site to 470 feet above MSL at the lower southern margin of the Site. Surface gradients within the property generally range from nearly level to 1.5:1 (H:V).

Surface drainage within the Site is generally directed by sheet flow from the hillsides into the south- to southwest-draining canyons. Drainage is then captured at the southerly margin of the Site in a west-flowing, concrete-lined, open-box flood control channel referred to as the Walnut Canyon Channel.

Vegetation currently within the Site consists of a light to moderate growth of grasses, weeds, and bushes. Scattered trees ranging in size from small to very large are also present throughout the Site.

1.2.3 Previous and Existing Land Use and Site Improvements

Based on our review of historical aerial photographs from 1929 through 1998 and review of the referenced reports by Gorian for the property, the Site was largely used for agricultural purposes since the 1920s (earliest available photographs) through the 1960s. This was evident by the presence of scattered groves and features that appear to be farmhouses on some of the ridge tops in the aerial phototrophs reviewed. Ground modifications in the form of roads associated with the agricultural activity were also noted throughout the Site. Some significant ground modifications were also noted in the northwesterly portion of the Site where some ridgetops were cut down and canyons were filled to create a gently sloping area for a later orchard.

Currently, the site appears to be primarily utilized for cattle grazing operations. The groves that previously existed on site have been removed and much of the site appears fallow. Improvements associated with the current Site operations include a horse stable, several small

(From: Google Earth)

N

SITE LOCATION MAP

Hitch Ranch
City of Moorpark, California

NOT TO SCALE

FIGURE 2

sheds, cattle pens, and several small water tanks and troughs within the flatter valley areas of the Site. Other site improvements include a paved street (Gabbert Road), several high-voltage overhead power lines and perimeter wire and chain-link fencing. Remnants of the Site's previous agricultural improvements are still scattered throughout much of the property. These improvements include abandoned water wells, an above-ground water-reservoir tank, concrete foundations from previous farmhouses and associated structures, above- and below-ground steel irrigation pipelines, and breached impoundment dams in some of the drainages.

1.3 PROPOSED DEVELOPMENT

Based on our review of the Preliminary Grading, Drainage, and Utilities Plans prepared by Encompass Consultant Group, dated August 13, 2018, the Site will largely be developed for residential use. Institutional, recreational and open space areas are also indicated on the plans. Associated improvements will include public and private streets, and large detention basins predominately located within the southern portion of the Site. The plan indicates a main transecting street, identified as North Hills Parkway, will extend from the northeast corner of the Site to Gabbert Road. The existing nearby streets Casey Road, High Street, and Meridian Hills Drive are also planned to be extended within the property and connect to proposed interior streets. No improvements are currently proposed west of Gabbert Road.

Future Site development will largely involve cut and fill grading to achieve designed grades. Based on the current referenced plans, proposed cuts and fills are anticipated to be as much as approximately 52 feet and 48 feet, respectively. Cut and fill slopes are proposed up to maximum heights of approximately 62 feet and 55 feet, respectively, at slope gradients of 2:1 (H:V) or flatter.

The residential portions of the Site will include both single- and multi-family dwellings. Details of the residential structures are not available at this time. We anticipate future residential structures will consist of slab-on-grade, one- to three-story, wood-framed structures yielding relatively light structural loads. Other associated site improvements are anticipated to include utility services, asphalt and concrete pavements, decorative hardscape, and masonry retaining and screen walls.

2.0 BACKGROUND REASEARCH

2.1 GENERAL

As part of our background research, we reviewed geologic publications and maps for the region as well as historic aerial photographs for the area. We also reviewed numerous geotechnical reports and fault studies prepared by others for the Site and nearby properties to gain an understanding of the local geology and the type and age of faulting reported in the Site vicinity. Data from these sources were utilized to develop some of our findings and conclusions presented in this report. A complete listing of geologic publications and maps, topographic maps and

aerial photographs, and geotechnical and fault studies reports reviewed for this study are provided in the References section of this report.

2.2 REGIONAL GEOLOGIC SETTING

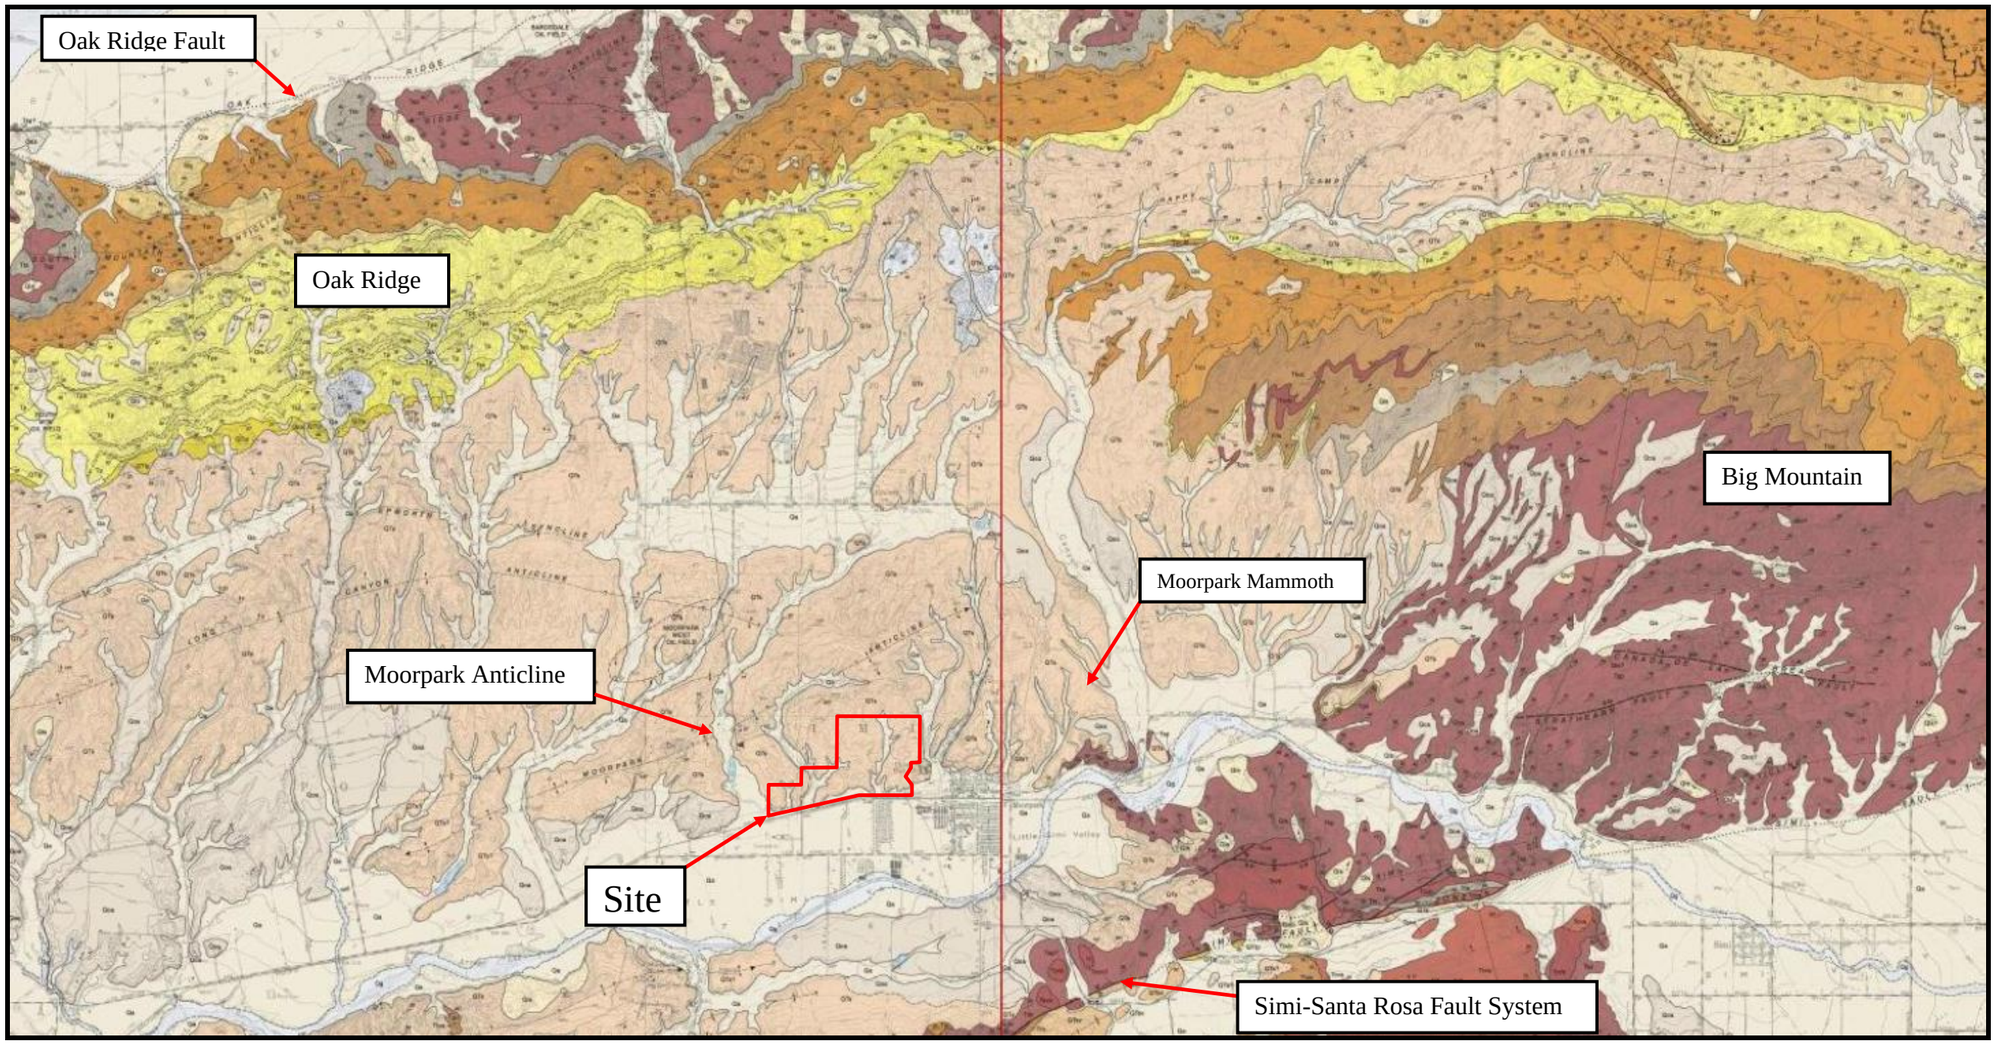
The Site is located within the south-central portion of the Ventura Basin, in the western Transverse Ranges geomorphic province. The Ventura Basin is an east-west-trending trough that experienced basin inversion (extensional to compressional forces) during the late Miocene to early Pliocene geologic eras (Yeats, Huftile & Stitt, 1994). The change from an extensional to compressional environment is believed to be associated with the development of the "Big Bend" of the San Andreas fault to the north, resulting in north-south crustal shortening of the region (DeVecchio et al., 2012b). Continued north-south compressional tectonics have produced an intricate system of generally east-west-trending thrust faults, reverse faults, and large-scale folding throughout the basin.

In closer proximity, the Site as shown on the Regional Geologic Map (Figure 3), is located in Moorpark on the southern piedmont slopes of Oak Ridge. The broad west-draining flood plain of the Arroyo Simi borders the Site to the south. Oak Ridge and the surrounding vicinity are underlain by Tertiary- and Quaternary-age sediments bounded by two major east-west trending faults: the Oak Ridge thrust fault to the north and the Simi-Santa Rosa reverse fault to the south. Crustal shortening of the sediments between these two major faults has resulted in a system of complex folds and thrust terrain. Major features identified on the Regional Geologic Map (Figure 3), include the Moorpark and Long Canyon anticlines and the Epworth syncline (Dibblee,1992a and 1992b). The Moorpark syncline and other less extensive folds have also been recognized in the region but are not shown on the Regional Geologic Map. These structures are generally broadly-diffused folds whose axes trend in an east-west to northeast direction.

2.3 OAK RIDGE AND SIMI-SANTA ROSA FAULTS

As previously discussed, the Site is bounded by two active fault zones, the Oak Ridge fault to the north and the Simi-Santa Rosa fault to the south. The Oak Ridge fault, as described in FER-219 (Treiman, 1990), is an east- to northeast-trending, south-dipping reverse fault that extends roughly 65 miles (100 km) from offshore Ventura/Oxnard to the Santa Susana Mountains. Folding and reverse slip on the Oak Ridge fault has resulted in the uplift of the Oak Ridge and piedmont slopes. In the literature, the fault itself is generally described as a blind thrust fault and is not well defined at the surface. However, local fault splays have been identified in the near surface and are zoned by the State as active faults (Treiman, 1990; C.D.M.G., 1999). The EFZ associated with the Oak Ridge fault is located approximately 5.5 miles northwest of the Site. Yeats (1998) has estimated a recurrence interval on the Oak Ridge fault of 250 to 500 years.

The closer Simi-Santa Rosa fault system is a prominent northeast-trending, north-dipping reverse fault zone that extends approximately 25 miles (40 km) from the Camarillo Hills to the northeastern end of Simi Valley (Treiman, 1998). Movement on the Simi-Santa Rosa fault system resulted in uplift of the Las Posas Hills. Within the Moorpark area, the Simi-Santa Rosa



fault system consists of a well-defined zone of deformation comprised of several folds and fault segments, also referred to as the Camarillo fold belt (DeVecchio et al., 2012b). The various fault segments are described as showing clear evidence of Holocene-age faulting and are also zoned by the State as active faults (Treiman, 1998; C.D.M.G., 1999). The EFZ associated with the Simi-Santa Rosa fault system is located approximately 1.5 to 2 miles southeast of the Site as shown on Figure 1. The recurrence interval on the Simi-Santa Rosa Fault Zone has been estimated at 900 years (C.D.M.G., 1998).

2.4 LOCAL GEOLOGIC SETTING

The project area, as indicated on the Regional Geologic Map (Figure 3), is largely underlain by sediments that have been assigned to the Pleistocene to Pliocene Saugus Formation (Dibblee, 1992a and 1992b). The valley floors and flood plains are generally underlain by Holocene-age alluvium. Older alluvial deposits of late Pleistocene age are also locally present in the area. Previous studies we reviewed suggest that older alluvial deposits are more widespread than indicated on the Regional Geologic Map.

The Saugus Formation in this locality is a non-marine unit comprised of alluvial materials deposited by the ancestral Santa Clara River. Levi and Yeats (1993) utilized magnetostratigraphy in the nearby Santa Susana Mountains to estimate the lower age of the Saugus at 2.3 million years old (Ma), and its upper age at 400 to 500 thousand years old (ka). Locally, the discovery of a mammoth (Moorpark Mammoth – see Figure 3) during grading for Tract 5054 has provided a biostratigraphic age of 850 ka to 780 ka for the upper Saugus Formation in the immediate Site vicinity (Wagner et al., 2007).

Structurally, the project area is situated on the southern flank of the Moorpark anticline and bedding structure generally dips at low angles to the south. Previous fault studies in the area, as discussed in detail in later sections of this report, have identified two significant thrust faults that are locally exposed at the surface that deform late-Quaternary sediments; the Northern Area Thrust fault and the Southern Area Thrust fault. The Northern Area and the Southern Area thrust faults are generally described as east- to northeast-trending thrust faults that dip at shallow angles (~15 to 30 degrees) to the north. These thrust faults are generally considered to be related to compression in the cores of the major folds in the area and are not considered seismic-generating sources (ECI, 1997). Minor normal faults (faults with less than 12 inches of offset), reverse faults, and strike-slip faults that generally exhibit offsets of a foot or less and are laterally discontinuous, as well as folding, have also been identified in previous fault studies in the project area. These structures have generally been interpreted to be secondary structures (e.g. back thrusts, bending-moment faults, tear faults, flexural-slip faults, and fault-related folding) associated with deformation of the late-Quaternary sediments in response to movement of the Northern Area and the Southern Area thrust faults in the area. The approximate locations of the Northern and Southern Area Thrust faults, as well as a significant reverse fault interpreted to be a backthrust to the Southern Area Thrust fault in Tract 5130, are shown on our Composite Regional Fault Study Map (Plate 3).

N

REGIONAL GEOLOGIC MAP, FIGURE 3

Hitch Ranch
City of Moorpark, California

From: Dibblee, T.W., and Ehrenspeck, H.E., ed., (1992a), Geologic map of the Moorpark quadrangle, Ventura County, California: Dibblee Geological Foundation, Dibblee Foundation Map DF-40, scale 1:24,000) & Dibblee, T.W., and Ehrenspeck, H.E., ed., (1992b), Geologic map of the Simi quadrangle, Ventura County, California: Dibblee Geological Foundation, Dibblee Foundation Map DF-39, scale 1:24,000)

NOT TO SCALE-

With regards to fault activity, none of the documents we reviewed report definitive evidence of Holocene-age faulting in the area of the Site. Where the age of faulting has been constrained by dated deposits, the faults have been determined to not deform late Pleistocene sediments, indicating these structures are pre-Holocene (ECI 1999, Geolabs 2003d, Geolabs 2003c, ECI 2006).

2.5 PREVIOUS FAULT STUDIES FOR THE SITE (HITCH RANCH, TRACT 5708)

Gorian and Associates, Inc. (Gorian) assessed faulting within the Site as part of their initial geotechnical investigation of the Site in 1994 (Gorian 1994). Based on aerial photographic evaluation, Gorian noted a prominent westerly- to southwesterly-trending geomorphic lineament consisting of aligned tributary draws traversing the central portion of the Site. The draws were noted to extend offsite in both the east and west directions. As part of their 1994 study, Gorian excavated and logged two trenches (labeled 1-1' and 2-2') perpendicular to this lineament to look for evidence of faulting. The trenches ranged from 10 to 15 feet in depth. No evidence of faulting was found in their trenches.

In 1999, Gorian excavated four (4) additional trenches (labeled 1A-1A', 3-3', 4-4', and 5-5') further to the south of the subject lineament, within the south-central portion of the Site (Gorian 2000c). This supplemental trenching work was performed to assess the continuity of the Southern Area Thrust fault, associated faults, and fault-related folds found offsite and south of this lineament by others (Gorian 1998a and 2000a). The additional trenches by Gorian ranged from 12 to 18 feet in depth. Gorian reported there was no evidence of faulting or deformation in their additional trenches in Hitch Ranch and interpreted the Southern Area Thrust fault dies out near the location of Walnut Canyon Road, about 1,100 feet east of the Site. The additional trench excavations were also reportedly reviewed by the City of Moorpark representative, Bing Yen and Associates, Inc., and BYA reportedly concurred with Gorian's trench findings.

BYA prepared a letter, dated January 19, 2000, summarizing their review of Gorian's report. BYA commented on the lack of trenching in the area south of Trench 5-5', within the southern portion of the Site, and questioned Gorian's justification for not trenching in the northern half of the Site. Gorian provided a response letter on August 28, 2000 (Gorian 2000b), addressing BYA's comments. In their letter, Gorian discussed how their recent trenching and grading work on the Walnut Canyon Elementary school, located immediately southeast of the Site, found no evidence of faulting and therefore addressed the area south of Trench 5-5'. With regards to the northern half of the Site, Gorian discussed how there was no geomorphic evidence associated with active faulting in the northern half of the Site and that trenching completed for projects to the north on Tract 5187 and to the east on Tract 5130 did not encounter any evidence of faulting or surface deformation projecting toward the northern half of the Site. A subsequent review letter or a letter of approval by BYA pertaining to Gorian's response letter dated August 28, 2000 was not found in the City of Moorpark files, and is thought to have never been issued.

The location of the geomorphic lineament identified by Gorian within the Site is shown on the

Composite Regional Fault Study Map, Plate 3. The locations of the trenches completed by Gorian for the Site are shown on the enclosed Plot Plans, Plates 1 & 2, as well as on the Composite Regional Fault Study Map, Plate 3. Trench logs for the Site completed by Gorian are presented in Appendix A. On a side note, during Gorian's later trenching, they reassigned the deposits of the Saugus Formation on the site from their earlier studies to older alluvium.

2.6 FAULT STUDIES BY OTHERS IN THE SITE VICINITY

We reviewed numerous fault/geotechnical studies performed in relatively proximity to the Site. The purpose of our review was to assess the findings of these previous studies with respect to the potential for Holocene-active faults or surface deformation projecting toward the Site. The locations of these previous studies completed in the Site vicinity and pertinent data (trench locations and major faults) are shown on the Composite Regional Fault Study Map, Plate 3. A brief summary of the findings from these previous studies is presented below.

Tract 5054

Based on review of various documents (Gorian 1997, 1998a, 1998b, 2000c, Geolabs 2003d, ECI 1997, 1999) multiple studies were performed by Pacific Materials Laboratory (PML) in 1996 and 1997 for Tract 5054, located approximately 3,300 feet east of the Site. Their studies involved numerous fault trenches and exploratory borings. Copies of their reports were not available at the City of Moorpark nor from other consultants we contacted. As such, we relied on summaries and data contained in the referenced documents to understand the work by PML. Based on these sources, we understand that PML encountered two significant faults in their study area, referred to as the Northern Area thrust and the Southern Area thrust faults, as well as associated smaller faults and folds. These faults and folds reportedly deformed the Saugus Formation and three generations of older alluvial deposits. According to ECI (1997), the age of the youngest deformed older alluvial deposit within Tract 5054 is closely constrained at about 50,000 years (late-Pleistocene).

The Northern Area thrust fault and the Southern Area thrust fault are reportedly east- to northeast-trending thrust faults that shallowly dip (~15 to 30 degrees) to the north. The Northern Area and Southern Area thrust faults were interpreted to be associated with regional folding of the Moorpark syncline and are not considered to be separate earthquake-generating sources (ECI, 1997). However, ECI (1997) considered these two thrust faults to be capable of small displacements in the event of a large earthquake on either the Oak Ridge fault to the north or the Simi-Sana Rosa fault to the south. As such, the Northern Area thrust fault and the Southern Area thrust fault were treated as active faults in Tract 5054.

Tract 5130

Gorian completed a fault study on Tract 5130 located approximately 1,000 feet east of the Site, and west of Tract 5054 (Gorian 1998a). Their report involved the excavation and logging of five trenches, 1-1' to 5-5'. The trenches ranged from 15 to 18 feet in depth. In the southern portion of the property, Gorian observed a prominent reverse fault coupled with significant folding of

the near-surface Saugus Formation and older alluvial deposits within their trenches 1-1' and 2-2'. These features occur several hundred feet south of the lineament identified earlier by Gorian in their study of Hitch Ranch-Tract 5708 (Gorian 1994, 2000c). Gorian interpreted the south-dipping reverse fault to be a possible backthrust of the Southern Area thrust mapped in Tract 5054 to the east and similarly treated the fault as an active fault. Gorian reported it was possible that the main trace of the Southern Area Thrust fault is buried at depth and may daylight south of the site.

Walnut Canyon Elementary School

Gorian completed an investigation for the neighboring Walnut Canyon Elementary school property to the east (Gorian 1997). Their study involved the excavation and logging of three trenches, 1-1' to 3-3', ranging from about 10 to 20 feet in depth. Gorian reported the trenches revealed no indication of active or potentially active faulting. In a response letter dated August 28, 2000 for the Hitch Ranch (Tract 5708), Gorian also reported that observations during the grading operations for the site did not reveal any evidence of faulting.

Tract 5187

A fault study was performed by Geolabs-Westlake Village (Geolabs) for Tract 5187, located immediately north of the Site. Although their fault study report was not available for our review, we were able to review a subsequent geotechnical report for the property by Geolabs (Geolabs 2003d), which included a brief summary of their findings as well as trench logs and maps. A brief summary of their findings was also presented in a report issued by Geolabs (Geolabs 2005a) for Tract 5505. Based on that report, Geolabs excavated ten exploratory trenches, FT-1 to FT-10, throughout the property. Their trenches were generally 7 to 20 feet deep, but locally were as deep as 40 feet (trench FT-8). Geolabs encountered the western extension of the Northern Area thrust in trenches FT-1, FT-4, FT-7, and FT-8. In FT-8, the Northern Area thrust fault was reportedly overlain by unbroken alluvium. Dr. Roy Shlemon, who provided soil stratigraphic assessment for their study, estimated the alluvium to be 15,000 to 20,000 years old, making the fault pre-Holocene and thus not active by current A-P standards (Geolabs 2003d). Secondary normal faults were also reportedly encountered throughout the property and these were also interpreted to be pre-Holocene faults by association with the main thrust fault.

Proposed Casey Road Senior Community Site

Geolabs conducted several investigations of the Casey Road Senior Community site, located east of the Site. The site has also been referred to as Tract 5424 and 5505. Although their fault study report was not available for our review, we were able to review a subsequent geotechnical report for the property prepared by Geolabs (Geolabs 2005a), which included a summary of findings and trench logs and maps from their fault study. According to the geotechnical report we reviewed, Geolabs' fault study involved the excavation and logging of three exploratory trenches, FT-1 to FT-3, oriented north-south to northeast-southwest. Their trenches ranged from 8 to 18 feet in depth. Geolabs encountered several south-dipping secondary normal faults within the southern portion of trench FT-2. Trench FT-3 was then excavated to overlap, along strike, the faulted area in FT-2 and no faults were encountered. As a result, these faults were

interpreted to be laterally discontinuous. Based on their interpretations of faults encountered within Tract 5187 to the north and within the senior community site, Geolabs considered all faults within the property to be pre-Holocene and thus there were no constraints to habitable structures.

To further assess the activity of faulting found in the site by Geolabs, a subsequent fault study was performed by Lawson & Associates Geotechnical Consulting, Inc. (LGC). Although their report was not available to us, we did review a report prepared by ECI (ECI 2006), who provided age estimates of near-surface deposits in support of LGC trenching. We also reviewed a later geotechnical report for the site by Workman Engineering & Consulting (WEC 2014), who summarized the findings from the previous studies by Geolabs and LGC. Their report also included a map showing the trench locations and limited data from these two previous fault studies. Based on these two secondary sources, LGC excavated and logged three additional exploratory trenches, T-1 to T-3, oriented east-west to northeast-southwest within the southerly portion of the property in the vicinity where Geolabs mapped a narrow zone of faulting. Their trenches ranged from 5 to 13 feet in depth. Based on this additional trenching work, LGC confirmed that the fault previously identified by Geolabs in the southerly portion of the site is pre-Holocene age. ECI (ECI 2006) supported this finding based on soil age estimates and geomorphic evidence. A zone of minor north-south-trending normal faults were also reportedly encountered during LGC's fault trenching work. The faults, according to ECI (ECI 2006), were confined to the Saugus Formation and were also determined to be pre-Holocene faults.

Tract 4928

Geolabs performed a fault study for Tract 4928, located approximately 2,000 feet north of the Site. Although we were not able to obtain copies of Geolabs' reports, we did obtain a report prepared by ECI (ECI 1999), who conducted a third-party review of Geolabs' draft report, as well as made field observations of some of the trenches still open onsite. According to ECI, Geolabs had excavated multiple trenches within the site. The trenches reportedly encountered mostly northwest to north-northwest-trending normal faults with vertical offsets ranging from a few inches to 5 feet. In one of the trenches referred to as T-5 where younger alluvium was present, the faults did not offset the overlying younger alluvium unit.

2.7 HISTORIC AERIAL PHOTOGRAPHS ASSESSMENT

We reviewed historical aerial photographs of the Site and surrounding area to look for landforms or other features that would be indicative of faulting. A listing of the aerial photos we reviewed are provided in the Reference section of this report. Features we looked for included linear troughs, vegetative lineaments, and tonal contrast lineaments. Based on the earliest aerial photographs we reviewed (10-31-29), much of the natural surface of the Site appears to have been altered as a result of agricultural activity (plowed and/or covered with orchards). As such, the aerial photographs were of not very helpful in identifying vegetative lineaments and tonal contrast lineaments within the Site. We did observe the prominent westerly to southwesterly trending geomorphic lineament consisting of aligned tributary draws noted by Gorian. This

lineament traverses the central portion of the Site and extends offsite both to the east and west. We did not observe other significant through-going geomorphic lineaments within the Site.

3.0 FIELD INVESTIGATION

3.1 INVESTIGATIVE APPROACH

As previously discussed, the focus of this study was to investigate the northerly unexplored portion of the Site to look for evidence of Holocene-active faulting as well as fault-related deformation (e.g. folding) that could impact future development. Based on our review of Gorian's previous studies for the Site, the central and southerly portions of the Site appear to have been sufficiently investigated to rule out the possibility of active faulting and fault-related deformation associated with the Southern Area thrust. However, we are of the opinion that the northern half of the Site was not sufficiently investigated by Gorian, especially given the large gaps between fault trenches on the adjacent site to the east (Casey Road Senior Community site, Formerly Tentative Tract 5424 and 5505). As such, our field investigative approach was to excavate two exploratory trenches oriented north-south, perpendicular to the regional structural trend, extending from the northeasterly corner of the Site to Gorian's Trench 4-4' at the eastern boarder of the Site. The trenches were sufficiently overlapped to prevent gaps in the data where continuous trenching was not feasible. To assess whether or not this portion of the Site is crossed by Holocene-active faults, our trenches were excavated deep enough to expose pre-Holocene geologic units. If pre-Holocene units and/or soil profiles were observed to extend continuously and unbroken (i.e., with not offset) across the trenched area, then the possibility of Holocene-active faults within the Site could be ruled out.

3.2 EXPLORATORY TRENCHING

Our exploratory trenching was performed from January 21, 2019 through February 13, 2019 and involved the excavation and logging of two overlapping exploratory trenches (FT-1 and FT-2) with a combined linear length of approximately 1,540 feet. The exploratory trenches were excavated utilizing a track-mounted excavator to depths varying from about 6 feet to 14 feet below the current ground surface. The trench walls stepped down in ±5-foot-tall benches for stability and safety in accordance with Cal-OSHA requirements for sloping/benching of open excavations. Engineering geologists from this firm conducted detailed logging of both trenches excavated for this investigation. The walls of the trenches were prepared for logging by removing all caked and smeared materials with hand tools to expose a fresh surface. Logging emphasis was placed on noting stratigraphic continuity within the geologic units exposed. Munsell color notation was used to describe color variations of the earth materials encountered. The trench walls were mapped at a scale of 1 inch equals 5 feet and photographed. To assist in our logging of the trenches, a level string-and-nail baseline was installed on the sides of the trenches and geologic features (lithologic contacts and planar features) were measured with a hand-held ruler from the baseline.

During our exploratory trenching, Mr. Jim O'Tousa (C.E.G. 1393), the County of Ventura Geologist and representative for RJR Engineering, Inc. (reviewing consultant for the City of Moorpark) visited the Site on five separate occasions to review our trenches and discuss our findings. As sections of the trenches were completed and logged, the trenches were backfilled to original grades with the trench spoils; the backfill soils were nominally compacted by wheel-rolling with the water truck or track-walked with the excavator. The approximate locations of our exploratory trenches are indicated on the enclosed Plot Plans, Plates 1 & 2, as well as on the enclosed Composite Regional Geologic Map, Plate 3. Graphic logs of the trenches are presented on our Fault Trench Logs, Plates 4 through 9.

In support of our study, representative soil profile samples were collected from trench FT-1 at specific locations for soil stratigraphic assessment by Earth Consultants International (ECI). The estimated ages of the soils from this soil stratigraphic assessment were then be used to evaluate activity of the faults encountered. The locations of the soil profiles sampled are shown on the Trench Logs. Results of their assessment are provided in the Supporting Soil Stratigraphic Assessment Report, dated March 29, 2019, attached herein as Appendix B.

4.0 FINDINGS AND DISCUSSION

4.1 GEOLOGIC UNITS

Geologic units encountered during our exploratory trenching within the Site consist of bedrock assigned to the Pleistocene-age Saugus Formation (Dibblee and Ehrenspeck, 1992a and 1992b). The bedrock is generally overlain by a thin mantle of topsoil. Colluvium and artificial fill were also locally encountered during our trenching study. Descriptions of the geologic units are provided in the following sections. For a graphic presentation of the trenches, refer to the Fault Trench Logs, Plates 4 through 9.

4.1.1 Artificial Fill (Af)

Artificial fill materials encountered within our exploratory trenches are primarily comprised of locally-derived, very dark grayish-brown clayey sand and sandy clay. The fill materials are typically damp to moist, loose to medium dense/soft to stiff, and contain scattered gravels, small cobbles, and roots. The artificial fill materials encountered are usually associated with old pipelines and generally range from 2 to 3 feet in thickness. However, in trench FT-1, artificial fill materials up to 10 feet in thickness were encountered around Station 6+ 97.

4.1.2 Topsoil (No Map Symbol)

A thin veneer of topsoil generally mantles the Site within the areas trenched. The topsoil generally formed in place by weathering of the underlying units and has been substantially disturbed by ploughing. The topsoil is generally comprised of very dark brown to very dark gray clayey sand and sandy clay that is typically damp to moist, loose/soft to medium stiff, and contains scattered gravel and roots. The topsoil was also observed to be moderately porous and locally has poorly-developed blocky ped structure where not completely disturbed by plowing.

4.1.3 Colluvium (Qcol)

A colluvial deposit associated with a subtle drainage swale was encountered in trench FT-1, between Stations 6+10 and 7+90. The colluvium is generally comprised of strong brown to very dark brown sandy clay. The colluvial materials are typically damp to moist, medium stiff to stiff, and moderately porous. Characteristics associated with soil development (pedogenesis) observed in these materials include moderately developed blocky ped structure with clay films, and manganese oxide staining on ped faces. The colluvial deposit was up to 4 feet in thickness within the center of the drainage.

4.1.4 Bedrock: Saugus Formation (Qs)

The bedrock materials encountered are assigned to the Saugus Formation and generally consist of interbedded sandstone and siltstone with scattered gravelly sandstone beds and lenses. These units are of various shades of brown in color. In general, the bedrock materials are thin to thickly bedded, dry to moist, and moderately hard to hard. Depositional features observed within the Saugus Formation include cross-bedding, graded-bedding, channel scours and fills, and lateral facies changes typically resulting in interfingered deposits of sand and silt. The orientations of the channel scours and fills noted in the trenches generally indicate a westerly paleo-drainage pattern.

The near-surface bedrock materials are generally moderately to extremely weathered and bioturbated with scattered infilled animal burrows (krotovina) and roots. Pedogenic characteristics observed within the near surface Saugus Formation include well-developed blocky ped structure with clay films on ped faces and bridging grains, local carbonate accumulation, iron and manganese oxide staining, and silica-cemented horizons. Numerous sub-horizontal, laterally-discontinuous, closely-spaced, clay-rich laminations or lamellae (termed "Bt lams" in this report) were also observed within the sandier units. The Bt lams were easily distinguished from the parent material by their darker oxide-stained color and increased hardness.

4.2 BEDDING STRUCTURE

Bedding structure observed in the Saugus Formation within our trenches was relatively uniform, with dips at shallow angles (~3-6 degrees) to the south-southwest. However, between Stations 7+30 and 10+30 in trench FT-1, the bedding structure is locally folded forming a broad, relatively-subtle, east-west-trending, asymmetrical anticlinal structure. The north side of the anticlinal structure is defined by north-dipping beds inclined up to 14 degrees from horizontal. The south side of the anticlinal structure is defined by south-dipping beds inclined up to 27 degrees from horizontal.

4.3 GROUNDWATER

Minor groundwater seepage associated with recent precipitation in the area was locally encountered within the bottom of some of the sandy channel fills in the Saugus Formation. Areas where seepage was noticed are shown on our enclosed Trench Logs, Plates 4 through 9.

4.4 FAULTS AND FRACTURES

Faulting was encountered within the Saugus Formation in our trench FT-1 at about Stations 7+75 and 8+40. The areas where these faults were encountered are generally closely associated with the northerly and southerly limbs, respectively, of the anticlinal structure we described in Section 4.2 above. The two fault zones, referred to as Fault Zone A and Fault Zone B, respectively, are described in detail below.

Fault Zone A consists of two subparallel faults that appear to merge at depth. The faults are 1/16- to 1/4-inch wide and are slightly cemented or have Bt soil development. These faults generally strike between N55W and N78W, dip 20 to 35 degrees to the south-southwest, and exhibit a reverse sense of displacement. No evidence of slickensides was observed. The fault with the largest amount of displacement exhibits up to about 12 inches of relative vertical separation in the sandstone unit of the Saugus Formation near the bottom of the trench. This same fault then extends upward and reverses dip direction within the overlying north-dipping siltstone unit, where it becomes indiscernible. This fault clearly did not offset or deform the overlying gravel bed of the Saugus Formation, nor the colluvium unit above (described by ECI as Buried Soil 2 and Buried Soil 1, respectively). The smaller of the two faults extends upward only a short distance from the bottom of the trench and terminates within the lower sandstone unit of the Saugus Formation.

Like Fault Zone A above, Fault Zone B also consists of two subparallel faults that appear to merge at depth. The faults are 1/16- to 1/4-inch wide and are slightly cemented or have Bt soil development. These faults generally strike N65E and dip as much as 32 degrees to the southeast. These faults also have an apparent reverse sense of movement and exhibit up to 2 inches of vertical separation. No evidence of slickensides was observed. The faults, including the small splay that branches off the larger of the two faults, terminate within bedrock of the Saugus Formation and do not break or deform the near-surface pedogenic Bt lams developed in the Saugus Formation.

A few zones of silica-cemented fractures were also encountered within trench FT-1 at around stations 9+70, 10+50, and 12+25. The fractures are generally 1/16- to 1/4-inch wide and typically die out at depth or flatten out and become indiscernible. Typically, these fractures are obscured by roots and rodent activity in the near surface, particularly in the vicinity of station 9+70. These fractures, similar to the minor faults described above, generally strike east-west and dip 5 to 40 degrees to the south. However, some of the fractures are also very irregular in nature.

4.5 CHARACTERISTICS AND AGE OF FAULTING AND FOLDING

The characteristics (e.g. type and orientations) of the faults and asymmetric anticlinal structure encountered during this investigation suggests these structures, like those discussed in reports for projects surrounding the Site, are secondary structures associated with deformation of the late-Quaternary sediments in response to movement of the Northern Area and the Southern Area thrust faults. More specifically, the reverse faults and folding encountered in trench FT-1 are

somewhat similar in characteristics, although not nearly as significant, to the reverse fault and associated folding identified by Gorian (1998) in Tract 5130 to the east. Gorian had interpreted the reverse fault in Tract 5130 to be a backthrust of the Southern Area thrust fault. As such, the Southern Area thrust fault may extend beneath the Site as a blind structure.

With respects to the age of faulting, the faults encountered during our investigation were confined to the Pleistocene-age Saugus Formation (minimum age of 400,000 years in the Site vicinity) and did not offset overlying soils. Results of the soil-stratigraphic assessment completed by ECI (attached as Appendix B) have estimated that the soils developed in the gravel bed (second buried soil) of the Saugus Formation overlying the faults in Fault Zone A has a minimum age of approximately 58,000 years and potentially much older. Similarly, the undeformed soil horizon in the Saugus Formation overlying the faults in Fault Zone B has an estimated age between of about 27,00 and 80,000 years. Thus, the faults in Zones A and B are interpreted to have last moved in the late Pleistocene and are considered pre-Holocene faults.

The age of the anticlinal fold observed between Stations 7+30 to 10+70 in trench FT-1 was also assessed. The anticlinal fold is confined to the Pleistocene-age Saugus Formation and the top of the entire sequence of the gently-folded sediments had been eroded down (planed off) such that the current topography and overlying colluvium and buried soils does not reflect the original shape of the anticline. This indicates that the folding had to occur after the deposition of the Saugus Formation, but before the establishment of the current topography and deposition of the colluvial unit observed locally. Based on the estimated age of the second buried soil in the area of Fault Zone A, ECI suggests the folding occurred more than 58,000 years ago (see Appendix B). However, this age is considered a minimum and does not account for the erosion of the Saugus Formation material that is missing from the top of the fold.

Since the anticlinal fold is interpreted to be a secondary feature associated with the Southern Area thrust fault that has demonstrated the largest amount of deformation of the Saugus Formation, we also assessed the potential vertical uplift and associated tilting of the ground surface that could potentially occur in the event that the Southern Area thrust fault moves in response to a large earthquake on either the Oak Ridge fault or the Simi-Sana Rosa fault, as suggested by ECI (1997). If we assume the folding of the anticline occurred somewhere between 58,000 years ago (minimum age of folding) and 400,000 years ago (minimum age of the Saugus Formation in Site vicinity) and the re-occurrence interval for the Oak old Ridge fault alone is 250 to 500 years (Yeats, 1988), then more than 684 ground rupturing earthquakes have likely occurred during this period resulting in the observed anticlinal fold. If we further assume the bedding structure previously dipped uniformly to the southwest prior to folding, then the maximum amount of apparent vertical uplift associated with the anticlinal structure is about 7.5 feet. Based on these assumptions, the average vertical uplift is estimated at about 0.13 inches per event. Even if we conservatively assume the vertical uplift of one individual event can be up to ten times the average uplift, the vertical uplift would be up to about 1.3 inches for one event. The associated tilting of the ground surface in response to this folding and vertical uplift would likely be very gently distributed over the broad area of the anticlinal structure leading to negligible differential tilting.

5.0 CONCLUSIONS AND RECOMMENDATIONS

5.1 SURFACE FAULT RUPTURE POTENTIAL

The results of our field investigation work within the northerly portion of the Site identified two faults zones in trench FT-1 (Fault Zones A and B). The faults were determined through soil-stratigraphic assessment to be pre-Holocene-age faults, as defined by the California Geological Survey Special Publication 42, revised 2018 (SP-42; CGS, 2018). In addition, previous studies by Gorian for the Site did not find any evidence of faulting or any other forms of deformation of the deposits encountered within their trenches in the central and southerly portions of the Site. Our research also indicates there have been no reports of definitive evidence of Holocene-age faulting during investigations of other projects neighboring the Site. In fact, where the age of faulting has been constrained by dated deposits and/or soils, such as on Tracts 4928, 5187 and the Casey Road Senior Community site [Former Tracts 5424 and 5505]), the faults have been determined to not deform late Pleistocene deposits and/or soils, indicating these faults are pre-Holocene faults. Given the findings for the Site and for the neighboring projects, we conclude the potential for future ground rupture within the Site associated with "active" faulting is considered very low and no mitigation measures are required.

5.2 FAULT-RELATED GROUND DEFORMATION POTENTIAL

Based on SP-42, fault-related (tectonic) ground deformation is defined as "Surface and near-surface deformation caused by fault rupture at depth or at some horizonal distance away from the fault that is not expressed as discrete surface faulting, including both brittle (fissures and tension cracks) and non-brittle (folding, warping, or tilting) deformation". The A-P act does not specifically address fault-related ground deformation. However, in accordance with the guidelines in SP-42, fault-related ground deformation should also be assessed with respect to its impact on the ability of a structure for human occupancy to provide for life-safety and serviceability.

Based on our assessment, the anticlinal fold encountered in our trench FT-1 in the northern portion of the Site is interpreted to be a fault-related structure associated with the Southern Area thrust fault. In addition, results of our the soil-stratigraphic assessment indicates the folding occurred more than 58,000 years ago and probably much later. Considering the folding encountered during our investigation is pre-Holocene in age and that previous studies by Gorian for the Site did not find any evidence of faulting or any other forms of deformation within their trenches in the central and southerly portions of the Site, the probability of fault-related ground deformation during the life of the proposed structures within the Site is considered very low. No mitigation measures are required.

Furthermore, our estimates of uplift of the anticlinal fold presented earlier indicate that if a large earthquake on either the Oak Ridge fault or the Simi-Sana Rosa happens to occur near the Site causing movement of the Southern Area thrust fault beneath the Site, the vertical uplift of the anticlinal structure within the Site would be relatively small. We have estimated the resulting vertical uplift would be about 1.3 inches or less. Due to the recurrence frequency of such events,

only one event is likely to occur during the design life of the project (50 to 100 years). This uplift would also likely be very gently distributed at the ground surface over the broad area of the anticlinal structure such that differential tilting would be negligible. Therefore, the ground displacement from such an event would not affect the ability of proposed habitable structures to provide for the safety and welfare of the occupants nor is expected to impact the performance of utilities.

5.3 GROUND SHAKING

During the life of the proposed development, the Site could experience very high levels of ground shaking associated with the nearby Oak Ridge fault, the Simi-Santa Rosa fault and other nearby faults. As such, future structures should be designed, as a minimum, in conformance with Chapter 16 of the latest California Building Code (CBC) to mitigate this potential hazard.

5.4 FUTURE DEVELOPMENT

Observation by a California Professional Geologist should be conducted during future grading of the Site to assess the geologic conditions exposed at that time in order to confirm or modify the conclusions and recommendations presented herein. This report does not include comprehensive geotechnical engineering design parameters and recommendations for the future grading and development. Future geotechnical reports should consider seismic aspects such as strong ground shaking and potential differential settlement when rendering recommendations for Site development. In addition, the trenches excavated during this investigation were backfilled to existing grades with trench spoils and generally wheel-rolled with the water truck or track-walked with the excavator. The soils were not compacted, nor were they placed under engineering observation and testing. These backfilled soils are not suitable for support of structural foundation. During future Site development, the backfill in these trenches below future grades should be removed and replaced with engineered fill.

6.0 LIMITATIONS

This report has been prepared for the exclusive use of **Comstock Homes**. This report is intended to aid in your assessment of potential land development opportunities within the property.

This report is based on the proposed development and the geologic data as described herein. The geologic conditions interpreted from our field investigation and described in the referenced publications and reports are believed representative of the project area and the conclusions and recommendations contained in this report are presented on that basis. However, geologic conditions can vary in characteristics between points of exploration, both laterally and vertically, and those variations could affect the conclusions and recommendations contained herein. As such, observation by a California Professional Geologist during the grading phases of the project should be performed to confirm the basis of this report.

This report has been prepared consistent with that level of care being provided by other professionals providing similar services at the same locale and time period. The contents of this report are professional opinions and as such, are not to be considered a guarantee or warranty.

This report should be reviewed and updated if the Site ownership or project concept changes from that described herein.

This report has not been prepared for use by parties or projects other than those named or described herein. This report may not contain sufficient information for other parties or other purposes.

Job No.: 2677.00	Date: 01/14/20	Plate: 3

FAULT TRENCH LOG EXPLANATION

FT-1

Artificial Fill (Af)

①

Clayey Sand and Sandy Clay (SC/CL), fine- to coarse-grained, very dark grayish brown (10YR 3/2), damp to moist, trace gravel and cobbles, some roots and intermixed clods of Saugus Formation.

Top Soil (No Map Symbol)

②

Silty Sand and Clayey Sand (SM/SC), fine-grained, very dark brown (10YR 2/2) to dark brown (10YR 3/3), damp to moist, trace gravel and small cobbles, moderately porous, some roots and rootlets, scattered krotovinas. Locally very dark gray (5YR 3/1) sandy clay with poorly developed blocky ped structure and clay films on ped surfaces. This unit is substantially disturbed by plowing. Contact at base is gradational in nature.

Colluvium (Qcol)

③

Sandy Clay (CL), fine-grained, very dark brown (10YR 2/2), moist, trace gravel, moderately porous, local poorly developed blocky ped structure, trace roots and krotovinas.

④

Sandy Clay (CL), fine-grained, strong brown (7.5YR 5/6), damp to moist, trace gravel, moderately porous, local moderately developed blocky ped structure with clay films, carbonate development, and manganese oxide staining on ped surfaces, trace roots and krotovinas.

Saugus Formation (Qs)

⑤

Clayey Sand and Sandy Clay (SC/CL), fine-grained, dark yellowish brown (10YR 3/6), yellowish brown (10YR 5/8), and strong brown (7.5YR 4/6), damp to moist, trace gravel moderately porous, local moderately developed blocky ped structure with clay films, carbonate filaments, and manganese oxide staining on ped surfaces, some roots and rootlets. Between stations 0 and 2+80, unit is olive brown (2.5YR 4/3) to dark brown (10YR 3/3) in color. Unit is moderately to extremely weathered throughout with scattered krotovinas and no visible bedrock structure. Contact at base is gradational in nature.

⑥

Clayey Sandstone to Sandstone, fine- to coarse-grained, strong brown (7.5YR 4/6 to 5/6), damp to moist, scattered granitic gravels, slightly friable, brown (7.5YR 4/4) 1/4- to 1-inch thick clay rich “BT lams”. Local channel fills with increased gravels and minor seepage.

⑦

Silty Sandstone to Sandstone, fine- to medium-grained, yellowish brown (10YR 5/4 to 5/6) and dark yellowish brown (10YR 4/4), damp to moist, well indurated, strong brown (7.5YR 4/6) 1/2- to 1-inch thick clay rich “BT lams”, faint iron oxidation staining. Upper 2- to 3-feet is silica-cemented, dark yellowish brown (10YR 3/4 and 3/6), and very hard with pinhole pores and manganese oxide staining. Between stations 12+00 and 12+58, unit becomes very well indurated and very difficult to excavate.

⑧

Silty Sandstone and Sandstone, fine-grained and fine- to medium-grained, yellowish brown (10YR 5/4 5/6), dry to damp, scattered granitic gravels, trace shale fragments, locally friable, some very irregular and discontinuous silt beds, abundant channel fills with increased gravel and cobbles up to 6 inches. Upper 3 to 5 feet of unit appears re-worked and is predominately a sandy claystone, fine-grained, dark yellowish brown (10YR 4/6), damp, trace coarse grained sand and gravel, moderately porous, local carbonate filaments and manganese oxide staining.

⑨

Siltstone to Sandy Siltstone, fine-grained, dark yellowish brown (10YR 4/6 to 3/6) to yellowish brown (10YR 5/4), dry to damp, slightly to moderately porous, very irregular desiccation cracks with carbonate development (particularly between Stations 0 and 2+10), occasional thin silty sand lenses, local faint laminations, trace roots. Local blocky ped structures with clay films and manganese oxide staining on ped surfaces. Between Stations 9+48 and 10+73 the upper 2 to 3 feet is silica-cemented and very hard.

⑩

Silty Sandstone to Sandstone, fine-grained and fine- to medium-grained, yellowish brown (10YR 5/4 to 5/6), brown (10YR 5/3) and pale brown (10YR 6/3), dry to damp, slightly friable to friable, some sand and magnetite layering, manganese specs, interbedded 2- to 3-inch thick olive brown (2.5Y 4/4) silt beds with abundant decomposed rootlets and carbonate development. Unit generally coarsens downward to light olive brown (2.5Y 5/3), fine-coarse grained sandstone with strong brown (7.5 YR 4/6), dark yellowish brown (10YR 4/6) and yellowish brown (10YR 5/8) 1/4- to 2 1/2 -inch thick clay rich “BT lams”, cross-bedding, gravel layering, and channel fills with increased granitic gravels and cobbles up to 10 inches in size. Contact at base is erosional in nature and sharp.

⑪

Clayey Siltstone to Siltstone, brownish yellow (10YR 6/6), damp to moist, well indurated, slightly porous, massive, thin discontinuous internal shears (very dark grayish brown 2.5Y 3/2), trace decomposed rootlets, some iron oxidation staining. Local moderately developed blocky ped structure with clay films, carbonate filaments, and manganese oxide staining on ped surfaces. At Station 7+95, unit gradually grades to the south into yellowish brown (10YR 5/6) Sandy Siltstone with some fine-grained silty sand lenses.

⑫

Sandstone and Gravelly Sandstone, fine- to medium-grained and fine- to coarse-grained, yellowish brown (10YR 5/4) to light olive brown (2.5Y 5/3), dry, trace shale fragments, friable, local sand and gravel layering, scattered granitic cobbles, dark yellowish brown (10YR 4/4) 1/4- to 2 1/2 -inch thick clay rich “BT lams”.

FT-2

Top Soil (No Map Symbol)

②

Silty Sand (SM), fine-grained, dark brown (10YR 3/3), damp to moist, trace gravel, moderately porous, some roots and rootlets, scattered krotovinas. This unit is substantially disturbed by plowing.

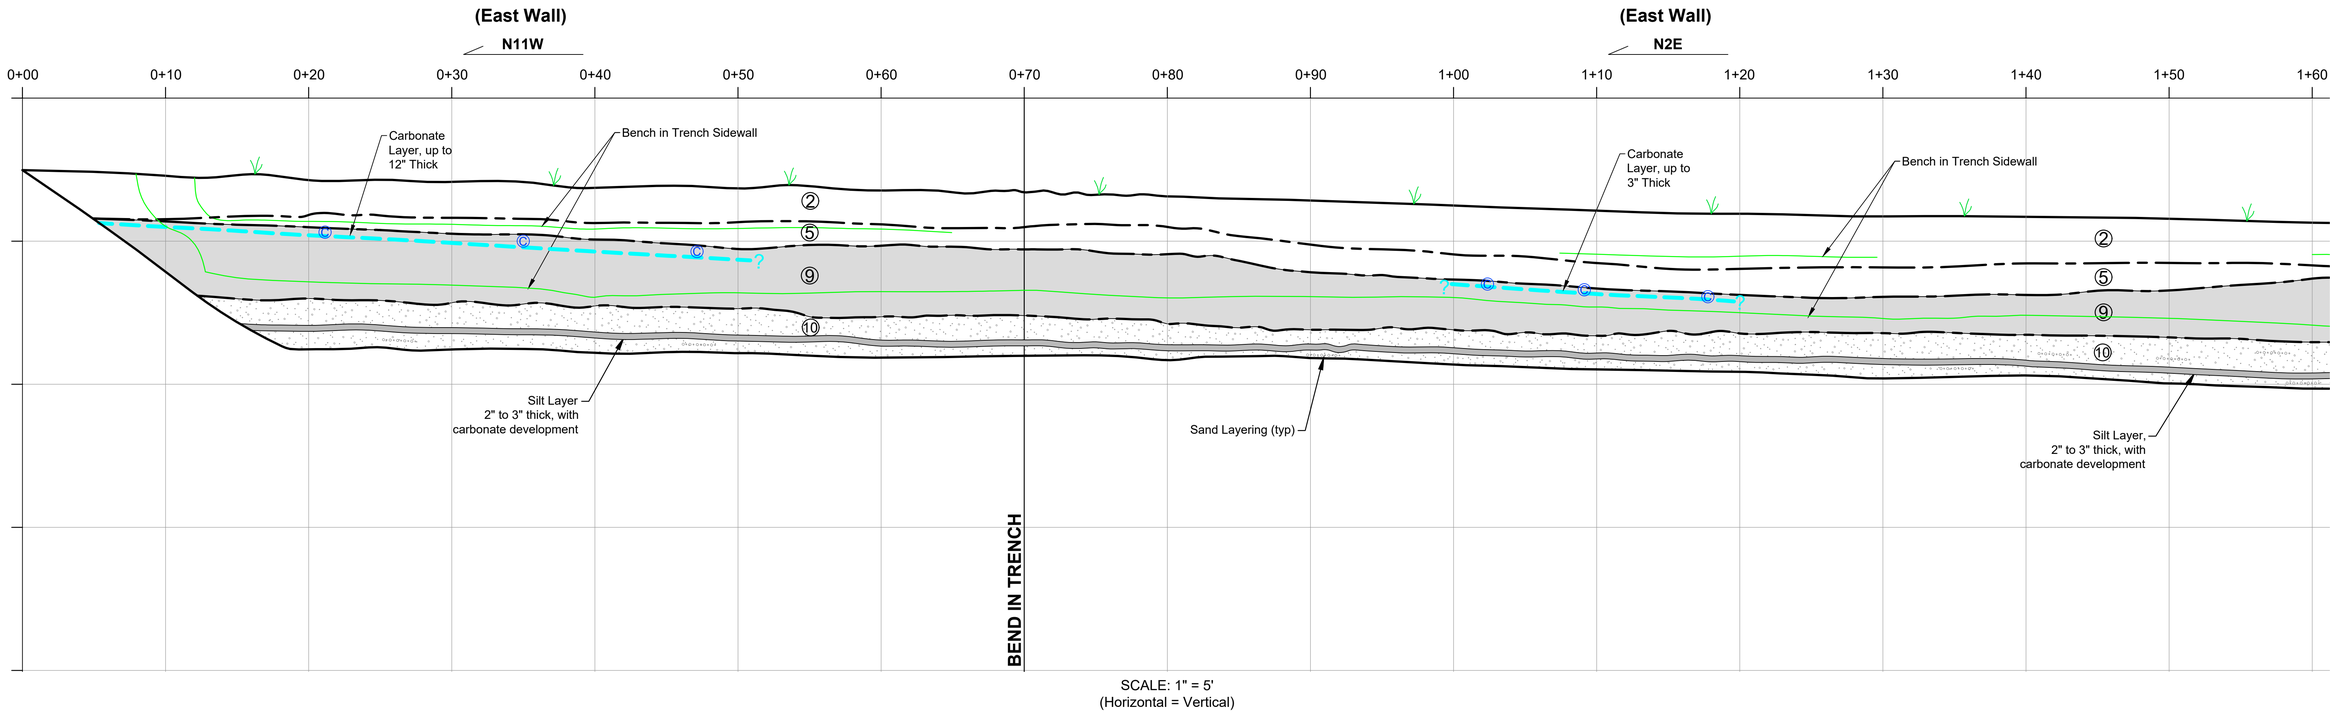
Saugus Formation (Qs)

⑤

Clayey Sand (SC), fine-grained, yellowish brown (10YR 5/6), damp to moist, trace gravel moderately porous, local moderately developed blocky ped structure with clay films, carbonate filaments, and manganese oxide staining on ped surfaces, some roots and rootlets. Unit is moderately to extremely weathered throughout with scattered krotovinas and no visible bedrock structure. Contact at base is gradational.

⑦

Sandstone, fine- to medium-grained, light yellowish brown (10YR 6/4), damp to moist, trace gravel, locally well indurated, strong brown (7.5YR 4/6) 1/2- to 1-inch thick clay rich “BT lams”, some sand and gravel layering, local fine- to coarse-grained channel fills with increased granitic gravels. Interbedded Silty Sandstone, fine-grained, dark yellowish brown (3/6), damp, well indurated, local moderately developed blocky ped structure with clay films and manganese oxide staining,. Silty Sandstone beds are typically very irregular and silica-cemented with pinhole pores and faint iron oxidation staining.



General Notes:

1. Sequence of units listed is generally from youngest ① to oldest ⑫.
2. Color of geologic units described when moist.

(1) DARK GRAYISH BROWN (10YR 4/2) SANDY CLAY (HARD, DRY TO DAMP). DESSICATED. SCATTERED ROOTS TO ROOTHAIRS. FEW GRAVEL. GRADATIONAL CONTACT OVER 6" WITH UNIT (2). HACKLY FRACTURES.

OLDER ALLUVIUM

(2) YELLOWISH BROWN (10 YR 5/4) SILTY CLAY, TRACE FINE SAND (HARD, DAMP TO MOIST). BLOCKY PEDS TYPICAL (STATION 4+15 TO 4+29 AND 0+00 TO 0+15), EXTENDING 2 FEET BELOW CONTACT WITH UNIT (1). BELOW BLOCKY PEDS, SCATTERED STAGE II CARBONATE, THEN UNIT GRADES TO YELLOWISH BROWN (10 YR 5/4) SANDY SILTY CLAY (HARD, MOIST) MOTTLED WITH LIGHT BROWNISH GRAY (10 YR 6/2) SANDY CLAY. FEW GRAVEL. SCATTERED MANGANESE STAINING. SLIGHTLY POROUS. STATION 0+35, UNIT GRADES DOWNWARD TO LIGHT YELLOWISH BROWN (10YR 6/4) SILTY FINE TO COARSE SAND WITH SOME GRAVEL (DENSE, DAMP). GRADATIONAL CONTACT WITH SANDY CLAY ABOVE OVER 18." UNIT (2), SHARP EROSIONAL CONTACT WITH UNIT (3); STATION 0+80 TO 0+85, UNIT YELLOWISH BROWN (10 YR 5/4) SILTY CLAY, TRACE FINE SAND (HARD, DAMP). SCATTERED STAGE II CARBONATE JUST BELOW SHARP CONTACT WITH UNIT (3). GRADES DOWNWARD OVER 12" TO LIGHT YELOWISH BROWN (10 YR 6/4) SILTY FINE TO MEDIUM SAND, SOME COARSE SAND, FEW GRAVEL. STATION 0+70 TO 0+76, SCATTERED STAGE II CARBONATE WITHIN YELLOWISH BROWN (10 YR 5/4) SILTY CLAY, TRACE FINE SAND. STATION 1+90 TO SOUTH, UPPER PORTION OF UNIT MOTTLED WITH LIGHT BROWNISH GRAY (10 YR 6/2) SANDY CLAY. STATION 3+05 TO 3+28 UPPER PORTION OF UNIT NEAR CONTACT WITH UNIT (3) BLOCKY PEDS.

(2A) STATION 3+90 TO 4+20, LOWEST PORTION OF UNIT BECOMES LIGHT YELLOWISH BROWN (2.5 Y 6/4) SILTY FINE TO COARSE SAND.

OLDER ALLUVIUM

(3) NEAR EDGE OF CONTACT WITH UNIT (2), LIGHT YELLOWISH BROWN (10 YR 6/4) CLAYEY FINE TO COARSE SAND WITH GRAVEL (MEDIUM DENSE, DAMP). UNIT INTERBEDDED WITH BROWNISH YELLOW (10YR 6/6) FINE TO MEDIUM SAND, FEW GRAVEL. STATION 0+44, 0+60, 0+63, 0+88 AND 1+70, CONTAINS RIP-UP CLASTS OF LIGHT YELLOWISH BROWN (2.5 Y 6/4) SANDY SILT. UNIT GRADES HORIZONTALLY TO PALE YELLOW (2.5 Y 7/4) FINE TO COARSE SAND AND GRAVEL, SOME COBBLES. TYPICALLY, FRIABLE WITH HIGH AND LOW ANGLE CROSS-BEDDING. CLASTS INCLUDE MODELO FORMATION CHERT AND SILTSTONE, GRANODIORITE, QUARTZITE, ANORTHOSITE AND SANDSTONE. WELL-ROUNDED TO SUBANGULAR. UNIT LOCALLY CONTAINS ARGILLACEOUS HORIZONS. STATION 1+80 TO 1+90, LIGHT YELLOWISH BROWN (10 YR 6/4) CLAYEY FINE TO COARSE SAND WITH GRAVEL JUST ABOVE SHARP EROSIONAL CONTACT WITH UNIT (2) AND AGAIN AT STATION 2+15. STATION 3+28 TO 3+82, LIGHTLY YELLOWISH BROWN (10 YR 6/4) SLIGHTLY CLAYEY FINE TO COARSE SAND WITH GRAVEL, FEW COBBLES. SHARP EROSIONAL CONTACT WITH UNIT (2). GRADES UPWARD TO YELLOWISH BROWN (10 YR 5/4) SILTY FINE SAND (VERY DENSE, DAMP) MOTTLED WITH PALE YELLOW (5Y 7/3) SILTY FINE SAND.

(3A) YELLOWISH BROWN (10 YR 5/4) CLAYEY SILT (HARD, DAMP) SLIGHTLY POROUS. TYPICALLY LENSES, GRADATIONAL CONTACT WITH UNIT (3) OVER 3" AT BASE OF UNIT (2A), SHARP CONTACT AT TOP OF UNIT (3A)

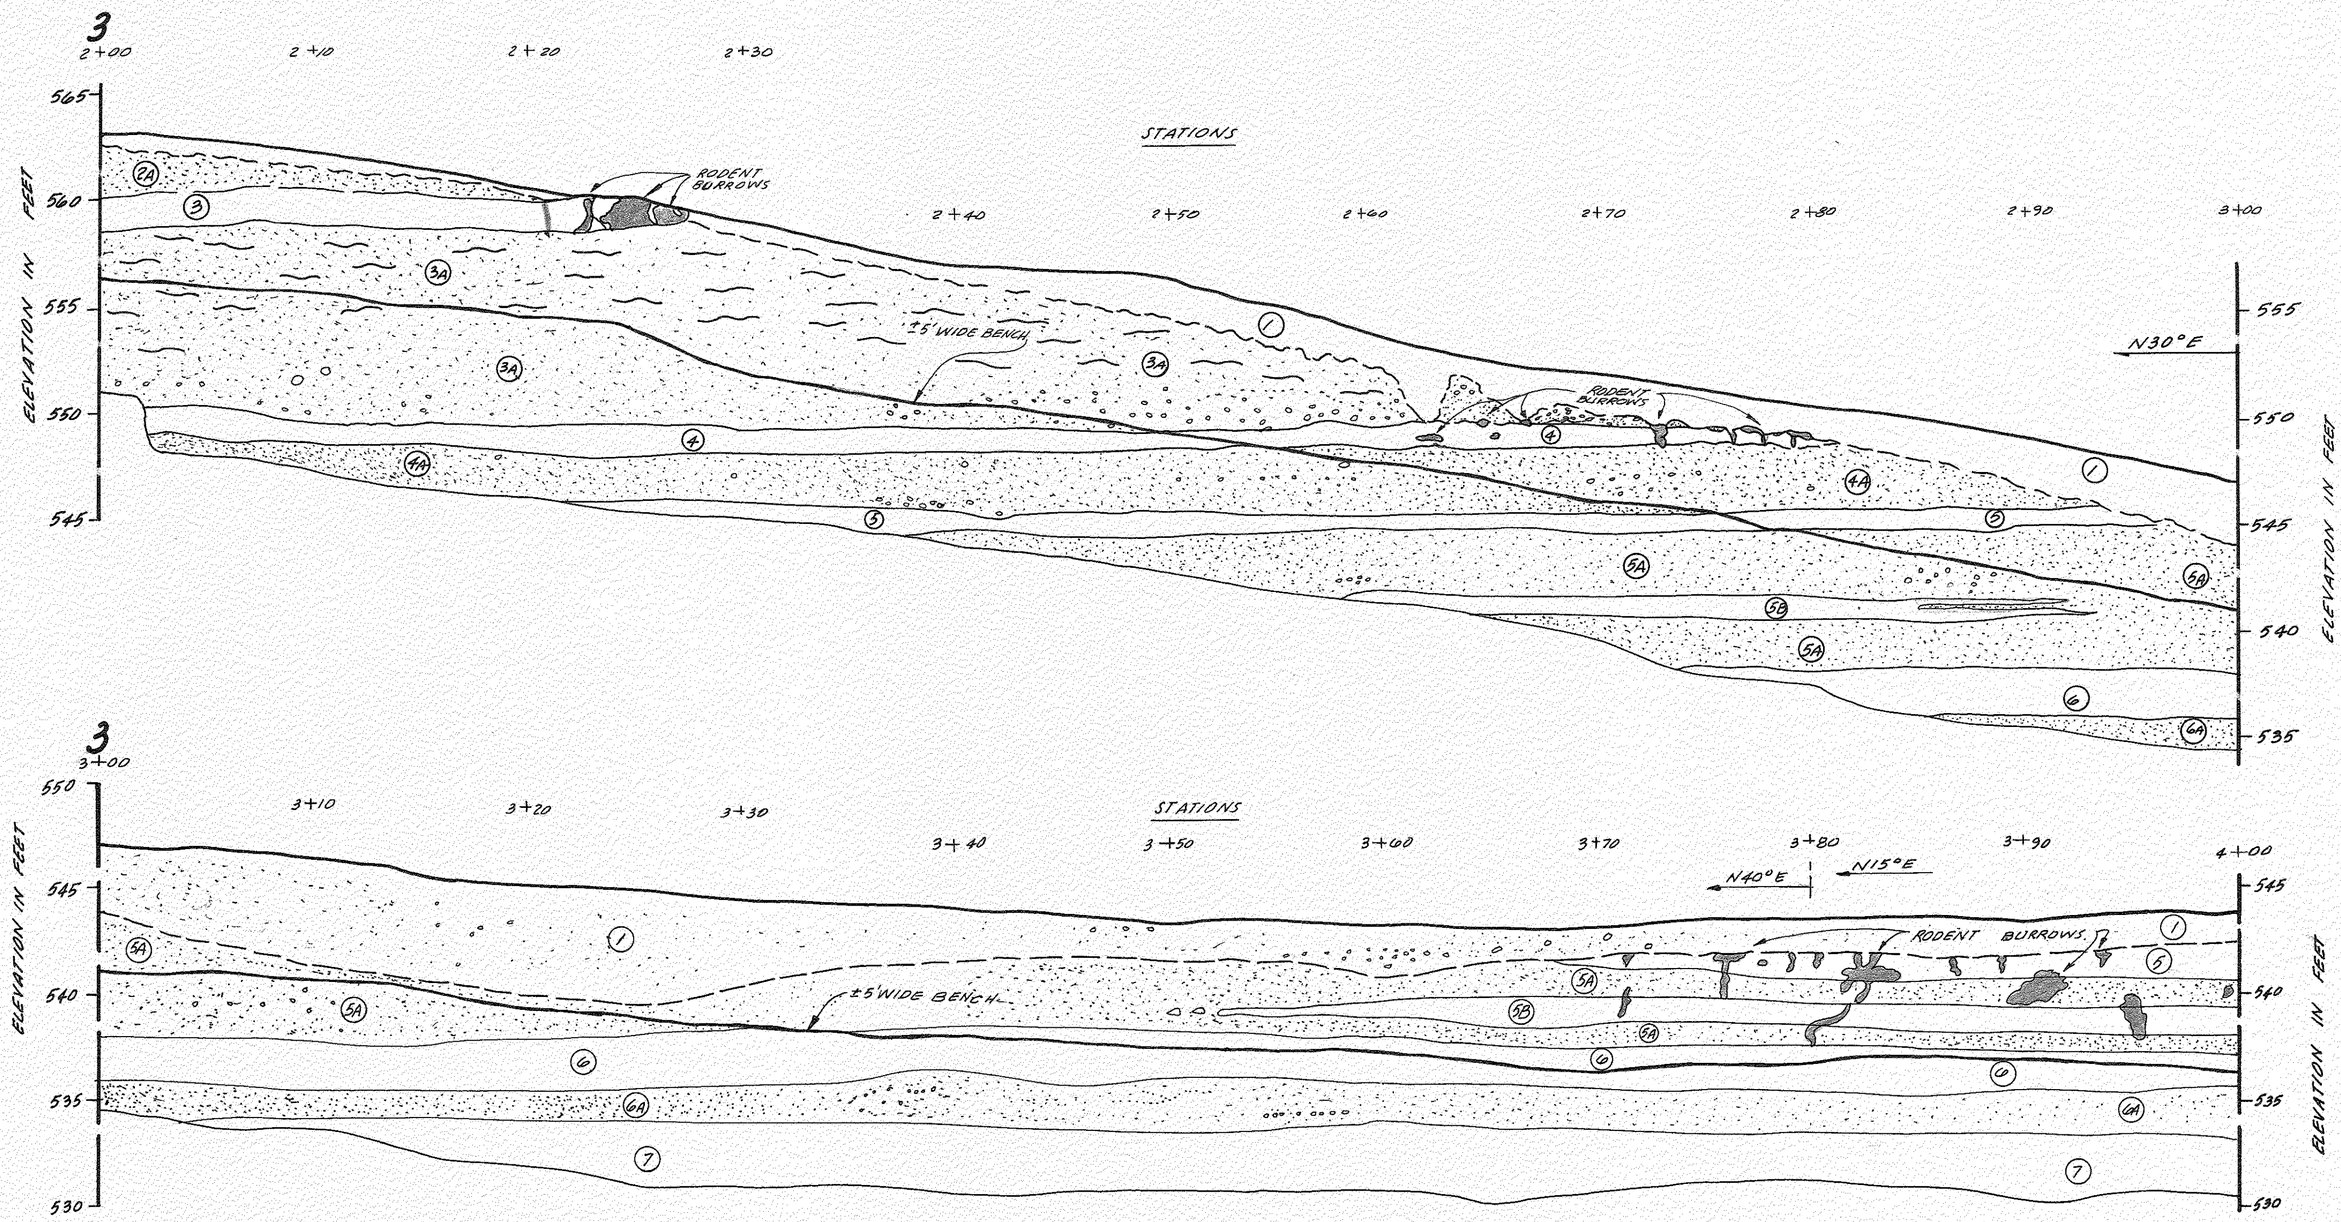
(1) BROWN (10YR 5/3) CLAYEY FINE SAND (MEDIUM DENSE, DRY TO DAMP). DESSICATED. SCATTERED ROOTS TO ROOTHAIRS. GRADATIONAL CONTACT OVER 6" WITH UNITS BELOW. SOME BLOCKY PEDS ABOVE UNIT (2) & (2A) WITH STAGE II CARBONATE AT CONTACT. STATION 3+00 TO 3+40, UNIT THICKENS, BECOMING DARK GRAYISH BROWN (10 YR 4/2) SILTY FINE TO COARSE SAND, TRACE CLAY (DENSE, DRY TO DAMP) GRADATIONAL CONTACT OVER 12" WITH UNITS (3A) & (4A). LOCALLY POROUS. SOME GRAVEL, FEW COBBLES.

OLDER ALLUVIUM

(2) YELLOWISH BROWN (10 YR 5/4) CLAYEY FINE SAND (DENSE, DAMP). FEW COARSE SAND, RARE GRAVELS. SLIGHTLY POROUS. SCATTERED MANGANESE STAINING. STATION 0+00 TO 0+92, UNIT CONTAINS LENSES IN UPPER PORTION OF YELLOWISH BROWN (10 YR 5/4) SILTY FINE TO COARSE SAND WITH SOME GRAVEL (MEDIUM DENSE, DRY TO DAMP). SLIGHTLY POROUS. FEW COBBLES. UPPER PORTION OF UNIT LOCALLY EXHIBITS BLOCKY PEDS WITH STAGE II CARBONATE.

(2A) GRADATIONAL CONTACT OVER 12" WITH UNIT (2). BROWNISH YELLOW (10 YR 6/6) SILTY FINE TO COARSE SAND. FEW GRAVEL. RARE COBBLES, (DENSE, DRY TO DAMP). MINOR CROSSBEDDING FROM STATION 1+30 TO 1+35. GRADITIONAL CONTACT OVER 6" WITH UNIT (3).

OLDER ALLUVIUM



(3) LIGHT YELLOWISH BROWN (2.5 Y 6/4) SILTY FINE SAND, FEW COARSE SAND AND GRAVEL. (DENSE, DAMP) SLIGHTLY POROUS. GRADING DOWNWARD OVER 3" TO LIGHT YELLOWISH BROWN (2.5Y 6/4) VERY SILTY, VERY FINE SAND (DENSE, MOIST TO WET). RARE GRAVEL. GRADATIONAL CONTACT OVER 3" WITH UNIT (3A).

(3A) PALE YELLOW (2.5Y 7/3 TO 7/4) SLIGHTLY SILTY FINE TO COARSE SAND WITH SOME GRAVEL AND COBBLES. (DENSE, DRY) FRIABLE. NEARLY HORIZONTALLY STRATIFIED. GRADATIONAL CONTACT OVER 3" WITH UNIT (3). CONTAINS CLASTS FROM MODELO FORMATION (CHERT AND SILTSTONE), QUARTZITE AND GRANITE. CLASTS ARE SUB ANGULAR TO WELL ROUNDED. LOCALLY EXHIBITS ARGILLACEOUS HORIZONS. SHARP CONTACT WITH UNIT (4). STATION 2+10 CONTAINS WELL ROUNDED RIP UP CLASTS OF LIGHT YELLOWISH BROWN (10YR 6/4) CLAYEY FINE SAND.

Subject: **Soil Stratigraphic Assessment in Support of a Study to Evaluate the Surface Fault Rupture Potential at Hitch Ranch, Tentative Tract 5708, City of Moorpark, California; Albus-Keefe & Associates Job No. 2677.00**

Dear Sirs,

Earth Consultants International (ECI) was retained by your firm to conduct an analysis of some of the soils and underlying parent materials (bedrock) exposed in trenches that you excavated at the above-referenced site. The purpose of our analysis was to estimate the age of the near-surface sediments that cap, unbroken, a pair of fault zones that you uncovered in the trenches. This in turn provided information on whether or not these faults have moved in the Holocene, and should therefore be considered active in accordance with the criteria for activity used by the California Geological Survey. This letter report summarizes our methodology, findings and conclusions regarding the age of the deposits that were exposed in the two areas of the trench where these minor faults were exposed, and our opinions regarding the recency of activity of the faults encountered.

Thank you for the opportunity to assist you with this project. Should you have any questions regarding our attached report, please do not hesitate to contact the undersigned.

Respectfully submitted for
Earth Consultants International, Inc.

Soil Stratigraphic Assessment in Support of a Study to Evaluate the Surface Fault Rupture Potential at Hitch Ranch, Tentative Tract 5708, City of Moorpark, California

1.0 INTRODUCTION

Per your request, we have completed a soil stratigraphic study to estimate the age of the soils exposed at about Stations 7+55 and 8+23 in your trench FT-1, a trench that Albus-Keefe & Associates (AKA) excavated in the northeastern portion of the Hitch Ranch property, in Moorpark California. The objective of our analysis was to estimate the age of the soils overlying the fault zones, and use that data to evaluate whether or not the two minor fault zones exposed in the trench are Holocene-active. We also described two other soil profiles and several samples from discrete geologic units that you collected and submitted to us; these two profiles were located farther south in the same trench, at Stations 10+20 and 11+30. Our descriptions of these soils and sedimentary units are provided in Appendix A, for your use.

1.1 Scope of Work and Methodology

Specific tasks that we completed for this project are described below. Where appropriate, we also describe the methodology we followed to complete the work.

- We described soil samples that you collected for us from four different sections of the trench, namely from Stations 7+55, 8+23, 10+20 and 11+30. The samples were collected from the upper soil horizons and some of the underlying bedrock units. The soil samples were described according to the characteristics and following the nomenclature set forth by the Soil Survey Staff (1975, 1992), Birkeland (1984, 1999), and the National Soil Survey Center (2012). Characteristics that we recorded include: 1) texture or grain-size distribution, 2) structure (whether the soil mass breaks into distinctive peds, or is single-grained), 3) the amount, distribution and thickness of translocated clay forming films or stains on the soil ped faces and clasts, in pores, between sand grains (called bridges), around clasts, and in clast pockets, 4) the looseness or induration of the soil peds when dry and moist, and 5) the stickiness and plasticity of the wet soil. Colors of the soil matrix and clay films in both the dry and moist states were recorded using a Munsell Soil Color Chart. We also described the approximate percent of gravel, its composition, size, degree of roundness, and weathering stages using McFadden et al.'s (1982) criteria. Finally, we observed the soils' reaction to hydrochloric acid, a qualitative measure of the soils' pH and presence of calcium carbonate. Abbreviated soil descriptions for the profiles collected near the fault zones are provided in Table 1. The complete soil descriptions are provided in Appendix A.
- We used the photographs you took of the soil sample locations and your trench logs to identify the different soil horizons within a given profile, measure the thickness of each horizon, and determine the characteristics of the boundaries between horizons.
- We calculated the profiles' Soil Development Indices (SDI) and Mean Horizon Indices (MHI) and used these values to estimate the age of the soils. Additional information regarding these methods is presented in the section below.
- We prepared this report summarizing our findings and conclusions.

1.2 Background

The term soil as used herein refers to a natural body consisting of layers (referred to as horizons) of mineral and/or organic material that are different from each other and from the underlying geologic material (either bedrock or unconsolidated sedimentary deposit) in their "morphological, physical, chemical and mineralogical properties and their biological characteristics" (Birkeland, 1984). These differences are the result of weathering and the effects of five main soil-forming factors: parent material, climate, slope or topography, organisms, and time (Jenny, 1941). Time is an important factor because the longer a geologic deposit is exposed to the effects of weathering and soil formation, the better developed the soil characteristics typically become. We take advantage of this factor when using soils to estimate the age of the deposits. It is important to keep in mind, however, that soil age estimates generally provide a minimum age for the deposits that the soils formed into, especially in depositional environments where periods of soil formation occur in between erosional and depositional events.

To estimate the age of geologic deposits using soil-stratigraphic techniques, we rely on a comparison of the characteristics of the soils in question with those of other soils developed in similar parent materials and climate that have been dated using both absolute and relative dating methods. For this quantitative comparison, the characteristics of the soils are assigned numerical values that are then used to calculate the soils' degree of development. We used two of these quantitative methods for this study: Harden's (1982) Soil Development Index (SDI), and Ponti's (1985) Maximum Horizon Index (MHI). Both SDI and MHI values have been shown to be useful relative indicators of soil age, with older, better developed soils typically having higher SDI and MHI values (Harden, 1982; Harden and Taylor, 1983; Rockwell et al., 1984; Rockwell et al., 1990; Bornyasz and Rockwell, 1997).

In these quantitative assessments, the characteristics of the soil are "subtracted" from the characteristics of the parent material to develop an empirical estimate of the length of time that a geologic deposit has been subjected to the effects of weathering and soil formation. For this analysis, we used a parent material consisting of sand to loamy sand, with 10YR hues, massive breaking to weak fine subangular blocky soil structure; loose to soft when dry, loose to very friable when moist, and non-sticky and non-plastic soil consistency when wet; and with no clay films. These characteristics describe the matrix in the C_{lam} soil horizon at the bottom of the profile described at Station 7+55, the least pedogenically altered horizon sampled that was not indurated bedrock.

To obtain minimum age estimates for the two soil profiles collected in the areas of Fault Zones A and B, we compared their SDI and MHI values with the chronofunctions presented in Dolan et al. (1997). These chronofunctions are in turn based on the chronosequences of the Ventura Basin by Rockwell (1983) and Rockwell et al. (1985), the Merced Valley by Harden (1982), and the Cajon Pass by McFadden and Weldon (1987). The SDIs and MHIs that we used to estimate the age of each soil are listed on Table 2.

TEXTURE: S= sand; LS = loamy sand; SL = sandy loam; L = loam; SCL = sandy clay loam; SC = sandy clay; CL = clay loam; Si = silt; SiL = silt loam; SiCL = silty clay loam; SiC = silty clay; C = clay. **STRUCTURE**: Grade: 1 = weak; 2 = moderate, 3 = strong. Class: 1f = very fine, f = fine, m = medium, c = coarse; vc = very coarse. Type: m = massive; sg = single-grained; gr = granular, cr = crumb, abk = angular blocky, sbk = subangular blocky, pr = prismatic. **CONSISTENCY**: Dry: lo = loose, so = soft, sh = slightly hard, h = hard, vh = very hard, eh = extremely hard. Moist: lo = loose, vfr = very friable, fr = friable, fi = firm, vfi = very firm, efi = extremely firm. Wet: ns = non-sticky, ss = slightly sticky, s= sticky, vs = very sticky; np = non-plastic, sp = slightly plastic, p = plastic, vp = very plastic. **CLAY FILMS:** Abundance: v1 = very few, 1 = few, 2 = common, 3 = many, 4 = continuous. Thickness: vn = very thin, n = thin, mk = moderately thick, k = thicK. Location: st = stains, cl = on clasts or clast pockets, po = in pores, br = forming bridges betweeen grains, pf = on ped faces.

2.0 FINDINGS

2.1 Geologic Setting

For an in-depth discussion on the geologic setting of the Hitch Ranch site and adjacent properties, and the geologic studies that have been conducted onsite and in the site vicinity, refer to the main AKA report that this letter is appended to. Essentially, the site is located in an area of northwest-southeast shortening that is being accommodated primarily by faulting on the Oak Ridge and Simi-Santa Rosa fault zones. Crustal shortening between these fault zones has also resulted in a complex system of folds and secondary faults that have been shown to impact the Tertiary and Quaternary sedimentary rocks that underlie and crop out in the region. These structures can be divided into four main groups based on their orientation (strike), dip, and kinematics. Each of these four main types of structures that have been previously exposed in the region are briefly described below: 1) northeast-trending regional folds such as the Moorpark anticline, the Moorpark syncline, and the Long Canyon anticline (Weber et al., 1973; Dibblee, 1992a, 1992b); 2) similarly oriented, smaller-scale, north-dipping flexural-slip blind faults overlain by folded late Quaternary deposits such as the Northern Area and Southern Area thrusts (Pacific Materials Laboratory [PML], as referenced in ECI, 1997a, 1997b, 1999); 3) similarly oriented but south-dipping small-scale dip-slip faults that are interpreted as backthrusts to the folds in 2) above, or as bending-moment faults responding to the folds below; and 4) northerly trending strike-slip to oblique normal faults, generally striking at high angles to bedding (Geolabs, 1997; LGC, as reported by ECI, 2006), that are likely to be strike-slip tear faults that formed to accommodate differences in the depth of the underlying blind thrusts or differential advances of the underlying thrusts (Twiss and Moores, 1992).

In the Hitch Ranch property that is the subject of this study, AKA exposed two shallow south-dipping fault zones with a reverse sense of separation. The faults vary in strike from N65E to N55W; this variation in strike is also observed in the bedding of the Saugus Formation. The faults are similar in character to the faults reported by Gorian (1998) in Tract 5130 to the east of the site (see Plate 3 of Albus-Keefe's report) that Gorian interpreted as backthrusts to the Southern Area thrust. The soil-age analysis described herein was conducted to evaluate the recency of activity of these structures.

2.2 Soil Descriptions and Soil Age Estimates

Per the trench log of trench FT-1, AKA observed and logged two zones of minor faulting in the excavation: 1) Fault Zone A which occurred between about Stations 7+50 to 7+75, and 2) Fault Zone B between Stations 8+25 and 8+40. You found that the faults terminate upward in deposits assigned to the Saugus Formation. We were asked to describe the soils that overlie the faults and estimate the amount of time that these soils have been exposed to soil forming processes, and the age of the overall unfaulted section. These data in turn would provide a minimum age of the most recent faulting event, and thus an assessment as to whether or not these faults should be considered Holocene-active per California's definition of fault activity as described in the most recent guidelines by the California Geological Survey that define the Holocene as the period of time covered by the past 11,700 years (CGS, 2018). Each of the soil profiles described in these fault zones are described below.

2.2.1 Fault Zone A

The photos and characteristics of the soils in the area of Fault Zone A indicate that this area is covered by colluvial deposits and possibly mudflow sediments that in turn overlie deposits typical of the Saugus Formation. The upper pedogenically altered colluvial deposit and **surface soil** has an Ap1/Ap2/A3/Bw soil profile, and consists of primarily dark grayish brown sandy clay loam with 5 to 10% fine-gravel sized clasts predominantly granitic in

composition, and a few of slate. The granitic clasts are unweathered to slightly weathered (Stage I[1]) (McFadden et al., 1982). The "p" in the upper horizon designations indicates that these horizons have been plowed, displaying a mixed appearance and softer-than-expected consistency when dry and moist given their sandy clay loam texture. These horizons also have common roots and rootlets, and are organic-rich as evidenced by their dark color. The Bw horizon at the bottom of the section has mixed colors in the 10YR, 10-7.5YR and 5YR hues, very few thin clay films on ped faces, and few thin clay films bridging grains. The structure of this soil is predominantly in the subangular to angular blocky category, with the strength of the peds varying from weak to strong depending on the horizon. The bottom of this soil is defined by an abrupt lower contact with the first buried soil below. The characteristics of this soil yield a normalized SDI value of 52 and an MHI value of 0.305. Using the soil-age regressions from Dolan et al. (1997), this soil has a minimum age of 4,700 years, and a median age of about 14,600 years. For the purposes of this study, and to be conservative, we give preference to the minimum age of 4,700 years.

The **first buried soil** in this profile is a truncated 2-foot-thick section comprised of two argillic (Bt) soil horizons (2Btb1/2Btb2). These horizons are distinguished from the overlying soil in that they have redder colors in the 7.5YR to 10-7.5YR range, better-developed soil structure described as strong coarse to very coarse angular blocky, more clay films than the horizons above, and silica cementation. These horizons also have a sandy clay loam texture but the gravel fraction is higher than the soil above, with 10 to 20 percent fine gravel. The larger percentage of gravel and the many pores up to 0.2 inch (5 mm) in diameter suggests that these sediments were deposited by a mudflow. The moderately well-developed soil characteristics also show that this sedimentary package was exposed to soil-forming processes at the surface for several thousands of years before it was buried by the sediments that form the uppermost soil described above. The contact between this soil and the underlying buried soil described next is abrupt.

This soil has a calculated normalized SDI value of 76.4 and an MHI value of 0.397. These values give an average estimate of exposure to soil-forming processes prior to burial of between 7,500 (minimum) and 23,000 (median) years. Again, to be conservative, we give preference to the minimum estimate of 7,500 years. The age of this soil is calculated by adding to its length of soil formation estimate the age of the overlying soil. Thus, the

---

[1] **Weathering Stages:**
Stage I: Unweathered bedrock, rings sharply to blow of hammer. Mafic rocks exhibiting stage I weathering characteristics are estimated to have been exposed to weathering agents for less than about 1,000 years. Leucocratic (light-colored igneous rocks) exhibiting stage I characteristics are thought to have been exposed to weathering agents for less than about 4,000 years.

Stage II: Slightly weathered bedrock, incipient to moderate surface pitting, fractured, with oxidation rinds greater than 1-2 mm in thickness, yields moderate ring to blow of hammer. Stage II mafic rocks have been exposed to weathering agents for about 4,000 years, whereas stage II leucocratic rocks could have been weathering for as much as about 10,000 years.

Stage III: Substantially weathered bedrock, surface highly pitted, strongly fractured, mafic minerals and feldspars may be strongly altered, clasts can be broken with difficulty by hand, dull sound to blow of hammer. Stage III mafic rocks are estimated to have been exposed to weathering agents for 10,000 to 75,000 years; stage III leucocratic rocks could have been weathering for as much as 400,000 years.

Stage IV: Very strongly weathered bedrock, easily disaggregated by hand into grus; very dull sound when struck with hammer. Stage IV mafic rocks have weathered for more than about 75,000 years; stage IV leucocratic rocks have weathered for more than 400,000 years.

minimum (preferred) age of this buried soil is 12,200 years. Based on these age assessments, the Holocene section in this portion of the site, as exposed in this portion of trench FT-1, consists of this buried soil and the overlying soil combined.

The **second buried soil** interpreted in this profile is also truncated as only a 1-foot-thick argillic soil horizon (3Btb3) remains. The fine-grained fraction of this horizon is clayey in texture, but 20 to 30 percent of the horizon is made up of gravel to cobble-sized clasts of siltstone and granitics. The high percentage of siltstone clasts indicates that this possible mudflow deposit was sourced from a different area than the overlying sediments, which include mostly granitics and slate fragments. This argillic horizon has clayey texture, strong coarse angular blocky structure, and significant concentration of illuviated clay in the form of continuous thin and common moderately thick films on ped faces and bridging grains, and continuous moderately thick films lining clast pockets. Colors of this horizon are in the 7.5YR range. These characteristics indicate that this sediment was exposed to soil-forming processes at the surface for a relatively long period of time prior to being buried. The lower boundary of this soil is abrupt and locally defined by a stoneline.

The horizon has a calculated normalized SDI value of 110.2 and an MHI value of 0.55. These values in turn yield an average estimate of length of soil formation for this soil of 15,600 (minimum), 46,200 (median) and 135,000 (maximum) years. Given the significant accumulation of pedogenic clay in this horizon, we prefer the (conservatively) median value of 46,200 years. The age of this horizon is calculated by adding this value to the estimated age of the section above. Thus, the median (preferred) age of this buried soil is approximately 58,400 years.

The **third buried soil** observed in this section of trench developed in sediments typical of the Saugus Formation of Quaternary age. The soil profile described in these deposits was incised into and partially removed by the overlying coarse-grained, high-energy mudflow deposits such that its topsoil (A horizon) and upper part of its argillic (Bt) section were not preserved. The remaining soil has an overall 4Btb4/4BCb1/4BCb2/4C_{lam} profile. The preserved argillic section is clayey in texture, has 7.5YR to 10-7.5YR colors, strong angular blocky to prismatic soil structure, continuous moderately thick clay films on ped faces, few thick and many to continuous moderately thick clay films bridging grains, and the root channels are lined with manganese oxide staining. The deposit has less than 5 percent fine gravel consisting predominantly of siltstone clasts.

The underlying BC horizons are silty clay to sandy clay in texture, have 7.5YR to 10-7.5YR matrix colors, 7.5YR to 5YR clay film colors, and strong medium to coarse angular blocky soil structure. The clay films in these horizons are less than the argillic horizon above, generally described as common thin and few moderately thick films on ped faces, and continuous moderately thick in pores. Manganese oxide staining occurs locally on ped faces and plugging root pores. The lower C_{lam} horizon consists of fine to medium sand with 1.5- to 2-inch thick argillic lamellae (Bt lams) held together by common moderately thick and continuous thin clay films bridging grains. The matrix has 10YR colors and the Bt lams have 7.5YR colors; the sand has very weak subangular blocky soil structure and is soft to loose when dry. The siltstone clasts observed in this unit are weathered to stages II to III.

The characteristics of this buried soil yield an SDI value of 77.3 and an MHI value of 0.715. The MHI value calculated for the argillic (4Btb4) horizon is most representative of the well-developed characteristics observed in this soil, including color, strong angular blocky to prismatic structure, and abundance and thickness of the clay films. The MHI value yields an estimate of length of soil formation prior to burial for this soil of 46,000 (minimum), 124,000 (median) and 329,000 (maximum) years (values rounded to the nearest 1,000). The age of this soil is calculated by adding these values to the estimated total age of the soil section above. Thus, this deeper soil is at a minimum 104,000 years old, but more likely between 183,000 (median) and 388,000 (maximum) years old. An even older age is possible if we use the median and maximum length-of-soil-formation estimates calculated for the overlying soils (Table 2).

Table 2: Length of Time (LofT) Soils Have Been Exposed to Soil-Forming Processes at the Ground Surface (rounded to the nearest 100 years)

Soil	SDI	MHI	Average LofT (years)	Minimum LofT (years)	Maximum LofT (years)
Profile in the Area of Fault Zone A (Station 7+55)					
Surface Soil	52.0	0.305	14,600	**4,700**	46,000
Buried Soil 1	76.4	0.397	23,000	**7,500**	70,000
Buried Soil 2	110.2	0.551	**46,200**	15,600	134,700
Buried Soil 3	77.3	0.715	**124,300**	45,700	**329,200**
Approximate Total Age of Section (using the preferred values shown in bold; rounded to nearest 1,000)			**183,000 – 388,000**		
Soil	**SDI**	**MHI**	**Average LofT (years)**	**Minimum LofT (years)**	**Maximum LofT (years)**
Profile in the Area of Fault Zone B (Station 8+23)					
Surface Soil	0.467	70.97	**26,800**	8,900	**80,400**

Bold values are the preferred estimates reported in the text of the report, with an emphasis on being conservative and reporting the youngest ages likely for the near-surface soils, and median to maximum ages for the deeper soils that clearly developed in in-situ Saugus Formation deposits.

2.2.2 Fault Zone B

The soils observed and described in the area of Fault Zone B formed entirely in sediments of the Saugus Formation. No overlying colluvial or debris flow deposits are interpreted near the ground surface in this portion of the trench. The soil described in this area has an Ap-Bt1/Bt2/BC1/BClam1/BC2/BClam2/C profile. Each of these horizons is briefly described below. Abbreviated soil descriptions are listed in Table 1, and complete soil descriptions are provided in our Appendix A.

The Ap-Bt1 horizon has mixed characteristics typical of a plowed soil, with organic-rich dark A horizon soil material, and zones or fragments of yellowish red and dark brown sediment typical of deeper portions of the profile. The colors of this horizon vary from 10-7.5YR to 7.5YR and 5YR in hue. The horizon has a sandy clay to clay texture with less than 5 percent of the mineral fraction consisting of gravel-sized chips of siltstone. This profile also has common to many thin and few moderately thick clay films bridging grains, and many roots and rootlets. The underlying Bt2 horizon is silty clay in texture, with less than 5 percent coarse-sand- to fine-gravel-sized clasts of siltstone, colors in the 10-7.5YR and 7.5YR hues, moderate to strong angular blocky soil structure, many thin and few moderately thick clay films on ped faces, and many thin clay films bridging grains. This horizon also has many roots and rootlets, and few pinhole-sized pores. The soil did not react to hydrochloric acid indicating that it has no free calcium carbonate.

The underlying BC and BC_{lam} horizons typically have sandy loam textures, colors in the 10-7.5YR and 7.5YR hues, subangular to angular blocky soil structure, often breaking to single-grained, and common to many thin clay films bridging grains. Coarse-sand to fine-gravel-sized clasts, when present, generally consist of siltstone and a few granitics; these are weathered to Stages II to III. The underlying C horizon is described as a friable sandstone with 10YR colors, very weak fine subangular blocky soil structure breaking to single-grained, and no clay films. The sample we described had possible cemented worm tubes or casts that could suggest a near-shore marine environment of deposition. If so, these sediments would be assigned to the lower, older section of the Saugus Formation.

The characteristics of this soil yielded an SDI value of 70.97 and an MHI value of 0.467. Based on its MHI value we estimate that this soil has been exposed to soil-forming processes at the ground surface for between 26,800 and 80,400 years, using the median and maximum estimates provided by the MHI-soil age regression equation used. These values underestimate by many hundreds of thousands of years the age of the Saugus Formation as reported by Wagner et al. (2007) based on the 780,000- to 850,000-years old biostratrigraphic age assigned to the mammoth fossil uncovered about 1.5 miles to the northeast of the site (see AKA's report, Section 3.1 for additional information). The soil-age estimates, however, provide information on when this section of the Saugus Formation was first exposed to soil-forming processes at and near the ground surface after the overlying Saugus deposits exposed farther south in the trench were removed from this area by erosion. Specifically, the log of Trench FT-1 shows that the Saugus Formation deposits in the area where Fault Zone B was exposed were originally stratigraphically deeper, and capped by a section at least 11 feet (3.4 m) thick of younger deposits also assigned to the Saugus Formation. These beds were removed by erosion from the area where Fault Zone B was exposed, with soil formation beginning only after erosion ceased or became negligible.

2.3 Age of Faulting

We interpret **Fault Zone A** as overlain by a relatively thick section of younger colluvial sediments that were deposited over time, with significant hiatuses in between that allowed for the formation of soils. Specifically, the soils overlying the faults in Fault Zone A are polygenetic, with the surface soil and at least one, and potentially two, of the buried soils in this area having formed in colluvial and/or mudflow sediments that cap finer-grained sediments of the Saugus Formation below. The degree of soil development in these units shows that the upper two units (the surface soil and the first buried soil) are likely Holocene in age. The second buried soil is definitely Pleistocene in age.

The surface soil and the upper two buried soils all extend across the fault zone without being impacted by the faults. Given that this second buried soil is not faulted, we can conclude that Fault Zone A is not Holocene-active. Our preferred combined age of this second buried soil is about 58,400 years, which means that the fault last moved more than 58,000 years ago. This age estimate is a minimum value, however, because 1) there are likely to have been several episodes of incision that are not reflected in the preserved soil profile, and 2) the faults are confined to layers within the Saugus Formation, which is several hundreds of thousands of years old. Nevertheless, this age estimate shows that the faulting in Fault Zone A is pre-Holocene in age and thus that this fault is not active. Note that in this section of the trench, the coarse-grained deposits (into which buried soil 2 developed) can be interpreted as a separate, younger unit that incised into the finer-grained Saugus Formation deposits below. Farther north, however, north of Station 6+90, AKA shows these coarse-grained deposits as interfingering with finer-grained sediments that are clearly part of the Saugus Formation. If these stratigraphic relations are correct, then our age estimate for this soil significantly underestimates the true age of the deposit. This in turn further supports the argument that the faults of Fault Zone A are actually much older than the soil-ages suggest.

The age of the soils developed in the area of **Fault Zone B** can be used only indirectly to evaluate when the faults in this area last moved. These soils developed entirely in in-situ Saugus Formation deposits of known Pleistocene age. The characteristics of the soil suggest that this area became sufficiently stable to allow for soil formation at a minimum about 27,000 years ago, and possibly as much as 80,000 years ago (rounded to the nearest 1,000). The faults mapped in this area are confined to an only partially pedogenically altered horizon characterized by clay-enriched thin layers referred to as Bt lamellae or Bt lams (horizon BC_{lam2} in the soil descriptions). The log prepared by AKA shows that several of these Bt lams extend unbroken across the fault closest to the surface. Given that neither the uppermost Bt lams, or the layers above, show evidence of warping or faulting, we conclude that this fault also last moved in the Pleistocene, probably when the Saugus sediments were still being deposited, and is thus no longer active.

The trench log suggests that this excavation also exposed an asymmetrical anticline defined by a sequence of tilted strata. The originally flat-lying layers now dip south from about Station 8+70 to at least near Station 10+70, and possibly the southern end of the trench. The north side of the fold is defined by the north-dipping beds observed from about Station 7+90 to about Station 7+40. The northern hinge of the top of this fold is approximately in the area of Fault Zone A, whereas the southern hinge of the fold, where bedding starts to dip south, occurs at about Station 8+70. It is possible that a north-dipping buried structure underlies this area, and that Fault Zones A and B are backthrusts off this more deeply buried structure. The top of this entire sequence of gently folded sediments has been eroded down (planed off) such that the current topography does not reflect the original shape of this antiform. These observations in turn indicate that the folding occurred after the sediments of the Saugus Formation exposed in the trench were deposited, but before the current topography was established. The soils described for this study provide a minimum age for when this area became stable enough for soils to form. Using our estimated age of the second buried soil in the area of Fault Zone A, we suggest that folding of these deposits occurred more than 58,000 years ago, with this estimate being a minimum as it does not consider the length of time it took to erode the at least 11-foot-thick section of Saugus Formation deposits that is missing at the top of the fold.

3.0 SUMMARY

Earth Consultants International was retained to conduct a soil-age analysis of the soils and sediments exposed in a few discrete sections of AKA's Trench FT-1. This was a 1,260-foot long trench excavated in the northeastern portion of the Hitch Ranch property to look for faulting or folding associated with the Southern Area thrust mapped by others to the east of the area trenched onsite. The trench exposed two areas where reverse faults with a shallow south dip were encountered. We were asked to estimate the age of the soils that extend unbroken across these structures, to evaluate whether or not these features should be considered Holocene-active under California's definition of fault activity for residential projects.

To that end, we described the near-surface soils collected by AKA in the area of the two fault zones. The faults in both areas are confined to sediments of the Quaternary-aged Saugus Formation. Fault Zone A is also capped by unfaulted colluvial deposits altered by pedogenic processes. The characteristics of these soils indicate that there have been several periods of erosion and deposition with long-enough periods in between to allow for soil formation. The combined age of the surface soil and the two buried soils that extend unbroken across Fault Zone A show that the fault has not moved in at least 58,000 years, and potentially much longer.

The faults in Fault Zone B are overlain by unbroken Bt lamellae that developed as a result of pedogenic processes in the deeper section of the soil that has developed in sediments of the Saugus Formation. This surface soil began developing once this portion of the site became sufficiently stable. The age of the soil that has developed in this area is estimated at between about 27,000 and 80,000 years old. Given that the faults do not extend into the upper soil horizons and do not impact the uppermost Bt lamellae, we conclude that these faults also last moved in the Pleistocene and are therefore not Holocene-active.

Appendix A: Soil Descriptions

Soil Profile Collected in Fault Zone A

Sample Number	Depth (ft)	Depth (cm)	Horizon	Description
1	0 – 0.5	0 - 15	Ap1	**SANDY CLAY LOAM**; dark grayish brown (10YR 4/2) when dry, very dark brown (10YR 2/2) when moist; moderate coarse subangular blocky breaking to weak fine subangular blocky soil structure and single-grained; loose to soft when dry, loose to very friable when moist, very slightly sticky and very slightly plastic when wet; 5-10% fine gravel- sized clasts of angular to subangular granitics and slate, unweathered to slightly weathered (stage I); clear lower boundary.
2	0.5 – 1.2	15 - 36	Ap2	**SANDY CLAY LOAM**; dark grayish brown (10YR 4/2) when dry, very dark brown (10YR 2/2) when moist; weak to moderate medium angular blocky breaking to moderate fine subangular blocky soil structure and single-grained; loose to soft when dry, loose to very friable when moist; very slightly sticky and very slightly plastic when wet; 10% coarse sand to fine gravel-sized clasts of angular granitics, unweathered to slightly weathered (stage I), few up to 1-inch in size; common roots and rootlets; clear lower boundary
3	1.2 - 2	36 - 60	A3	**SANDY CLAY LOAM**; dark grayish brown (10YR 4/2) and (10YR 5/3) when dry, very dark grayish brown (10YR 3/2) and brown (10YR 4/3) when moist; weak to moderate medium subangular blocky breaking to weak to moderate fine subangular blocky soil structure and single-grained; loose to soft when dry, loose to very friable when moist, very slightly sticky and very slightly plastic when wet; very few thin clay films on ped faces; 5-10% coarse sand to fine gravel-sized clasts of mostly granitics and few slate; unweathered to slightly weathered (stage 1), few scattered angular gravel; common roots and rootlets; scattered charcoal; abrupt to clear lower boundary
4	2 – 3	60 - 90	Bw	**SANDY CLAY LOAM** to **SANDY CLAY**; dark grayish brown (10YR 4/2) and reddish brown (5YR 4/4) when dry, very dark brown to very dark grayish brown (7.5-10YR 2.5/2) and dark brown (7.5YR 3/2) when moist; weak to moderate medium angular blocky breaking to weak very fine angular blocky soil structure and single-grained; loose to soft when dry, loose to very friable when moist, very slightly sticky and slightly plastic when wet; very few thin clay films on ped faces, few thin clay films bridging grains; 5% subangular to subrounded fine gravel-sized clasts of mostly granitics; few roots and rootlets; abrupt lower boundary.
5	3 – 4.2	90 - 127	2Btb1	**SANDY CLAY LOAM**; brown to dark grayish brown (10-7.5YR 4/2) and brown to grayish brown (10-7.5YR 5/2) when dry, dark brown (7.5YR 3/2) when moist; strong very coarse subangular blocky breaking to strong fine to medium subangular blocky soil structure; slightly hard and fragic when dry, firm to very firm when moist, very slightly sticky and very slightly plastic when wet; common thin clay films on ped

				faces, common thin clay films bridging grains, common thin clay films lining clast pockets; 20% rounded to subangular coarse sand to fine gravel-sized clasts up to ½ inch in size; many rootlets; many pinhole-sized to 5-mm-sized pores; cemented, possibly with silica, as there is no reaction to hydrochloric acid; clear lower boundary. [Possible debris flow deposit]
6	4.2 - 5	127 - 152	2Btb2	**SANDY CLAY LOAM**; brown to light brown (7.5YR 5/3-6/3) with dark brown (7.5YR 3/2) clay films when dry, dark brown (7.5YR 3/2.5) and dark brown (7.5YR 3/2) clay films when moist; strong coarse angular blocky soil structure; extremely hard and fragic when dry, very firm when moist; very slightly sticky and very slightly plastic when wet; many thin and few moderately thick clay films bridging grains; 10-20% coarse sand and fine gravel-sized clasts of granitics, quartzite, and Monterey siltstone; common very fine and fine rootlets; common to many pinhole-sized pores, few up to 2 millimeters; cemented, possibly with silica, as there is no reaction to hydrochloric acid; abrupt lower boundary.
7	5 – 6	152 - 182	3Btb3	**CLAY**; yellowish brown to brown (10-7.5YR 5/4) and brown (10-7.5YR 4/3) with dark brown (7.5YR 3/2) clay films when dry, brown (7.5-10YR 4/3) when moist; strong coarse angular blocky soil structure; extremely hard when dry, very firm to extremely firm when moist; very sticky and very plastic when wet; continuous thin and common moderately thick clay films bridging grains, continuous moderately thick clay films lining clast pockets; 20-30% gravel- to cobble-sized clasts of mostly Monterey siltstone and few granitics; no reaction to hydrochloric acid; abrupt lower boundary. [Possible debris flow deposit]
8	6 - 7	181 - 212	4Btb4	**CLAY**; light yellowish brown to brown (10-7.5YR 5.5/4) with very dark gray to dark brown (7.5YR 3/1.5) and brown to dark brown clay films (7.5YR 3.5/3) when dry, brown (7.5YR 4/4) with dark brown (7.5YR 3/2) clay films when moist; strong medium to coarse angular blocky breaking to prismatic soil structure; extremely hard when dry, very firm to extremely firm when moist; very sticky and very plastic when wet; continuous moderately thick clay films on ped faces, few thick and many to continuous moderately thick clay films bridging grains; less than 5% fine gravel-sized clasts of predominately Monterey siltstone; root channels lined with manganese oxide stains; abrupt to clear lower boundary.
9	7 – 7.8	212 - 236	4BCb1	**SILTY CLAY**; light brown to light yellowish brown (7.5-10YR 6/4) with dark brown (7.5YR 3/3) clay films on ped faces and dark brown (7.5YR 3/2) clay films in pores when dry, brown (7.5YR 4.5/4) with very dark grayish brown (10YR 3/2) clay films on ped faces and dark brown to very dark gray (7.5YR 3/1.5) clay films in pores when moist; strong coarse angular blocky soil structure; extremely hard when dry, firm when moist, very sticky and very plastic when wet; common thin clay films on ped faces, continuous thick clay films in pores; few coarse sand-sized clasts of siltstone; few scattered

				rootlets; common pores and root channels 4-5 millimeters in diameter, plugged with manganese oxide and clay; clear lower boundary.
10	7.8 – 9.25	236 - 260	4BCb2	**SANDY CLAY**; very pale brown to pink (10-7.5YR 7/4) with yellowish red (5YR 4/6) and reddish brown (5YR 5/4) mottles and brown (7.5YR 4.5/2) clay films when dry, brown (7.5YR 4.5/4) with yellowish red (5YR 5/6) mottles and brown to dark brown (7.5YR 3.5/3) clay films when moist; strong medium to coarse angular blocky soil structure; extremely hard when dry, extremely firm when moist, sticky and plastic when wet; few moderately thick and common thin clay films on ped faces, few moderately thick and many thin clay films bridging grains, and many thin and few thick clay films in pores and root channels; manganese staining locally, red staining (mottled); few rootlets; very few pinhole pores; abrupt lower boundary.
11	9.25 – 13.95+	260 – 425+	$4C_{lam}$	Fine to medium **SAND** with Bt lams 1.5-2 inches thick that consist of **LOAMY SAND. Matrix:** light gray to very pale brown (10YR 7/2.5) when dry, brown (10YR 5/3) when moist; very weak fine subangular blocky soil structure; loose and soft when dry, loose and very friable when moist, non-sticky and non-plastic when wet; less than 5% fine gravel-sized clasts of granitics and Monterey siltstone; lower boundary not described. **Bt lams**: brown (7.5YR 5/4) with dark brown (7.5YR 3/2) clay films when dry, brown to dark yellowish brown (7.5-10YR 4/4) with dark brown to very dark gray (7.5YR 3/1.5) when moist; strong coarse to very coarse angular blocky breaking to strong fine to medium angular blocky soil structure; slightly hard to hard when dry, firm when moist, very slightly sticky and non-plastic when wet; common moderately thick and continuous thin clay films bridging grains; 5% gravel typically less than ½-inch in diameter, few larger, clasts consist subrounded to subangular volcanics and Monterey siltstone weathered to stage II to III and subrounded.

Soil Profile Collected in Fault Zone B

Sample	Depth (ft)	Depth (cm)	Horizon	Description
1	0 – 0.66	0 - 20	Ap-Bt	**SANDY CLAY** to **CLAY**; brown (10-7.5YR 4/3) with few yellowish red (5YR 4/6) zones and dark brown (7.5YR 3/2) clay films when dry, brown (7.5YR 4/2) with reddish yellow (7.5YR 6/6) zones and dark brown (7.5YR 3/2) clay films when moist; moderate medium to coarse angular blocky soil structure; hard when dry, firm when moist, sticky and very plastic when wet; common to many thin and few moderately thick clay films bridging grains; mixed; less than 5% angular siltstone chips; many roots and rootlets; very few pinhole-sized pores; clear lower boundary.
2	0.66 – 1.3	20 - 40	Bt	**SILTY CLAY**; yellowish brown to brown (10-7.5YR 5/4) to (10-7.5YR 5/6) with dark grayish brown to brown (10-7.5YR 4/2) clay films when dry, brown (7.5YR 4/4) with (7.5YR 4/1.5) clay films when moist; moderate to strong coarse angular blocky breaking to moderate fine angular blocky soil structure; very hard to extremely hard when dry, very firm when moist, sticky and very plastic when wet; many thin and few moderately thick clay films on ped faces, many thin clay films bridging grains; less than 5% coarse-sand and fine gravel-sized clasts of predominantly siltstone; many roots and rootlets; few pinhole-sized pores; abrupt lower boundary.
3	1.3 – 2.3	40 - 70	BC1	**SANDY LOAM**; brown to yellowish brown (10-7.5YR 5/4) with brown (7.5YR 4/4) clay films when dry, brown (7.5YR 4/4) with dark brown (7.5YR 3/3) clay films when moist; weak to moderate medium subangular blocky breaking to weak fine subangular blocky soil structure and single-grained; very hard when dry, very friable to friable when moist, very slightly sticky and non-plastic to very slightly plastic when wet; common thin clay films bridging grains; common roots and rootlets; clear to gradual lower boundary.
4a	2.3 – 3.1	70 - 95	BC_{lam1}	Fine to medium **SANDY LOAM** with Bt lams of medium to coarse **SANDY LOAM. Matrix:** yellowish brown to strong brown (10-7.5YR 5/6) with pockets of gray (10YR 6/1) and light brownish gray (10YR 6/2) when dry, brown (7.5YR 4/4 and 7.5YR 4/2) when moist; moderate fine angular blocky soil structure; hard and slightly fragic when dry, friable when moist, very slightly sticky and non-plastic when wet; no reaction to hydrochloric acid; few roots; gradual lower boundary. **Bt lams**: dark brown (7.5YR 3/3) when dry, dark brown (7.5YR 3/2) when moist; moderate very coarse angular blocky soil structure; hard when dry, very firm when moist, slightly sticky and non-plastic when wet; many to continuous thin clay films bridging grains; >50% coarse sand.
4b	3.1 -4	95 - 122	BC2	**SANDY LOAM**; light yellowish brown to brown (10-7.5YR 5.5/4) with dark brown (7.5YR ¾) clay films when dry, brown (7.5YR 4/4) with dark brown (7.5YR 3/3) clay films when moist; strong very coarse angular blocky soil structure; very hard when dry, very firm when moist, very slightly sticky and non-plastic to very slightly plastic when wet; common thin

Sample	Depth (ft)	Depth (cm)	Horizon	Description
				clay films bridging grains; less than 5% scattered angular chips of Monterey siltstone weathered to stage III; common roots along ped faces; few pinhole-sized pores and few up to 4 millimeters in diameter; slightly cemented; primary bedding of coarse and fine sand locally still visible; clear lower boundary.
5	4 - 7	122 - 213	BC_{lam2}	Fine grained **LOAMY SAND** with 1- to 2-inch-thick Bt lams of **SANDY LOAM. Matrix:** brown to light brown (7.5YR 5.5/4) when dry, brown (7.5YR 4/4) when moist; weak medium subangular blocky breaking to weak fine subangular blocky soil structure and single-grained; loose to slightly hard and fragic when dry, very friable when moist, non-sticky and non-plastic when wet; few thin clay films bridging grains in some sections; 5-10% coarse sand to fine gravel-sized clasts of angular to subrounded, weathered (stage II-III) Monterey siltstone and granitics; calcium carbonate cemented tubes; clear lower boundary. **Bt lams**: brown (7.5YR 5/4) with dark brown (7.5YR 3/2) clay films when dry, brown (7.5YR 4/4) with very dark brown (7.5YR 2.5/2) clay films when moist; string coarse to very coarse angular blocky soil structure; very hard when dry, very firm when moist, very slightly sticky and non-plastic to very slightly plastic when wet; many thin clay films bridging grains; 5-10% gravel-sized clasts of mostly angular to subangular granitics and Monterey siltstone up to 1.5 inches in size, but mostly ¼-inch in size.
6	7 – 8+	213 – 243+	C	Fine to medium **SANDSTONE**; pale brown (10YR 6/3) when dry, yellowish brown (10YR 5/4) when moist; very weak fine subangular blocky soil structure and single-grained; loose when dry, loose when moist, non-sticky and non-plastic when wet; 5-10% coarse-grained sand; coarser than the unit above; possible cemented worm casts or tubes; lower boundary not observed.

Subject: **Response to City of Moorpark Review Comments and Recommendations, Hitch Ranch Fault Study, Tentative Tract 5708, City of Moorpark, California.**

References: Review of Fault Report, Hitch Ranch, TT 5708, Moorpark, California, by Mr. Jim O' Tousa, dated May 8, 2019. (On behalf of RJR Engineering Group for the City of Moorpark)

Geologic Assessment of Surface Fault Rupture Potential, Hitch Ranch, Tentative Tract 5708, City of Moorpark, California, prepared by Albus-Keefe & Associates Inc., dated April 3, 2019 (J.N. 2677.00).

Dear Ms. Rapista,

The city of Moorpark consultant has completed their review of our referenced fault report for the subject site. In the referenced review letter, Mr. Jim O' Tousa, the reviewing engineering geologist, generally stated that he agrees with our findings concerning the absence of "active" faulting within the site. However, he had several technical comments concerning the trench logs in our report as well as recommendations to be considered for future plan review purposes. This correspondence has been prepared to address these comments and recommendations. A copy of their review letter is attached herein for reference. We are also resubmitting our fault report (revised dated June 3, 2019) with revised trench logs as part of our response to the comments below.

Responses to Comments

Comment 1:
Acknowledge. As suggested, we revised our fault trench logs to clearly indicate that the horizontal scale equals the vertical scale. (See Plates 5 through 9 in our fault report, revised dated June 3, 2019)

Comment 2:
Acknowledge. For better correlation purposes we have included the major soil horizons described by ECI directly on Fault Trench FT-1. (See Plate 7 in our fault report, revised dated June 3, 2019)

Comment 3:
Fault trench FT-2 overlaps the upper northerly end of Gorian's fault trench FT-4. Where the fault trenches overlap, Unit C in our fault trench FT-2 actually correlates with both Units 3 and 4 of Gorian's fault trench FT-4.

Comment 4:
Acknowledge. The site is not in a State of California Earthquake Fault Hazard Zone and will not need to be submitted to the State. Three (3) hard copies and an electronic copy of our fault report with the revised plates, as discussed herein, have been resubmitted to the city along with this response letter.

Responses to Recommendations

Recommendation 1:
Acknowledge. We concur that the Moorpark area is part of a compressional framework. However, based on the findings from our study, we are currently of the opinion that the probable magnitude of displacement (small-scale shear displacements or general ground tilting) associated with a significant earthquake on either the Oak Ridge or Simi-Santa Rosa faults during the life of the proposed habitable structures within the site would likely be extremely small. Therefore, no additional structural mitigation measures for the proposed habitable structures were deemed necessary at this time to provide for the safety and welfare of the occupants. In the event that geologic observations during site grading indicate that small-scale deformation in the area of the shears in fault trench FT-1 or other areas of the site could potentially rise to a level that could impact habitable structures within the site, the findings should be reviewed by the geotechnical and structural engineer and mitigation measures should be incorporated in the design of foundations for habitable structures to provide an increased resistance to small-scale ground movements.

Recommendation 2:
Acknowledge. Potential seepage issues associated with daylighted sand lenses and channel features in cut slopes and other excavations will be addressed during future geotechnical studies of the site.

Recommendation 3:
Acknowledge. The changes in the physical properties of the site earth materials resulting from variations in moisture content will be addressed during future geotechnical studies of the site.

We hope the information presented herein meets the approval of the city of Moorpark. If you should have any questions or need clarification regarding this letter, please do not hesitate to call this office.

Respectfully submitted,

Albus-Keefe & Associates, Inc.

SECTION 1: PROJECT SUMMARY

1.1 - Purpose and Scope

At the request of Comstock Homes, FirstCarbon Solutions (FCS) conducted an updated paleontological records search and literature review for the Hitch Ranch Specific Plan (proposed project). An earlier paleontological assessment was done for this project (SWCA 2006). Pursuant to comments and direction received from the City of Moorpark, it was determined that an updated paleontological records search for the project area would be required to bring the report's findings up to date, particularly in light of significant discoveries made in the area that were not available to the study's authors at the time of writing. Chief among them are two particularly important discoveries (the Moorpark Highlands Project and the "Moorpark Mammoth" site) that were recovered from the Saugus Formation in 2005 and have added significant information to the age and nature of Saugus Formation deposits in the area of the proposed project.

This report update provides an updated paleontological records search and literature review that takes this new information into account, and assesses the applicability of the recommendations and proposed mitigation measures outlined in the original 2006 SWCA report. For the purposes of clarity, this report update has attempted to follow the format used in the 2006 report wherever possible.

1.2 - Dates of Investigation

Records search requests were submitted to the Santa Barbara Museum of Natural History and the Natural History Museum of Los Angeles County (LACM) on January 30, 2020. The museum records search results were received on February 21 and February 14, 2020, respectively. Additional archival research including outreach to individuals and firms associated with the two Moorpark discoveries for unpublished draft reports and data was conducted from January 27 to February 7, 2020. The report update was completed on February 27, 2020.

1.3 - Result of Investigation

According to geological mapping of the project area (Dibblee 1992), the proposed project is immediately underlain by late Quaternary older alluvium and the Plio-Pleistocene Saugus Formation. However, more recent geotechnical studies conducted by Gorian and Associates, Inc. (2000) within the project area indicate the presence of Holocene (recent) alluvium colluvium, and artificial fill underlain by late Quaternary older alluvium. Collection records from the LACM indicate no known fossil localities within the project boundaries. Fossil localities have, however, been documented in the vicinity of the project. LACM (CIT) 560, the nearest documented site, is in a canyon southwest of the project area within surficial deposits of older Quaternary alluvium, and produced a specimen of fossil horse (*Equus*). Slightly south of LACM (CIT) 560 is LACM (CIT) 585, which produced an undetermined mastodon tusk fragment from the Saugus Formation. Subsequent Moorpark projects near the project site have uncovered two kinds of mammoth, horse, llama, rabbit, and at least six kinds of rodent from the Saugus Formation.

Results of the literature review, including the Draft Paleontological Resource Impact and Mitigation Report prepared by Chambers Group for the Moorpark Highlands Project (Chambers 2007) are detailed below. This report, along with the LACM Records Search Results, are included in Appendix A.

1.4 - Conclusion and Recommendations

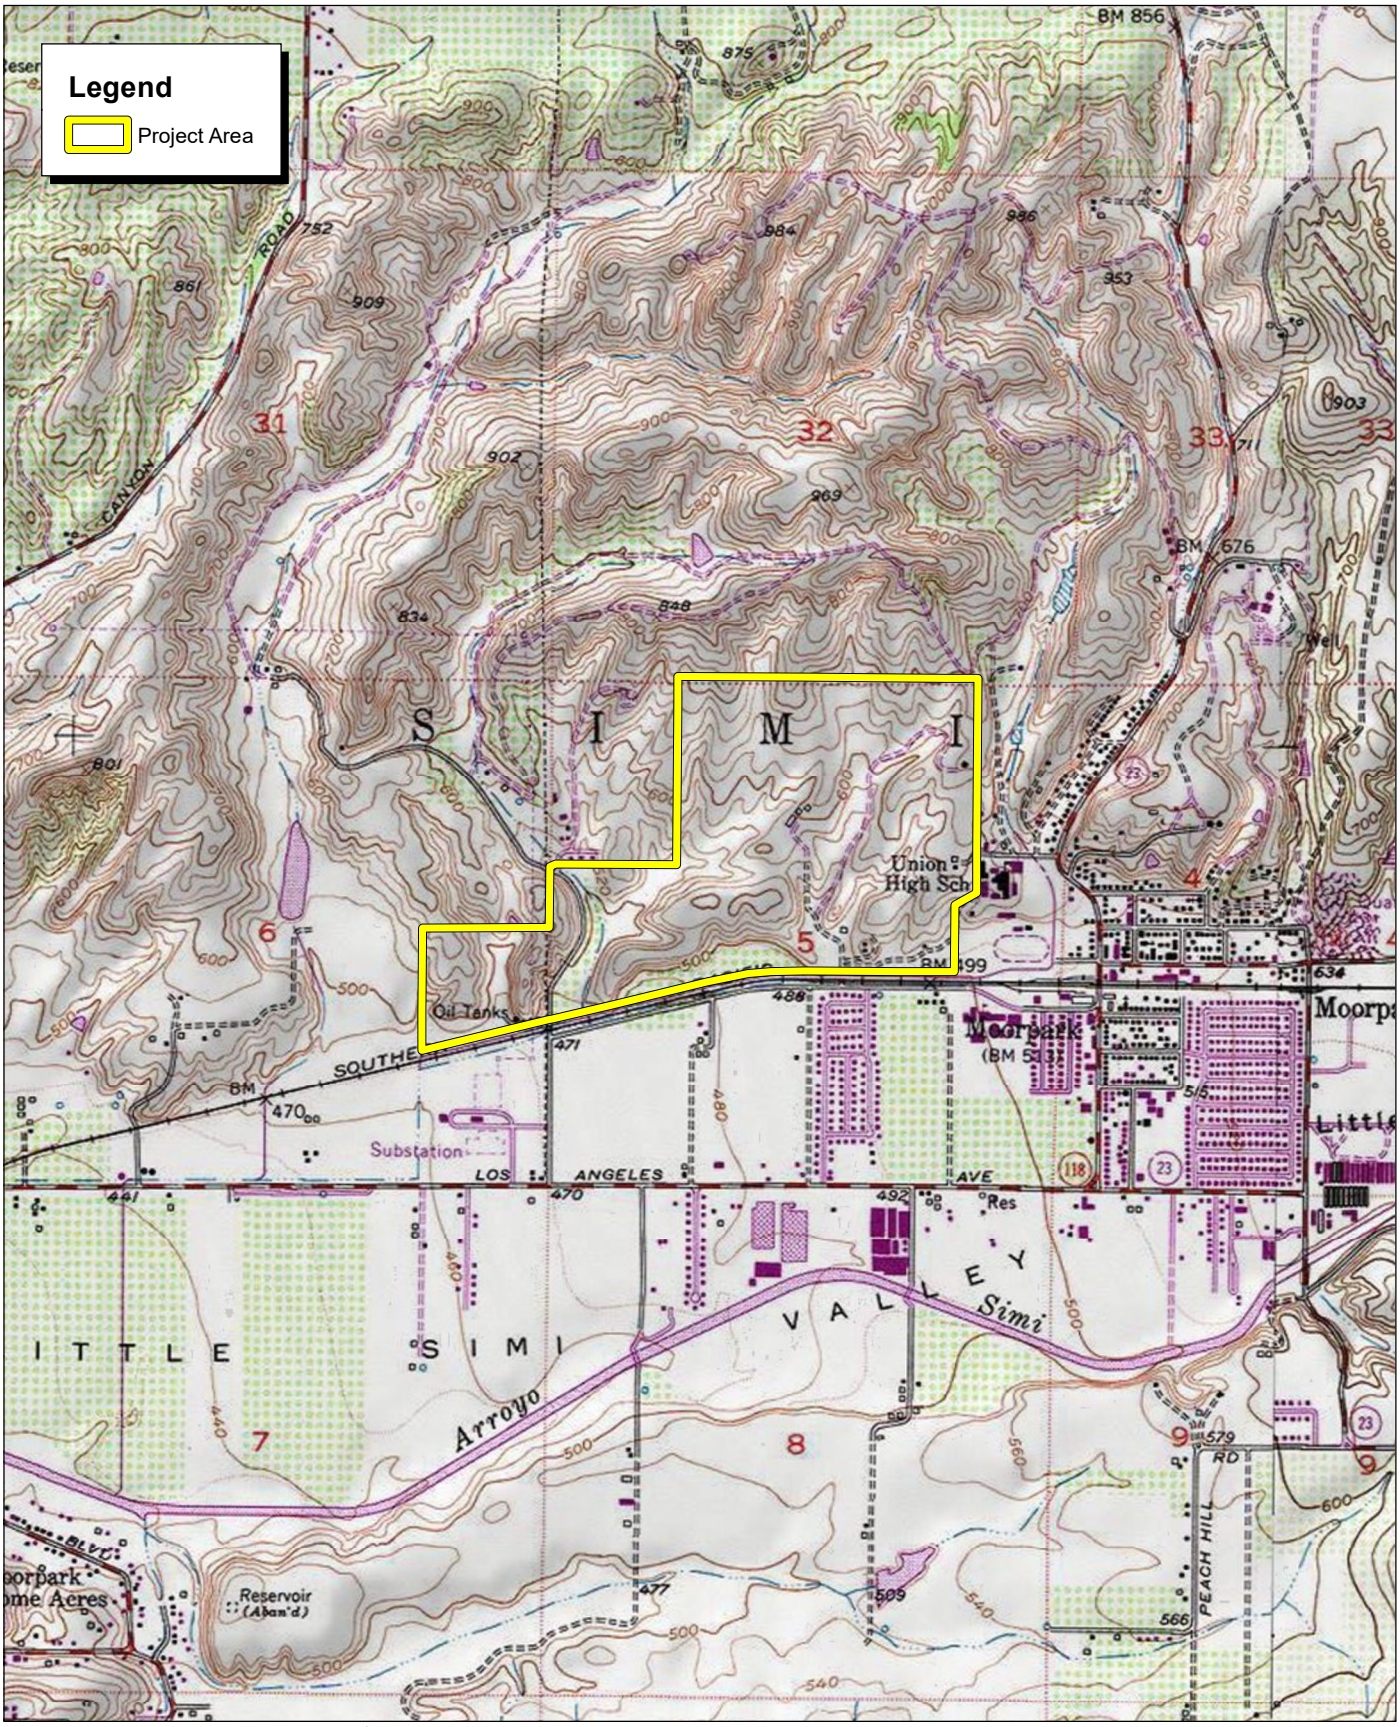
Based on the results of the updated records search and literature review, FCS concurs with the findings and proposed mitigation measures detailed in the 2006 SWCA Paleontological Assessment (SWCA 2006)**.** While significant paleontological resources associated with the Saugus Formation have been discovered in recent years in proximity to the project site, none have been discovered within the project area, nor were any defined features or outcrops identified over the course of the 2006 pedestrian survey that would lend themselves to an effective testing program. As such, FCS concludes that the proposed mitigation measures, which require full-time paleontological monitoring of all ground disturbance within Saugus Formation or Quaternary older alluvium, are sufficient to protect any paleontological resources that may be encountered over the course of project construction. These mitigation measures, detailed in the report, were developed in accordance with the 1995 Society of Vertebrate Paleontology (SVP) standards and Ventura County Guidelines, and meet the most recent SVP 2010 standards as well.

1.5 - Disposition of Data

This report update will be filed with Comstock Homes and with the City of Moorpark. A copy will be retained at FCS.

SECTION 2: INTRODUCTION

The proposed project is located in Moorpark, California, and lies on the Moorpark 7.5-minute quadrangle (Exhibit 1). An earlier paleontological assessment was done for the proposed project (SWCA 2006). Multiple subsequent reports on nearby projects in the Saugus Formation necessitated an update. FCS was retained by Comstock Homes to update the 2006 report. This report presents the findings of an updated museum records search and an updated comprehensive literature review. A field survey was done in 2006. No new field survey was performed for this update, as the previous survey indicated that vegetation obscured inspection of any possible sediment outcrops.



The combination of geologic mapping of the project area (Dibblee 1992) and geotechnical investigations (Gorian and Associates 2000) indicates that the sediments that will be impacted by development of this parcel are the Plio-Pleistocene Saugus Formation, older alluvium, younger alluvium colluvium, and artificial fill. Collection records from the Natural History Museum of Los Angeles County and the Santa Barbara Museum of Natural History were consulted.

Professional Guidelines from the SVP have been revised since the 2006 report, so the resource assessment guidelines have been appropriately updated to 2010 standards. The definition of the Saugus Formation has also been revised as a result of more recent scholarship, and the usage in the document has been modified to conform accordingly.

2.1 - Definition and Significance of Paleontological Resources

The SVP Standard Procedures (2010) state: “Significant paleontological Resources are fossils and fossiliferous deposits, here define as consisting of identifiable vertebrate fossils, large or small, uncommon invertebrate, plant, and trace fossils, and other data that provide taphonomic, taxonomic, phylogenetic, paleoecologic, stratigraphic, and/or biochronologic information. Paleontological resources are considered to be older than recorded human history and/or older than middle Holocene (i.e., older than about 5,000 radiocarbon years).”

SECTION 3: RESOURCE ASSESSMENT GUIDELINES

Paleontological resources are limited, non-renewable resources of scientific, cultural and educational value, and are afforded protection under federal (National Environmental Policy Act [NEPA]), State (California Environmental Quality Act [CEQA]), and local (County of Ventura) laws and regulations. This study satisfies project requirements in accordance with CEQA (13 Public Resources Code [PRC] 2100 *et seq*.) and complies with guidelines and significance criteria specified by the SVP (SVP 2010).

3.1 - Laws, Ordinances, Regulations, and Standards

Fossils are classified as non-renewable scientific resources and are protected by various laws, ordinances, regulations, and standards (LORS) across the country. The SVP (2010) has established professional standards for the assessment and mitigation for adverse impacts to paleontological resources. This paleontological assessment was conducted in accordance with the LORS applicable to paleontological resources within the project area.

3.2 - Professional Standards

The SVP updated their standard guidelines for impact mitigation (SVP 2010). These outline professional protocols and practices for conducting paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, and specimen preparation, identification, analysis, and curation. Most practicing professional vertebrate Paleontologists adhere closely to the SVP's assessment, mitigation, and monitoring requirements as specifically provided in its standard guidelines.

As defined by SVP, significant paleontological resources are fossils and fossiliferous deposits, defined as consisting of identifiable vertebrate fossils, large or small, uncommon invertebrate, plant, and trace fossils, and other data that provide taphonomic, taxonomic, phylogenetic, paleoecologic, stratigraphic, and/or biochronologic information. Paleontological resources are considered to be older than recorded human history and/or older than middle Holocene (i.e., older than about 5,000 radiocarbon years).

3.3 - Paleontological Sensitivity

The following categories of sensitivity are taken from the guidelines of the SVP (2010), and provide an update to the SWCA 2006 report.

3.3.1 - High Potential

Rock units from which vertebrate or significant invertebrate, plant, or trace fossils have been recovered are considered to have a high potential for containing additional significant paleontological resources. Rock units classified as having high potential for producing paleontological resources include but are not limited to, sedimentary formations and some volcaniclastic formations (e.g., ashes or tephras), some low-grade metamorphic rocks that contain significant paleontological resources anywhere within their geographical extent, and sedimentary rock units temporally or

lithologically suitable for the preservation of fossils (e.g., middle Holocene and older, fine-grained fluvial sandstones, argillaceous and carbonate-rich paleosols, cross-bedded point bar sandstones, fine-grained marine sandstones, etc.). Paleontological potential consists of both (a) the potential for yielding abundant or significant vertebrate fossils or for yielding a few significant fossils, large or small, vertebrate, invertebrate, plant, or trace fossils and (b) the importance of recovered evidence for new and significant taxonomic, phylogenetic, paleoecologic, taphonomic, biochronologic, or stratigraphic data. Rock units that contain potentially datable organic remains older than late Holocene, including deposits associated with animal nests or middens, and rock units that may contain new vertebrate deposits, traces, or trackways are also classified as having high potential.

3.3.2 - Undetermined Potential

Rock units for which little information is available concerning their paleontological content, geologic age, and depositional environment are considered to have undetermined potential. Further study is necessary to determine if these rock units have high or low potential to contain significant paleontological resources. A field survey by a qualified professional Paleontologist to specifically determine the paleontological resource potential of these rock units is required before a paleontological resource impact mitigation program can be developed. In cases where no subsurface data are available, paleontological potential can sometimes be determined by strategically located excavations into subsurface stratigraphy.

3.3.3 - Low Potential

Reports in the paleontological literature or field surveys by a qualified professional Paleontologist may allow determination that some rock units have low potential for yielding significant fossils. Such rock units will be poorly represented by fossil specimens in institutional collections, or based on general scientific consensus only preserve fossils in rare circumstances and the presence of fossils is the exception not the rule (e.g. basalt flows or Recent colluvium). Rock units with low potential typically will not require impact mitigation measures to protect fossils.

SECTION 4: PROJECT LOCATION AND DESCRIPTION

The proposed project is located in the City of Moorpark, Ventura County, California (Exhibit 1). The 270.64-acre project site is approximately 1,600 feet west of Moorpark Avenue (State Route 23) at its intersection with Casey Road. The southern boundary of the project site is approximately parallel with Poindexter Avenue, and the project area extends west beyond Gabbert Road.

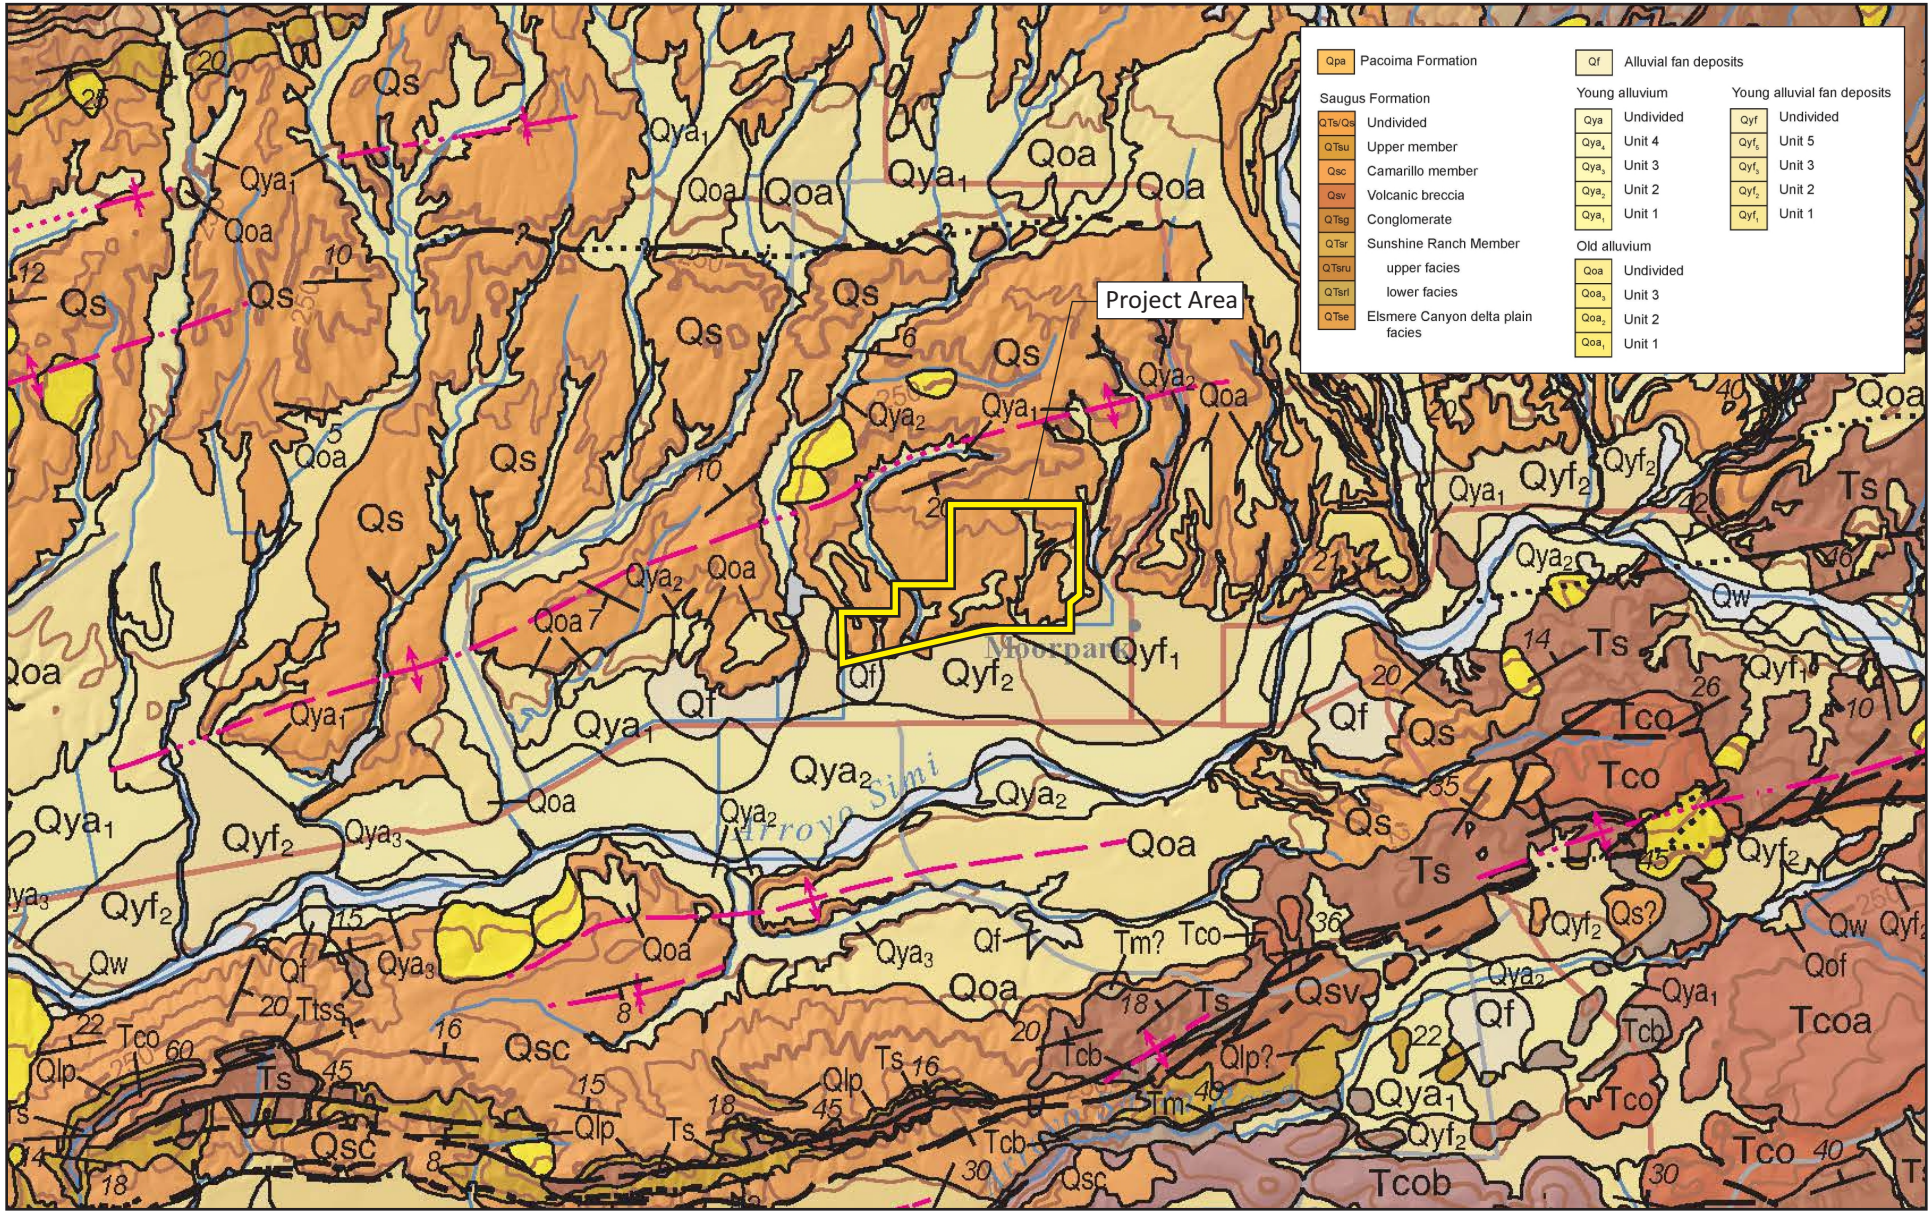
4.1 - Geology and Paleontology

The geologic map of the project area is shown on Exhibit 2. Previous geologic mapping of the project area indicates the presence of late Quaternary older alluvium and the underlying Plio-Pleistocene Saugus Formation (Dibblee 1992) within the project area. However, it should be noted that geotechnical studies conducted at the project site instead report the composition of the surficial sediments as late Quaternary older alluvium and Holocene (recent) alluvium, colluvium, and artificial fill (Gorian and Associates 2000). Core samples taken from the project site indicate that the Plio-Pleistocene Saugus Formation is present beneath the older alluvium. Thus, the Saugus Formation may be impacted during grading of the project area.

4.1.1 - Saugus Formation

The definition of the Saugus Formation has been revised since the original report (SWCA 2006). It is now defined as being a non-marine formation. Marine strata formerly assigned to the Saugus Formation are now assigned to the Pico Formation (Swanson and Irvine 2015). The Sunshine Ranch and Camarillo members of the Saugus Formation have been formally adopted (Swanson and Irvine 2015). Some strata producing marine organisms and formerly assigned to the Saugus Formation are now assigned to the Pico Formation (Squires et al., 2006; Squires 2012.) However, in the Moorpark area, Campbell et al. (2014) map the Saugus Formation as undifferentiated as to member.

The Saugus Formation is the oldest formation within the project area. Dibblee (1992) maps the Saugus Formation in the hills of the project area. Geotechnical work by Gorian and Associates, Inc. (2000) indicates it occurs beneath older alluvium in the western portion of the proposed project. It is described as moderately-sorted commonly cross-bedded and channeled; interbedded with moderate-brown to reddish-brown poorly sorted sandy mudstone and local claystone seams in the type area and other portions of the eastern Ventura basin, reflecting overbank deposits and paleosols; fluvial near the basin axis, transitioning to alluvial fan environment near the basin margins; interfingers with shallow marine sands to the west (Campbell et al., 2014). Mammalian fossils collected from the upper member of this formation belong to the Irvingtonian North American Land Mammal Age (Wagner et al., 2007). A combination of faunistic and geomagnetic evidence indicates an age range of 850,000 to 780,000 years for the part of the Saugus Formation that produced those fossils (Wagner et al., 2007).



4.1.2 - Late Quaternary Older Alluvium

Geologic mapping (Dibblee 1992) of the project area indicates that late Quaternary older alluvial deposits are exposed in the valleys of the project area. Other workers designate the rock units in the

hills of the project site as late Quaternary (Pleistocene) older alluvium (Impact Sciences 2000). The older Alluvium at Hitch Ranch is composed of up to 36 feet of interbedded, lenticular yellowish-brown sand, light yellowish-brown silt and yellowish-brown clay that often contain clasts from the underlying Modelo Formation. Current data indicates that the older Alluvium in the Moorpark area is Middle Pleistocene (400,000 to 280,000 years old) (Lander 1997.

4.1.3 - Recent Alluvium Colluvium, and Artificial Fill

Geotechnical studies performed by Gorian and Associates, Inc. for the proposed project indicate that some of the surficial sediments overlying the late Quaternary older alluvium in the project area are Holocene (recent) alluvial stream deposits, colluvium and artificial fill (Impact Sciences 2000). Holocene deposits are too young to contain fossils and are thus classified as low sensitivity sediments. The uppermost younger alluvial deposits are determined to have a low paleontological sensitivity rating; however, according to SVP guidelines, geologic units greater than 5,000 years old may contain fossilized material. Therefore, the paleontological sensitivity of the young alluvial sediments mapped within the project site increases with age (i.e., depth). Artificial fill obviously has low potential for paleontological resources. Even if fossils were found in artificial fill, the original locality of the fossils would be unknown.

SECTION 5: METHODS

The methods employed in this report included an updated paleontological records search and an updated literature search.

5.1 - Updated Paleontological Records Search Results

The updated paleontological records search showed no localities within the boundaries of the proposed project. The list of fossils and localities that the LACM reported this year in the vicinity of the proposed project (MacLeod 2020) does not differ from the list provided by MacLeod (2005) in the 2006 SWCA report. There is one recorded fossil from older Quaternary alluvium. It is that of a horse. That locality is southwest of the proposed project. The other is of a mastodon (family *Mammutidae*), from the Saugus Formation, locality LACM (CIT) 585. That locality is somewhat farther to the southwest. Personnel involved in the recovery and reporting of the Meridian Hills Project (see below) reported that a collection of Saugus fossils from that project were curated at the Santa Barbara Museum of Natural History. The Curator of Geology at that institution made available a spreadsheet of the Meridian Hills Project fossils curated there. The Meridian Hills Project is a very short distance from the proposed project. Jonathan Hoffman (pers. com., Feb 2020) reported 16 horse fossils, six mammoth fossils-including two species, two llama fossils, five specimens belonging to camel family, one rabbit, an unspecified number of rodent teeth belonging to six general and one extinct species, and one specimen of an unspecified proboscidean. Mr. Hoffman also reported that the museum has no other collections from the Saugus Formation or from Moorpark.

5.2 - Updated Literature Search Results

Jefferson (1991) recorded one Pleistocene vertebrate fossil from Moorpark. This specimen is of a fossil horse from the collection of the Natural History Museum of Los Angeles County. These include a fossil horse from older Quaternary alluvium at locality LACM (CIT) 560, which is the same specimen mentioned by MacLeod in the 2006 and 2020 records search reports. Lander (2007) summarized the known vertebrate fossils from the Saugus Formation of the Santa Clarita and San Fernando valleys. These include dog, cat, mastodon, tapir, horse, peccary, camel, pronghorn, deer, rabbit, gopher, and pack rat, as well as pond turtle and alligator lizard.

At the time of the original report (SWCA 2006), the Saugus Formation had not produced a significant amount of vertebrate fossils in the Simi Valley. However, since the publication of the original report, a considerable number of fossils have been collected from the Saugus Formation in Moorpark. A development known as the Meridian Hills Project produced vertebrate fossils, and that project lies a few yards northeast of the proposed project. These findings were detailed in an unpublished report (Lander 2007). The Meridian Hills Project produced a 70 percent complete skeleton of the southern mammoth (*Mammuthus meridionalis*), elements of the Columbian mammoth (*Mammuthus columbi*), the western horse (possibly *Equus occidentalis*), the large-headed llama (*Hemiauchenia macrocephala*), as well as smaller vertebrates. The smaller organism include a probable cottontail rabbit (possibly *Sylvilagus*), a species of the pocket gopher (*Thomomys*), a species of the pocket mouse (*Perognathus*), a species of the kangaroo rat (*Dipodomys*), a species of the harvest mouse

(*Reithrodontomys*), a species of the wood rat (*Neotoma*), and Mead's pine mouse (*Pitymys meadensis*). The demonstration that these two species of *Mammuthus* overlapped in this time interval is important. The collection of organisms from this project was designated the Meridian Hills local fauna (Wagner et al., 2007). Those authors demonstrated that the known ranges of the southern mammoth and Mead's pine mouse plus the magnetostratigraphic data from the site narrowed the age range of this deposit to 850,000 to 780,000 years. The collection was accessioned by the Santa Barbara Museum of Natural History.

Another development known as Moorpark Highlands Project produced vertebrate fossils, and it lies farther to the northeast, across Walnut Canyon Road. The final report for the paleontological resource monitoring and mitigation effort by the Chambers Group was authored by Hugh Wagner (Chambers 2007). Mr. Wagner reported that a collection of mollusk fossils was obtained from the Pico Formation, and several vertebrate fossils, including a partial skeleton of a mastodon (*Mammut* sp.,) from the Saugus Formation. Fossils of horse were also recovered. The report states that, "The specimens have since been cleaned, sorted, and analyzed and were recently curated into the collections of the Museum of Natural History, Los Angeles, California." An accession form from the Natural History Museum of Los Angeles County was included as Attachment F. However, the form is undated, has no accession number, and is not signed by any staff member of the museum. Through a personal communication, Dr. Samuel McLeod of the Natural History Museum of Los Angeles County assured that no vertebrate fossils from that project were ever accessioned or curated by that museum (pers. Comm. February 2020). Furthermore, Jonathan Hoffman (pers. comm., Feb 2020) stated that no such collection had been curated at the Santa Barbara Museum of Natural History.

SECTION 6: ANALYSIS

The table below summarizes the paleontological sensitivity ratings of the geologic units underling the project area.

Table 1: Paleontological Sensitivity by Geological Formation

Geologic Formation	Age	Fossils	Paleontological Sensitivity	Monitoring Recommendation
Alluvium, colluvium, and fill	Holocene	none	low to high	Part-time to full-time
Older alluvium	Pleistocene-to Holocene	terrestrial vertebrates	high	full-time
Saugus Formation	Plio-Pleistocene	terrestrial vertebrates	very high	full-time

The search of the LACM collections records indicated that at least one nearby locality produced vertebrate fossils in the older alluvium, and many localities in the older alluvium in Southern California. Older alluvium is almost always rated at least at a high level of paleontological sensitivity. When the first paleontological assessment was written, the LACM collections records showed a single Simi Valley locality that had produced a vertebrate fossil. That statistic has not changed, but multiple subsequent projects near the proposed project have produced significant vertebrate fossil collections. The Saugus Formation in Moorpark must therefore be rated as having a very high level of paleontological sensitivity.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 7: CONCLUSIONS

Adverse impacts on paleontological resources result when sediment units become unavailable for study and observation by scientists. The destruction of fossils as a result of human-induced ground disturbance has a significant impact as it makes biological records of ancient life permanently unavailable for study by scientists. Implementation of proper mitigation measures can, however, reduce the impacts to the paleontological resources to below the level of significance.

Due to the very high paleontological sensitivity of the Plio-Pleistocene Saugus Formation and the older Quaternary alluvium, excavations in these units within the project area are likely to have a negative impact on non-renewable paleontological resources unless proper mitigation measures are implemented. The surficial Holocene alluvium, when accurately mapped, is too young to contain *in situ* nonrenewable paleontological resources and thus does not require close paleontological monitoring.

Based on the results of the updated records search and literature review, FCS concurs with the findings and proposed mitigation measures detailed in the 2006 SWCA Paleontological Assessment. While significant paleontological resources associated with the Saugus Formation have been discovered in recent years in proximity to the project site, none have been discovered within the project area, nor were any defined features or outcrops identified over the course of the 2006 pedestrian survey that would lend themselves to an effective testing program. As such, FCS concludes that the project's previously proposed mitigation measures are sufficient to protect any paleontological resources that may be encountered over the course of project construction. These mitigation measures, detailed in the next section, were originally developed in accordance with the 1995 SVP standards and Ventura County Guidelines, and meet the most current (2010) SVP standards.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 8: RECOMMENDED MITIGATION MEASURES

The following mitigation measures have been developed in accordance with the SVP (1995; 2010) standards and Ventura County Guidelines, and meet the paleontological requirements of CEQA Guidelines. These mitigation measures have been used throughout California and have been demonstrated to be successful in protecting paleontological resources while allowing timely completion of construction.

1. All project-related ground disturbances that could potentially impact the Saugus Formation and Quaternary older alluvium will be monitored by a qualified Paleontological Monitor on a full-time bases, as these geologic units are determined to have a high paleontological sensitivity rating. Since younger alluvial and colluvial deposits are considered to have a low paleontological sensitivity, monitoring of excavation activities in this unit will be conducted on a part-time basis to ensure that no underlying sensitive unites are being impacted.
2. A qualified Paleontologist as defined by the SVP Guidelines (2010) will be retained to supervise monitoring of construction excavations and to produce a mitigation plan for the proposed project. Paleontological monitoring will include inspection of exposed rock units during active excavations. The Paleontological Monitor will have authority to temporarily divert grading away from exposed fossils in order to professionally and efficiently recover the fossil specimens and collect associated data. The qualified Paleontologist will prepare monthly progress reports to be filed with Comstock Homes and the lead agency.
3. At each fossil locality, field data forms will be used to record pertinent geologic data, stratigraphic sections will be measured, and appropriate sediment samples collected and processed for analysis.
4. Recovered fossils will be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and curated in a recognized paleontological curation facility. Potential repositories include the Natural History Museum of Los Angeles County and the San Bernardino County Museum.
5. The qualified Paleontologist will prepare a final monitoring and mitigation report to be filed with Comstock Homes , the lead agency, and the repository.

Attn: Dana DePietro, Project Manager, Archaeologist

re: Paleontological resources for the proposed Hitch Ranch Project, FirstCarbon Solutions Project # 3183.0006, in the City of Moorpark, Ventura County, project area

Dear Dana:

I have conducted a thorough search of our paleontology collection records for the locality and specimen data for the proposed Hitch Ranch Project, FirstCarbon Solutions Project # 3183.0006, in the City of Moorpark, Ventura County, project area as outlined on the portion of the Moorpark USGS topographic quadrangle map that J.D. Stewart sent to me via e-mail on 30 January 2020. We do not have any vertebrate fossil localities that lie directly within the proposed project area boundaries, but we do have localities nearby from the same sedimentary deposits that occur at in the proposed project area, either at the surface or at depth.

In the canyons, drainages, and lower-lying portions of the proposed project area there are surficial deposits of younger Quaternary Alluvium. These deposits typically do not contain significant vertebrate fossils in the uppermost layers, but older sedimentary deposits at modest depth may well contain significant fossil vertebrate remains. Our closest locality in these sediments is LACM (CIT) 560, southwest of the proposed project area in one of the canyons on the north side of the Las Posas Hills on the south side of Little Simi Valley. A specimen of a fossil horse, *Equus*, was recovered from LACM (CIT) 560.

The more elevated terrain in the proposed project area has exposures of the Plio-Pleistocene Saugus Formation. We have numerous fossil vertebrate localities in the Saugus Formation, primarily

to the east and northeast of the proposed project area, but our closest locality is LACM (CIT) 585, southwest of the proposed project area on the south side of the Las Posas Hills, further southwest of locality LACM (CIT) 560 mentioned above. An specimen of undetermined mastodon, Mammutidae, was recovered from LACM (CIT) 585.

Shallow excavations in the uppermost layers of soil and younger Quaternary Alluvium in the lower lying terrain of the proposed project area are unlikely to encounter significant fossil vertebrate remains. Deeper excavations that extend down into older sedimentary deposits, and any excavations in the Saugus Formation exposed in the hills of the proposed project area, however, may well encounter significant fossil vertebrate remains. Any substantial excavations in the proposed project area, therefore, should be closely monitored to quickly and professionally collect any specimens without impeding development. Also, sediment samples should be collected and processed to determine the small fossil potential in the proposed project area. Any fossils recovered during mitigation should be deposited in an accredited and permanent scientific institution for the benefit of current and future generations.

This records search covers only the vertebrate paleontology records of the Natural History Museum of Los Angeles County. It is not intended to be a thorough paleontological survey of the proposed project area covering other institutional records, a literature survey, or any potential on-site survey.

Sincerely,

Samuel A. McLeod

SECTION 1.0 – EXECUTIVE SUMMARY

Paleontological resource mitigation work was conducted during grading associated with the development of an approximately 800-acre parcel of the Moorpark Highlands project for Pardee Homes, in the city of Moorpark, Ventura County, California. This mitigation work included construction monitoring, fossil salvage, laboratory preparation of salvage specimens, curation of prepared specimens, and storage of curated specimens.

This final report summarizes the work performed under this mitigation program.

Earthmoving activities on the subject property were monitored from July, 2004 to September, 2005 and exposed marine and nonmarine Pliocene and Pleistocene age sedimentary rocks to the Pico Formation, the Saugus Formation and Older alluvium. The underlying Plio-Pleistocene age marine of the Pico Formation and Pleistocene age nonmarine rocks of the Saugus Formation and Older alluvium were well exposed as construction activities unearthed a substantial portion of these units in what is mapped as the Moorpark Anticline (Dibblee, 1992). Here the Pico and Saugus formations were dominated by yellow to brown medium and fine-grained, poorly consolidated sandstones, sandy siltstones and claystones with lesser interbedded graded sequences of coarser clastics including coarse sandstones and conglomeratic sandstones. Coarse clasts were observed to be primarily re-worked from the Modelo Formation with some granitic and metamorphic clasts and fragments of marine invertebrates in the nonmarine Saugus Formation. An angular unconformity was documented between the Pico Formation and the overlying Saugus Formation. Disconformably overlying the Saugus Formation a fairly thick sequence of nonmarine Older Alluvium was present that consisted of friable sands and silty sandstones and claystones. The Saugus Formation and the Older Alluvium appeared to have well-developed brown silty claystone paleosols. A majority of the project was located on the southern portion of the anticline bounded on the east by Spring Road. Significant marine invertebrate fossils were collected from the Pico Formation and vertebrate fossils were recovered from the deposits of the Saugus Formation, and poorly preserved unidentifiable bone was observed in the deposits of the overlying Older Alluvium on this project.

Two significant fossil localities were collected on the Moorpark Highlands project. A sample of marine invertebrates was recovered during the early phase of the development of the project from what is considered to be the Pico Formation on this project. A portion of a mastodon skeleton including limb elements, parts of the left fore foot, vertebrate and ribs was collected near Spring Road. Nearby, a separate occurrence of mastodon tusks, were recovered from near Spring Road in July of 2005 just below the contact with the Older Alluvium.

The Saugus Formation has some nomenclature problems associated with the type section near the city of Saugus. The most recent published work by Stevens (1985), Groves and Squires (1988) and Groves (1991) include the underlying marine deposits that have been previously referred to such units as the Pico Formation among others within the Saugus Formation. More recently Squires, Groves and Smith (In Press) have identified the lower marine unit as the Pico Formation and the overlying non-marine deposits as the Saugus Formation. This approach has been used in this report as it follows earlier description and interpretation of these rock units and conforms to the conventional methodology utilized for recognizing lithologic rock units. Groves (1991) provides an excellent review of the nomenclatorial problems surrounding the use of the Saugus Formation. Unfortunately, the author of this report was not present during a majority (98%) of the grading, so the following description of the Pico Formation and some of the Saugus Formation and its depositional and structural features relative to this project are borrowed from the Geotechnical work provided by Geolabs-Westlake Village, for the Moorpark Highlands project, Ventura County, California. There is a reference in the information provided by Geolabs indicating the presence of an angular unconformity within the “Saugus Formation” observed by staff Geologists of Geolabs (2004, 2005) and a Geotechnical Report provided by Pacific Materials Laboratory, Inc. (1997). This is significant as stratigraphic and paleontological work in the last 20 years on the “Saugus Formation” has indicated that there is an unconformity within the “Saugus Formation” where studied elsewhere in Los Angeles and Ventura counties. The rocks below the angular unconformity are here referred to the Pico Formation following Squires, Groves and Smith (In Press) and are, in general,

marine and contain a late Pliocene-early Pleistocene marine to brackish-water invertebrate fauna. Above this unconformity, the rocks of the Saugus Formation are non-marine and do locally contain terrestrial vertebrates. The fossil localities collected on this project and discussed in this report are from a geographic area that prior to this report has no known reported fossils recovered from either the Pico or Saugus formations. The Older Alluvium overlying the Saugus Formation on the Moorpark Highlands property was observed to contain terrestrial mammal bone, but unfortunately, the bone was too poorly preserved to be identifiable. It should be noted, that the Older Alluvium directly overlying the mastodon site appeared to be conformably deposited on a weathered surface of the Saugus Formation and therefore apparently deposited prior to the deformation that produced the Moorpark Anticline. However, Pacific Materials Laboratory, Inc. (1997) indicates that this contact is a disconformity indicating that there may be a significant interval of time missing, but that the deposition of the overlying Older Alluvium was consistent with that of the underlying Saugus Formation.

The marine invertebrate fauna was recovered in the southern portion of the project from olive-gray silty sandstones and a gray fine-gray sandstone in marine deposits of the Pico Formation. Groves (1991) lists 106 mega-invertebrate taxa recovered from the lower Saugus Formation, here recognized as the Pico Formation and indicates that no Pliocene taxa occur above the unconformity in the Saugus Formation in the Santa Susana Mountains of Los Angeles and Ventura counties. Squires (1991) indicates that marine microfossils recovered from above the unconformity in places contains Pleistocene taxa, but in most places, the Saugus Formation is a nonmarine rock unit. At the Moorpark Highlands project an angular unconformity exists between the marine shell-bearing unit here referred to the Pico Formation and the overlying nonmarine deposits of the Saugus Formation. The marine invertebrate and vertebrate fossils collected from the Pico Formation at Moorpark Highlands represent a shallow estuarine environment and the following mega-invertebrates, micro-fossils, and vertebrates were recovered from these rocks (see Table 1, Attachments A, B, C,).

The terrestrial vertebrate fossils recovered from the Moorpark Highlands project were collected from the northwestern portion of the site, just east of Spring Road. These fossils consist of two tusk fragments and a portion of the forequarters of a mastodon *Mammut americanum*. The diagnostic elements of the right front foot including the unciform and 4 other foot elements provided sufficient material to identify this primitive elephant as *Mammut.* Also thoracic vertebrae of a horse *Equus* were collected at this site. The two tusks were collected a short distance from the postcranial material at the same elevation, but are not part of the same individual. This local area appears to be part of a landslide that could had deformed the sediments enough to have juxtaposed the tusks from one individual within a short distance (approximately 100 feet) from the skeletal material of another individual. Nearby at another site, the lower jaw of a horse referred to *Equus scotti* was collected (Table 2)

SECTION 2.0 – INTRODUCTION

During earthmoving activities for the housing development for the Moorpark Highlands Project in the city Moorpark, Ventura County Chambers Group completed a paleontological resource mitigation program. (Figures 1 and 2). The parcel consisted of approximately 800 acres north of the city of Moorpark in Little Simi Valley several miles northeast of Moorpark and State Highway 118. The Moorpark Highlands project occurs on the southern limb of the Moorpark Anticline as mapped by Dibblee (1992) on eastern margin of the Moorpark 7.5 Minute Quadrangle. The paleontological resource management program undertaken by Chambers Group was developed to specifically comply with the conditions and regulations of Ventura County and the City of Moorpark regarding the mitigation of paleontological resources. Compliance was completed by identifying the underlying rock units or formations if formally designated, with relative potential for containing fossil remains that could be disturbed during earthmoving activities. Measures were generated to mitigate the disturbance by recovering scientifically important fossil remains and associated geologic data and preserving them in a public museum, where they are available for future study by qualified scientists. During construction from May of 2004 to September of 2005, the field mitigation program was implemented. The specimens have since been cleaned, sorted, and analyzed, and were recently curated into the collections of the Museum of Natural History, Los Angeles County, California. This report describes the methods and results of the paleontological mitigation program. See attachments (D, E, F, G) for specific data regarding fossil collections.

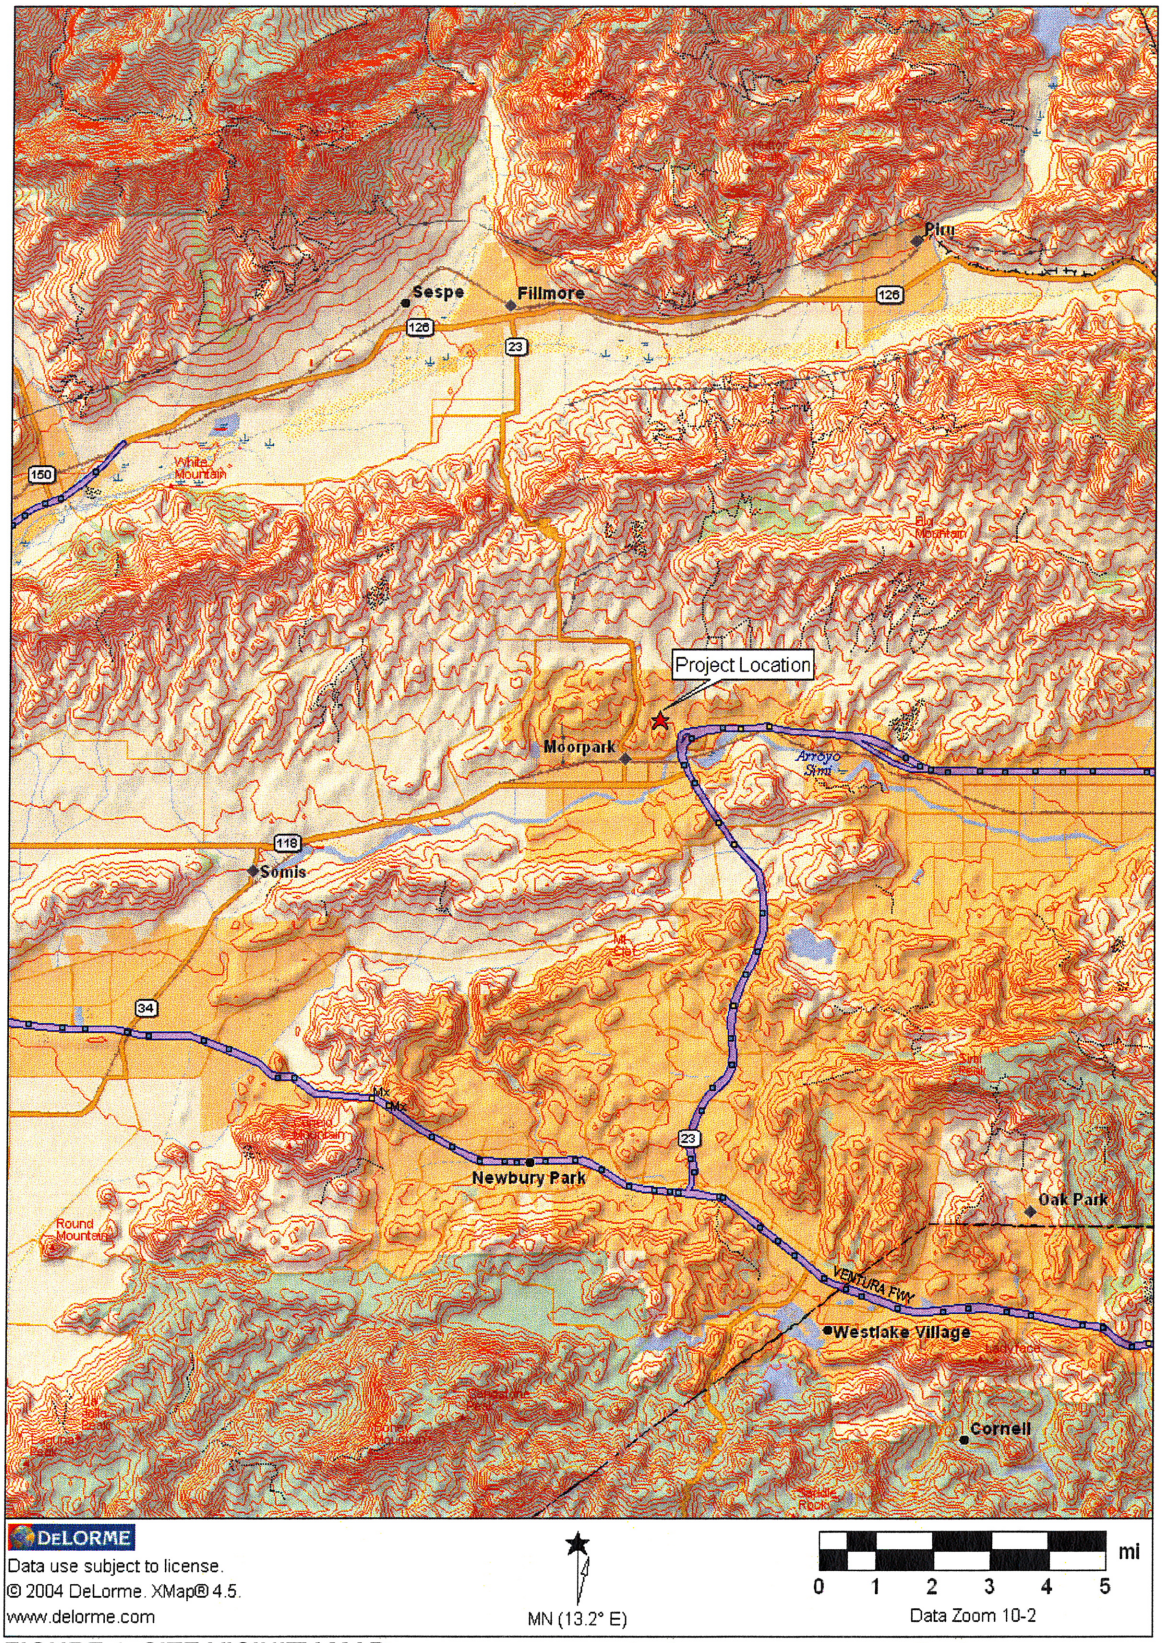

FIGURE 1. SITE VICINITY MAP

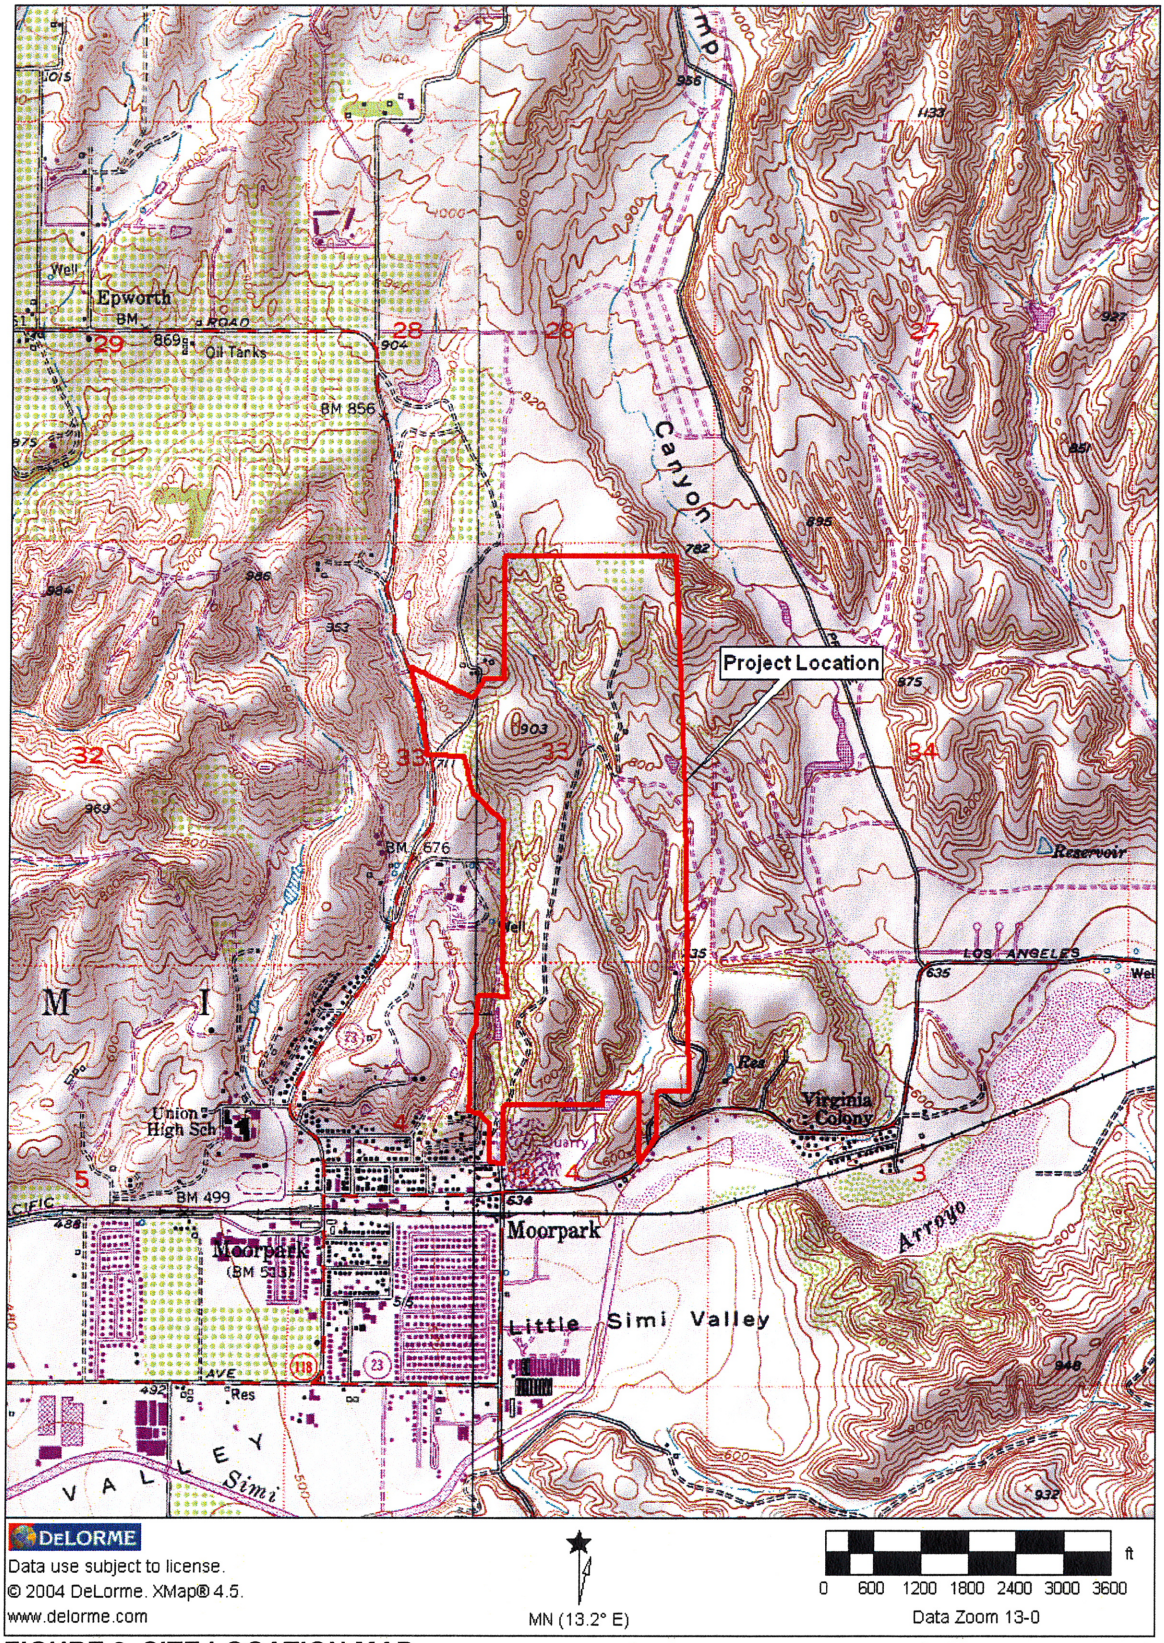

FIGURE 2. SITE LOCATION MAP

SECTION 3.0 – METHODS

The specific mitigation procedures were implemented in the paleontological resource management program during earthmoving activities between May 2004 and September 2005. In the sampling plan all sedimentary rock units to be impacted by earthmoving activities related to the construction of house pads and streets were evaluated for their ability to yield significant fossils. As a result a level of paleontological sensitivity was applied to each rock unit and where this rock unit was present on the project. Specific mitigation efforts were applied to the rock units that had a potential for producing significant fossils. During earthmoving activities in 2004 and 2005 paleontological resource mitigation was performed and consisted of examining fresh cuts and following equipment to locate exposed fossil resources.

3.1 PERSONNEL

The following individuals participated in the mitigation program for this project. Judy McKeehan of Chambers Group supervised all the environmental disciplines on this project. Initially, archaeological and paleontological monitoring of earthmoving activities was conducted by personnel of subcontractor, ArchaeoPaleo Resource Management, Inc. (APRMI) from May 2004 to July 2005. The monitors for APRMI were M. Jean Black, Kristin E. Vowels, and Diane Ward. Later paleontological monitoring was conducted by Chambers Group staff from July to September 2005. The monitors were Trevor J. Lindsay, Mark A. Roeder and David A. Alexander. Salvage activities related to recovering a partial mastodon in the Saugus Formation included Dr. Hugh M Wagner, Mark A. Roeder, Dave A. Alexander, Gino Calvano, Darryl J. Dang Trevor J. Lindsay and Susan Underbrink. Fossil preparation was undertaken by Maureen Walsh and Dave Alexander. Mark Roeder and Hugh Wagner provided supervision for field and laboratory activities. The report was written Dr. Hugh M. Wagner.

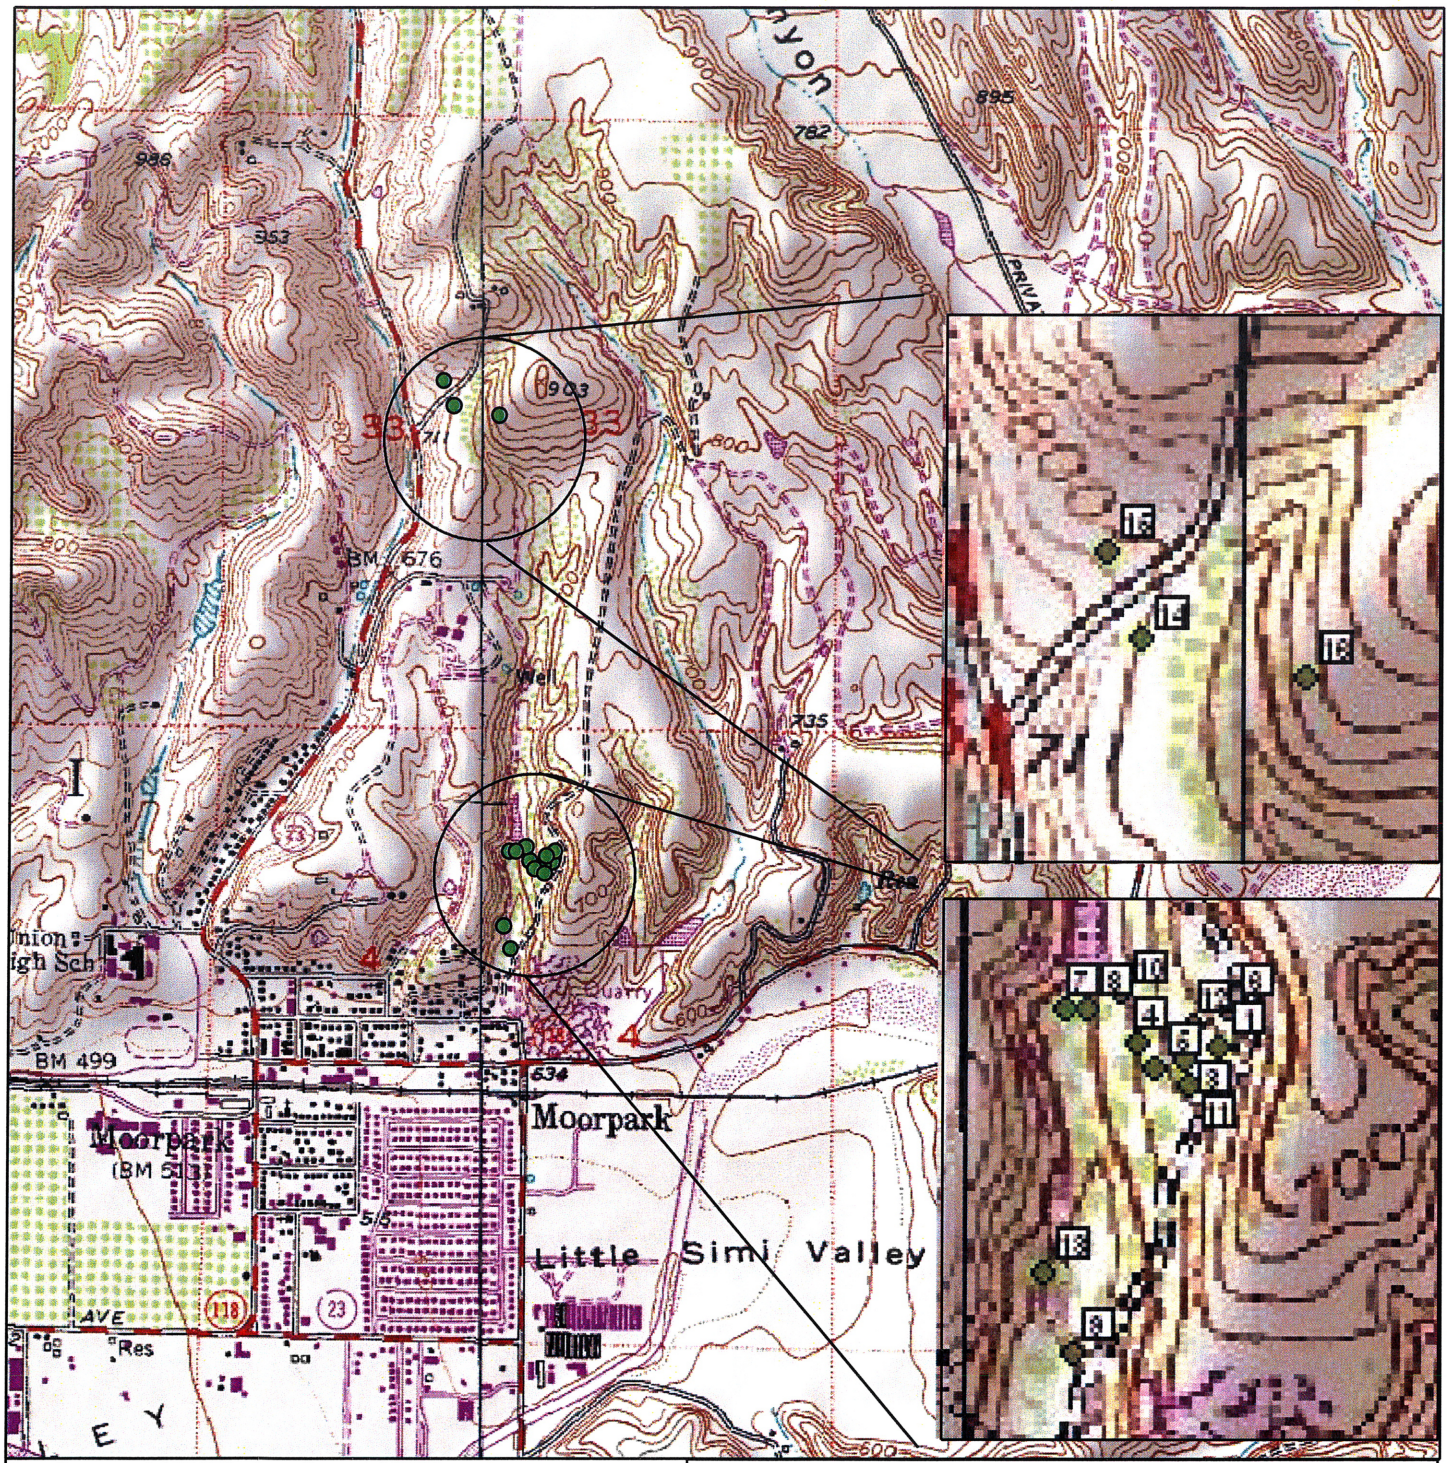
3.2 ACKNOWLEDGEMENTS

The personnel of the Pardee Homes and Hewitt & McGuire, LLP who helped to implemented and funded the paleontological mitigation activities for this project. Field geologists included Kristina Mohos and office personnel with Geolabs-WestLake Village also provided important field and geotechnical data utilized in this report. The following individuals and organizations provided professional evaluations of these disciplines: microfossils-Micropaleo Consultants, Inc., fossil invertebrates- N. Scott Rugh and Lindsey Groves; fossil vertebrates- Hugh M. Wagner, Mark A. Roeder, Richard W. Huddleston.

SECTION 4.0 – PALEONTOLOGICAL UNITS AND RESULTS

Significant fossils consisting of Pliocene marine invertebrate and vertebrate fossils were encountered and recovered from fossiliferous rocks of the Pico Formation during earthmoving activities Marine invertebrates were collected from two shell beds. These invertebrate fossils consisted of 38 taxa of mega and micro invertebrates, 11 kinds of micro-fossils, and 11 vertebrates (Table 1) characteristic of an estuarine environment according to N. Scott Rugh (Attachment A), Micro Paleo Consultants Inc. (Attachment B) and Finger (Attachment C). Also terrestrial Pleistocene vertebrate fossils were found and collected from fossiliferous rocks of the Saugus Formation during monitoring of earthmoving activities. Nonmarine vertebrate fossils consisting of possibly two individuals of the American mastodon *Mammut americanum* (Figures 4 and 5) and a lower jaw of a horse *Equus scotti* were recovered from middle Pleistocene age was found (Irvingtonian Land Mammal Age) deposits of the Saugus Formation (Table 2). These are the first known reported fossils from the Saugus Formation in this region of Ventura County.

4.1 PLIOCENE MARINE FORMATION-PICO FORMATION (TP)



The Pico Formation as recognized in this report is a nearshore marine to estuarine unit known to be very fossiliferous in some regions of Los Angeles and Ventura counties. This lower unit yielded mega-invertebrate fossils that have been discussed and described in the literature since Hershey first named the "Saugus division" in 1902 for rocks near the city of Saugus that were nonmarine In 1902 Hershey named the "Saugus division" for a nonmarine rock unit designating its type section as alluvial deposits exposed in railroad cuts near town of Saugus. At the same time Hershey also described a "Soledad division" underlying the "Saugus division" that contained abundant marine invertebrate fossils. Expanding similar appearing rocks into Los Angeles and Ventura counties Kew (1924) formally named the Saugus Formation with a lower marine unit that intergraded with a nonmarine unit of the type Saugus Formation. Subsequently, the Saugus Formation has been subjected to a progression of re-evaluations of the name, lithologic content and paleontology by such authors as Woodring (1930), Oakshott (1958), Winterer and Durham (1962) Saul (1975, 1979), Squires and White (1983), White (1983), White (1983, 1985) Groves and Squires (1988) and Squires, Groves, and Smith, (In press). In this report, the lower Plio-Pleistocene marine unit is referred to the Pico Formation following Squires, Groves and Smith (In Press) as it contains the same invertebrate assemblage as the "Soledad division" of Hershey (1902).

4.2 PLEISTOCENE NONMARINE FORMATION – SAUGUS FORMATION (QTS)

The Saugus Formation as recognized in this report follows the nomenclature suggested by Squires, Groves, and Smith (In press) and consists of the non-marine deposits unconformably overlying the Pico Formation. The purpose of this report is to provide the results of the paleontological mitigation of the Moorpark Highlands project (Tract 5045) and uses the most recent work of Givens (1991) and Squires, Givens and Smith (In press) and data provided by Geolabs-Westlake Village.

The Saugus Formation at Moorpark Highlands consists of a nonmarine rock unit that characteristically consists of reddish-brown to yellowish-brown siltstones, silty sandstones, sandstones that appear to coarsen up section into some bedded, coarse pebble sandstones containing clasts of igneous, metamorphic and pebbles of reworked Modelo and Saugus formation.

The Saugus Formation is usually always a nonmarine deposit consisting of alluvial fan and other nonmarine facies as it appears in its type area near the city of Saugus in Los Angeles County. At Moorpark Highlands this is also the case. An angular unconformity exists between the underlying marine Pico Formation (Pacific Materials Laboratory, Inc., 1997) and the overlying Saugus Formation. The presence of an angular unconformity between marine and nonmarine rocks usually indicates not only a change in environment of deposition, but also an alteration in the orientation of the land surface and most probably a significant temporal hiatus in deposition. The nonmarine Saugus Formation at Moorpark Highlands consists of brown to yellowish brown sandstones with some interbedded light gray, friable, fine-grained,

cross-bedded, fluvial appearing sandstones. Bones of two individuals of mastodons were collected from the northwest portion of the project at an elevation of 739 and 740 feet, very close to the contact with the overlying Older Alluvium. At one of the mastodon localities the contact between the Saugus Formation and the Older Alluvium (Qoal1 of Pacific Materials Laboratory, Inc. (1997) was approximately 15 feet above the bone bearing horizon in the Saugus Formation. At this location conformably overlying the consolidated concretionary sandstones of the Saugus Formation was a 12 feet thick bed of Older Alluvium that consisted of white to light gray, friable medium- to fine-grained sand with rounded pebbles from some arkosic source and reworked rounded claystones pebbles of the Modelo Formation (Figure X). Overlying the friable light sands was a moderate to poorly consolidated reddish-brown, massive sandy siltstone that contained weekly calcified small rootcasts. This moderately consolidated, weakly bedded, sandy siltstone persisted relatively uniformly for a thickness of 40 vertical feet where it became covered with vegetation. Rare small poorly developed calcareous concretions were observed in the upper portion of this unit.

The Saugus Formation at the mastodon locality was a reddish-brown, well sorted, consolidated silty sandstone that contained abundant off-white, hard, calcareous concretions. The deposits of the Saugus Formation were significantly more lithified than those of the overlying Older Alluvium. Directly underlying the fossil-bearing reddish-brown sandstone was a lighter colored, fine-grained, brown to gray sandstone. The bone was conspicuous because it was white with dark manganese staining and was in a tabular horizon with an orientation of N75W dipping close to 20 degrees to the west. The bone-bearing bed was carefully excavated using rubber-tired equipment with blades. The concentration of bone diminished to zero to the southwest. The major concentration of bone was to the northeast and two small proboscidean tusks that belonged to a different mastodon were collected 100 feet to the northwest at an elevation of 740 feet. The following elements of the left forefoot of the mastodon were identified: left magnum, left trapezoid, left metacarpal II, partial left scaphoid and a fragment of metacarpal V. Other elements of this mastodon consisting of ribs, vertebrae and on a partial tibia were also recovered. (Figures 4 and 5)

4.3 OLDER ALLUVIUM (QAO, QC, QOA)

Older Alluvium is not mapped on either Jennings and Strand (1969) or Dibblee (1992) in this region of Moorpark on the Moorpark Anticline. Subsequent to the work by Pacific Materials Laboratory, Inc. (1997) in response to a seismic study of the Moorpark Highlands Parcel, they recognized three distinct deposits younger than the upper Saugus Formation in this region that they assigned these to the Older Alluvium. These units are sometimes incised into the underlying Saugus Formation requiring PML, Inc. to slightly revise the upper boundary between the Saugus Formation and the Older Alluvium. Pacific Materials Laboratory, Inc. (1997) recognizes three distinct deposits of Older Alluvium deposited overlying the upper Saugus Formation. All three units appear to conformably overlie the Saugus Formation. These three units are defined as: Qoal1, the oldest unit, Qoal2 second oldest unit, and the Qoal3 as the youngest unit. All three units were deposited on sediments of the upper Saugus Formation, though apparently not in direct superposition as paleosols of different color and development occur between Qoal1 and Qoal2 on the Saugus Formation indicating different intervals of time of exposure of the upper surface of the Saugus Formation prior to deposition of the overlying unit of Older Alluvium. Qoal3 closely resembles Qoal2 and appears to lies directly on this unit and exhibits evidence of the least amount of deformation as the formation of the Moorpark Anticline developed and subsequently has been incised and eroded resulting in the development alluvial fans and terrace surfaces.

PLM, Inc. (1997) utilizing structural data based on evidence generated from trench borings and well holes suggest that the age of the oldest deposit of Older Alluvium (Qaol1) is probably greater than 750,000 ka, Their estimate of the age of Qoal2 is less than 50,000ka and the Qoal3 at less than 11,000 ka. They estimate the thickness of the two older units of Older Alluvium to be between 90 and 120 feet. The age of the deposits of the upper Saugus Formation appear to greater the 750,000 years based upon the structural data of Pacific Materials Laboratory. This would be late Irvingtonian in age.

Vertebrate fossils have not been previously reported from deposits mapped as Older alluvium in this Moorpark region of Ventura County during earth moving activities. Some specimens of vertebrate fossils were observed in the deposits mapped as Older Alluvium on the Moorpark Highlands Project; however,

unfortunately on this project they were very poorly preserved unidentifiable fossil bone and not well enough preserved to allow for identification. An age determination on these deposits of Older Alluvium would have been nice as it would have provided an opportunity to possibly determine the interval of time missing between the disconformity between the Older Alluvium and the Saugus Formation at this location where one could visibly discriminate the two different units by their lithology.

ATTACHMENT A – MARINE MOLLUSCAN IDENTIFICATIONS AND REPORT BY N. SCOTT RUGH

Interpretation of Mollusk Species From Moorpark Highlands Project
Recovered From the Pico Formation

An analysis of the mollusk species found in the Moorpark Highlands Project, and their use in inferring the paleoenvironment is based on the assumption that all field numbers represent one single locality. For the most part this assumption should be sound. Mark Roeder informed me that the specimens generally came from the same fossil horizon. And in my examination of the specimens, I noted that the specimens were either preserved with a weathered original shell material, or as casts and molds in a mostly concreted tan-green, or brown, very fine-grained sandstone, or in occasional samples as a soft mudstone that I considered to be part of the same environment. Some of the specimens recovered however suggested a possibly somewhat different local depositional environment, these being the samples dominated by *Nutricola* sp. and *Amnicola* sp.

I consider the fossil material to be very significant for at least two reasons: 1.) The presence of a dominant *Macoma inquinata/Mya arenaria* bivalve fauna association that I have observed in two other formations, one in the San Jaoquin Formation at the Kettleman Hills, which is an Upper San Diego Formation equivalent (M. Roeder, pers. comm.), and in the Lower San Diego Formation, Tsd 2, from the Otay Ranch development in the city of Chula Vista in San Diego. And 2.) The observation of a specimen of *Littorina plena*, which may be a unique fossil record, and could have at least anectodal value in the study of the orgins of *Littorina* species in the eastern Pacific.

The two dominanat species, *Macoma inquinata* (701 specimens recovered) and *Mya arenaria* (64 specimens recovered), seems to indicate an enclosed bay, in the upestuary portion (farthest from the entrance to the ocean) where sediments are fine grained and water motion is greatly reduced. This is suggested by the observation of *Mya arenaria* in the San Francisco Bay today, where it has been introduced from the east coast of the U.S. This species is considered to have gone extinct at least several tens of thousand years ago. Records of *Mya* are known from the Miocene and the Pliocene, such as the rich fossil record in the *Mya* beds of the San Joaquin Formation. So living Mya in the San Francisco Bay are not considered to be a native species. However, there is a very similar native species found in the deep water off the Pacific Northwest. This species is *Mya truncata*, and resembles it's east coast relative, except that it is distinctly truncated at one end. The other species in the bivalve association is *Macoma inquinata*. The name of this species has reverted back to it's original name, as it was once changed to *Macoma irus* in recent decades. This species is also a calm water estuary species. I have observed specimens of *Macoma inquinata* washed up on beaches of the harbor behind the Half Moon Bay breakwater in northern California, along the sheltered shores of the eastern edge of Humboldt Bay, and from the Puget Sound. I have never seen this species south of Half Moon Bay, so it might be inferred that it's presence in the Pico Formation from the Moorpark Highlands project indicates a northern climate. However, I believe it was a southern climate, because of the presence of the southern species *Tagelus subteres*, and *Trachycardium quadrigenarium*. Also, where the *Macoma inquinata/Mya arenaria* association was observed in the older Lower San Diego Formation from the Otay Ranch project, the species *Macoma inquinata* (a "northern" species) was present with *Bulla gouldiana* (a southern species). So it would appear that the *Macoma inquinata* found in Moorpark Highlands, the Kettleman Hills, and at Otay Ranch were warm water ancestors of the now cold water *Macoma inquinata*.

The *Macoma* found at the Kettleman Hills are morphologically different than those found at Otay Ranch and Moorpark Highlands. While the last two are fairly similar to modern *Macoma inquinata*, those found at the Kettleman Hills are more rounded in a lateral view of the pair or valve, and the pairs are much less inflated from Kettleman Hills. These specimens are identified as *Macoma affinis* by Woodring, but I consider them to be a very close relative to *Macoma inquinata*. Since the San Joaquin Formation is considered to be relatively younger, then it may be a subspecies or species that diverged from the ancestral *M. inquinata*. Between the two dominant bivalve species, Macoma sp. and Mya arenaria, it is interesting to observe the relative dominance of each at each of the three locations where I have observed this association. At Kettleman Hills, the proportion of the two species seems to be nearly equal, or perhaps *Mya arenaria* is the dominant species. At the Moorpark Highlands and Otay Ranch locations it is the other way around. In both cases, *Macoma inquinata* is much more dominant, by a factor of about 5 in both cases. I believe that *Macoma inquinata* lives in a more aerated portion of the estuary, and that *Mya arenaria* would have become more dominate in more anoxic, muddy portions of the estuary, most likely to the exclusion of *Macoma inquinata*. I have not seen a modern example. One would have to find an estuary in the Pacific Northwest where introduced *Mya arenaria* occur together with native *Macoma inquinata*. I only have been able to observe that *Mya arenaria* is very common in some places along the muddy shores of the San Francisco Bay. This led me to hypothesize that the environment represented by the *Mya arenaria* beds was very much like the shores of the modern San Francisco Bay, and that perhaps there was a super bay in central California during the late Pliocene and early Pleistocene. When I observed the specimens from the Moorpark Highlands project, I thought it was possible that this was further evidence of this super bay, perhaps at a different point in time.

The much higher proportion of *Macoma inquinata* than *Mya arenaria* suggests to me that the marine paleoenvironment was nearer to an entrance of a bay. This is supported by the observation of such bivalve species as *Tracycardium quadrigenarium, Clinocardium* sp., *Macoma nasuta, Tagelus subteres*, and *Sanguinolaria nuttalli* (*Nutallia* sp. is a genus equivalent to *Sanguinolaria*), and gastropod species as *Olivella biplicata*, and *Nassarius* sp., which are all found in sandy, well aerated bays, especially near the entrance to the ocean. These species also occur beyond the surf in shallow water along sandy exposed shores. This leads me to modify my hypothesis about the super bay in the lowlands of central California. My assumption was that the bay would have been like the San Francisco Bay, with an entrance near the Golden Gate. But with the presence of the sandy bay and beach species mentioned above, this is not very likely. There would have had to have been an entrance to the super bay near the area of the construction site at Moorpark Highlands.

Finally, additional information is provided by the presence of an adult-sized specimen of *Littorina* I identified as *Littorina plena* (Rugh, 1997). The specimen is characterized by a distinct ridge near the base of the specimen, which is a distinct characteristic of *Littorina plena*. In my Master's Thesis research, I discovered that *Littorina plena* are most common and reach their greatest size within the sheltered waters of bays, especially in the upper estuary where the water is calmest, and often where a source of fresh water, such as a river or creek enters the bay. This observation fits in well with the environment suggested by the bivalve species discussed above. I observed *Littorina plena* in dozens of California bays during research for my thesis, and the largest specimens were always in the back parts of bays, like the specimen I observed in the collection from the Moorpark Highlands Project. I have also observed Littorina from the Lower

San Diego Formation from several project sites in the area of south San Diego Bay. These specimens are generally referred to as *Littorina mariana*. These Littorina, resemble *Littorina scutulata*, the sibling species of *Littorina plena*, except that they often have an umbilicus, a feature that is completely lacking in *Littorina* species all around the world today. Only the sister taxa, *Lacuana* species have an umbilicus. But the lower San Diego species are definitely *Littorina*. Because the *Littorina* species from the Lower San Diego Formation seems to be a primitive species, I believe that it is much older than the *Littorina* I identified from the Moorpark Highlands project. And because the specimen I studied from this project resembles a modern *Littorina plena*, I believe the fossil material from this site must be much more recent than that of the Lower San Diego Formation. I assume the age to be latest Pliocene or early Pliestocene. The recovery of a fragment of *Pecten bellus* in one of the field sites from the overlaying Saugas Formation gives some support to this approximated age. The age of rocks in which Pecten bellus have been found are late Pliocene or early Pleistocene.

Two other mollusk species were so abundant that their presence in the project area must be addressed. These species are *Nutricola* sp. and *Amnicola longinqua* and were obtained from friable sediments. However, neither of these species would appear to have lived in the primary marine paleoenvironment indicated by the other species. The *Nutricola* sp. are a small clam that are very common in deeper water (100 feet or greater), and may not have occurred in the area of the *Macoma inquinata/Mya arenaria* beds. However, they may have occurred in the deeper channel waters of the entrance to the bay. This suggests that the material containing the *Nutricola* may have occurred in a slightly different fossil horizon. The other abundant mollusk is an opposite kind of environmental indicator. The hydobid snail *Amnicola longiqua* would have most likely occured in a brackish water environment, similar to the Tulare Formation found at Kettleman Hills. Again, it does not seem that the material containing this species was part of the environment suggested by most of the other species, found in a mostly concreted material. These other species, prominent in the fossil material I examined, suggest an area in between the entrance of an enclosed estuary, and probably not immediately near a place where a fresh water creek or river entered. For this reason, I also suspect that these abundant small snails could have come from a different fossil layer.

To summarize, the environment suggested by the species of mollusks I examined in mostly concreted sediment was most likely in shallow water, no deeper than 50 to 100 feet, where the water was calm, and near the upper, or inner-most portion of an estuary, but probably not extremely close to where a source of fresh water entered this estuary, as suggested by the relatively low proportion of *Mya arenaria*. This estuary may have been part of a super bay that occurred throughout much of what is now the Central Valley of California. However, the entrance to this super bay was not necessarily limited to the present day Golden Gate, because a number of sandy shore bivalve and gastropod species occurred in the fossil material recovered from the Moorpark Highlands Project, which would not have occurred if there was not a direct connection to the ocean in the area.

RESULTS

1. MJB 041505-1 (Box 4)

Age:	Pliocene to Pleistocene. Pico Formation
Environment:	Marginal Marine to Inner Neritic.
Washed Lithology:	Light brown mudstone.
Fossils:	*Cribroelphidium incertum* (C), *C.* cf. *hughesi* (A), *Nonion (Pseudononion) auriculum* (R), ostracods (A) and shells (A).

2. MJB 041505-1 (Box 3)
Green Bed C-1

Age:	Pliocene to Pleistocene. Pico Formation
Environment:	Marginal Marine to Inner Neritic.
Fossils:	*Cribroelphidium incertum* (Fl), *C.* spp. (R), *Nonion (Pseudononion) auriculum* (R), ostracods (VA) and shells (FT).
Washed Lithology:	No lithology.

Summary

Both samples contain essentially the same fossils: *Cribroelphidium incertum*, *C.* cf. *hughesi*, rare *Nonion (Pseudononion) auriculum*, plus shells and ostracods. This assemblage is not very age indicative other than to say Pliocene to Pleistocene. Typically, shallow water Pico strata are assigned to the Hallian Stage, which is generally placed in the later part of the Pleistocene. However, the Hallian is very poorly constrained and may not be a very reliable zone.

The depositional environment is marginal marine to inner neritic. Water depth was certainly less than 200 feet and may well have been less than 50 feet. The assemblages do not reflect either marsh conditions or a high energy setting. A protected bay/estuary system might best describe the paleoenvironment.

Re: Analysis of Ostracodes from MJB-041505-1, Chambers Group Job #5448

As per your request, I have examined the two ostracode assemblages (A and B) that you forwarded to me and found that they consist of the following:

Ostracode Species	A (1-3)	B (4)
Cyprideis beaconensis (LeRoy, 1943)	few	common
Cythere maia (Benson, 1959)	very rare	none
Cytheromorpha sp.	very rare	none
Perissoscytheridae sp.	rare	few
Potamocypris smaragdina (Vávra, 1891)	very rare	none
Puriana horrida (Benson & Kaesler, 1963)	rare	few
Xestoleberis cf. *X. hopkinsi* (Skogsberg, 1950)	few	common

In contrast to assemblage A, Assemblage B is richer in numbers and include single specimens of three very rare species.

The ostracode genera present suggest a polyhaline (18-30‰) environment:

Genus	Salinity Tolerance
Cyprideis	meso- to polyhaline, some hyperhaline
Cythere	mesohaline to normal marine
Cytheromorpha	mesohaline to littoral
Perissoscytheridae	meso- to polyhaline
Potamocypris	mostly freshwater, some mesohaline
Puriana	polyhaline to marine
Xestoleberis	polyhaline to littoral, some hyperhaline

The associated forams, mostly *Cribroelphidium* but with some *Pseudononion*, clearly indicate that the polyhaline conditions were due to a marine influence rather than desiccation of a freshwater lake. The apparent lack of size-sorting is due to the absence of strong currents or wave action, and the predominance of complete carapaces in Assemblage B suggests its rapid burial. These brackish-water microfossil associations inhabited a low-energy environment, such as a semi-restricted coastal lagoon. The genus *Cythere* indicates an age not older than Pliocene.

ATTACHMENT D – NATURAL HISTORY MUSEUM OF LOS ANGELES COUNTY REQUIREMENTS FOR ACCEPTANCE OF THE PARDEE HOMES MOORPARK HIGHLANDS PROJECT PALEONTOLOGIC RESOURCE IMPACT MITIGATION PROGRAM VERTEBRATE FOSSILS

Conditions to be included in any LACM Vertebrate Paleontology Curation Agreement

All localities must be described according the standard format used on the LACM-VP locality form, including a description of the geographic position, lithology, stratigraphy, and depositional environment if known.

All localities must be plotted on standard USGS topographic maps.

All specimens must be fully stabilized and prepared.

All specimens must be designated in such a way as to directly tie them to the localities described above.

All specimens must be identified to the lowest taxonomic level possible.

The collection must be accompanied by copies of any field notes and mitigation or salvage reports.

The collection must be accompanied by a deed-of-gift or letter of transmittal giving free and clear title of the collection to the Natural History Museum of Los Angeles County.

The collection must be accompanied by specimen cabinets, drawers and trays similar to those used by the LACM-VP.

The collection must be accompanied by a curation fee at $10 per locality and $4 per specimen.

The collection must be accompanied by a permanent storage and maintenance fee at a rate of $150 per cubic foot of fully prepared vertebrate fossils.

Subject: invertebrate fossil collections
Re: Pardee Homes, Moorpark Highlands, Tract 5045, City of Moorpark, Ventura Co., CA

Dear Mark,

The conditions pertaining to acceptance of the invertebrate fossil collections are presented in the enclosed document. Although an estimate of the amount of storage space required to house the material can be calculated from the tray dimensions given below, the final total storage volume will not be known with certainty until after the specimens have been put into archival-grade containers, arranged in the trays, and placed in the cabinet.

Best regards,
Harry Filkorn

Collections of Invertebrate Fossils resulting from Monitoring of Paleontologic Resources at Construction Sites and Other Excavations

The Natural History Museum of Los Angeles County, Department of Invertebrate Paleontology (LACMIP) agrees to function as a repository for collections of invertebrate fossils made during monitoring of paleontologic resources at construction sites and other excavations, provided that the collection and related data meet the criteria stated herein. Collections will be assessed a storage and maintenance fee of $150.00 per tray space (23.25" x 29.75" x 1.75"h) in a Lane-style museum storage cabinet, in single-spaced configuration. Any labor involved with the curation of the specimens, including re-housing, data entry, labeling, and integration of the specimens into the main collections, will be billed at a rate of $80.00 per hour.

The LACMIP will make every effort to accommodate new collections of invertebrate fossils, but LACMIP also reserves the right to limit the size and number of specimens in incoming collections, particularly in cases when they are perceived to be unnecessarily large or excessively redundant.

A completed Deed of Gift to the Natural History Museum of Los Angeles County, signed by the legal owner of the property or their assigned agent, herein called the Donor, must accompany each incoming collection of invertebrate fossils.

It is essential that the Donor (or their assigned agents) use LACMIP locality numbers and provide accurate and complete locality coordinates and descriptions, maps, and other relevant locality data (see below) for each collection of invertebrate fossils to be placed in the LACMIP collections.

Specimens must be taxonomically classified and identified to the lowest level possible, relatively clean, prepared if necessary, trimmed of excess rock, and individually labeled with the correct LACMIP locality number (see below). Specimens that are too small to be individually labeled must be placed in an appropriate archival-grade container (e.g., vial) that is clearly labeled with the LACMIP locality number. The Donor is responsible for ensuring that new collections are securely packaged and safely delivered to the LACMIP research and collections facility.

All locality and specimen data must be entered in the LACMIP collections database.

The LACMIP Locality data fields and descriptions of their contents are as follows:

LACMIP locality number:
LACMIP locality numbers are assigned to fossil collecting localities by the Collections Manager. Every fossil locality collecting event that is curated in the LACMIP collections is assigned a unique LACMIP number. Note that each specimen curated in the LACMIP collections must be affixed with an archival-grade label that bears its LACMIP locality number. The locality number is to be placed on the specimen by either: 1) using an archival-grade adhesive (e.g., Jade R) to attach a small piece (about 3-4 mm by 10-12 mm) of archival-grade paper that has been pre-printed with the LACMIP locality number; or 2) painting a small, clean area (about 3-4 mm by 10-12 mm) on the specimen with white paint (e.g., automotive touch-up paint works well; however, do not use white-out) and then using a fine-tipped pen with permanent ink (e.g., rapidograph with drawing ink) to hand write the LACMIP locality number on the painted area.

Summary:
The Summary is a very brief, concise description of the geographic position of the collecting locality and ideally it includes any common or popular name used for the area (e.g., Bone bed on Shark Tooth Hill, Kern County, California).

Geography:
The city (or nearest city), county, state, and country of the collecting locality.

Age:
The geologic age of the rocks which yielded the fossils, as placed within the framework of the ages delineated on the geologic time scale of the Geological Society of America (1999). The stated age must be determined and constrained as precisely as possible (e.g., early Steptoean to late Sunwaptan).

Rock unit:
The stratigraphic horizon of the fossil collecting locality, specifically including the member, formation, and group of the fossil bearing unit. Additional information on the precise position of the stratigraphic horizon of the locality (e.g., its height above a particular horizon in a measured section; its relation to a key marker bed; any description of its position in a section; etc.) must be included in the database field provided for the full description of the locality (see below).

Collector:
The name of the fossil collector.

Collection date:
The date the specimens were collected. Only one collection date is entered for each locality.

Collector's field number:
The locality number assigned by the Collector in the field.

Accession number:
A Museum number will be assigned by the Museum Registrar to each incoming collection of fossils that will be accessioned by the Museum.

Other institution number:
Any other locality numbers assigned to the fossil locality by any other institution(s) (e.g., CIT locality 1234).

Position:
The geographic position of a fossil locality is plotted by using at least one, but preferably two, sets of coordinates: 1) latitude and longitude, and 2) township and range.
Latitude and longitude must be determined in degrees, minutes, and seconds, and preferably taken by a modern GPS unit. Alternatively, these coordinates also may be taken from a topographic map grid, provided the name and year or edition of the map also are given.
Section, Township and Range, if the area has been surveyed on the 7.5 minute topographic map, must be determined to the nearest quarter quarter section (e.g., SW 1/4, SW 1/4, section 5, T8S, R35E).

Map citation:
The name, scale, year of publication, and year of edition or photorevision of any map (topographic, geologic, forestry service, etc.) used to plot the position of a fossil locality must be provided along with the above data. This category also must include bibliographic references that contain specific information or maps (e.g., journal articles, field guidebooks, etc.) that were used to plot the position of a fossil locality. Copies, or scanned or digital images, of relevant areas of USGS topographic maps showing the positions of collecting localities must be provided with the locality data.

Description of fossil locality:
This field accommodates any additional information and details that pertain to the fossil collecting locality. This information may include specific details about the position of the fossil

locality (e.g., on south hill side; along ridge crest; in drainage, etc.), the occurrence of fossils at the locality, a list of the taxa collected and their abundance, and comments about the lithology, stratigraphy, geologic structure, diagenesis, taphonomy, and any other significant information.

The information contained in this document is subject to review and revision by the Department of Invertebrate Paleontology and supervising personnel.

Common Name: forams, ostracods, clams, and snails, bony fish, shark	**Class:** Sarcodina, Ostracoda, Bivalvia, Gastropoda, Pisces, Chondrichthyes

Identified By (Affiliation): N. Scott Rugh, San Diego Natural History Museum, Lindsay Groves, Natural History Museum of Los Angeles County, Micro Paleo Consultants, Inc., Mark Roeder, Chambers Group, Inc. (CGI).

Reference:

Remarks: According to Christina Mohos of Geo Labs-Westlake in conversation with Hugh Wagner (2-06-2006), there were two fossil mollusk-bearing horizons roughly ten feet stratigraphically apart that were on the limb of an anticline and the fossil sites climbed in elevation as earthmoving moved to the west on Spring Road. Friable matrix recovered from the preparation of marine invertebrates was water screened by CGI staff through fine mesh sieves to recover foraminifera, ostracods, micro mollusks, fish, and shark. Foraminifera and ostracods submitted to Micropaleo Consultants, Inc for analysis. The field data provided by APRMI was not exact. CGI replotted the locality location based on the elevations and descriptions in M. Jean Black's notes.

Remarks: According to Christina Mohos of Geo Labs-Westlake in conversation with Hugh Wagner (2-06-2006), there were two fossil mollusk-bearing horizons roughly ten feet stratigraphically apart that were on the limb of an anticline and the fossil sites climbed in elevation as earthmoving moved to the west on Spring Road. The field data provided by APRMI was not exact. CGI replotted the locality location based on the elevations and descriptions in M. Jean Black's notes.

Simi Valley

A Journey Through Time

Historical Text by Patricia Havens

Photographs Compiled and Edited by Bill Appleton

Published by the Simi Valley Historical Society and Museum
1997

California Institute of Technology (CIT) fossil site 150 in upper middle member of Sespe Formation. Site existed in area now occupied by Waste Management of California, Inc., Simi Valley Landfill and Recycling Center. Quarry excavated at site yielded diverse late middle Eocene (early Duchesnean North American Land Mammal Age) Pearson Ranch Local Fauna, which includes large semi-aquatic rhinoceros Amynodontopsis bodei (see Figure 7) and large primitive hyena-like carnivore (creodont) Hyaenodon vetus (see Figure 6). From CIT files at LACM.

Chapter Ten

Geology and Vertebrate Paleontology of Cenozoic Nonmarine Rock Units in Simi Valley

E. Bruce Lander, Ph.D

Four nonmarine sedimentary rock units present in Simi Valley have yielded the fossilized remains of extinct continental vertebrates, including land mammals, from the Cenozoic Era (Age of Mammals). These rock units, in order of decreasing age, include the Sespe and Saugus Formations and the older and younger alluvium, all of which are composed of sediments deposited on land by rivers and streams during floods. Emergence of the Simi Valley area above sea level during the Cenozoic primarily reflects regional uplift of the area resulting from interaction of the western edge of the North American continental plate with the eastern edges of the crustal plates underlying the floor of the Pacific Ocean, and to a lesser extent, development of polar ice caps and a corresponding global fall in sea level.

The Sespe Formation, approximately 42.5 to 28.0 million years in age (early middle Eocene to late Oligocene Epochs), is the oldest rock unit in Simi Valley to contain the remains of land mammals. The sediments comprising the Sespe Formation were deposited by streams flowing in a southerly direction from the Mojave Desert following a period of submergence beneath the Pacific Ocean that lasted at least 6 million years. The Sespe Formation represents a period of emergence about 14.5 million years in duration. During this interval, the Pacific Ocean gradually withdrew southward over a period approximately 14.35 million years, during which the sea level reached its lowest level recorded during the entire Cenozoic, but returned to the Simi Valley in only 300,000 years as the area rapidly subsided below sea level. Fossil remains from the Sespe Formation in and near Simi Valley represent approximately 120 species of vertebrates, including fish, frogs, turtles, crocodiles, lizards, snakes, and birds, as well as a numerous primitive species of land mammals, including opossums, shrews, hedgehogs, bats, primates, squirrels, gophers, mice, rabbits, dogs, cats, saber-toothed cats, horses, rhinoceroses, camels, and other less familiar forms.

During deposition of the sediments comprising the Sespe Formation, the subtropical woodlands and climate of the middle Eocene gave way to the semi-arid grasslands and cooler, dryer, and more seasonal (temperate) climate of the Oligocene, this transition reflecting the northward drift of the North American plate from a tropical climatic zone into a more temperate one. Following deposition of the sediments comprising the Sespe Formation, interaction of the western edge of the North American plate and the eastern edge of the Pacific plate and the resulting offset along the San Andreas and San Gabriel Faults moved the Simi Valley area approximately 190 miles in a northwesterly direction to its present location from an area now occupied by northern Baja California, and to undergo 90 degrees of clockwise rotation.

The Saugus Formation, which overlies the Sespe Formation, represents the final withdrawal of the Pacific Ocean from the Simi Valley area after more than 26 million years of submergence. The geologic activity that resulted in emergence of the area is responsible for the earthquake activity being experienced today in coastal southern California. In Simi Valley, the base of the Saugus Formation is less than 1.9 million years in age (early Pleistocene Epoch). Near Simi Valley, the top of the formation has been determined to be 400,000 years (middle Pleistocene) in age. The Saugus Formation has yielded only fragmentary remains of an extinct Pleistocene (Ice Age) horse in Simi Valley, but has yielded the remains of numerous Pliocene and Pleistocene land mammal species near Simi Valley.

The older alluvium, which overlies the Saugus Formation, has yielded the remains of large extinct Pleistocene land mammal species in Simi Valley, including Harlan's ground sloth, which emigrated from South America, two species of horse, and imperial mammoth, whose immediate ancestor emigrated from Asia. Ground sloths and mammoths entered North America during the Pliocene, when glaciers in the Northern Hemisphere periodically had grown sufficiently large to cause falls in sea level (roughly 400 feet) great enough to expose the Panamanian and Bering land bridges. Available data suggest the older alluvium is 400,000 to 280,000 years and middle Pleistocene in age.

The older alluvium is overlain by the younger alluvium, which has yielded no fossil remains in Simi Valley. However, areas underlain by the younger alluvium has yielded the remains of large extinct Pleistocene land mammal species at a number of fossil sites near Simi Valley. The occurrence of bison remains at some of these sites indicates the younger alluvium is partly middle to late Pleistocene and 280,000 to 10,000 years in age. In Simi Valley, the younger alluvium, of modern age and less than 10,000 years old (Holocene Epoch) at and near the surface, could be old enough at depth to contain the remains of similar land mammal species.

The end of the Pleistocene, which occurred about 10,000 years ago, is marked by the extinction of most larger land mammal species of the world as the result of overkill by early man and/or severe climatic changes (particularly increasing seasonality and drought) and the accompanying alterations of habitat and vegetation that lead to modern conditions. Modern climates of the Northern Hemisphere may only represent a brief interglacial period.

Introduction

The geologic and associated paleontologic (fossil) records of Simi Valley,

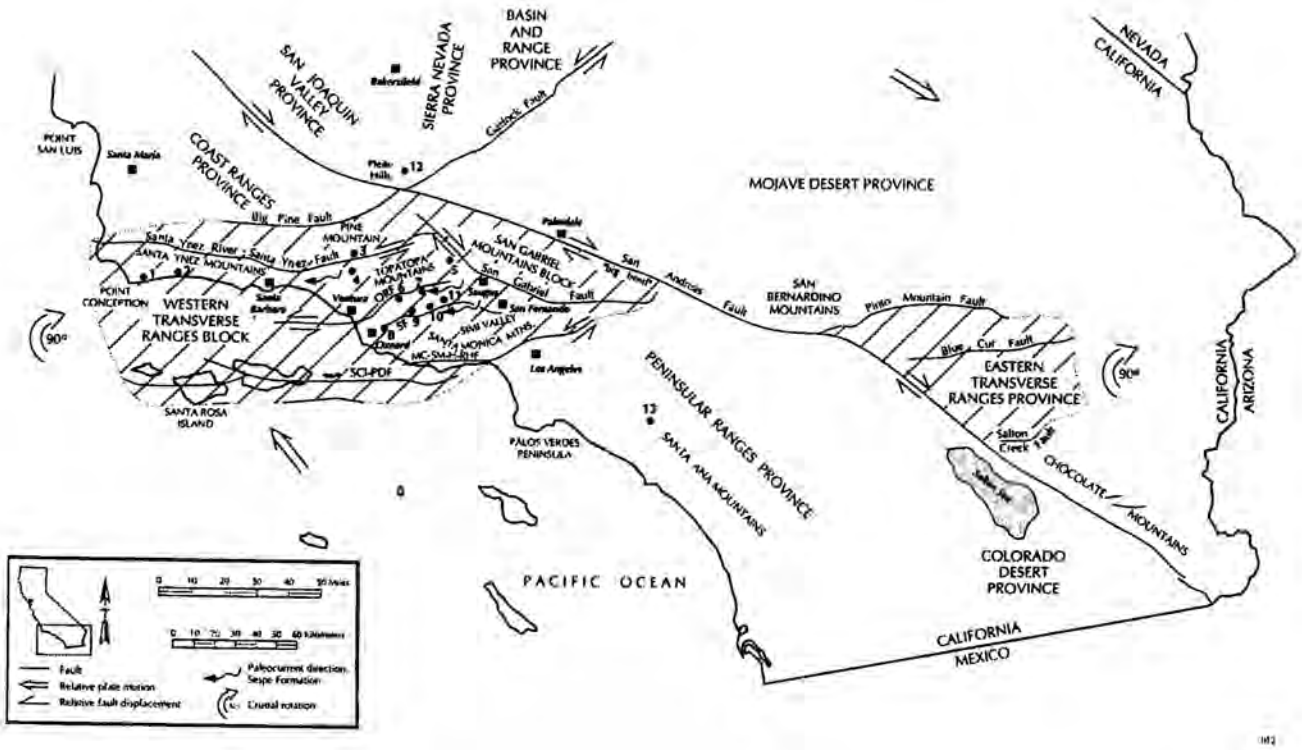

Figure 1. Simplified fault map of southern California. After Jennings (1992). Most faults not shown. Provinces and blocks after Luyendyk and others (1980, 1985) and Whidden and others (1994). MC-SM-H-RHF: Malibu Coast-Santa Monica-Hollywood-Raymond Hill Fault; ORF: Oak Ridge Fault; SCI-PDF: Santa Cruz Island-Point Dume Fault; SF: Simi Fault; 1, Point Conception (Canada del Cementerio); 2, Canada de la Gaviota Local Fauna, Gaviota Pass; 3, Hartman Ranch Local Fauna, southern Pine Mountain; 4, unnamed local fauna, western Nordhoff Ridge; 5, Canton Canyon; 6, South Mountain Local Fauna, South Mountain; 7, Shiells Canyon Local Fauna, Oak Ridge; 8, unnamed local fauna, oil well between Oxnard and Camarillo; 9, Kew Quarry Local Fauna, Las Posas Hills; 10, unnamed local fauna, Little Simi Valley; 11, unnamed local fauna, Tapo Canyon, Brea Canyon, Strathearn, Pearson Ranch, Simi Valley Landfill, and Alamos Canyon Local Faunas, Simi Valley; 12, Tecuya Canyon Local Fauna, southern San Joaquin Valley; 13, Bolero Lookout and Santiago Canyon Landfill Local Faunas, northern Santa Ana Mountains.

California, particularly with regard to the deposition of marine versus nonmarine sediments forming the sedimentary rock layers (strata) underlying Simi Valley and the accompanying preservation of the fossilized remains of the particular kinds of animals found in these strata, reflect major vertical shifts of the earth's crust in the Simi Valley area relative to sea level. These shifts were the result primarily of plate tectonic (structural) activity related to sea floor spreading and subduction, and, to a lesser degree, of global sea level (glacio-eustatic) fluctuations resulting from variations in development of the Arctic and Antarctic ice caps (see below).

Simi Valley lies in the western portion of the western Transverse Ranges Province, which is situated along the southern California portion of the North American plate margin (eastern portion of province restricted to San Gabriel Mountains area). The southern and central California continental margin is bounded to the northeast by the San Andreas Fault. In the western Transverse Ranges Province, most linear features, including mountain ranges, the intervening valleys, and underlying major geologic structures (faults, folds) are oriented in an east-west direction (Figure 1; in adjacent geographic provinces, most features oriented in northwest-southeast direction). The western portion of this geographic province (western Transverse Ranges block) is a crustal block bounded on the north and south by east-west-trending left-lateral-displacement faults (Big Pine and Malibu Coast-Santa Monica-Hollywood-Raymond Hill Faults, respectively; other east-west-trending faults cross block) and on the east by the northwest-southeast-trending right-lateral-displacement San Gabriel Fault (Hornafius, 1985; Kamerling and Luyendyk, 1979; Luyendyk and others, 1980, 1985; Whidden and others, 1994), which is a branch of the San Andreas Fault farther to the northeast, and the San Gabriel Mountains Block. The east-west-trending faults extend offshore and delineate the block on the continental shelf to the west. Presumably, the eastern continuations of these latter faults bound or cross the eastern Transverse Ranges Province, which was once continuous with the western Transverse Ranges Province and block, but has since been shifted gradually to the southeast by offset along the right-lateral-displacement San Gabriel and San Andreas Faults and now is located near the Salton Sea (Luyendyk and others, 1980). Simi Valley lies near the eastern end of a smaller elongate fault-bounded crustal block or segment forming the southern portion of the western Transverse Ranges block. The segment is bounded to the north by the east-west-trending Oak Ridge Fault, which forms the break in slope between the foot of Oak Ridge and the floor of the Santa Clara River valley to the north and exhibits geologic evidence indicating past left-lateral displacement (Kamerling and Luyendyk, 1979). The Simi Fault, which forms the break in slope between the floor of Simi Valley and the foot of Big Mountain to the north (see Dibblee, 1992a, -b; Squires, 1983, this volume), was thought to represent a similar boundary by Luyendyk and others (1980), but lacks evidence of left-lateral offset (Hanson, 1983).

Simi Valley is underlain by a thick succession of strata forming the sedimentary rock units (formations) that, along with the intervening lava flows, record the geologic and paleontologic histories of the area. This sequence of rock units ranges in age from late Cretaceous (roughly 80 million to 70 mil-

lion years) at the base to Holocene (10,000 to 0 years) at the top of the sequence (see Dibblee, 1992a, -b; Squires, this volume; Squires and Filewicz, 1983). Nonmarine rock units in the succession represent periods during which the Simi Valley area was above sea level. Of the nonmarine sedimentary rock units, only the Sespe and Saugus Formations and the older alluvium of Cenozoic age (Figure 2) have yielded fossilized land mammal remains in Simi Valley, although the younger alluvium has yielded land mammal remains near Simi Valley. A study of these remains, primarily skulls, jaws, and teeth, has been critical in determining the ages of the strata that contained them, documenting the nonmarine origin of the sediments comprising these strata, reconstructing the climate and environment that existed at the time, and in estimating the timing of the geologic events (rise and fall of sea level; subsidence and uplift) that lead to the deposition of the particular types of sediments comprising the strata and to their subsequent erosion, respectively, and to the eventual deformation (folding) and displacement (faulting) of the strata and the rock units they comprise.

This chapter, which details the geology and paleontology of the nonmarine fossil-bearing rock units in Simi Valley, substantially updates environmental review documents covering the paleontologic resources of Simi Valley (Lander, 1986, 1988b) and complements the chapter by Dr. Richard L. Squires (this volume), whose contribution covers the geology and paleontology of the entire sequence of rock units in Simi Valley, but emphasizes the marine rock units. Geologic mapping of Simi Valley is provided by Dibblee (1992a, -b), Squires (1983, this volume), and Weber and others (1973). The North American land mammal ages cited in this report and presented in Figure 2 (in order of decreasing age, Uintan, Duchesnean, Chadronian, Orellan, Whitneyan, Arikareean, Hemingfordian, and Blancan Land Mammal Ages of Wood and others, 1941; Irvingtonian and Rancholabrean Land Mammal Ages of Savage, 1951) are based on distinctive, temporally restricted associations of particular land mammal species (see Emry and others, 1987; Kelly, 1990; Kelly and Whistler, 1994; Krishtalka and others, 1987; Lucas, 1992; Lundelius and others, 1987; Tedford and others, 1987; Woodburne, 1987). Determination of the geologic ages (in years) of the land mammal age boundaries, and correlation of the land mammal ages with the Eocene, Oligocene, Miocene, Pliocene, and Pleistocene Epochs are presented in Figure 2 and based on the geologic time scales and correlations provided by Emry and others (1987), Krishtalka and others (1987), Lander (1994a), Lundelius and others (1987), Prothero and Swisher (1992), Prothero and others (in press), Tedford and others (1987), and Woodburne (1987). These time scales and correlations, in turn, primarily are based on radiometric (including fission-track and radioisotopic [potassium-argon, argon-argon]) age determinations for volcanic ash layers or lava flows interbedded with fossiliferous (particularly mammal-bearing) strata, radioisotopic (carbon-14) age determinations on fossil remains, or on paleomagnetic polarity data reflecting reversals of the earth's magnetic field recorded by the strata. Radiometric age determinations, in turn, are based on the predictable decay rate of particular radioactive isotopes that were incorporated into once-living bone or into the minerals that crystallized when a volcanic rock cooled and solidified, thereby trapping the stable decay products (see Prothero, 1994). Paleomagnetic polarity data are based on the orientations of magnetic mineral grains in the sediments deposited during a particular interval. All magnetic mineral grains deposited during a particular paleomagnetic polarity zone (chron) would have pointed to one of the Earth's two magnetic poles, while grains deposited during the adjacent chrons would have pointed toward the opposite pole (see Prothero, 1994). Absolute geologic ages (ages in years) of the chron boundaries are presented in Figure 2 and follow Cande and Kent (1992).

Sespe Formation

The Sespe Formation, which overlies the marine Llajas Formation and underlies the marine Vaqueros Formation in Simi Valley (Figure 1, site 11), is composed of nonmarine sediments deposited during a 14.65-million-year period of emergence beginning roughly 42.6 million years ago (early middle Eocene) and ending approximately 27.95 million years ago (late Oligocene) (Figure 2; Howard, 1988, 1989; Lander, 1983, 1994a; D.R. Prothero, unpublished data; Prothero and others, 1992a, -b, in press; Squires, this volume; see below). The Sespe Formation is the oldest rock unit to have yielded land mammal remains in the western Transverse Ranges block.

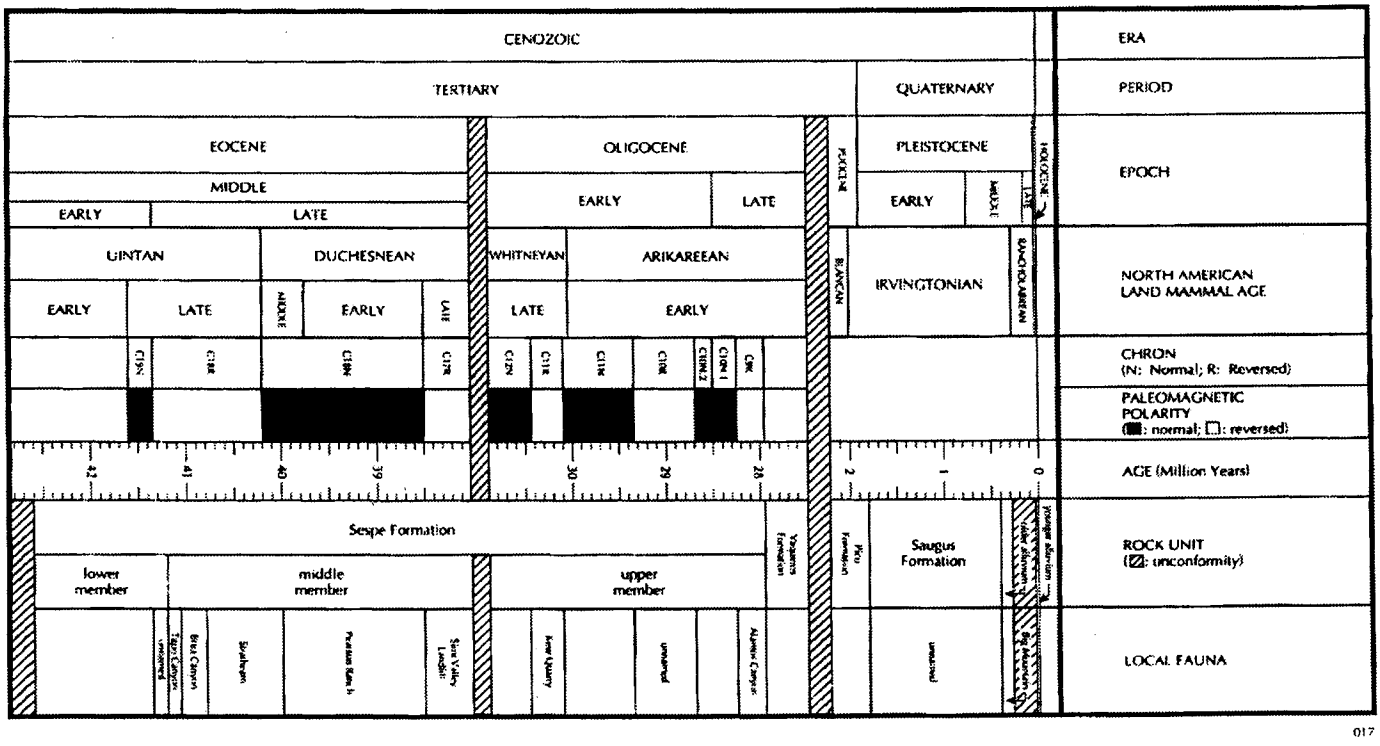

Figure 2. Land mammal local faunas, paleomagnetic polarity zonation, and ages, nonmarine rock units, Simi Valley and vicinity, California. Paleomagnetic polarity zonation modified slightly from Prothero and others (in press). Sespe Formation after Lander (1994).

The Sespe Formation, up to 5,575 feet thick in Simi Valley, consists almost entirely of river (fluvial) flood deposits laid down in river channels and on the adjacent floodplains (Howard, 1988, 1989; Prothero and others, 1992a, -b, in press; Squires, this volume; Taylor, 1983). Although sedimentologic (paleocurrent) data (orientation of water-laid cobbles, indicating direction of current depositing sediments comprising a flood deposit) suggest these rivers flowed in a westerly direction from a mountainous source area to the east, paleomagnetic polarity data suggest the western Transverse Ranges block has been rotated approximately 90 degrees in a clockwise direction since deposition of the sediments comprising the Sespe Formation, and that the rivers actually flowed in a more southerly direction from a source area to the north during the Tertiary (Figure 3; Howard, 1988, 1989; Lander, 1994a; Mason, 1988; Prothero and others, 1992a, -b, in press; Taylor, 1983). Mineralogical compositions of cobbles in Sespe Formation conglomerates indicate the source for the cobbles in all but the uppermost part of the formation is east of Simi Valley and northeast (on opposite side) of the San Andreas Fault in the Mojave Desert (possibly even in southwestern Arizona) (Howard, 1988, 1989; Prothero and others, in press), which once lay north of the Simi Valley area (Figure 3).

The Sespe Formation in Simi Valley is divided into three superposed members (lower, middle, upper) (Figure 2; Prothero and others, in press; Taylor, 1983). With the exception of the upper third (720 feet) of the upper member, the formation represents a major marine regression, during which the Pacific Ocean gradually withdrew from the southern California portion (including western Transverse Ranges block) of the North American plate margin (Golz and Lillegraven, 1977; Howard, 1988, 1989; Lander, 1983, 1994a). Sediment-laden rivers and streams flowed into (and parallel to long axis of) a depositional (fore-arc) basin that lay along and parallel to the edge of the continental margin (Howard, 1988) and immediately landward of the oceanic trench (North American Trench or subduction zone) that once lay just beyond and parallel to the edge of the margin (Figures 3, 4). As the basin slowly filled with sediments, the coastal plain built progressively outward into the basin, causing the Pacific coastline to gradually retreat (regress) westward (southward after correcting for approximately 90 degrees of clockwise crustal rotation; see below) (Howard, 1988; Lander, 1994a; Taylor, 1983). Restoring for crustal rotation and offset along the San Andreas Fault and related northeast-southwest-trending right-lateral-displacement faults, it is presumed rivers and streams once carried sediments southward from the Mojave Desert, across the San Gabriel Mountains, which had not yet been uplifted, and into the fore-arc basin, which included the area now recognized as the western Transverse Ranges block (Figures 3, 4; Hornafius, 1985; Howard, 1988, 1989; Luyendyk and others, 1980, 1985).

Lower Member

The lower member of the Sespe Formation, approximately 42.6 million years old at its base (see below), is separated from the underlying marine Llajas Formation by an erosional surface (unconformity), which reflects withdrawal of the Pacific Ocean from the Simi Valley area after more than 6 million years of submergence, and, in Simi Valley, subsequent erosion and removal of the uppermost part of the Llajas Formation (and any sediments deposited between Llajas and Sespe Formations) prior to deposition of the sediments comprising the Sespe Formation (Figure 2; Squires, this volume; Taylor, 1983). The nonmarine lowermost part of the Llajas Formation is presumed to be at least 48.95 million years old (end of Chron C22N) on the basis of marine microfossil assemblages from the middle part of the formation (see Almgren and others, 1988; Cande and Kent, 1992; Filewicz and Hill, 1983; Haq and others, 1987). The uppermost part of the Llajas Formation is presumed to be older than 46.3 million years in age (end of Chron C21N) on the basis of marine microfossil assemblages (see Almgren and others, 1988; Cande and Kent, 1992; Filewicz and Hill, 1983; Haq and others, 1987), the unconformity separating the lower member from the Llajas Formation probably representing a gap in the rock record spanning roughly 3 million to 4 million years and part of the early middle Eocene. Emergence of the Simi Valley area probably reflects uplift of the region above sea level rather than a global (eustatic) fall in sea level. Uplift, in turn, probably resulted from a change in the rate of convergence of the California continental margin and the leading (subducting) eastern edge of the oceanic (Farallon) plate underlying the adjacent floor of the Pacific Ocean (Figures 3, 4).

The sediments comprising the lower member were laid down as thick layers of sand and gravel during flash floods by braided rivers, whose channels migrated laterally within a broad river bed that extended down a comparatively steep gradient from the nearby mountains, these deposits reflecting continued uplift (relative to Simi Valley area) and erosion of the mountainous source area (Figure 4; Howard, 1988; Squires, this volume; Taylor, 1983). The composition of some gravel cobbles indicates a source area in the Mojave Desert (Howard, 1988, 1989). The gravel comprising the conglomerate beds (layers) at the base of the member in Tapo Canyon shows evidence of wave action, and, along with the presence of burrows in the conglomerate, suggests the gravel is partly marine in origin and was deposited at the mouths of rivers or along the adjacent coastal beaches (Figure 3, sites 11, A; Howard, 1988). As deposition continued, the Pacific coastline gradually receded westward (uncorrected for crustal rotation) from the Simi Valley, indicating the beginning of a major marine regression as the Pacific Ocean withdrew from the fore-arc basin. The sand and gravel layers of the lower member form the thick beds of brown sandstone and conglomerate, respectively, exposed north of the Simi Valley Freeway, each sandstone or conglomerate bed representing the coarser-grained sediments that, because of their larger particles, were deposited first, during the initial active phase of a major flash flood (see Taylor, 1983). Each sandstone or conglomerate bed often is overlain by a thin red or green claystone or mudstone bed, each bed representing the finer-grained sediments (clay, mud) that, because of their smaller particles, were held in suspension longer and not deposited until the final or waning stage of the flood as the floodwaters returned to the river channels (see Taylor, 1983). Development of red or green coloration and calcareous nodules following deposition of the clay and mud layers suggest an extended period of exposure to the atmosphere and intense weathering, resulting in formation of an ancient soil zone (paleosol) in these layers before their burial by the next flood deposit (Taylor, 1983). The paleosols in the uppermost part of the lower member are best exposed in roadcuts along the Simi Valley Landfill and Recycling Center access road, the First Street offramp from the westbound Simi Valley (118) Freeway, and the northern side of the freeway between First Street and Madera Road.

The uppermost part of the lower member at fossil sites (Figure 1, site 11) roughly 900 feet above the base of the formation has yielded the shells of freshwater snails and clams and the remains of a diversity of continental vertebrate species, including tortoises, lizards, opossum-like marsupials, hedgehog-like insectivores, and mouse-like rodents, nearly 41.35 million years in age (beginning of paleomagnetic polarity zone [Chron] C18R; late middle Eocene Epoch, late Uintan North American Land Mammal Age) (Figure 2; Kelly and others, 1991; Prothero and others, in press). With the exception of the tortoise, the vertebrate material (unnamed local fauna of Kelly and others, 1991) was recovered from the paleosols exposed along the Simi Valley Landfill and Recycling Center access road as part of an environmental impact mitigation program. Previously, identifiable land mammal remains were not known from the lower member. Prothero and others (in press) assign the upper (but not uppermost) part of the lower member to Chron C19N, which is no older than 41.6 million years (early middle Eocene) in age (Figure 2). The lower part of the lower member, which contains fossilized wood (Taylor, 1983), is undated. However, the base of the member could be at least as old as 42.6 million years in age (beginning of Chron C19R; Lander, 1994a; Figure 2), based on the correlation (D.R. Prothero, unpublished data) of the upper (but not uppermost) part of the lower member with the lower (but not lowermost) part of a middle Eocene marine rock unit (Coldwater Sandstone) that underlies and interfingers with the Sespe Formation roughly 35 to 40 miles to the northwest in the western Nordhoff Ridge area (Figure 1, site 4) and also is assigned to Chron C19N. The lowermost part of the Coldwater

Sandstone is assigned to Chron C19R (D.R. Prothero unpublished data), and could be the marine continuation of, and, therefore, the same age as the lower part of the lower member of the Sespe Formation in Simi Valley. Moreover, in the southern Pine Mountain area roughly 35 to 40 miles northwest of Simi Valley (Figure 1, site 3), the Coldwater Sandstone contains middle Eocene marine mollusks slightly younger than those from the Llajas Formation, which underlies the Sespe Formation in Simi Valley (Krishtalka and others, 1987; Golz and Lillegraven, 1977).

Middle Member

The middle member of the Sespe Formation is a thick succession composed of numerous superposed flood deposits laid down by meandering rivers crossing a broad floodplain (Howard, 1988; Squires, this volume; Taylor, 1983). These flood deposits, generally composed of finer-grained sediments than those in the lower member, indicate a shallower gradient than for the lower member, and reflect a decrease in the rate of uplift of the source area relative to the Simi Valley area as the fore-arc basin continued filling with sediments (Figure 4; Squires, this volume; Taylor, 1983). Each flood deposit consists of a light-gray sandstone bed (occasionally with a conglomerate layer at its base) overlain by a bed of red-to-green claystone or mudstone (paleosol) (Kelly and others, 1991). The basal conglomerate, when present, often cuts into the upper part of the underlying flood deposit (Kelly and others, 1991), and may represent initial deposition in an active flooding channel after floodwater had eroded or incised the channel into the previous flood deposit. Over thirty-five of these flood deposits are recognized on the Simi Valley Landfill and Recycling Center property between Alamos and Brea Canyons (Figure 1, site 11; see Kelly, 1990), where these deposits appear as a sequence of alternating tan-to-gray sandstone and red-to-green claystone or mudstone layers. These beds extend to the southwest, where they can be seen in roadcuts along the Simi Valley Freeway (west of Madera Road) and California Highway 23, and to the northeast, where they can be seen in roadcuts in the Tapo Canyon area. The middle member also forms badlands exposures north of the Simi Valley Freeway in the Brea Canyon and Alamos Canyon areas (see Taylor, 1983).

The middle member of the Sespe Formation in Simi Valley contains among the most fossiliferous strata known from the formation, and has yielded plant roots, the shells of freshwater snails and clams, and remains representing approximately 90 species of continental vertebrates, including a fish (gar), frog, turtles (terrapins, tortoises), a crocodile, lizards (night lizard, chuckwalla, monitor), snake (boa), and a bird, as well as a diversity of primitive mammals, including opossum-like marsupials, shrew- and hedgehog-like insectivores, bats, tarsier-like primates (Figure 5), squirrel-, gopher-, and mouse-like rodents, hyena-like (creodonts; Figure 6) and dog-like carnivores, a large rhinoceros-like ungulate (titanothere), small tapir-like ungulates, a small rhinoceros, large semi-aquatic tapir-like rhinoceroses (amynodonts; Figure 7), a pig-like ungulate, camel, camel-like ungulates (including oromerycids and oreodonts), pronghorn-like ungulates, and mouse deer-(chevrotain-) like ungulates (hypertragulids) (Golz and Lillegraven, 1977; Kelly, 1990, 1992; Kelly and Whistler, 1994; Kelly and others, 1991; Lander, 1987; Mason, 1988, 1990; Savage and others, 1954). Many of these land mammal species were based on and named for material from the middle member, and some have been recognized from rock units of similar age in Utah, Wyoming, South Dakota, and Texas. The remains representing these species were recovered from over 100 fossil sites in Simi Valley, most in the paleosols. It is very likely more new species will be discovered. Some of the species from the middle member, such as the amynodont rhinoceros, repre-

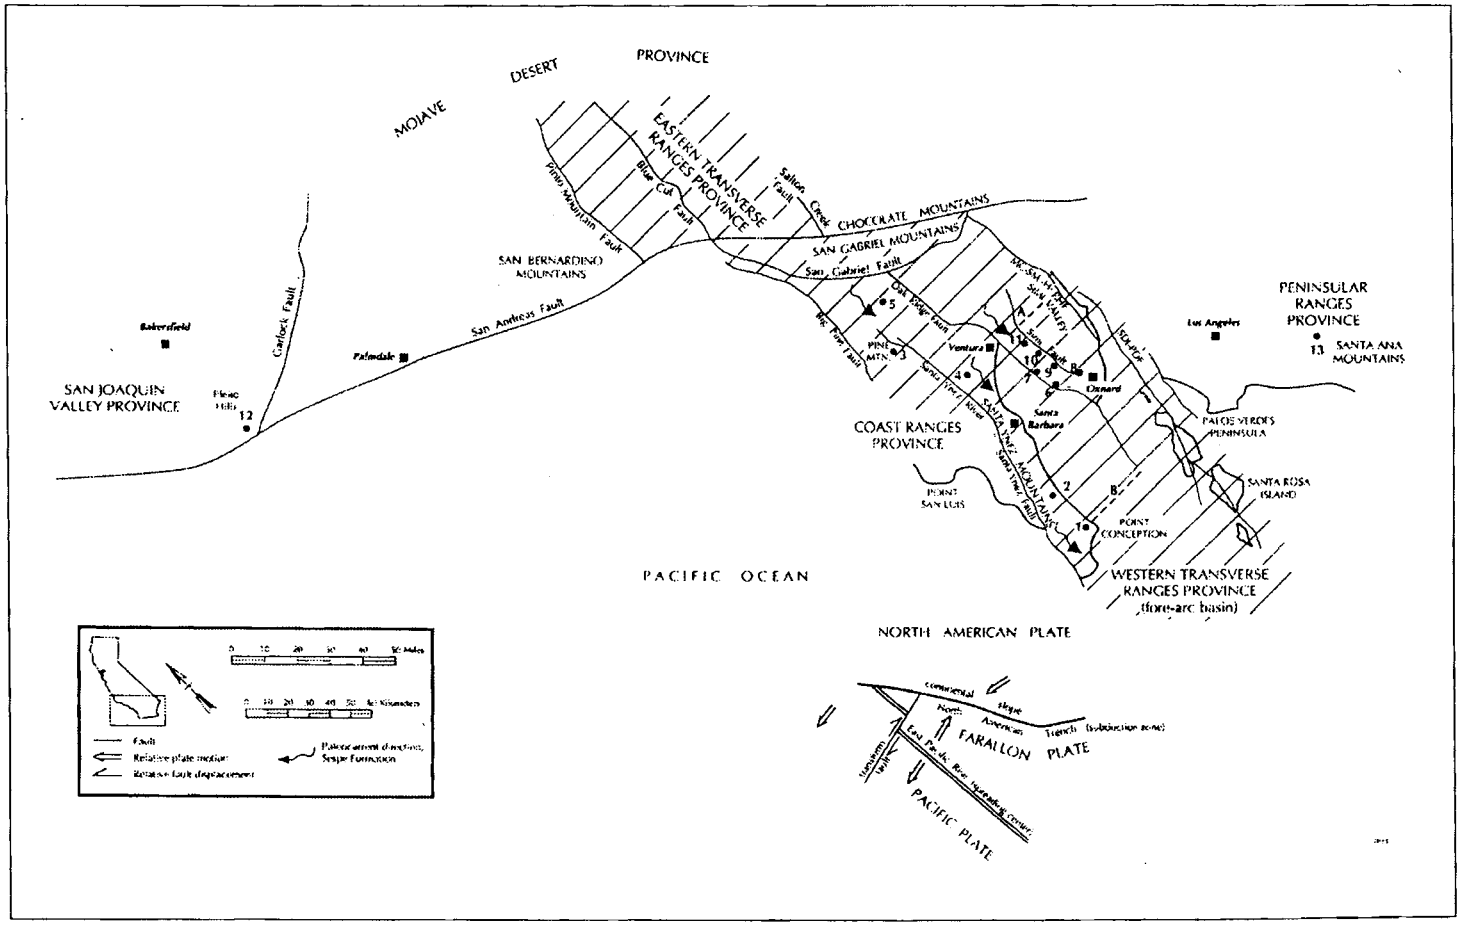

Figure 3. Simplified geologic map of southern California approximately 30 million years ago (early Oligocene) after restoring for offset along major faults and 90 degrees of crustal rotation. Modified from Luyendyk and others (1980, 1985). See Figure 1 for key. A: location of coastline, 42.6 (early middle Eocene) and 27.95 million years ago (late Oligocene); B: location of coastline, 28.25 million years ago (late Oligocene).

sent recent Asian immigrants (Prothero, 1994). The occurrence of plant roots is additional evidence the red-to-green claystone and mudstone beds, like those in the lower member, are paleosols.

The land mammal species from the middle member comprise some of the most diverse land mammal faunas and one of the most complete evolutionary sequences of land mammals known from the late middle Eocene of North America. Five successive faunas (Tapo Canyon, Brea Canyon, Strathearn, Pearson Ranch, Simi Valley Landfill Local Faunas) are now recognized in the middle member (Figure 2; Kelly and others, 1991; Prothero and others, in press), and evolutionary changes, particularly in tooth structure, can be observed in some mammalian evolutionary lineages (particularly rodents, oreodonts, hypertragulids) as they reappear in successively higher (younger) faunas.

During the late middle Eocene, much of North America was covered by subtropical woodlands that developed under the influence of a semi-arid seasonally dry climate (Prothero, 1994). The secondary development of caliche (limy) nodules in the paleosols of the Sespe Formation are consistent with a such a climatic regime (see Prothero, 1994). However, the occurrence of gars, frogs, crocodiles, monitors, boas, arboreal (tree-dwelling) primates, and semi-aquatic rhinoceroses suggest the Simi Valley area was covered by river-border forests. The woodlands reflect a transitional stage from the tropical rainforests and warm moist climate of the early Eocene to the more arid grasslands and cooler and more temperate (seasonal) climate of the Oligocene (see Gyllenhaal, 1991; Prothero, 1994). This change might reflect a much more southerly position for the North American plate in the past, the current location and more temperate (cooler, dryer, more seasonal) climate resulting mostly from the steady northward drift of the plate during the Cenozoic (see below; Gyllenhaal and others, 1991). During deposition of the sediments comprising the Sespe Formation, the Simi Valley area might have been at least 17 to 18 degrees of latitude south of its current position, presumably near the latitude now occupied by southernmost Mexico (about 16 to 17 degrees north latitude) (see Luyendyk and others, 1985; Prothero and others, in press). Right-lateral offset along the San Andreas and San Gabriel Faults account for only 3 to 4 degrees of northward translation (Figures 1, 3; Luyendyk and others, 1985; see below), the remainder (approximately 15 degrees) presumably being the result of continental drift. However, the development of a cooler climate might also reflect, at least in part, global climatic cooling and the development of an Antarctic ice cap (Prothero, 1994). Following the end of the Duchesnean, many land mammal species went extinct because of the development of a cooler dryer climate and the accompanying changes in vegetation (Prothero, 1994).

The land mammal species from the middle member are characteristic of the late Uintan to late Duchesnean North American Land Mammal Ages (Figure 2; Golz and Lillegraven, 1977; Kelly, 1990,1992; Kelly and Whistler, 1994; Kelly and others, 1991; Krishtalka and others, 1987; Prothero and others, 1992a, -b, in press; Savage and others, 1954). Prothero and others (in press) assign the Tapo Canyon, Brea Canyon, and Strathearn Local Faunas to Chron C18R (41.35 million to 40.2 million years old); the Pearson Ranch Local Fauna, to Chron C18N (40.2 million to 38.5 million years old); and the Simi Valley Landfill Local Fauna, to Chron C17R (38.5 million to 38.0 million years old). Prothero and others (1992a, -b, in press) considered the top of the middle member to be in Chron C17N (late middle to late Eocene). However, strata in the middle member above the Simi Valley Landfill Local Fauna are above the Canada de la Brea Fault and are actually the same as strata lower in the middle member, presumably in Chron C18N (see Kelly, 1990; Kelly and others, 1991; Lander, 1994a). Therefore, the top of the middle member is no younger than Chron C17R (38.0 million years) and late middle Eocene in age (Lander, 1994a; Figure 2).

During the late middle Eocene and deposition of the sediments comprising the middle member, the marine regression continued and the Pacific coastline retreated farther westward (southward after correcting for 90 degrees of crustal rotation) from the Simi Valley area to points roughly 35 to 40 miles away (presumably substantially less after correcting for offset along intervening left-lateral-displacement faults) in the southern Pine Mountain/western Nordhoff Ridge area (Figures 1, 3, sites 3, 4). In the latter region, the Sespe Formation overlies and interfingers with a middle Eocene marine formation (Coldwater Sandstone), which, in the southern Pine Mountain area, contains marine mollusks slightly younger than those from the Llajas Formation in Simi Valley (Figure 2; Golz and Lillegraven, 1977; Krishtalka and others, 1987; Lander, 1994a; see Squires, 1988). At a fossil site in the Sespe Formation along Sespe Creek (Figure 1, site 3), the Hartman Ranch Local Fauna contains late Uintan rodent species similar or identical to those from the Tapo Canyon and Brea Canyon Local Faunas, and occurs roughly 100 to 200 feet above the base of the formation in strata the same age (Chron C18R) as those low in the middle member (at least 950 feet above base of Sespe Formation) in Simi Valley (Figure 2; see Golz and Lillegraven, 1977; Kelly and others, 1991; Lander,

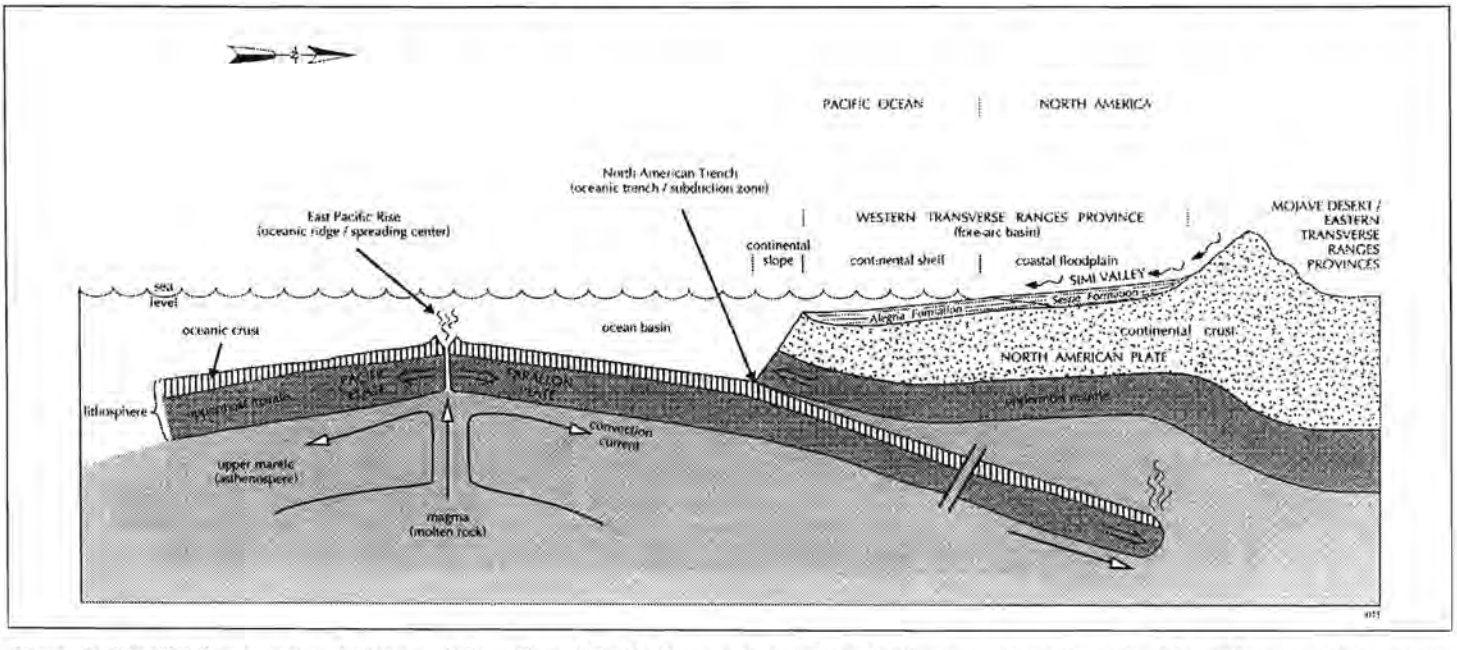

Figure 4. Simplified cross section of plates underlying floor of Pacific Ocean and of southern California continental margin of North American plate approximately 30 million years ago (early Oligocene) during deposition of sediments comprising Sespe Formation. Not to scale.

1994a; Lindsay, 1968; Prothero and others, 1992a, -b; Taylor, 1983). Sandstone beds similar to those in the Coldwater Sandstone occur in the Sespe Formation along Sespe Creek, suggesting the Hartman Ranch Local Fauna is from the transitional zone between the two formations (Lindsay, 1968). Fossil sites in red claystone beds similar to those in the Sespe Formation along Sespe Creek and in Simi Valley occur in the Coldwater Sandstone at the western end of Nordhoff Ridge (Figure 1, site 4). The red claystone beds indicate the fossil sites, which have yielded a rodent and a large rhinoceros-like ungulate (Lander, 1988; D.R. Prothero, unpublished data), are in the same transition zone as that found along Sespe Creek. Presumably, the fossil-bearing beds, which have been assigned to Chron C18N, are the same age as those in the middle member of the Sespe Formation in Simi Valley that yielded the Pearson Ranch Local Fauna (Figure 2; D.R. Prothero, unpublished data). Of particular interest is the occurrence of the mouse Simimys simplex only about 300 feet above the base of the Sespe Formation near Oxnard, approximately 25 to 30 miles south-southwest of Simi Valley (Figure 1, site 8; Lander, 1988, 1994a). This specimen was recovered from an oil well at a depth of 8,195 feet, and may be the deepest occurrence of a land mammal fossil ever recorded. Simimys simplex also occurs from the local faunas in the middle member of the Sespe Formation in Simi Valley, and an undetermined species of Simimys (possibly Simimys simplex) occurs in the Hartman Ranch Local Fauna and in the local fauna in the lower member in Simi Valley (see Figure 2).

Extensive field investigations by California Institute of Technology personnel, who, under the direction of the late Dr. Chester Stock, conducted extensive quarry operations to collect concentrations of fossil remains, were begun around 1930. Many scientific publications, mostly by Stock and one of his students (Dr. Robert W. Wilson), resulted from studies of the numerous fossil specimens recovered by these operations in both the middle and upper members (see below). Subsequently, less extensive investigations were conducted and scientific publications contributed by University of California Museum of Paleontology (Berkeley) and Natural History Museum of Los Angeles County (LACM) personnel. Recently, Dr. Donald R. Prothero and his students (Prothero and others, 1992a, -b, in press) in the Department of Geology at Occidental College have integrated their paleomagnetic polarity data from the Sespe Formation in Simi Valley (particularly on the Simi Valley Landfill and Recycling Center property) and vicinity with the vertebrate paleontologic record of the same strata (Figure 2). Although additional refinement and different age assignments are possible (see Prothero and Swisher, 1992), these data have allowed more accurate assessments of the absolute ages (in years) of these strata and their faunas, and of their relative (land mammal) ages compared to strata and faunas in other regions.

Much information regarding the smaller vertebrates, particularly the mammals, from the middle member has been acquired as the result of the work undertaken for the paleontologic resource impact mitigation program being conducted at the Simi Valley Landfill and Recycling Center with the support of Waste Management of California, Inc., owner of the landfill. The mitigation program has been conducted since 1987 by Mr. Mark A. Roeder and other personnel of Paleo Environmental Associates, Inc. (PEAI), with the assistance of Dr. David P. Whistler, formerly of the LACM Vertebrate Paleontology Section and now with PEAI, Dr. Thomas S. Kelly of the same section, and, initially, Mr. Robert E. Reynolds of the San Bernardino County Museum Division of Earth Sciences to ensure compliance by the landfill operation with Ventura County Resource Management Agency Planning Division environmental guidelines, which were developed in response to the California Environmental Quality Act of 1970, and with recommended mitigation measures presented in the paleontologic resource assessment technical appendix (Lander, 1987) prepared in support of the environmental impact report for the proposed landfill expansion. These guidelines require protection of paleontologic resources by recovering scientifically important fossil remains and associated geologic and geographic site data to reduce the adverse environmental impact of the landfill operation on fossil sites, and to ensure these remains and site data are preserved in a museum for future study by scientific investigators. By the end of 1993, over 75 tons of fossiliferous rock had been processed under this program to allow the recovery of smaller fossil remains normally too small to be observed in the field. Nearly 4,000 identifiable fossil remains, primarily the teeth of small mammals, have been recovered as the result of processing. Due to their very small size, identification of most of these teeth has required study under a microscope. A number of new rodent species have been identified, most from the highest beds in the middle member (Kelly, 1990, 1992; Kelly and Whistler, 1994; Kelly and others, 1991), the first records of land mammals from this part of the member and components of a newly recognized fauna (Simi Valley Landfill Local Fauna of Kelly and others, 1991). A new species of tarsier-like primate (Macrotarsius roederi Kelly, 1990; see Figure 5), the first new primate species collected from the Sespe Formation in over 50 years, received wide media coverage and will also be discussed in several forthcoming high school science textbooks (note: modern tarsiers are found only in the tropical rain forests of southeast Asia). This species, based on a lower right jaw, was named in honor of Mr. Roeder in recognition of his work under the mitigation program and his recovery of the primate specimen. Recently, parts of the lower left jaw of the same individual were recovered by Mr. Roeder, 5 years after discovering the right jaw. The remains of larger land mammals, including the most complete oreodont specimen known from the middle member, were collected during excavation of a small quarry (Kelly and others, 1991). Processing of fossiliferous rock samples also resulted in the recovery of the first identifiable land mammal fossils from the lower member of the formation (Kelly and others, 1991; see above). The fossil material recovered by the program has been the subject of several scientific contributions (Kelly, 1990, 1992; Kelly and Whistler, 1994; Kelly and others, 1991). Recognizing the scientific and educational benefits of its impact mitigation program and the fossil remains from its property, the Simi Valley Landfill and

Figure 6. Right side of skull of large primitive hyena-like carnivore (creodont Hyaenodon vetus) from late middle Eocene (early Duchesnean North American Land Mammal Age) Pearson Ranch Local Fauna, upper middle member, Sespe Formation. Specimen collected by California Institute of Technology personnel in 1932 from large quarry at site (see Figure 8) now occupied by Waste Management of California, Inc., Simi Valley Landfill and Recycling Center. After Stock (1933a).

Recycling Center developed an exhibit on the paleontology of the landfill property. The Simi Valley Historical Society and Museum, and the Rancho Simi Recreation and Park District have begun developing a similar exhibit at the Strathearn Historical Park and Museum.

Upper Member

The upper member of the Sespe Formation is separated from the middle member by an unconformity (Figure 2; Howard, 1988, 1989; Prothero and others, 1992a, -b; however, see Prothero and others, in press). This unconformity, which is documented as far west as the Santa Ynez Mountains (Figure 1; Howard, 1988, 1989), reflects increased emergence of the Simi Valley area relative to sea level and, in Simi Valley, erosion and removal of the uppermost part of the middle member (and any sediments deposited between the middle and upper members) prior to deposition of the sediments comprising the upper member (see Figure 2).

Howard (1988, 1989) suggested the unconformity, which spans the Chadronian, Orellan, and early Whitneyan North American Land Mammal Ages, resulted from the pronounced global fall in sea level that accompanied development of an Antarctic ice cap near the early-late Oligocene boundary. However, paleontologic and paleomagnetic polarity data indicate the unconformity is older and spans all of the late Eocene and much of the early Oligocene, a gap in the rock record spanning roughly 7 million years (Figure 2; Prothero and others, in press; see below). It is possible the unconformity resulted from a global lowstand in sea level that spanned Chrons C17N to C13N (see Haq and others, 1987; Lander, 1994a), or, like the unconformity separating the lower member from the underlying Llajas Formation (see above), could reflect further uplift of the Simi Valley area above sea level as the result of a change in the rate of convergence of the California continental margin and the Farallon plate (Figures 3, 4; see below).

The lower two thirds of the upper member, like the lower member of the formation, consists of thick intervals of yellow sandstone and conglomerate representing deposits of sand and gravel, respectively, laid down during flash floods by braided rivers flowing from the nearby mountains, these deposits reflecting renewed uplift (relative to Simi Valley area) and erosion of the mountainous source area and the return to a steeper gradient (Figure 4; Taylor, 1983). The presence of andesitic (volcanic) cobbles in the upper member suggest a source area in southwestern Arizona (Prothero and others, in press). These sandstone and conglomerate intervals are exposed in Alamos Canyon north of the Simi Valley Freeway (Figure 1, site 11). During deposition of the sediments comprising the lower two thirds of the upper member in Simi Valley, the marine regression continued and finally ended as the fore-arc basin filled with sediments and the Pacific coastline subsequently withdrew to its westernmost point (Lander, 1983, 1994a; Howard, 1988, 1989, however, considered these sediments to have been deposited during the subsequent marine transgression, when the Pacific Ocean returned to the area). Strata in the Sespe Formation the same age as those in the lower two thirds of the upper member in Simi Valley are recognized approximately 100 miles west of Simi Valley in Canada del Cementerio at the southwestern corner of the Santa Ynez Mountains near Point Conception in western Santa Barbara County (Figures 1, 3, sites 1, B), where they overlie and interfinger with a marine rock unit (lower regressive part of Alegria Formation) (Figure 4; Howard, 1988, 1989; Lander, 1983, 1994a; Rigsby, 1988).

No fossil remains are recorded from this portion of the upper member in Simi Valley. However, the upper member and strata of similar age in the Sespe Formation at fossil sites in Little Simi Valley and the Las Posas Hills, at South Mountain, along Oak Ridge, and in the Santa Ynez Mountains (Figure 1, sites 2, 6, 7, 9, 10) have yielded remains representing approximately 30 continental vertebrate species that are early to late Oligocene (late Whitneyan to early Arikareean North American Land Mammal Ages) and about 30.45 million to 27.95 million years in age (beginning of Chron C11R to end of Chron C9R) (Figure 2; see below; Lander, 1983, 1994a; Prothero and others, 1992a, -b, in press; Savage and others, 1954; Tedford and others, 1987). These species include tortoises, a rabbit, rodents (squirrels, a gopher, mice), a bear-like carnivore, small and large dogs, a cat, small saber-tooth cat, horse, small and large rhinoceroses, a hippopotamus-like ungulate, camel, three to five evolutionary lineages of advanced camel-like ungulates (oreodonts), and a mouse deer- (chevrotain-) like ungulate (Lander, 1983), and are decidedly more advanced than their ancestors in the middle member of the formation. The Kew Quarry Local Fauna, which is from a fossil site on the southern side of the Las Posas Hills (Figure 1, site 9) and occurs in a reversed paleomagnetic polarity interval in the upper member, is considered late Whitneyan or early Arikareean (early Oligocene) and assignable to Chron C11R or C10R by Prothero and others (1992a, -b, in press). A normal interval occurs lower in the upper member in the Las Posas Hills (Prothero and others, in press). On the other hand, the comparatively primitive dentition of the rhinoceros ("Subhyracodon" kewi) and the relatively small size of the cat (Nimravus brachyops) in the fauna suggests the Kew Quarry Local Fauna, the oldest known from the upper member, is late Orellan or early Whitneyan in age (Lander, 1983), although the rather large size and prominent metastylids of the horse (Miohippus annectens?) compared to its presumed late Orellan ancestor suggests the fauna is no older than Whitneyan. However, the rhinoceros may be assignable to a late Whitneyan species from Oregon (Lander, 1994a). The Kew Quarry Local Fauna, therefore, probably is late Whitneyan (early Oligocene) and between about 30.45 million and 30.1 million years in age, and presumably assignable to Chron C11R (Lander,

Figure 7. Right side of skull of large semi-aquatic tapir-like rhinoceros (Amynodontopsis bodei) from late middle Eocene (early Duchesnean North American Land Mammal Age) Pearson Ranch Local Fauna, upper middle member, Sespe Formation. Specimen collected by California Institute of Technology personnel in 1932 from large quarry at site (see Frontspiece, pg. 302) now occupied by Waste Management of California, Inc., Simi Valley Landfill and Recycling Center. After Stock (1933b).

1994a; see Figure 2), an assignment consistent with paleomagnetic polarity data for the upper member in Simi Valley (see Prothero and others, 1992a, -b; however, see Prothero and others, in press).

The upper member has yielded an unnamed fauna at a fossil site in Little Simi Valley near Virginia Colony (Figure 1, site 10), approximately 1,000 feet below the base of the overlying marine Vaqueros Formation and presumably from Chron C10R (early Arikareean, early Oligocene, 29.35 million to 28.7 million years ago; see Figure 2; Prothero and others, in press). The fauna is represented by remains probably belonging to one of the late Whitneyan to early Arikareean oreodont species (Sespia nitida, which includes Sespia californica) (Lander, 1983, 1994a; Prothero and others, in press). In the Sespe Formation along Oak Ridge (Shiells Canyon) (Figure 1, site 7), Sespia (Shiells Canyon Local Fauna) occurs only 100 feet below the Vaqueros Formation in strata the same age as the upper member, although the uppermost part of the Sespe Formation in Shiells Canyon might have been removed by faulting and the Sespia nitida specimen from this area could be from a level corresponding to one at least 500 feet below the Vaqueros Formation at South Mountain (Lander, 1983, 1994a; see below). A volcanic ash bed (Willard Canyon Tuff) occurs in the Sespe Formation at South Mountain (Figure 1, site 6), 890 feet below the Vaqueros Formation in strata the same age as those in the upper member, and has been determined to be 28.2 million years old and in Chron C10N (see Figure 2; Mason and Swisher, 1989; Prothero and others, 1992a, -b, in press). This ash bed and an ash bed 150 feet below the top of the upper member in Simi Valley (Corey, 1927) indicate the occurrence of volcanic activity, presumably in the Simi Valley region, during the late Oligocene (see Figure 2). The Sespe Formation at South Mountain has yielded early Arikareean land mammal species (South Mountain Local Fauna), including Sespia nitida, which extends from approximately 1,200 feet below (at base of exposed section, where it occurs with another early Arikareean oreodont species, Merycoides pariogonus) to 400 feet above the ash bed (2,100 to 500 feet below Vaqueros Formation, from Chron C10R to top of Chron C10N or base of Chron C9R; another oreodont species occurs higher in Sespe Formation, presumably still in Chron C9R) (see Figure 2; Lander, 1983, 1994a; Mason and Swisher, 1989; Prothero and others, in press). Lander (1994a) and Prothero and others (1992a, -b, in press) consider this fauna and the upper 2,100 feet of the Sespe Formation to early to late Oligocene (29.35 million to 27.95 million years) in age (Chrons C10R to C9R; see Figure 2). In Canton Canyon (Figure 1, site 5), a different oreodont species occurs near the level of the contact between the Sespe and Vaqueros Formations (E.B. Lander and R.L. Squires, unpublished data). Of particular interest is a fossil site at Gaviota Pass in the south-central Santa Ynez Mountains (Figure 1, site 2), where the lower (regressive) part of the marine Alegria Formation, which is the marine continuation of the upper (but not uppermost) part of the Sespe Formation in the southeastern Santa Ynez Mountains (see Figure 4), also has yielded Sespia nitida (Canada de la Gaviota Local Fauna), as have strata of similar age in the upper (but not uppermost) part of the Sespe Formation in the southeastern Santa Ynez Mountains north and northwest of Santa Barbara (Lander, 1983, 1994a). The Sespe Formation overlies and interfingers with the lower part of the Alegria Formation from the Gaviota Pass area westward nearly to Point Conception in Canada del Cementerio (Figure 1, sites 1, 2; Lander, 1983, 1994a; see Rigsby, 1988). These occurrences of Sespia nitida are younger than the diverse Kew Quarry Local Fauna, which lacks Sespia. The upper (transgressive) part of the Alegria Formation overlies and interfingers with, and, therefore, is the marine continuation of the uppermost part of the Sespe Formation and underlies the Vaqueros Formation from Canada del Cementerio eastward past Gaviota Pass (Figure 1, sites 1, 2; see Figure 4; Howard, 1988; Lander, 1994a; Rigsby, 1988).

In Nebraska, the oldest occurrence of Sespia (Sespia nitida) is in Chron C11N, approximately 15 feet below a volcanic ash bed (Nonpareil Ash) determined to be 30.05 million years old (late Whitneyan, early Oligocene), and the youngest occurrence presumably is in Chron C9N (27.95 million to 27.0 million years in age), above the level of a volcanic ash bed in Chron C9N determined to be 27.8 million years old (early Arikareean, late Oligocene) (Lander, 1994a; D.R. Prothero, unpublished data; Prothero and Swisher, 1992; Prothero and others, 1991a, -b; Tedford and others, 1985; see Figure 2). Presumably, Sespia could have existed in California as early as about 30.05 million years ago (near beginning of Chron C11N), although only the records from the Santa Ynez Mountains (including those from upper part of Sespe Formation), which are still undated, could be so old. Moreover, Sespia appears not to have existed as late in California as it did in Nebraska, probably not lasting past Chron C9R (27.95 million years ago) and possibly not even surviving past Chron C10N (28.25 million years ago) (Lander, 1994a).

The upper third (720 feet) of the upper member of the Sespe Formation in Simi Valley (Figure 1, site 11) consists of sandstone and claystone beds representing sand and clay layers, respectively, deposited on a coastal floodplain (Taylor, 1983). The occurrence of anorthosite (granite-like) pebbles in the uppermost part of the formation in Simi Valley (upper 725 feet; Chron C9R) and Canton Canyon indicate a source area in the San Gabriel Mountains, suggesting the San Gabriel Mountains were uplifted relative to, and lay adjacent to (north of) Simi Valley and Canton Canyon during deposition of the sediments comprising the uppermost part of the Sespe Formation, and were subsequently moved approximately 35 miles to the southeast by right-lateral offset along the San Gabriel Fault (Howard, 1988, 1989; Lander, 1994a; see Prothero and others, in press; Figures 1, 3, sites 5, 11). In Simi Valley, this part of the formation is transitional with the base of the overlying marine Vaqueros Formation (Figure 2; Taylor, 1983; Topanga Formation of Dibblee, 1992b; see below), with which the upper 100 feet of the upper member interfinger (Blundell, 1983; Lander, 1983; Squires, this volume), indicating continuous deposition and subsidence accompanying a major marine transgression as the Pacific Ocean returned to Simi Valley after nearly 15 million years of emergence, the Pacific coastline advancing eastward approximately 100 miles from Canada del Cementerio near Point Conception (probably less than 50 miles south of Simi Valley after correcting for 90 degrees of clockwise crustal rotation and offset along intervening left-lateral-displacement faults) (Figures 1, 3, sites 1, 11, A; see below; Howard, 1988; Lander 1983, 1994a; Rigsby, 1988). Fossil remains from this transitional zone in the Alamos Canyon area of Simi Valley (Figure 1, site 11) represent land mammals (mouse [Leidymys nematodon], rabbit, mouse deer- [chevrotain-] like ungulate), marine vertebrates (sharks), marine mollusks (snails, clams), and land plants, the land mammal and shark remains occurring at the base of the transition zone, 95 to 100 feet below the top of the Sespe Formation (Blundell, 1983; Lander, 1983, 1994a; Prothero and others, in press; Taylor, 1983). The species represented by the land mammal remains comprise a fauna (Alamos Canyon Local Fauna) that lies roughly 900 feet above and postdates the last local occurrence of Sespia in the upper (but not uppermost) part of the upper member and probably is late early Arikareean in age (Lander, 1983, 1994a; Figure 2). Prothero and others (1992a, -b, in press) consider this fauna (and upper part of upper member) to be late Oligocene (28.0 million to 27.5 million years) in age (Chron C9R; see Figure 2; however, see Prothero and others, in press). However, in the Pleito Hills at the southern end of the San Joaquin Valley (Figure 1, site 12), late early Arikareean land mammal species (including Leidymys nematodon) comprising the Tecuya Canyon Local Fauna occur in the uppermost part of the lower member of the Tecuya Formation, as high as a level about 25 feet below a lava flow determined to be 22.9 million years (earliest Miocene) in age (Lander, 1983). Presumably, the Alamos Canyon Local Fauna is older than the Tecuya Canyon Local Fauna, or the estimated age for one of the faunas is in error.

In the northern Santa Ana Mountains area of the Peninsular Ranges Province in Orange County (Figures 1, 3, site 13), approximately 60 miles southeast of Simi Valley, the upper part of the Sespe Formation underlies and interfingers with its marine continuation, the Vaqueros Formation, but has yielded younger land mammal assemblages (Bolero Lookout and Santiago Canyon Landfill Local Faunas) assignable to the early Hemingfordian North American Land Mammal Age (late early Miocene; 18

million to 20 million year old; Lander, 1994b; H.W. Wagner, personal communication in Belyea and Minch, 1989). These assemblages include the oreodont Merychyus arenarum and overlie an early Arikareean assemblage containing Sespia nitida (Lander, 1994b; RMW Paleo Associates, unpublished data). Paleontologic data suggest the Pacific coastline transgressed beyond the Simi Valley area and into the northern Santa Ana Mountains during the early Miocene.

Recalibration of Marine RegressiveTransgressive Cycle Recorded by Sespe Formation

A major marine regressive-transgressive cycle is recorded in the western Transverse Ranges block by the Sespe Formation, and by this and other nonmarine rock units elsewhere along the southern and central California portion of the North American plate margin. Based on geologic and paleontologic evidence from the Santa Ynez Mountains (see above), Lander (1983, 1994a) considered the sediments comprising all but the uppermost (transgressive) part (upper third of upper member) of the Sespe Formation in Simi Valley to have been deposited during the regression and before the last local occurrence of Sespia. Howard (1988, 1989), however, considered the sediments comprising only the lower and middle members of the Sespe Formation to have been deposited during the regression, the unconformity between the middle and upper members spanning the time during which a sudden pronounced drop in sea level and the maximum extent of the accompanying regression occurred. The latter interpretation is not consistent with paleontologic evidence or paleomagnetic polarity data (see above). The maximum extent of the regression and the transition from regressive to transgressive sedimentation, as recognized in the Santa Ynez Mountains, occurred by about 28.25 million years ago (end of Chron C10N), probably as late as the late Oligocene and after the last local occurrence of Sespia (Lander, 1983, 1994a; see Figure 2; see above). During the Oligocene, broad areas of the southern and central California continental margin were exposed as a result of the marine regression and covered by nonmarine deposits as the mountainous source areas farther inland were extensively eroded (Ingle, 1981; Nilsen, 1987).

Data presented above and in Lander (1994a) indicate the Pacific coastline was in Simi Valley (Tapo Canyon) during the early middle Eocene, probably near the beginning of Chron C19R about 42.6 million years ago, when the sediments comprising the basal conglomerate of the lower member of the Sespe Formation were being deposited on the marine Llajas Formation (Figure 2; Figure 3, sites 11, A). The coastline subsequently withdrew westward (southward after correcting for 90 degrees of crustal rotation; Prothero and others, 1992a, -b, in press), probably passing through the southern Pine Mountain area by the end of Chron C18R and the western Nordhoff Ridge area by the end of Chron C18N (late middle Eocene) (Lander, 1994a; Figure 2; Figure 3, sites 3, 4). The coastline finally reached the Point Conception area (Canada del Cementerio) at the western end of the Santa Ynez Mountains, where the upper part of the formation interfingers with and pinches out between the lower (regressive) and upper (transgressive) parts of the marine Alegria Formation, probably after the last local occurrence of Sespia and presumably near the Chron C10N-C9R boundary, about 28.25 million years ago (late Oligocene) (Lander, 1983, 1994a; Figure 2; Figure 3, sites 1, B). Recalibration of the beginning and end of the regression suggest the regressive phase of the regressive-transgressive cycle lasted approximately 14.3 million years (Lander, 1994a).

The coastline subsequently returned from Point Conception to Simi Valley (Figure 3, sites 11, A), where the upper third of the upper member of the Sespe Formation underlies and interfingers with the marine Vaqueros Formation, by the end of Chron C9R, about 27.95 million years ago (late Oligocene) (Lander, 1983, 1994a). Recalibration of the beginning and end of the transgression suggest the transgressive phase of the regressive-transgressive cycle lasted only about 500,000 years, a duration roughly 2 per cent of that estimated for the transgressive phase (Lander, 1994a). These data suggest the Simi Valley area was emergent for approximately 14.65 million years during deposition of the sediments comprising the Sespe Formation. However, the Santa Ana Mountains might have been emergent for over 22 million years (see above).

Causes of Apparent Sea Level Changes During Deposition of Sediments Comprising Sespe Formation

Several geologic phenomena have been identified to account for the initial fall and subsequent rise in sea level that comprise the regressive-transgressive cycle recorded by the Sespe Formation. These phenomena include changes in the size of the Antarctic ice cap, which would have caused global (glacio-eustatic) fluctuations in sea level, and plate tectonic (structural) processes, including changes in the sea floor spreading rate along an oceanic ridge, which also would have caused global (eustatic) sea level fluctuations, and interaction of the western margin of the North American plate and the eastern edges of the oceanic plates underlying the Pacific Ocean (changes in convergence/subduction rate; collision of continental plate margin and East Pacific Rise), which would have resulted in sea level fluctuations that were primarily regional in extent. It is difficult to distinguish the influences of plate tectonic and climatic changes because these phenomena appear to have occurred at about the same time and to have had similar effects (Howard, 1989; Lander and Butcher, 1984). Moreover, fluvial sedimentation would have had a pronounced local effect on sea level (Lander, 1994a).

Filling of Fore-arc Basin with Fluvial Sediments

The influences of glacio-eustatic and plate tectonic events would have been imprinted on fluvial deposition, which, even without the effects of regional uplift or a global fall in sea level, would have built the coastal plain seaward and caused the Pacific Ocean to withdraw from the southern and central California portion of the North American plate margin, particularly with regard to the western Transverse Ranges block as the fore-arc basin filled with fluvial sediments, including those comprising all but the uppermost part of the Sespe Formation (Lander, 1994a; see Howard, 1988; Ingle, 1981; Figure 4). Filling of the fore-arc basin might have caused the reduction in gradient documented from the lower to middle members of the formation in Simi Valley (see above). However, the development of unconformities, which, in the Simi Valley area, separate the Sespe Formation from the underlying marine Llajas Formation and the middle member of the Sespe Formation from the upper member, as well as the apparent uplift relative to sea level and accompanying erosion of the Simi Valley area and the rest of the western Transverse Ranges block during the time intervals represented by these unconformities, suggest some other mechanism was causing global falls in sea level or regional uplift.

Sea Floor Spreading Rate

Gurnis (1992) and Vail and others (1977) suggested increased upwelling of molten mantle rock under an oceanic ridge (as indicated by accelerated sea floor spreading rate along ridge), as well as the accompanying increased arching of the sea floor centered about the ridge, as a possible cause for a global rise in sea level, increased arching of the sea floor displacing a sufficient volume of sea water to cause a global rise in sea level. An increase in the sea floor spreading rate would have resulted in subsidence and an even greater regional rise in sea level along the adjacent continental plate margins landward of the associated oceanic trenches, where the leading edges of the oceanic plates generated by the ridge were being subducted and pulling down the continental margins (Gurnis, 1992; Ingle, 1981). Presumably, a decrease in the spreading rate would have been accompanied by a global fall in sea level, as well as regional uplift of the continental plate margins.

Ingle (1981) reported an increase in the sea floor spreading rate along the East Pacific Rise during the late Oligocene to earliest Miocene approximately 22 million to 25 million years ago (presumably Chron C6, as indicated by sea floor paleomagnetic polarity data; see Haq and others, 1987) as being responsible for subsidence of the southern and central California continen-

A view of "Whiteface," the prominent cliff that dominates the northern view of Simi Valley, comprised of exposed white diatomite of the Modelo Formation 12 to 6 million years old. Diatomite is a soft white silica-rich deposit that is formed in a cold, deep marine environment and is composed largely of the remains of microscopic floating algae (diatoms). (Photo by Bill Appleton.)

tal margin (particularly Simi Valley area) and the accompanying marine transgression, as reflected by marine sediments comprising the Vaqueros Formation being deposited on nonmarine sediments comprising the Sespe Formation. However, subsidence of the plate margin began during deposition of the sediments comprising the uppermost part of the Sespe Formation in the area now comprising the western Transverse Ranges block near the Chron C10N-C9R boundary approximately 28.25 million years ago (see below).

Ward (1991), on the other hand, has argued that a dramatic slowing in the rate at which the Farallon plate was being subducted under the North American plate margin resulted in uplift of the margin, presumably by the beginning of Chron C19R (see below). This reduction in the subduction rate, however, was not related to a decrease in the sea floor spreading rate along the East Pacific Rise (Ward, 1991). Instead, the East Pacific Rise migrated northwestward away from the subduction zone, which resulted in the decreased subduction rate.

Interaction of Oceanic Plates and North American Plate Margin

Convergence of the East Pacific Rise and the southern and central California portion of the North American plate margin as the margin overrode the intervening Farallon plate (see Figures 3, 4) might explain the apparent uplift and the accompanying progressive withdrawal of the Pacific Ocean from the continental margin (including fore-are basin and area now comprising western Transverse Ranges block) during the early middle Eocene to late Oligocene (see Lander, 1994a; Nilsen, 1987; Ward, 1991)

The sea floor gradually rises towards an oceanic ridge, where the earth's crust is hotter, less dense, and, therefore, more buoyant due to convection currents in the lower liquid portion of the mantle (asthenosphere) and the resulting upwelling of the molten mantle rock that forms new oceanic lithosphere (crust and underlying upper rigid portion of mantle) in the spreading center that lies along the ridge crest (see Figure 4; Anderson, 1971; Burchfiel, 1983; Francheteau, 1983). Farther from the ridge, the crust is increasingly older and, therefore, cooler and denser, displacing the underlying asthenosphere and subsiding farther below sea level. In those instances where the oceanic ridge and corresponding subduction zone are widely separated, the sea floor slopes away from the oceanic ridge to a depth over 2 miles greater at the subduction zone (Francheteau, 1983).

During the regression, the Farallon plate, which comprised the oceanic crust that lay east of, and was being generated by the spreading center along the crest of the East Pacific Rise, was moving eastward and plunging (subducting) under the western margin of the North American plate, where an oceanic trench (North American Trench or subduction zone) existed and beyond which the leading edge of the Farallon plate was being consumed in the asthenosphere (Anderson, 1971). Regional uplift of the southern and central California continental margin above sea level and, in the western Transverse Ranges block, deposition of nonmarine sediments comprising the Sespe Formation over marine sediments as the margin rode up the shallow gradient towards the East Pacific Rise (Lander, 1994a).

According to Ward (1991), the segment of the East Pacific Rise between the Pioneer and Murray fracture zones approached the oceanic trench off the coast of northwestern Mexico, presumably by Chron C19R (early middle Eocene; 42.6 million to 41.6 million years ago). Ward (1991) argued that subduction of the Farallon plate slowed dramatically or even stopped, at which time uplift of the continental margin occurred and major unconformities developed because of the difficulty subducting increasingly buoyant oceanic

crust. During the early middle Eocene, the western Transverse Ranges block was adjacent to northern Mexico (see above), and the beginning of the regression and deposition of the sediments comprising the lower member of the Sespe Formation in Simi Valley roughly 42.6 million years ago (beginning of Chron C19R) appears to coincide with the approach of the East Pacific Rise to the continental margin and the reduction in the subduction rate. Moreover, a major unconformity separates the Sespe Formation from the underlying marine Llajas Formation. Because one of the earliest occurrences of nonmarine deposition along the central and southern California continental margin during the early middle Eocene was in Simi Valley, it is probable the western Transverse Ranges block, particularly with regard to Simi Valley, was one of the areas of the margin closest to the East Pacific Rise.

During the late Oligocene (presumably during Chron C9, approximately 27.0 million to 28.25 million years ago), the East Pacific Rise finally collided with, or was overridden by that part of the continental margin now comprising the western Transverse Ranges block when the block was adjacent to that portion of northwestern Mexico currently situated near 32.5 degrees north latitude; following the initial collision event, the fore-arc basin and the drainage system depositing the sediments comprising all but the uppermost part of the Sespe Formation were disrupted as spreading and subduction ended along the lengthening contact zone, which reflected the transition from a zone of convergent and collisional tectonics to one of extension and right-lateral transform shear (Figures 1-4; see below; Anderson, 1971; Bohannon and others, 1994; Howard, 1988; Lander, 1994a; McLaughlin and Underwood, 1993). Extension (stretching) of the continental margin resulted from coupling and subsequent divergence of the margin and the Pacific plate, which lies northwest of, and is being generated in a northwesterly direction by remnants and newly developed segments of the East Pacific Rise spreading center north and south of the zone of contact (Figure 3; see Anderson, 1971). Extension caused the margin to break up along east-west-trending normal (extensional) faults (see Squires, this volume; north-south-trending after correcting for 90 degrees of crustal rotation; see below) oblique to the direction of extension. Ancient normal faults were active during deposition of the sediments comprising the uppermost part of the Sespe Formation (but not the overlying Vaqueros Formation) at Big Mountain (northern side of Simi Valley) (Dibblee, 1992b; Yeats, 1983). Normal faulting caused the development of parallel elongate fault-bounded basins and ridges, this development disrupting the fore-arc basin and the drainage system that had occupied the fore-arc basin and deposited the nonmarine sediments comprising all but the uppermost part of the Sespe Formation (see Howard, 1988, 1989). The Simi Valley area and the rest of the region now forming the western Transverse Ranges block became part of a large subsiding basin south of the emerging San Gabriel Mountains during deposition of the sediments comprising the uppermost part of the Sespe Formation and the overlying marine Vaqueros Formation (Lander, 1994a; see Howard, 1988, 1989). Deposition of marine sediments comprising the Vaqueros Formation over nonmarine sediments comprising the Sespe Formation records subsidence and the resulting marine transgression (Ingle, 1981; Lander, 1994a).

Extension also caused the margin to break up along more recently developed northwest-southeast-trending right-lateral-displacement faults (transform shear zones) related to and including the San Andreas and San Gabriel Faults (see below). The onset of widespread volcanism in southern and central California (including southern San Joaquin Valley; see above) approximately 25 million to 23 million years ago was an additional effect of extension.

Antarctic Glaciation

A pronounced global fall in sea level began in the early Oligocene (Chron C12R) and ended with a dramatic plunge just after the early-late Oligocene boundary during Chron C10N.1; the subsequent rise in sea level began during Chron C10N.1 and ended in the earliest Miocene during Chron C6BR (Haq and others, 1987) (see Figure 2). Recent revisions of the paleomagnetic polarity time scale (Cande and Kent, 1992) suggest the regression lasted from about 33 million until about 28.5 million years ago, the transgression from about 28.5 million until about 23 million years ago. Recent estimates for the magnitude of the sea level fall range from 100 to 650 feet (Hallam, 1992; Haq and others, 1987). These estimates indicate the excursion is the most pronounced documented in the Tertiary geologic record (Hallam, 1992; Haq and others, 1987; Vail and others, 1977). Fluctuations in Antarctic glaciation and ice cap volume during the Tertiary and the corresponding variations in sea level have been identified by some workers (for example, Hallam, 1992) as the causes for the global transgressive-regressive cycle documented in Oligocene rock unit sequences around the world.

An ice cap develops when precipitation falls on a continent at high latitudes during an interval of lower temperatures and, rather than flowing back to the ocean as water, is converted into glacial ice and trapped on the continent as part of the ice cap. The progressive growth of the ice cap results in a corresponding global (glacio-eustatic) fall in sea level, while melting of the ice cap leads to a corresponding global rise in sea level as glacial meltwater flows into the ocean (Vail and others, 1977). Melting of the modern Antarctic ice cap, for example, would cause a global rise in sea level of 200 to 250 feet (Hallam, 1992).

Bartek and others (1992) and Wise and others (1991) have recently assessed various lines of geologic and paleontologic evidence regarding development of an Antarctic ice cap during the Tertiary. The oldest Antarctic glacial debris (tillite deposits) underlies lava flows determined to be 49.4 million years (early Eocene) in age. Glaciers had grown sufficiently large to have reached the ocean by the late Eocene. An ice cap (or extensive ice sheets) began developing during the early Oligocene and attained its maximum volume, up to twice that of the modern ice cap according to one estimate, by the late Oligocene, when growth of the ice cap is presumed to have resulted in the dramatic global fall in sea level documented elsewhere. Glacial ice was present until the early Miocene, when the Antarctic continent deglaciated. Based on estimates for the volume of the late Oligocene ice cap and for sea level changes resulting from melting of the modern ice cap, fluctuations in development of the Tertiary Antarctic ice cap could have resulted in sea level changes up to 500 feet.

Ingle (1981), Howard (1988, 1989), Lander (1983), particularly with regard to the Sespe Formation, and Lander and Butcher (1984) suggested glaciation of the Antarctic continent and the accompanying global fall in sea level as the causes of the regression recorded in rock unit sequences of early middle Eocene to late Oligocene age along the southern and central California continental margin. Similarly, Lander (1983) and Lander and Butcher (1984) proposed deglaciation of the Antarctic continent and the corresponding rise in sea level, rather than collision of the California continental margin and the East Pacific Rise, as the causes for the subsequent transgression from the late Oligocene to early Miocene. The regressive-transgressive cycle is recorded in a number of rock unit sequences of similar age along the southern and central California continental margin (Lander and Butcher, 1984), the end of the regression and the beginning of the transgression appearing to have occurred in California at about the same time similar transitions occurred elsewhere in the world. Lander and Butcher (1984) argued that the end of the regression and the beginning of the transgression at one site appeared too similar in age to the transitions documented at other widely separated sites along the California continental margin to have been caused by a regional tectonic (collision) event, in which the transition should have occurred earliest nearest the point of initial contact and subsequent crustal extension.

Howard (1988, 1989) considered the unconformity between the middle and upper members of the Sespe Formation in Simi Valley and between the lower and upper parts of the Sespe Formation in the Santa Ynez Mountains and elsewhere in the western Transverse Ranges block to be the result of the pronounced glacio-eustatic drop in sea level that occurred during Chron C10N. However, paleontologic and paleomagnetic polarity data from the Sespe Formation in these areas indicate the unconformity is too old to have resulted from the glacio-eustatic event (see above; Figure 2).

Summary

Integration of geologic, paleomagnetic polarity, and paleontologic data have allowed a more refined calibration of the regressive-transgressive cycle than available previously, and permits correlation of each phase of the cycle with other calibrated geologic phenomena.

The initial phase of the regression in the western Transverse Ranges block and deposition of the sediments comprising the regressive lower and middle members of the Sespe Formation in the Simi Valley area began during the early middle Eocene, presumably by the beginning of Chron C19R, 42.6 million years ago (Lander, 1994a; see Figure 2). This phase of the regression appears to have been a regional phenomenon that occurred in response to a plate tectonic event--the approach and close proximity of the East Pacific Rise to the southern California portion of the North American plate margin, and possibly an accompanying dramatic decrease in the rate at which the Farallon plate was being subducted under the margin (Lander, 1994a; Nilsen, 1987; Ward, 1991). Alternatively, the initial phase of the regression also might be the result, at least in part, of another regional plate tectonic phenomenon--the overriding of progressively younger, hotter, more buoyant, and, therefore, shallower sea floor of the Farallon plate by the continental margin as the margin rode up a shallow gradient towards the topographic high created by the East Pacific Rise (Lander, 1994a). No global eustatic event appears to coincide with this phase of the regression. Moreover, Nilsen (1987) suggested that the effects of eustatic sea level changes would have been more uniform in their timing and more widespread than the observed effects.

The temporal gap represented by the unconformity separating the middle and upper members of the Sespe Formation in Simi Valley, on the other hand, seems to coincide with a pronounced late Eocene eustatic sea level lowstand of undetermined origin that spanned Chrons C17N to C13N, 36.65 to 33.05 million years ago (Lander, 1994a; Haq and others, 1987; Vail and others, 1977; however, see Prothero and others, in press; see Figure 2). There is no evidence this lowstand is a global glacio-eustatic event, but it is possible a regional reduction in the sea-floor spreading rate and a corresponding reduction in the volume and elevation of the affected spreading ridge might have caused a global lowstand in sea level (see Vail and others, 1977).

The final phase of the regression in the western Transverse Ranges block and deposition of the sediments comprising the lower regressive part of the upper member of the Sespe Formation in Simi Valley began during the early Oligocene, presumably just after the beginning of Chron C13N, 33.55 million years ago (Lander, 1994a; see Figure 2). This phase of the regression appears to correlate with an early Oligocene eustatic fall in sea level of undetermined origin that began near the beginning of Chron C12R and ended with the dramatic late Oligocene glacio-eustatic sea level lowstand that occurred during an Antarctic glacial maximum just before the end of Chron C10N.1 about 28.25 million years ago (Lander, 1994a; see Figure 2). Alternatively, the final phase of the regression again might be the result of the overriding of the Farallon plate (see above).

However, regressive sedimentation caused by these tectonic and eustatic events was imprinted on coastal fluvial deposition, which, even without uplift or a drop in sea level, would have caused the seaward or westward (southward after correcting for 90 degrees of crustal rotation; Prothero and others, 1992a, -b, in press) expansion of the alluvial coastal plain as the source area eroded and the fore-arc basin filled with fluvial sediments (Lander, 1994a).

The transgression in the western Transverse Ranges block and deposition of the sediments comprising the transgressive upper part of the upper member of the Sespe Formation began during the late Oligocene, presumably near the beginning of Chron C9R about 28.25 million years ago (Lander, 1994a; see Figure 2). This transgression appears to have occurred too rapidly, and its magnitude seems to have been too great to be the result of a glacio-eustatic rise in sea level (Lander, 1994a; see Hallam, 1992). Instead, the development of normal faults that offset strata within the Sespe Formation but not the overlying Vaqueros Formation in Simi Valley, and the occurrence of San Gabriel Mountains anorthosite clasts in the upper part of the upper member in Simi Valley and Canton Canyon suggest the transgression was a regional response to a plate tectonic event that occurred subsequent to the initial contact of the continental margin and the East Pacific Rise and as a result of the coupling of the margin with the Pacific plate--crustal extension of the margin as the margin and the Pacific plate diverged. Crustal extension, in turn, resulted in tectonic subsidence of that part of the continental margin now comprising the western Transverse Ranges block when the block was adjacent to that part of northwestern Mexico (after correcting for 190 miles of right-lateral-displacement along San Andreas and San Gabriel Faults) where the initial contact of the margin and the East Pacific Rise occurred (Bohannon and others, 1994; Lander, 1994a). The sediments comprising the upper part of the upper member of the Sespe Formation and the overlying marine rock units in the western Transverse Ranges block probably were deposited in a large, rapidly subsiding basin immediately south of the emerging San Gabriel Mountains, subsidence possibly occurring along a normal fault that subsequently developed right-lateral displacement and became the San Gabriel Fault (Lander, 1994a).

Crustal Rotation of Western Transverse Ranges Block Following Deposition of Sediments Comprising Sespe Formation

Paleocurrent and paleomagnetic polarity data indicate rivers depositing the sediments comprising the Sespe Formation flowed in a southerly direction; however, following deposition of these sediments about 28 million years ago and beginning during the early middle Miocene about 16 million years ago, the western Transverse Ranges block (including former fore-arc basin and present Simi Valley area) was gradually rotated 90 to 95 degrees in a clockwise direction so that the ancient river channels preserved in the Sespe Formation are now directed to the west (Figures 1, 3; Hornafius, 1985; Howard, 1988, 1989; Kamerling and Luyendyk, 1979; Luyendyk and others, 1980, 1985; Mason, 1988; Prothero and others, 1992a, -b; Taylor, 1983; see above). The block was transformed from a zone of extension and normal faulting to one of right-lateral shear between the rest of the North American plate to the northeast and the Pacific plate to the southwest (Luyendyk and others, 1980, 1985). Following collision of the East Pacific Rise and the North American plate, the North American plate was offset to the southeast along the right-lateral-displacement San Andreas Fault while the Pacific plate drifted in a northwesterly (right-lateral) direction, the intervening crustal segments of the continental margin now comprising the western Transverse Ranges block rotating in a clockwise direction in response to this right-lateral shear couple, rotation being accommodated by left-lateral displacement along previously existing normal (extensional) faults that developed during and/or after deposition of the sediments comprising the upper member of the Sespe Formation (Figure 9; see above). As a result of left-lateral displacement, these fault-bounded crustal segments comprising the fore-arc basin were offset relative to one another (see Figure 9).

Northwestward Translation Along Right-Lateral-Displacement Faults Following Deposition of Sediments Comprising Sespe Formation

Since inception of right-lateral offset (see Squires, this volume) along the San Andreas Fault and related faults (including San Gabriel Fault) to the southwest, the southern and central California continental margin, including the Simi Valley area, has been displaced in a northwesterly direction relative to the rest of North America, which lies on the opposite (northeastern) side of the San Andreas Fault, at the rate of about 0.5 inch per year (Anderson, 1971). Displacement has occurred because the continental margin is coupled to the Pacific plate, which is pulling the margin in a northwesterly direction at a rate approaching 2 inches per year relative to the rest of the North American plate (U.S. Geological Survey and Southern California Earthquake Center, 1994). During deposition of the sediments comprising the Sespe Formation, the Simi Valley area lay approximately 190 miles to the southeast relative to the area northeast of the fault (see Howard, 1988), and is pre-

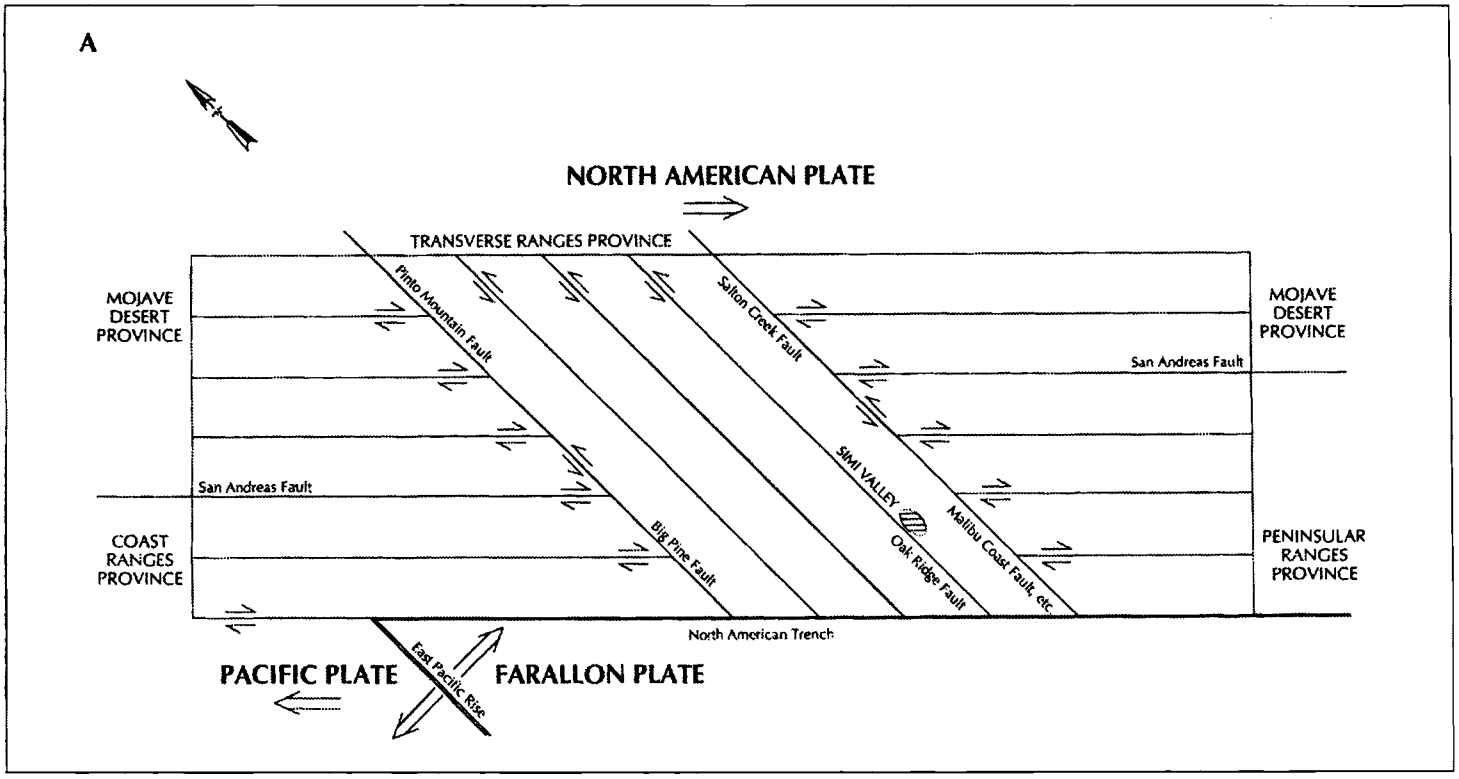

Figure 9A. Simplified diagrammatic representation of tectonic history of southern California. Modified from Luyendyk and others (1980, 1985). At initial contact of East Pacific Rise and southern California continental margin of North American plate approximately 28.25 million years ago (late Oligocene).

sumed to have been located in the area now occupied by northern Baja California. Continued movement along the San Andreas Fault and other active faults in southern California is responsible for the earthquake activity experienced in the Simi Valley area today.

Today, the continental margin (including all of California southwest of San Andreas Fault and Baja California), along with the Pacific plate, continues to be transported in a northwesterly direction towards the Aleutian Trench, which borders the southern edge of the Aleutian Islands chain and along

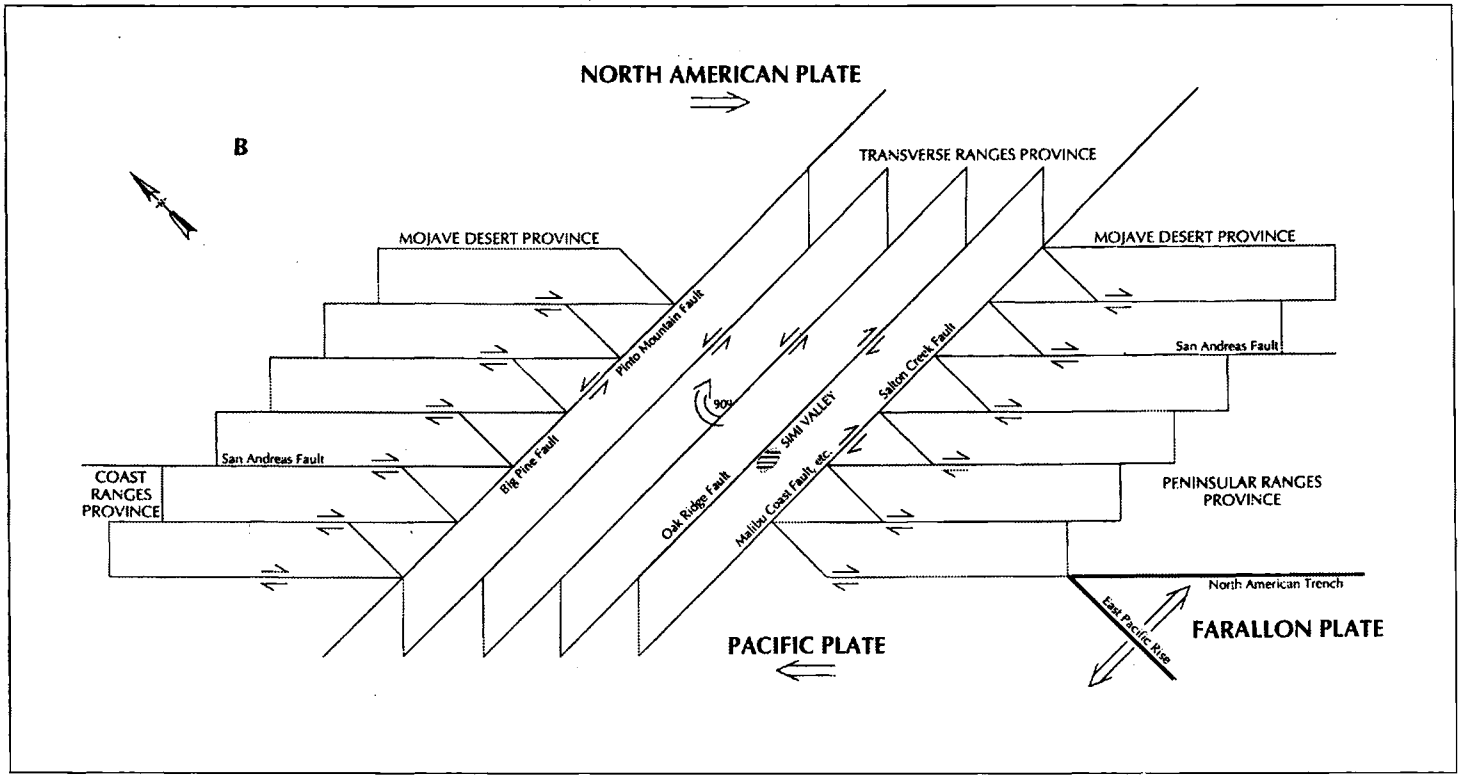

Figure 9B. Simplified diagrammatic representation of tectonic history of southern California. Modified from Luyendyk and others (1980, 1985). Subsequent to rotation of Transverse Ranges Province, prior to offset along San Andreas Fault.

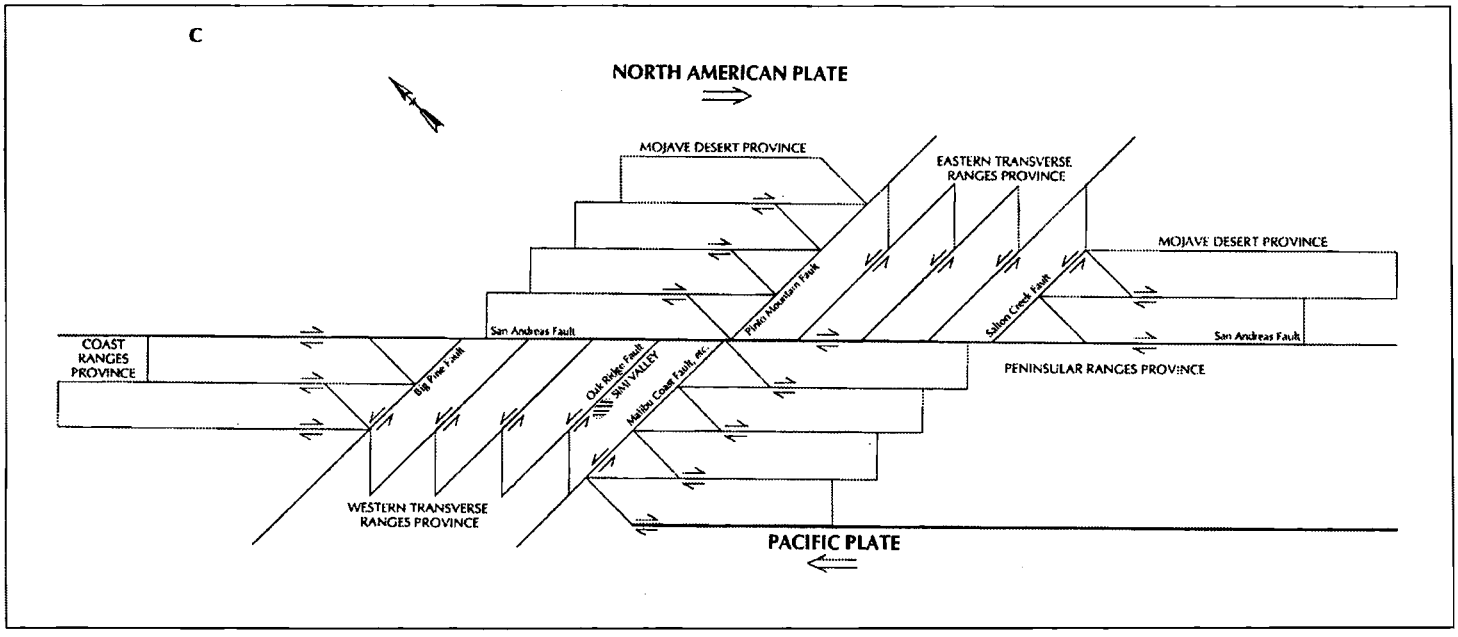

Figure 9C. Simplified diagrammatic representation of tectonic history of southern California. Modified from Luyendyk and others (1980, 1985). Subsequent to offset along San Andreas Fault.

which the Pacific plate is being subducted into the mantle. Eventually, the continental margin will form an island off the North American coast, finally encountering the Aleutian Trench and becoming attached (accreted) to that part of the North American plate forming the northern border of the trench.

Saugus Formation

The Saugus Formation (upper member of Saugus Formation of earlier workers) is composed of nonmarine sandstone and conglomerate beds representing the sand and gravel layers, respectively, deposited by rivers crossing a river delta during floods (Squires, this volume). Strata at the base of the rock unit interfinger with and are continuous with marine strata at the top of the underlying Pico Formation (lower member of Saugus Formation of earlier workers) at a number of places on the southern side of Big Mountain (see Dibblee, 1992a, -b; Squires, 1983, this volume), indicating a fluctuating coastline. Deposition of the nonmarine sediments comprising the Saugus Formation over the marine sediments of the Pico Formation reflects the final marine regression along the southern California continental margin as the Pacific Ocean withdrew from the Simi Valley area for the last time after an interval of marine deposition lasting approximately 26 million years (see above, below).

This final period of emergence, which continues today, reflects uplift resulting from regional north-south compression (shortening) of the southern California portion of the North American plate margin now occupied by the western Transverse Ranges block. Compression occurred during displacement of this part of the southern California continental margin westward (rather than northward) past the "big bend" of the San Andreas Fault, the "big bend", in turn, reflecting the diversion of the fault and the plate margin around the resistant masses formed by the Sierra Nevada and San Bernardino Mountains (Anderson, 1971; U.S. Geological Survey and Southern California Earthquake Center, 1994; see Figure 1). Compression results because the remainder of the plate margin (including Peninsular Ranges Province and Baja California) south of the western Transverse Ranges block, like the Pacific plate, continue to be transported in a more northerly direction, pushing the western Transverse Ranges block against the Sierra Nevada and San Bernardino Mountains, causing the east-west trending folds and reverse and thrust faults that characterize the block (Anderson, 1971; U.S. Geological Survey and Southern California Earthquake Center, 1994; see Squires, this volume; Figure 1). The recent Northridge earthquake occurred on one of these thrust faults, which extends under Simi Valley, and reflects continued compression of the western Transverse Ranges block.

The initial emergence of the Simi Valley area could also reflect, though only in part, the profound glaciations and corresponding glacio-eustatic drops in sea level that characterized the Pleistocene (Ice Ages) in the Northern Hemisphere (see above). The North American ice cap had grown sufficiently large by the late Pliocene to have reached as far south as Iowa, where glacial till is overlain by a volcanic ash bed determined to be 2.2 million years old (Lundelius and others, 1987). The glacial cycles recorded during the Pliocene and Pleistocene reflect predictable periodic changes in the tilt of the earth's axis of rotation and in the earth's orbit around the sun (Milankovitch cycles). These changes, in turn, affected the intensity of sun light hitting the earth's surface and the resulting global temperature. For example, a decrease in the tilt of the earth's axis would have resulted in a decrease in temperature and an increase in glacial ice in the Northern Hemisphere because of the failure of snow to melt during the summer (Webb and Rind, 1991). The buildup of glacial ice would have led to a glacio-eustatic fall in sea level (see above). Reliable estimates indicate sea level was approximately 400 feet lower than modern sea level during the Pleistocene (Hallam, 1992). However, regional tectonic uplift along the continental margin during the Pleistocene and Holocene was great enough to exceed the 400-foot rise in sea level resulting from melting of the Pleistocene ice cap that covered much of the Northern Hemisphere.

No age-diagnostic land mammal species are recorded from the Saugus Formation in Simi Valley, where only the fragmentary remains of a horse (presumably Equus; unnamed local fauna) have been reported (Raschke, 1991; see Figure 2). However, the occurrence of Pleistocene marine mollusks near the top of the underlying Pico Formation (Groves, 1991) indicate the rock unit is no older than Pleistocene (about 1.9 million years; see Cande and Kent, 1992). In the western Santa Clarita Valley north-northeast of Simi Valley, and in the northwestern San Fernando Valley to the east in western Los Angeles County, the Saugus Formation has yielded a diversity of land mammal species, including dog, cat, mastodon, tapir, horse, peccary, camel, pronghorn, deer, rabbit, gopher, and pack rat, as well as pond turtle and alligator lizard (Chen, 1988; Jefferson, 1991; Lander, 1988a, 1990; Saul, 1975; Whistler, 1991). Reynolds (1987) assigned the Porter Ranch Local Fauna from the San Fernando Valley to the Irvingtonian North American Land Mammal Age (latest Pliocene to middle Pleistocene), which began approxi-

mately 2.0 million years ago (beginning of Chron C2N) and ended approximately 280,000 years ago (see below).

A series of volcanic ashes have been found in the Pico Formation and in rock units that are the marine continuation of the Saugus Formation at South Mountain and on the slopes north of the Santa Clara River near Ventura; these ashes, which also have been found as far east as the Great Plains and Gulf Coast areas of the United States, have been determined to be approximately 1.9 million to 620,000 years in age and to have erupted from volcanic sources in northern Owens Valley of California and the Yellowstone National Park area of Wyoming (Lajoie and others, 1982; Yeats, 1988). One of these ashes (Bishop Ash), which resulted from an immense volcanic eruption in the northern Owens Valley approximately 777,000 to 762,000 years ago, has been recognized in the Saugus Formation on the northern side of the Santa Susana Mountains in the Santa Clarita Valley, 5 to 10 miles north-northeast of Simi Valley in northwestern Los Angeles County, where the top of the formation has been determined to be about 400,000 years in age (Izett and Obradovich, 1991; Treiman, 1982; Yeats, 1988). These data and paleontologic data from the Pico Formation in Simi Valley indicate the Saugus Formation in Simi Valley is Irvingtonian and less than 1.9 million to approximately 400,000 years (early to middle Pleistocene) in age. Identifiable land mammal remains from the Saugus Formation in Simi Valley could substantiate and refine estimates for the age of the formation.

Rotation of the western Transverse Ranges block continued during the Pleistocene. Paleomagnetic polarity data for the Saugus Formation in the Santa Clarita Valley indicate the block has rotated approximately 30 degrees in the last 2.2 million years (since end of Chron C2R.1N) and approximately 15 degrees in the last 780,000 years (since beginning of Chron CN1) (Levi and others, 1986; see Cande and Kent, 1992). Folding of the strata comprising the Saugus Formation may not have begun until after deposition of the sediments comprising the strata (Levi and others, 1986).

During the Pleistocene, the climate of much of North America, including California, though still temperate, was cooler, wetter, and milder than today, but quite unlike the tropical climate that existed over much of North America during the middle Eocene. The change from a tropical to a temperate climate reflects, in part, gradual northward movement of the North American plate from a tropical climatic belt or zone far to the south, to a temperate one as the result of continental drift (Gyllenhaal and others, 1991; see above). Modern climates of the Northern Hemisphere may only represent a brief interglacial period.

Older Alluvium

The older alluvium (terrace deposits of some workers) is separated from the underlying Saugus Formation by an unconformity (Figure 2), indicating renewed uplift of the Simi Valley area and erosion of the Saugus Formation before deposition of the older alluvium, which consists of sediments eroded from the Saugus Formation and the other underlying rock units in Simi Valley and subsequently transported and deposited by rivers and streams during floods (Squires, this volume). The older alluvium occurs as isolated erosional remnants across most of the southern side of Big Mountain, which has been uplifted relative to the floor of Simi Valley by late Quaternary offset along the north-sloping reverse-displacement Simi Fault (Hanson, 1983; Squires, 1983, this volume; Yeats, 1983; see Dibblee, 1992a, -b).

The older alluvium has yielded a small fauna (Big Mountain Local Fauna) containing large extinct Pleistocene (Ice Age) land mammal species, including Harlan's ground sloth (Glossotherium), two species of horse (Equus, including Equus [Equus] with anterior protoconal extension; see Downs and Miller, 1994), imperial mammoth (Mammuthus imperator), and an undetermined large ungulate (artiodactyl) in the Alamos Canyon and Brea Canyon areas (Jefferson, 1991; Lander, 1986; Lander and others, in preparation).

Some of the species from the older alluvium reflect periodic dispersal events from Asia or South America into North America during major glacial advances in the Northern Hemisphere, each glaciation resulting in a corresponding glacio-eustatic drop in sea level of roughly 400 feet (see above; Hallam, 1992; Haq and others, 1987; Vail and others, 1977) and the subsequent emergence of the Bering and Panamanian land bridges, which allowed invasion of North America by these and many other species (Lindsay and others, 1987; Lundelius and others, 1987; Woodburne, 1987). Glossotherium, for example, immigrated to North America from South America at the beginning of the late Blancan North American Land Mammal Age (late Pliocene), about 2.5 million to 2.7 million years ago, presumably during a major drop in sea level that occurred roughly 2.8 million years ago; Mammuthus, however, emigrated from Asia at the beginning of the succeeding Irvingtonian North American Land Mammal Age (latest Pliocene), which began about 2.0 million years ago (beginning of Chron C2N), Mammuthus imperator having existed in North America during the late Irvingtonian and succeeding earlier Rancholabrean North American Land Mammal Ages (early to late Pleistocene), approximately 1 million or 700,000 to 200,000 or 130,000 years ago (Agenbroad, 1984; Graham, 1986; Haq and others, 1987; Lindsay and others, 1987; Lundelius and others, 1987; Maglio, 1973; Vail and others, 1977; Woodburne, 1987). These data, as well as the apparent absence of Bison (see below) in the older alluvium and an age determination of roughly 400,000 years for the top of the Saugus Formation (see above) suggest the older alluvium is late Irvingtonian and roughly 400,000 to 280,000 years (middle Pleistocene) in age. Additional land mammal remains from the older alluvium in Simi Valley could allow changes to or refinement of these age estimates.

Younger Alluvium

The younger alluvium consists of the most recent nonmarine sediments, primarily sand and gravel, deposited by streams during floods. The younger alluvium overlies the older alluvium and underlies the floor of Simi Valley and its tributaries (see Dibblee, 1992a, -b; Squires, 1983, this volume; Figure 2).

No vertebrate fossil remains are recorded from the younger alluvium in Simi Valley. However, the younger alluvium has yielded the remains of large extinct Pleistocene land mammals (primarily ground sloths, horses, mastodons, mammoths, camels, and bison) at a number of fossil sites in the Simi Valley vicinity, including the northwestern and north-central San Fernando Valley, where the remains of a horse (Equus) were found only 3 feet below the surface in Chatsworth (see Jefferson, 1991; Lander, 1988b; Reynolds, 1987). The occurrence of North American buffalo (Bison) at some of these sites indicates the younger alluvium is partly late Pleistocene (Rancholabrean) in age. Bison appeared in California at the beginning of the Rancholabrean approximately 280,000 years ago, and is associated with columbian mammoth (Mammuthus columbi) (see Jefferson, 1991, 1992), which arose from the imperial mammoth 200,000 or 130,000 years ago (Agenbroad, 1984; Graham, 1986; Maglio, 1973; however, see Remeika and Jefferson, 1994, regarding age of first appearance of Mammuthus columbi) and went extinct at the end of the Pleistocene about 10,000 years ago. Bison entered North America from Asia across the Bering land bridge during the glacio-eustatic fall in sea level that occurred during the last glaciation of the Northern Hemisphere (see above), and its appearance in North America is defined as the beginning of the Rancholabrean North American Land Mammal Age (Lundelius and others, 1987; Woodburne, 1987). Therefore, it is presumed the Rancholabrean began about 280,000 years ago.

Most of the fossil sites in the younger alluvium were discovered below the surface in excavations for construction projects or aggregate. In Simi Valley, the younger alluvium, of modern (Holocene) age or less than 10,000 years old at the surface (Figure 2), could be old enough at depth to contain Rancholabrean land mammal remains.

The end of the Pleistocene (and Rancholabrean) is marked by the extinction of most larger land mammal species of the world, particularly herbivores, and diminishing average adult body size in successive generations of

smaller herbivores (Lander, 1988c; Lundelius and others, 1987). Many phenomena have been proposed to account for these faunal events, including overkill resulting from intense hunting by prehistoric humans, as well as severe climatic changes following the end of the last glaciation and the accompanying alterations of habitat and vegetation that lead to present conditions (Lander, 1988c; Lundelius and others, 1987). Lander (1988c) concluded that increasing aridity, particularly seasonal drought, that characterizes modern climates would have resulted in reduction of the vegetation the herbivores fed on. This reduction in turn would have caused the observed extinctions and changes in body size. Pleistocene extinctions remain an area of intense investigation and controversy.

ACKNOWLEDGEMENTS

The author wishes to acknowledge Scott Ellison and Kim Uhlich of the Ventura County Resource Management Agency Planning Division, Michael Kuhn of the City of Simi Valley Department of Community Development, and Michael Williams, Paul Spencer and Silvio Mode, formerly of the Waste Management of California, Inc., Simi Valley Landfill and Recycling Center, for their recognition of the scientific and educational importance of the paleontologic resources of Simi Valley. The Simi Valley Landfill and Recycling Center, in particular, has been generous in its support of the paleontologic resource impact mitigation program, which has been conducted at the landfill by PEAI personnel since 1987. Mr. Mark Roeder of Paleo Environmental Associates, Inc., has conducted most of the fieldwork for this program at the landfill. Dr. David Whistler of Paleo Environmental Associates, Inc., and formerly with the Natural History Museum of Los Angeles County Vertebrate Paleontology Section, with the assistance of Robert Reynolds of the San Bernardino County Museum Division of Earth Sciences, conducted the laboratory work for the program. Dr. Whistler and Dr. Thomas Kelly, also of the Vertebrate Paleontology Section, identified the specimens recovered by the program. Dr. Kelly has been responsible for most of the scientific publications on the specimens. Dr. Donald Prothero of the Occidental College Department of Geology allowed use of unpublished paleomagnetic polarity data for the Sespe Formation, some of which is presented in Prothero and others (in press). Eric Scott of the San Bernardino County Museum Division of Earth Sciences and George Jefferson of the Anza-Borrego Desert State Park identified the horse and mammoth species, respectively, from the older alluvium. Lisa I. Yoshisato completed the graphics. Preparation of this report was supported by Paleo Environmental Associates, Inc. (See appendix for literature cited.) □

1.0 PROJECT SUMMARY

1.1 PURPOSE AND SCOPE

SWCA Environmental Consultants was retained by Impact Sciences to conduct a paleontological field survey and assessment of the Hitch Ranch Specific Plan project located in the city of Moorpark, Ventura County, California. The scope of services included a comprehensive literature review and museum records search, a field survey, recommendations for mitigation measures, and preparation of this technical report.

1.2 DATES OF INVESTIGATION

The museum records search was performed on December 8, 2005. The paleontological field survey was conducted on January 5, 2006. This technical report was completed on February 10, 2006.

1.3 RESULTS OF INVESTIGATION

According to geological maps of the project area (Dibblee 1992), the Hitch Ranch Specific Plan project is immediately underlain by Late Quaternary Older Alluvium and the Plio-Pleistocene Saugus Formation. However, geotechnical studies conducted by Gorian and Associates, Inc. (2000) within the project area indicate the presence of Holocene (Recent) alluvium, colluvium and artificial fill underlain by Late Quaternary Older Alluvium. Collections records from the Natural History Museum of Los Angeles County (LACM) indicate the absence of known fossil localities within the project boundaries. Fossil localities have, however, been documented in the vicinity of the project. LACM (CIT) 560, the nearest documented site, is in a canyon southwest of the project area within surficial deposits of older Quaternary alluvium, and produced a specimen of fossil horse, *Equus*. Slightly south of LACM (CIT) 560 is LACM (CIT) 585, which produced an undetermined elephantoid tusk fragment from the Saugus Formation.

1.4 RECOMMENDATIONS

Recommendations presented in this report are based on the assumption that all of the geologic units mapped within the project area by various authors are present on site, either at the surface or at depth. Although shallow excavations will not negatively impact non-renewable fossil resources since young surficial sediments typically do not contain significant vertebrate fossils, the underlying Saugus Formation may also be impacted during grading. Therefore, if project-related excavations are deep enough to impact underlying older alluvial sediments and the paleontologically sensitive Saugus Formation, it is strongly recommended that a qualified paleontologist be retained to develop and implement a paleontological monitoring and mitigation program during such excavations within the Hitch Ranch project site.

1.5 DISPOSITION OF DATA

This report will be filed with Impact Sciences. A copy will be retained at SWCA Environmental Consultants, along with all maps, notes and data relevant to this project.

2.0 INTRODUCTION

This report presents the findings of a museum records search, comprehensive literature review, and field survey conducted in order to evaluate the paleontological sensitivity of geologic units underlying the Hitch Ranch Specific Plan project area located in the City of Moorpark, Ventura County, California. This study was performed to evaluate the paleontological sensitivity of the project area and vicinity, assess potential project-related impacts, and provide recommendations for project-specific mitigation measures in accordance with the professional guidelines established by the Society of Vertebrate Paleontology (SVP) (1995) and guidelines set forth by Ventura County.

2.1 DEFINITION AND SIGNIFICANCE OF PALEONTOLOGICAL RESOURCES

Paleontology is a multidisciplinary science that combines elements of geology, biology, chemistry, and physics in an effort to understand the history of life on earth. Paleontological resources, or fossils, are the remains, imprints, or traces of once-living organisms preserved in rocks and sediments. These include mineralized, partially mineralized, or unmineralized bones and teeth, soft tissues, shells, wood, leaf impressions, footprints, burrows, and microscopic remains. The fossil record is the only evidence that life on earth has existed for more than 3.6 billion years. Fossils are considered non-renewable resources because the organisms they represent no longer exist. Thus, once destroyed, a fossil can never be replaced. Fossils are an important scientific and educational resource because they are used to:

- Study the phylogenetic relationships between extinct organisms, as well as their relationships to modern groups.
- Elucidate the taphonomic, behavioral, temporal, and diagenetic pathways responsible for fossil preservation, including biases in the fossil record.
- Reconstruct ancient environments, climate change, and paleoecological relationships.
- Provide a measure of relative geologic dating, which forms the basis for biochronology and biostratigraphy, and which is an independent and supporting line of evidence for isotopic dating.
- Study the geographic distribution of organisms and tectonic movements of land masses and ocean basins through time.
- Study patterns and processes of evolution, extinction, and speciation.
- Identify past and potential future human-caused effects to global environments and climates.

3.0 RESOURCE ASSESSMENT GUIDELINES

Paleontological resources are limited, non-renewable resources of scientific, cultural and educational value, and are afforded protection under federal (National Environmental Policy Act, or NEPA), state (California Environmental Quality Act, or CEQA), and local (County of Ventura) laws and regulations. This study satisfies project requirements in

accordance with CEQA (13 PRC, 2100 et seq.) and complies with guidelines and significance criteria specified by the SVP (SVP, 1995).

3.1 LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Fossils are classified as non-renewable scientific resources and are protected by various laws, ordinances, regulations, and standards (LORS) across the country. The SVP (1995) has established professional standards for the assessment and mitigation of adverse impacts to paleontological resources. This paleontological assessment was conducted in accordance with the LORS applicable to paleontological resources within the project area.

3.2 PROFESSIONAL STANDARDS

The Society of Vertebrate Paleontology's Conformable Impact Mitigation Guidelines Committee has established standard guidelines (SVP, 1995) that outline professional protocols and practices for conducting paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, and specimen preparation, identification, analysis, and curation. Most practicing professional vertebrate paleontologists adhere closely to the SVP's assessment, mitigation, and monitoring requirements as specifically provided in its standard guidelines. Most state regulatory agencies with paleontological LORS accept and utilize the professional standards set forth by the SVP.

As defined by the SVP (1995:26), significant nonrenewable paleontological resources are defined as:

> ...fossils and fossiliferous deposits here restricted to vertebrate fossils and their taphonomic and associated environmental indicators. This definition excludes invertebrate or paleobotanical fossils except when present within a given vertebrate assemblage. Certain invertebrate and plant fossils may be defined as significant by a project paleontologist, local paleontologist, specialists, or special interest groups, or by lead agencies or local governments.

As defined by the SVP (1995:26), significant fossiliferous deposits are defined as:

> A rock unit or formation which contains significant nonrenewable paleontologic resources, here defined as comprising one or more identifiable vertebrate fossils, large or small, and any associated invertebrate and plant fossils, traces and other data that provide taphonomic, taxonomic, phylogenetic, ecologic, and stratigraphic information (ichnites and trace fossils generated by vertebrate animals, e.g., trackways, or nests and middens which provide datable material and climatic information). Paleontologic resources are considered to be older than recorded history and/or older than 5,000 years [before present].

Based on the significance definitions of the SVP (1995), all identifiable vertebrate fossils are considered to have significant scientific value. This position is adhered to because vertebrate fossils are relatively uncommon, and only rarely will a fossil locality yield a statistically significant number of specimens of the same genus. Therefore, every vertebrate fossil found has the potential to provide significant new knowledge in one of the following areas.

- **Taxonomy** - fossils that are scientifically judged to be important for representing rare or unknown taxa, such as defining a new species.
- **Evolution** – fossils that are scientifically judged to represent important stages or links in evolutionary relationships, or fill gaps or enhance under represented intervals in the stratigraphic record.
- **Biostratigraphy** – fossils that are scientifically judged to be important for determining or constraining relative geologic (stratigraphic) age, or for use in regional to interregional stratigraphic correlation problems.
- **Paleoecology** – fossils that are scientifically judged to be important for reconstructing ancient organism community structure and interpretation of ancient sedimentary environments.
- **Taphonomy** – fossils that are scientifically judged to be exceptionally well or unusually/uniquely preserved, or are relatively rare in the stratigraphy.

3.3 PALEONTOLOGICAL SENSITIVITY

As indicated by the SVP's definition of fossiliferous deposits, there is a direct correlation between fossils and the geologic formation in which they are preserved. This is because "...paleontologic sites...indicate that the containing sedimentary rock unit or formation is fossiliferous. The limits of the entire rock formation, both areal and stratigraphic, therefore define the scope of the paleontologic potential in each case." This is contrary to archaeological sites, where "the boundaries of archaeological sites define the areal extent of the resource." For this reason, "it is extremely important to distinguish between archaeological and paleontological (fossil) resource sites when defining the sensitivity of rock units."

Therefore, paleontological sensitivity is defined as the potential for a geologic unit to produce scientifically significant fossils. The level of sensitivity is determined by rock type, past history of the geologic unit in producing significant fossils, and fossil localities that are recorded from that unit. Paleontological sensitivity is derived from the known fossil data collected from the entire geologic unit, not just from a specific location. In its "standard guidelines for the assessment and mitigation of adverse impacts to non-renewable paleontologic resources," the SVP (1995:23) defines three categories of paleontological sensitivity (potential) for rock units: high, low, and undetermined:

- **High Potential.** Rock units from which vertebrate or significant invertebrate fossils or suites of plant fossils have been recovered and are considered to have a high potential for containing significant non-renewable fossiliferous resources. These units include, but are not limited to, sedimentary formations

and some volcanic formations that contain significant non-renewable paleontologic resources anywhere within their geographical extent and sedimentary rock units temporally or lithologically suitable for the preservation of fossils. Sensitivity comprises both (a) the potential for yielding abundant or significant vertebrate fossils or for yielding a few significant fossils, large or small, vertebrate, invertebrate, or botanical, and (b) the importance of recovered evidence for new and significant taxonomic, phylogenetic, ecologic, or stratigraphic data. Areas which contain potentially datable organic remains older than Recent, including deposits associated with nests or middens, and areas which may contain new vertebrate deposits, traces, or trackways are also classified as significant.

- **Low Potential**. Reports in the paleontological literature or field surveys by a qualified vertebrate paleontologist may allow determination that some areas or units have low potentials for yielding significant fossils. Such units will be poorly represented by specimens in institutional collections.
- **Undetermined Potential**. Specific areas underlain by sedimentary rock units for which little information is available are considered to have undetermined fossiliferous potentials.
- **No Potential**. Metamorphic and granitic rock units do not yield fossils and therefore have no potential to yield significant non-renewable fossiliferous resources.

Furthermore, all geologic units in which vertebrate fossils have previously been found are considered to have high sensitivity. Identifiable plant and invertebrate fossils are considered significant if found in association with vertebrate fossils, or if defined as significant by project paleontologists, specialists, or local government agencies.

Full-time monitoring is generally recommended during any project-related ground disturbance in highly potential geologic units, whereas part-time monitoring is recommended for geologic units with a low potential. Protection or salvage efforts will not generally be required for units with no potential. Field surveys by a qualified vertebrate paleontologist should be conducted in units with undetermined potential to specifically identify the paleontologic potential of the rock units within the study area.

4.0 PROJECT LOCATION AND DESCRIPTION

The Hitch Ranch project area is located in the City of Moorpark, Ventura County, California (Figure 1). The 283.2-acre project site is approximately 1,600 feet west of Moorpark Avenue (State Route 23) at its intersection with Casey Road. The southern boundary of the area is approximately parallel with Poindexter Avenue, and the project extends west beyond Gabbert Road.

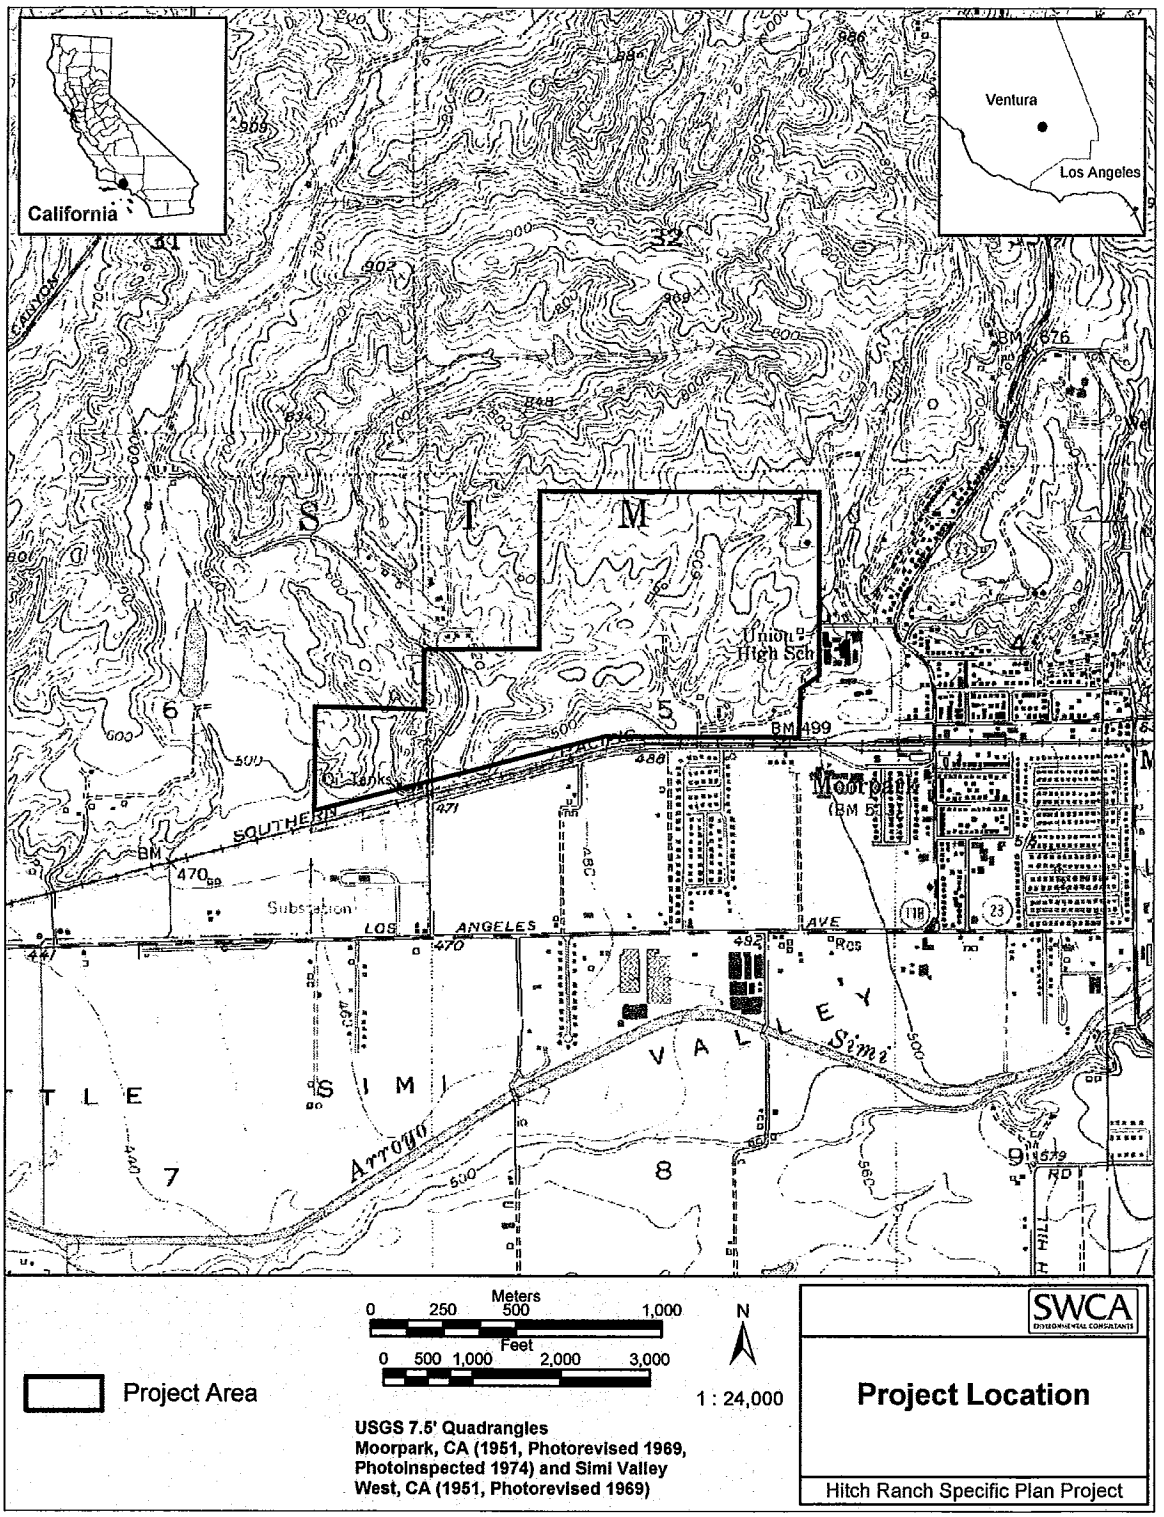

Figure 1. Project Location Map

4.1 GEOLOGY AND PALEONTOLOGY

Previous geologic mapping of the project area indicates the presence of Late Quaternary Older Alluvium and the underlying Plio-Pleistocene Saugus Formation (Dibblee 1992) within the project area. However, it should be noted that geotechnical studies conducted at the project site instead report the composition of the surficial sediments as Late Quaternary Older Alluvium and Holocene (Recent) alluvium, colluvium and artificial fill (Gorian and Associates Inc. 2000). Core samples taken from Hitch Ranch indicate that the Plio-Pleistocene Saugus Formation is present beneath the Older Alluvium. Thus, the Saugus Formation may be impacted during grading of the proposed project area

The controversy over the Saugus Formation/Older Alluvium has been ongoing for more than 75 years. In fact there has been considerable debate in the scientific community since 1924 as to whether the Saugus Formation is exposed in the hills of the project site as mapped by Dibblee (1992), or if the units outcropping in the hills are actually Late Quaternary Older Alluvium. Unfortunately due to heavy vegetation, no geologic units were exposed at Hitch Ranch during this field survey. Therefore, this question remains out of this scope of study and will not be addressed in this report. However, recommendations presented in this report are based on the assumption that all of the geologic units mapped for Hitch Ranch by various authors are present on site, either at the surface or at depth.

4.1.1 SAUGUS FORMATION

The oldest formation within the project area is the Plio-Pleistocene (2.5 million to 200,000 years old) Saugus Formation, which is potentially exposed in the hills of the project area (Dibblee 1992), and is underlying Older Alluvium in the western portion of Hitch Ranch (Gorian and Associates, Inc 2000).

The Saugus Formation is divided into lower and upper members, although only the Upper Saugus Formation is present in the project area. The lower member of the Saugus is composed of marine conglomerates, sandstones, siltstones and coquinites, and is well known for its marine invertebrate fossil localities (Squires and White 1983, White 1983). The upper member of the Saugus Formation, which is present within the project area, is composed of coarse-grained nonmarine conglomerates and sandstones (Levi et al. 1983).

The Upper Saugus Formation in the Moorpark area is well known for several Pleistocene large mammal fossil sites. These localities have produced a wide diversity of animals including mastodons, tapirs, horses and camels. The Saugus Formation is considered to have high paleontologic sensitivity due to its very high potential to produce significant non-renewable paleontologic resources in the Moorpark area (Lander 1997).

4.1.2 LATE QUATERNARY OLDER ALLUVIUM

Geologic mapping (Dibblee 1992) of the project area indicates that Late Quaternary older alluvial deposits are exposed in the valleys of the Hitch Ranch project area. Other

workers designate the rock units exposed in the hills of Hitch Ranch as Late Quaternary (Pleistocene) Older Alluvium (Impact Sciences EIR 2000). The Older Alluvium at Hitch Ranch is composed of up to 36 feet of interbedded, lenticular yellowish-brown sand, light yellowish-brown silt and yellowish-brown clay that often contain clasts from the underlying Modelo Formation. Current data indicates that the Older Alluvium in the Moorpark area is Middle Pleistocene (400,000 to 280,000 years old) (Lander 1997). However the occurrence of bison remains found at several localities in the Moorpark area indicates that some Older Alluvium may have been deposited in the Late Pleistocene (280,000 to 10,000 years old) (Lander 1997).

Due to its high potential to produce significant non-renewable paleontologic resources, Pleistocene Older Alluvium has been assigned high paleontologic sensitivity throughout Southern California (Reynolds and Reynolds 1991). The Older Alluvium in the Moorpark area has yielded the remains of several large Pleistocene land mammal species, including Harlan's ground sloth, two species of horses, and the remains of an imperial mammoth (Lander 1997).

4.1.3 RECENT ALLUVIUM, COLLUVIUM AND ARTIFICIAL FILL

Geotechnical studies performed by Gorian and Associates, Inc. for the Hitch Ranch Specific Plan project indicate that some of the surficial sediments overlying the Saugus Formation and Older Pleistocene alluvium in the project area are Holocene (Recent) alluvial stream deposits, colluvium and artificial fill (Impact Sciences EIR 2000). Holocene deposits are too young to contain fossils and are thus classified as low sensitivity sediments. The uppermost younger alluvial deposits are determined to have a low paleontological sensitivity rating; however, according to SVP guidelines, geologic units greater than 5,000 years old may contain fossilized material. Therefore, the paleontological sensitivity of the young alluvial sediments mapped within the project site increases with age (i.e., depth).

5.0 METHODS

A paleontological reconnaissance survey of the 283.2-acre parcel was conducted on January 5, 2006. The fieldwork consisted of a thorough pedestrian inspection of the study area for (1) surface fossils, (2) exposures of potentially fossil-bearing geologic units, and (3) areas in which fossil-bearing geologic units could be exposed during pre-construction grading activity.

5.1 MUSEUM RECORDS SEARCH

A detailed review of museum collections records of the Los Angeles County Museum (LACM) was performed for the purposes of: (1) determining whether there are any known fossil localities in or near the project area, (2) identifying the geologic units present in the project area, and (3) determining the paleontological sensitivity ratings of those geologic units in order to assess potential impacts to nonrenewable paleontological

resources. Published and unpublished literature and geologic maps were reviewed, and mitigation measures specific to this project were developed in accordance with the SVP professional standards and guidelines (1995).

5.2 PROJECT PERSONNEL

Jessica DeBusk conducted the museum records search. Cara Corsetti, Qualified Paleontologist and Paleontology Program Director, conducted the field survey with Lori Browne, primary author of this technical report. Heather Timmons produced graphics.

6.0 RESULTS AND ANALYSIS

The following table summarizes the paleontological sensitivity ratings of the geologic units underlying the Hitch Ranch Specific Plan project area.

Geologic Formation	Age	Fossils	Paleontological Sensitivity	Monitoring Recommendation
alluvium, colluvium, and fill	Holocene	none	low to high	part-time to full-time
older alluvium	Pleistocene-Holocene	terrestrial vertebrates	high	full-time
Saugus Formation	Plio-Pleistocene	marine invertebrates, terrestrial vertebrates	very high	full-time

Table 1. Paleontological Sensitivities of Geologic Units Within the Hitch Ranch Project Area

The search of the LACM collections records indicated the absence of documented fossil localities within the project area. Fossil localities have, however, been documented in the vicinity of the project. LACM (CIT) 560, the nearest documented site, is in a canyon southwest of the project area within surficial deposits of older Quaternary alluvium, and produced a specimen of fossil horse, *Equus*. Slightly south of LACM (CIT) 560 is LACM (CIT) 585, which produced an undetermined elephantoid tusk fragment from the Saugus Formation.

7.0 CONCLUSIONS

Adverse impacts on paleontological resources result when rock units become unavailable for study and observation by scientists. The destruction of fossils as a result of human-induced ground disturbance has a significant impact as it makes biological records of ancient life permanently unavailable for study by scientists. Implementation of proper mitigation measures can, however, reduce the impacts to the paleontological resources to below the level of significance.

Due to the high paleontological sensitivity of the Plio-Pleistocene Saugus Formation and the older Quaternary alluvium, excavations in these units within the Hitch Ranch project area are likely to have a negative impact on non-renewable paleontological resources unless proper mitigation measures are implemented. The surficial Holocene alluvium is too young to contain nonrenewable scientific resources and thus does not require close paleontological monitoring.

8.0 RECOMMENDED MITIGATION MEASURES

The following mitigation measures have been developed in accordance with the SVP (1995) standards and Ventura County guidelines, and meet the paleontological requirements of CEQA. These mitigation measures have been used throughout California and have been demonstrated to be successful in protecting paleontological resources while allowing timely completion of construction.

1. All project-related ground disturbances that could potentially impact the Saugus Formation and Quaternary older alluvium will be monitored by a qualified paleontological monitor on a full-time basis, as these geologic units are determined to have a high paleontological sensitivity rating. Since younger alluvial and colluvial deposits are considered to have a low paleontological sensitivity, monitoring of excavation activities in this unit will be conducted on a part-time basis to ensure that no underlying sensitive units are being impacted.
2. A Qualified Paleontologist will be retained to supervise monitoring of construction excavations and to produce a mitigation plan for the proposed project. Paleontological monitoring will include inspection of exposed rock units during active excavations. The monitor will have authority to temporarily divert grading away from exposed fossils in order to professionally and efficiently recover the fossil specimens and collect associated data. The Qualified Paleontologist will prepare monthly progress reports to be filed with the client and the lead agency.
3. At each fossil locality, field data forms will be used to record pertinent geologic data, stratigraphic sections will be measured, and appropriate sediment samples collected and submitted for analysis.
4. Recovered fossils will be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and reposed in a designated paleontological curation facility. Potential repositories include the Natural History Museum of Los Angeles County and the San Bernardino County Museum.
5. The Qualified Paleontologist will prepare a final monitoring and mitigation report to be filed with the client, the lead agency, and the repository.

FIRSTCARBON SOLUTIONS™

DANA DOUGLAS DePIETRO, PH.D.—Cultural Resources Lead (North)

OVERVIEW

- More than 15 Years' Experience in Archaeology and Cultural Resources

Education

- Ph.D., Near Eastern Art and Archaeology, University of California at Berkeley, 2012
- M.A., Near Eastern Art and Archaeology, University of California at Berkeley, 2005
- B.A., Archaeology and History (double major), University of California at San Diego, 2002

Fellowships and Awards

- Albright Institute Educational and Cultural Affairs Fellowship (2015)
- Katherine Davis Foundation Projects for Peace Prize (2012)
- International House Gateway Fellowship (2011-2012)
- The George Franklin Dales Foundation Fellowship for Archaeological Research (2011)
- CAORC Multi-Country Dissertation Research Fellowship (2010)

Dana DePietro, Ph.D. is a Registered Professional Archaeologist who meets the Secretary of Interior's standards for historic preservation programs in archaeology. Dr. DePietro has over 15 years of experience in all aspects of cultural resource management, including prehistoric and historic archaeology, paleontology, materials conservation, history of art and architecture, and community engagement. He has experience in compliance with the National Environmental Policy Act (NEPA), the California Environment Quality Act (CEQA), the National Historic Preservation Act (NHPA), and the Archaeological Resources Protection Act (ARAP). Dr. DePietro has completed cultural resource projects that have involved agency, client, Native American, and subcontractor coordination; treatment plans and research design development; archival research; field reconnaissance; site testing; data recovery excavation; construction monitoring; site recordation; site protection/preservation, mapping/ cartography; spatial analysis/GIS; laboratory analysis; materials conservation; artifact curation and exhibition; and report production. He has completed projects in California within the jurisdiction of the Bureau of Land Management (BLM) and other federal agencies requiring compliance with Section 106 of the NHPA. He has also completed projects throughout California under CEQA for state and local governments and municipalities, including the California Department of Transportation (Caltrans) and has worked with clients to insure deliverables meet and exceed the standards set by the State Historic Preservation Office (SHPO).

RELATED EXPERIENCE AND CLIENT SUMMARY

FirstCarbon Solutions

As the Lead Archaeologist/Cultural Resource Specialist for FCS, Dr. DePietro conducts evaluations and performs field documentation of historic and prehistoric cultural resources; prepares environmental impact reports (EIRs), cultural resources assessments (CRAs), DPR forms and Section 106 reports; conducts mapping, GIS analysis, and state and county record searches; leads archaeological surveys and field monitoring efforts; and coordinates with state, federal and tribal officials and institutions for a variety of FCS projects, including the following:

DANA DOUGLAS DePIETRO, PH.D.—Cultural Resources Lead (North)

- Atherton Baptist Homes Master Plan/Phase II, City of Alhambra, Los Angeles County
- Biological and Cultural Resources Assistance 140-Acre Project Site Woodcrest, Riverside County, CA

Other Relevant Experience

The Society for Humanitarian Archaeological Research and Exploration

Dr. DePietro is the Founder and Executive Director of The Society for Humanitarian Archaeological Research and Exploration. He manages the projects, staff, and the daily operation of this not-for-profit organization. Dr. DePietro likewise establishes relationships with partner universities and institutions, writes grant proposals, supervises fundraising projects, and maintains accounts, financial records, and the organization's online presence.

University of California at Berkeley

Dr. DePietro was a lecturer at the University of California, Berkeley from August 2003 to January 2015. During his tenure, he prepared University-level source and lectures in the history of the modern and ancient Middle East, performed student advising and evaluation, and university administrative duties. Dr. DePietro provided resources and opportunities that empower people to critically engage with other cultures as well as with their own communities.

DANA DOUGLAS DePIETRO, PH.D.—Cultural Resources Lead (North)

Penn State University—Tel Akko Total Archaeology Project

Dr. DePietro was the Director of Community Engagement from 2013 to 2014 at the Penn State University for the Tel Akko Total Archaeology Project. He developed and executed a community engagement program, supervised staff and community participants, taught excavation and conservation techniques to groups of young people in Akko, and performed outreach, dialogue, and program developments in partnership[with community leaders.

Harvard University—Leon Levy Expedition to Ashkelon, Israel

Dr. De Pietro was the excavation supervisor during the summers of 2007-2013 for the Harvard University—Leon Levy Expedition to Ashkelon, Israel. He supervised the excavation and stratagraphic interpretation and instructed students in excavation techniques, data collection, photography, analysis, and publication.

Early Iron Age Cemetery Excavation—Dhamar, Yemen

Dr. De Pietro was the Area Supervisor during the summer of 2004 for the Early Iron Age Cemetery Excavation in Dhamar, Yemen. He supervised the excavation and stratagraphic interpretation, taught excavation techniques, strategy and implementation, field conservation, surveying techniques, data collection and analysis, and site management.

Journal of Associated Graduates in Near Eastern Studies (JAGNES)

Dr. DePietro was the Associate Editor from August 2003 to May 2012 for the Journal of Associated Graduates in Near Eastern Studiers (JAGNES). He solicited and proofread submissions, fundraising, and advertisements.

"Travel Today: Egypt" Magazine

Dr. De Pietro was an Archaeological Correspondent from December 2002 to February 2005. He wrote magazine articles, conducted relevant interviews and research, and procured photos and images to compliment articles.

J. D. STEWART, PHD—PRINCIPAL PALEONTOLOGIST

Other Relevant Experience

Tenaska Imperial Solar Energy Center (ISEC) West Project, Imperial Valley, CA

For the Tenaska Imperial Solar Energy Center West Solar Project, Dr. Stewart supervised paleontological monitoring activities on private lands.

BrightSource Sonoran West Solar Project, Blythe, CA

Dr. Stewart supervised paleontological surveys on the U.S. Bureau of Land Management (BLM) and private lands. He worked on the Application for Certification (AFC) and wrote the final report when the project was terminated.

TerraGen Project

Dr. Stewart performed pedestrian paleontological surveys of the TerraGen Project site and wrote the Paleontological Resources section for the AFC.

BrightSource Rio Mesa Solar Project, Blythe, CA

Dr. Stewart supervised paleontological surveys on BLM and private lands, and prepared the Paleontological Resources section for the AFC.

Pio Pico Energy Center, Otay Mesa, CA

The Pio Pico Energy Center is a 300 MW simple-cycle electrical generating facility that is contracted under a 25-year power purchase agreement with San Diego Gas & Electric. Pio Pico is located on a 10-acre site in Otay Mesa, an unincorporated area of San Diego County, California, approximately 15 miles southeast of downtown San Diego. Dr. Stewart supervised paleontological surveys and wrote the Paleontological Resources section for the AFC for this project.

Mesquite Nevada Replacement General Aviation Airport, Clark County, NV

Dr. Stewart prepared the Paleontological Resource Assessment for the Federal Aviation Administration.

Marsh Landing Generating Station Application for Certification, Contra Costa County, CA

Dr. Stewart performed a paleontological pedestrian survey of a project area in Contra Costa County and wrote the Paleontological Resources section of the AFC. He also served as the Paleontological Resource Specialist during construction and prepared the final report.

Imperial Valley Solar Application for Certification, Imperial Valley, CA

Dr. Stewart directed paleontological pedestrian surveys within a project area in San Bernardino County and wrote the Paleontological Resources section of the AFC.

Calico Solar Application for Certification, San Bernardino County, CA

Dr. Stewart participated in paleontological pedestrian surveys of the Calico Solar project area, edited the Paleontology section of the AFC, and served as the Paleontological Resource Specialist.

J. D. STEWART, PHD—PRINCIPAL PALEONTOLOGIST

Starwood Power-Midway, LLC Peaking Project Construction

Dr. Stewart wrote a mitigation plan for paleontological resources, oversaw paleontological monitoring during project construction, and wrote the final report.

Calnev Pipeline Project, San Bernardino County, CA and Clark County, NV

Dr. Stewart directed paleontological surveys of a 234-mile-long project area in San Bernardino County, California and Clark County, Nevada. He also prepared the paleontological assessment.

Willow Pass Generating Station Application for Certification, Contra Costa County, CA

Dr. Stewart participated in paleontological pedestrian surveys of a project area in Contra Costa County and wrote the Paleontological Resources section of the AFC.

San Joaquin One and Two Application for Certification, Fresno County, CA

Dr. Stewart directed paleontological pedestrian surveys of a project area in Fresno County and prepared the Paleontological Resources section of the AFC.

Carrizo Energy Solar Farm (Ausra) Application for Certification, Simmler, CA

Dr. Stewart participated in paleontological pedestrian surveys of the Carrizo Energy Solar Farm project area and edited the Paleontology section of the AFC.

Starwood Power-Midway, LLC Peaking Project Application for Certification

Dr. Stewart participated in the responses to the CEC Provisional Staff Assessments for Starwood Power-Midway, LLC's Peaking Project AFC.

Path 15 500-kV Power Transmission Line between Los Banos and Gates Substations, Los Banos, CA

Dr. Stewart supervised paleontological resource monitoring, excavations, specimen preparation, specimen identification, and report writing for this 80-mile-long power line.

1.0 PROJECT SUMMARY

1.1 PURPOSE AND SCOPE

SWCA Environmental Consultants was retained by Impact Sciences to conduct a paleontological field survey and assessment of the Hitch Ranch Specific Plan project located in the city of Moorpark, Ventura County, California. The scope of services included a comprehensive literature review and museum records search, a field survey, recommendations for mitigation measures, and preparation of this technical report.

1.2 DATES OF INVESTIGATION

The museum records search was performed on December 8, 2005. The paleontological field survey was conducted on January 5, 2006. This technical report was completed on February 10, 2006.

1.3 RESULTS OF INVESTIGATION

According to geological maps of the project area (Dibblee 1992), the Hitch Ranch Specific Plan project is immediately underlain by Late Quaternary Older Alluvium and the Plio-Pleistocene Saugus Formation. However, geotechnical studies conducted by Gorian and Associates, Inc. (2000) within the project area indicate the presence of Holocene (Recent) alluvium, colluvium and artificial fill underlain by Late Quaternary Older Alluvium. Collections records from the Natural History Museum of Los Angeles County (LACM) indicate the absence of known fossil localities within the project boundaries. Fossil localities have, however, been documented in the vicinity of the project. LACM (CIT) 560, the nearest documented site, is in a canyon southwest of the project area within surficial deposits of older Quaternary alluvium, and produced a specimen of fossil horse, *Equus*. Slightly south of LACM (CIT) 560 is LACM (CIT) 585, which produced an undetermined elephantoid tusk fragment from the Saugus Formation.

1.4 RECOMMENDATIONS

Recommendations presented in this report are based on the assumption that all of the geologic units mapped within the project area by various authors are present on site, either at the surface or at depth. Although shallow excavations will not negatively impact non-renewable fossil resources since young surficial sediments typically do not contain significant vertebrate fossils, the underlying Saugus Formation may also be impacted during grading. Therefore, if project-related excavations are deep enough to impact underlying older alluvial sediments and the paleontologically sensitive Saugus Formation, it is strongly recommended that a qualified paleontologist be retained to develop and implement a paleontological monitoring and mitigation program during such excavations within the Hitch Ranch project site.

1.5 DISPOSITION OF DATA

This report will be filed with Impact Sciences. A copy will be retained at SWCA Environmental Consultants, along with all maps, notes and data relevant to this project.

2.0 INTRODUCTION

This report presents the findings of a museum records search, comprehensive literature review, and field survey conducted in order to evaluate the paleontological sensitivity of geologic units underlying the Hitch Ranch Specific Plan project area located in the City of Moorpark, Ventura County, California. This study was performed to evaluate the paleontological sensitivity of the project area and vicinity, assess potential project-related impacts, and provide recommendations for project-specific mitigation measures in accordance with the professional guidelines established by the Society of Vertebrate Paleontology (SVP) (1995) and guidelines set forth by Ventura County.

2.1 DEFINITION AND SIGNIFICANCE OF PALEONTOLOGICAL RESOURCES

Paleontology is a multidisciplinary science that combines elements of geology, biology, chemistry, and physics in an effort to understand the history of life on earth. Paleontological resources, or fossils, are the remains, imprints, or traces of once-living organisms preserved in rocks and sediments. These include mineralized, partially mineralized, or unmineralized bones and teeth, soft tissues, shells, wood, leaf impressions, footprints, burrows, and microscopic remains. The fossil record is the only evidence that life on earth has existed for more than 3.6 billion years. Fossils are considered non-renewable resources because the organisms they represent no longer exist. Thus, once destroyed, a fossil can never be replaced. Fossils are an important scientific and educational resource because they are used to:

- Study the phylogenetic relationships between extinct organisms, as well as their relationships to modern groups.
- Elucidate the taphonomic, behavioral, temporal, and diagenetic pathways responsible for fossil preservation, including biases in the fossil record.
- Reconstruct ancient environments, climate change, and paleoecological relationships.
- Provide a measure of relative geologic dating, which forms the basis for biochronology and biostratigraphy, and which is an independent and supporting line of evidence for isotopic dating.
- Study the geographic distribution of organisms and tectonic movements of land masses and ocean basins through time.
- Study patterns and processes of evolution, extinction, and speciation.
- Identify past and potential future human-caused effects to global environments and climates.

3.0 RESOURCE ASSESSMENT GUIDELINES

Paleontological resources are limited, non-renewable resources of scientific, cultural and educational value, and are afforded protection under federal (National Environmental Policy Act, or NEPA), state (California Environmental Quality Act, or CEQA), and local (County of Ventura) laws and regulations. This study satisfies project requirements in

accordance with CEQA (13 PRC, 2100 et seq.) and complies with guidelines and significance criteria specified by the SVP (SVP, 1995).

3.1 LAWS, ORDINANCES, REGULATIONS, AND STANDARDS

Fossils are classified as non-renewable scientific resources and are protected by various laws, ordinances, regulations, and standards (LORS) across the country. The SVP (1995) has established professional standards for the assessment and mitigation of adverse impacts to paleontological resources. This paleontological assessment was conducted in accordance with the LORS applicable to paleontological resources within the project area.

3.2 PROFESSIONAL STANDARDS

The Society of Vertebrate Paleontology's Conformable Impact Mitigation Guidelines Committee has established standard guidelines (SVP, 1995) that outline professional protocols and practices for conducting paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, and specimen preparation, identification, analysis, and curation. Most practicing professional vertebrate paleontologists adhere closely to the SVP's assessment, mitigation, and monitoring requirements as specifically provided in its standard guidelines. Most state regulatory agencies with paleontological LORS accept and utilize the professional standards set forth by the SVP.

As defined by the SVP (1995:26), significant nonrenewable paleontological resources are defined as:

> ...fossils and fossiliferous deposits here restricted to vertebrate fossils and their taphonomic and associated environmental indicators. This definition excludes invertebrate or paleobotanical fossils except when present within a given vertebrate assemblage. Certain invertebrate and plant fossils may be defined as significant by a project paleontologist, local paleontologist, specialists, or special interest groups, or by lead agencies or local governments.

As defined by the SVP (1995:26), significant fossiliferous deposits are defined as:

> A rock unit or formation which contains significant nonrenewable paleontologic resources, here defined as comprising one or more identifiable vertebrate fossils, large or small, and any associated invertebrate and plant fossils, traces and other data that provide taphonomic, taxonomic, phylogenetic, ecologic, and stratigraphic information (ichnites and trace fossils generated by vertebrate animals, e.g., trackways, or nests and middens which provide datable material and climatic information). Paleontologic resources are considered to be older than recorded history and/or older than 5,000 years [before present].

Based on the significance definitions of the SVP (1995), all identifiable vertebrate fossils are considered to have significant scientific value. This position is adhered to because vertebrate fossils are relatively uncommon, and only rarely will a fossil locality yield a statistically significant number of specimens of the same genus. Therefore, every vertebrate fossil found has the potential to provide significant new knowledge in one of the following areas.

- **Taxonomy** - fossils that are scientifically judged to be important for representing rare or unknown taxa, such as defining a new species.
- **Evolution** – fossils that are scientifically judged to represent important stages or links in evolutionary relationships, or fill gaps or enhance under represented intervals in the stratigraphic record.
- **Biostratigraphy** – fossils that are scientifically judged to be important for determining or constraining relative geologic (stratigraphic) age, or for use in regional to interregional stratigraphic correlation problems.
- **Paleoecology** – fossils that are scientifically judged to be important for reconstructing ancient organism community structure and interpretation of ancient sedimentary environments.
- **Taphonomy** – fossils that are scientifically judged to be exceptionally well or unusually/uniquely preserved, or are relatively rare in the stratigraphy.

3.3 PALEONTOLOGICAL SENSITIVITY

As indicated by the SVP's definition of fossiliferous deposits, there is a direct correlation between fossils and the geologic formation in which they are preserved. This is because "...paleontologic sites...indicate that the containing sedimentary rock unit or formation is fossiliferous. The limits of the entire rock formation, both areal and stratigraphic, therefore define the scope of the paleontologic potential in each case." This is contrary to archaeological sites, where "the boundaries of archaeological sites define the areal extent of the resource." For this reason, "it is extremely important to distinguish between archaeological and paleontological (fossil) resource sites when defining the sensitivity of rock units."

Therefore, paleontological sensitivity is defined as the potential for a geologic unit to produce scientifically significant fossils. The level of sensitivity is determined by rock type, past history of the geologic unit in producing significant fossils, and fossil localities that are recorded from that unit. Paleontological sensitivity is derived from the known fossil data collected from the entire geologic unit, not just from a specific location. In its "standard guidelines for the assessment and mitigation of adverse impacts to non-renewable paleontologic resources," the SVP (1995:23) defines three categories of paleontological sensitivity (potential) for rock units: high, low, and undetermined:

- **High Potential.** Rock units from which vertebrate or significant invertebrate fossils or suites of plant fossils have been recovered and are considered to have a high potential for containing significant non-renewable fossiliferous resources. These units include, but are not limited to, sedimentary formations

and some volcanic formations that contain significant non-renewable paleontologic resources anywhere within their geographical extent and sedimentary rock units temporally or lithologically suitable for the preservation of fossils. Sensitivity comprises both (a) the potential for yielding abundant or significant vertebrate fossils or for yielding a few significant fossils, large or small, vertebrate, invertebrate, or botanical, and (b) the importance of recovered evidence for new and significant taxonomic, phylogenetic, ecologic, or stratigraphic data. Areas which contain potentially datable organic remains older than Recent, including deposits associated with nests or middens, and areas which may contain new vertebrate deposits, traces, or trackways are also classified as significant.

- **Low Potential**. Reports in the paleontological literature or field surveys by a qualified vertebrate paleontologist may allow determination that some areas or units have low potentials for yielding significant fossils. Such units will be poorly represented by specimens in institutional collections.
- **Undetermined Potential**. Specific areas underlain by sedimentary rock units for which little information is available are considered to have undetermined fossiliferous potentials.
- **No Potential**. Metamorphic and granitic rock units do not yield fossils and therefore have no potential to yield significant non-renewable fossiliferous resources.

Furthermore, all geologic units in which vertebrate fossils have previously been found are considered to have high sensitivity. Identifiable plant and invertebrate fossils are considered significant if found in association with vertebrate fossils, or if defined as significant by project paleontologists, specialists, or local government agencies.

Full-time monitoring is generally recommended during any project-related ground disturbance in highly potential geologic units, whereas part-time monitoring is recommended for geologic units with a low potential. Protection or salvage efforts will not generally be required for units with no potential. Field surveys by a qualified vertebrate paleontologist should be conducted in units with undetermined potential to specifically identify the paleontologic potential of the rock units within the study area.

4.0 PROJECT LOCATION AND DESCRIPTION

The Hitch Ranch project area is located in the City of Moorpark, Ventura County, California (Figure 1). The 283.2-acre project site is approximately 1,600 feet west of Moorpark Avenue (State Route 23) at its intersection with Casey Road. The southern boundary of the area is approximately parallel with Poindexter Avenue, and the project extends west beyond Gabbert Road.

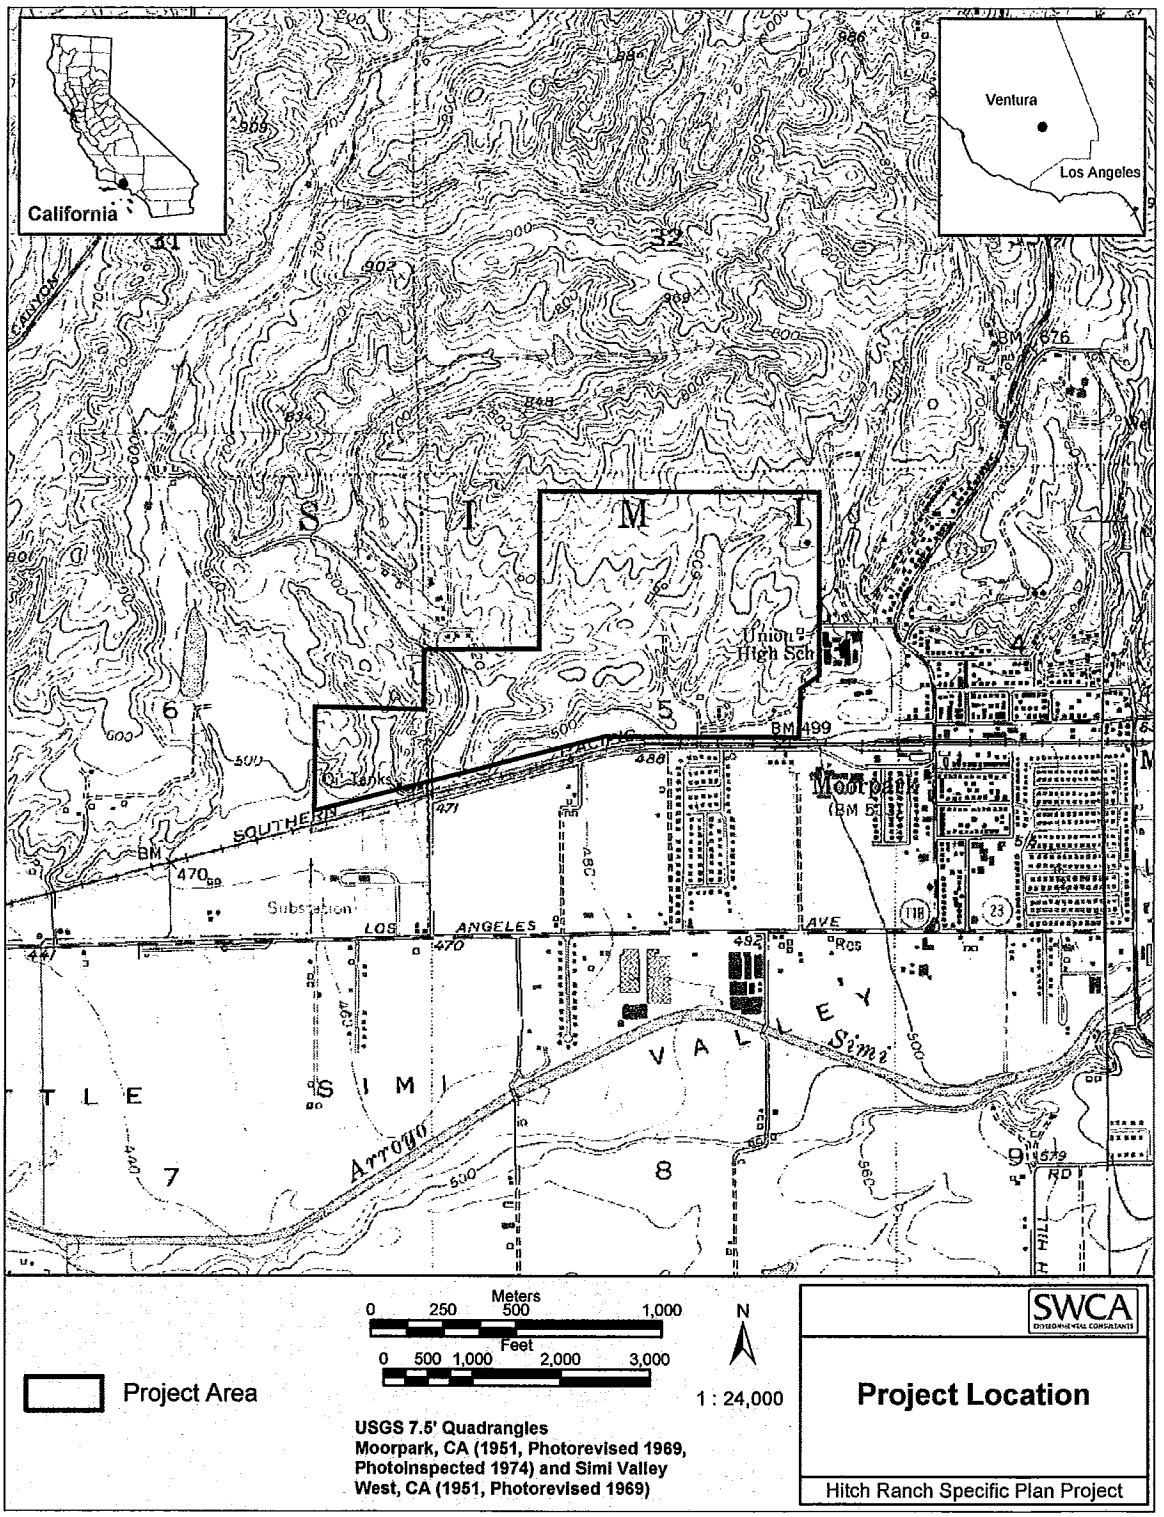

Figure 1. Project Location Map

4.1 GEOLOGY AND PALEONTOLOGY

Previous geologic mapping of the project area indicates the presence of Late Quaternary Older Alluvium and the underlying Plio-Pleistocene Saugus Formation (Dibblee 1992) within the project area. However, it should be noted that geotechnical studies conducted at the project site instead report the composition of the surficial sediments as Late Quaternary Older Alluvium and Holocene (Recent) alluvium, colluvium and artificial fill (Gorian and Associates Inc. 2000). Core samples taken from Hitch Ranch indicate that the Plio-Pleistocene Saugus Formation is present beneath the Older Alluvium. Thus, the Saugus Formation may be impacted during grading of the proposed project area

The controversy over the Saugus Formation/Older Alluvium has been ongoing for more than 75 years. In fact there has been considerable debate in the scientific community since 1924 as to whether the Saugus Formation is exposed in the hills of the project site as mapped by Dibblee (1992), or if the units outcropping in the hills are actually Late Quaternary Older Alluvium. Unfortunately due to heavy vegetation, no geologic units were exposed at Hitch Ranch during this field survey. Therefore, this question remains out of this scope of study and will not be addressed in this report. However, recommendations presented in this report are based on the assumption that all of the geologic units mapped for Hitch Ranch by various authors are present on site, either at the surface or at depth.

4.1.1 SAUGUS FORMATION

The oldest formation within the project area is the Plio-Pleistocene (2.5 million to 200,000 years old) Saugus Formation, which is potentially exposed in the hills of the project area (Dibblee 1992), and is underlying Older Alluvium in the western portion of Hitch Ranch (Gorian and Associates, Inc 2000).

The Saugus Formation is divided into lower and upper members, although only the Upper Saugus Formation is present in the project area. The lower member of the Saugus is composed of marine conglomerates, sandstones, siltstones and coquinites, and is well known for its marine invertebrate fossil localities (Squires and White 1983, White 1983). The upper member of the Saugus Formation, which is present within the project area, is composed of coarse-grained nonmarine conglomerates and sandstones (Levi et al. 1983).

The Upper Saugus Formation in the Moorpark area is well known for several Pleistocene large mammal fossil sites. These localities have produced a wide diversity of animals including mastodons, tapirs, horses and camels. The Saugus Formation is considered to have high paleontologic sensitivity due to its very high potential to produce significant non-renewable paleontologic resources in the Moorpark area (Lander 1997).

4.1.2 LATE QUATERNARY OLDER ALLUVIUM

Geologic mapping (Dibblee 1992) of the project area indicates that Late Quaternary older alluvial deposits are exposed in the valleys of the Hitch Ranch project area. Other

workers designate the rock units exposed in the hills of Hitch Ranch as Late Quaternary (Pleistocene) Older Alluvium (Impact Sciences EIR 2000). The Older Alluvium at Hitch Ranch is composed of up to 36 feet of interbedded, lenticular yellowish-brown sand, light yellowish-brown silt and yellowish-brown clay that often contain clasts from the underlying Modelo Formation. Current data indicates that the Older Alluvium in the Moorpark area is Middle Pleistocene (400,000 to 280,000 years old) (Lander 1997). However the occurrence of bison remains found at several localities in the Moorpark area indicates that some Older Alluvium may have been deposited in the Late Pleistocene (280,000 to 10,000 years old) (Lander 1997).

Due to its high potential to produce significant non-renewable paleontologic resources, Pleistocene Older Alluvium has been assigned high paleontologic sensitivity throughout Southern California (Reynolds and Reynolds 1991). The Older Alluvium in the Moorpark area has yielded the remains of several large Pleistocene land mammal species, including Harlan's ground sloth, two species of horses, and the remains of an imperial mammoth (Lander 1997).

4.1.3 RECENT ALLUVIUM, COLLUVIUM AND ARTIFICIAL FILL

Geotechnical studies performed by Gorian and Associates, Inc. for the Hitch Ranch Specific Plan project indicate that some of the surficial sediments overlying the Saugus Formation and Older Pleistocene alluvium in the project area are Holocene (Recent) alluvial stream deposits, colluvium and artificial fill (Impact Sciences EIR 2000). Holocene deposits are too young to contain fossils and are thus classified as low sensitivity sediments. The uppermost younger alluvial deposits are determined to have a low paleontological sensitivity rating; however, according to SVP guidelines, geologic units greater than 5,000 years old may contain fossilized material. Therefore, the paleontological sensitivity of the young alluvial sediments mapped within the project site increases with age (i.e., depth).

5.0 METHODS

A paleontological reconnaissance survey of the 283.2-acre parcel was conducted on January 5, 2006. The fieldwork consisted of a thorough pedestrian inspection of the study area for (1) surface fossils, (2) exposures of potentially fossil-bearing geologic units, and (3) areas in which fossil-bearing geologic units could be exposed during pre-construction grading activity.

5.1 MUSEUM RECORDS SEARCH

A detailed review of museum collections records of the Los Angeles County Museum (LACM) was performed for the purposes of: (1) determining whether there are any known fossil localities in or near the project area, (2) identifying the geologic units present in the project area, and (3) determining the paleontological sensitivity ratings of those geologic units in order to assess potential impacts to nonrenewable paleontological

resources. Published and unpublished literature and geologic maps were reviewed, and mitigation measures specific to this project were developed in accordance with the SVP professional standards and guidelines (1995).

5.2 PROJECT PERSONNEL

Jessica DeBusk conducted the museum records search. Cara Corsetti, Qualified Paleontologist and Paleontology Program Director, conducted the field survey with Lori Browne, primary author of this technical report. Heather Timmons produced graphics.

6.0 RESULTS AND ANALYSIS

The following table summarizes the paleontological sensitivity ratings of the geologic units underlying the Hitch Ranch Specific Plan project area.

Geologic Formation	Age	Fossils	Paleontological Sensitivity	Monitoring Recommendation
alluvium, colluvium, and fill	Holocene	none	low to high	part-time to full-time
older alluvium	Pleistocene-Holocene	terrestrial vertebrates	high	full-time
Saugus Formation	Plio-Pleistocene	marine invertebrates, terrestrial vertebrates	very high	full-time

Table 1. Paleontological Sensitivities of Geologic Units Within the Hitch Ranch Project Area

The search of the LACM collections records indicated the absence of documented fossil localities within the project area. Fossil localities have, however, been documented in the vicinity of the project. LACM (CIT) 560, the nearest documented site, is in a canyon southwest of the project area within surficial deposits of older Quaternary alluvium, and produced a specimen of fossil horse, *Equus*. Slightly south of LACM (CIT) 560 is LACM (CIT) 585, which produced an undetermined elephantoid tusk fragment from the Saugus Formation.

7.0 CONCLUSIONS

Adverse impacts on paleontological resources result when rock units become unavailable for study and observation by scientists. The destruction of fossils as a result of human-induced ground disturbance has a significant impact as it makes biological records of ancient life permanently unavailable for study by scientists. Implementation of proper mitigation measures can, however, reduce the impacts to the paleontological resources to below the level of significance.

Due to the high paleontological sensitivity of the Plio-Pleistocene Saugus Formation and the older Quaternary alluvium, excavations in these units within the Hitch Ranch project area are likely to have a negative impact on non-renewable paleontological resources unless proper mitigation measures are implemented. The surficial Holocene alluvium is too young to contain nonrenewable scientific resources and thus does not require close paleontological monitoring.

8.0 RECOMMENDED MITIGATION MEASURES

The following mitigation measures have been developed in accordance with the SVP (1995) standards and Ventura County guidelines, and meet the paleontological requirements of CEQA. These mitigation measures have been used throughout California and have been demonstrated to be successful in protecting paleontological resources while allowing timely completion of construction.

1. All project-related ground disturbances that could potentially impact the Saugus Formation and Quaternary older alluvium will be monitored by a qualified paleontological monitor on a full-time basis, as these geologic units are determined to have a high paleontological sensitivity rating. Since younger alluvial and colluvial deposits are considered to have a low paleontological sensitivity, monitoring of excavation activities in this unit will be conducted on a part-time basis to ensure that no underlying sensitive units are being impacted.
2. A Qualified Paleontologist will be retained to supervise monitoring of construction excavations and to produce a mitigation plan for the proposed project. Paleontological monitoring will include inspection of exposed rock units during active excavations. The monitor will have authority to temporarily divert grading away from exposed fossils in order to professionally and efficiently recover the fossil specimens and collect associated data. The Qualified Paleontologist will prepare monthly progress reports to be filed with the client and the lead agency.
3. At each fossil locality, field data forms will be used to record pertinent geologic data, stratigraphic sections will be measured, and appropriate sediment samples collected and submitted for analysis.
4. Recovered fossils will be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and reposed in a designated paleontological curation facility. Potential repositories include the Natural History Museum of Los Angeles County and the San Bernardino County Museum.
5. The Qualified Paleontologist will prepare a final monitoring and mitigation report to be filed with the client, the lead agency, and the repository.

SECTION 1: PROJECT SUMMARY

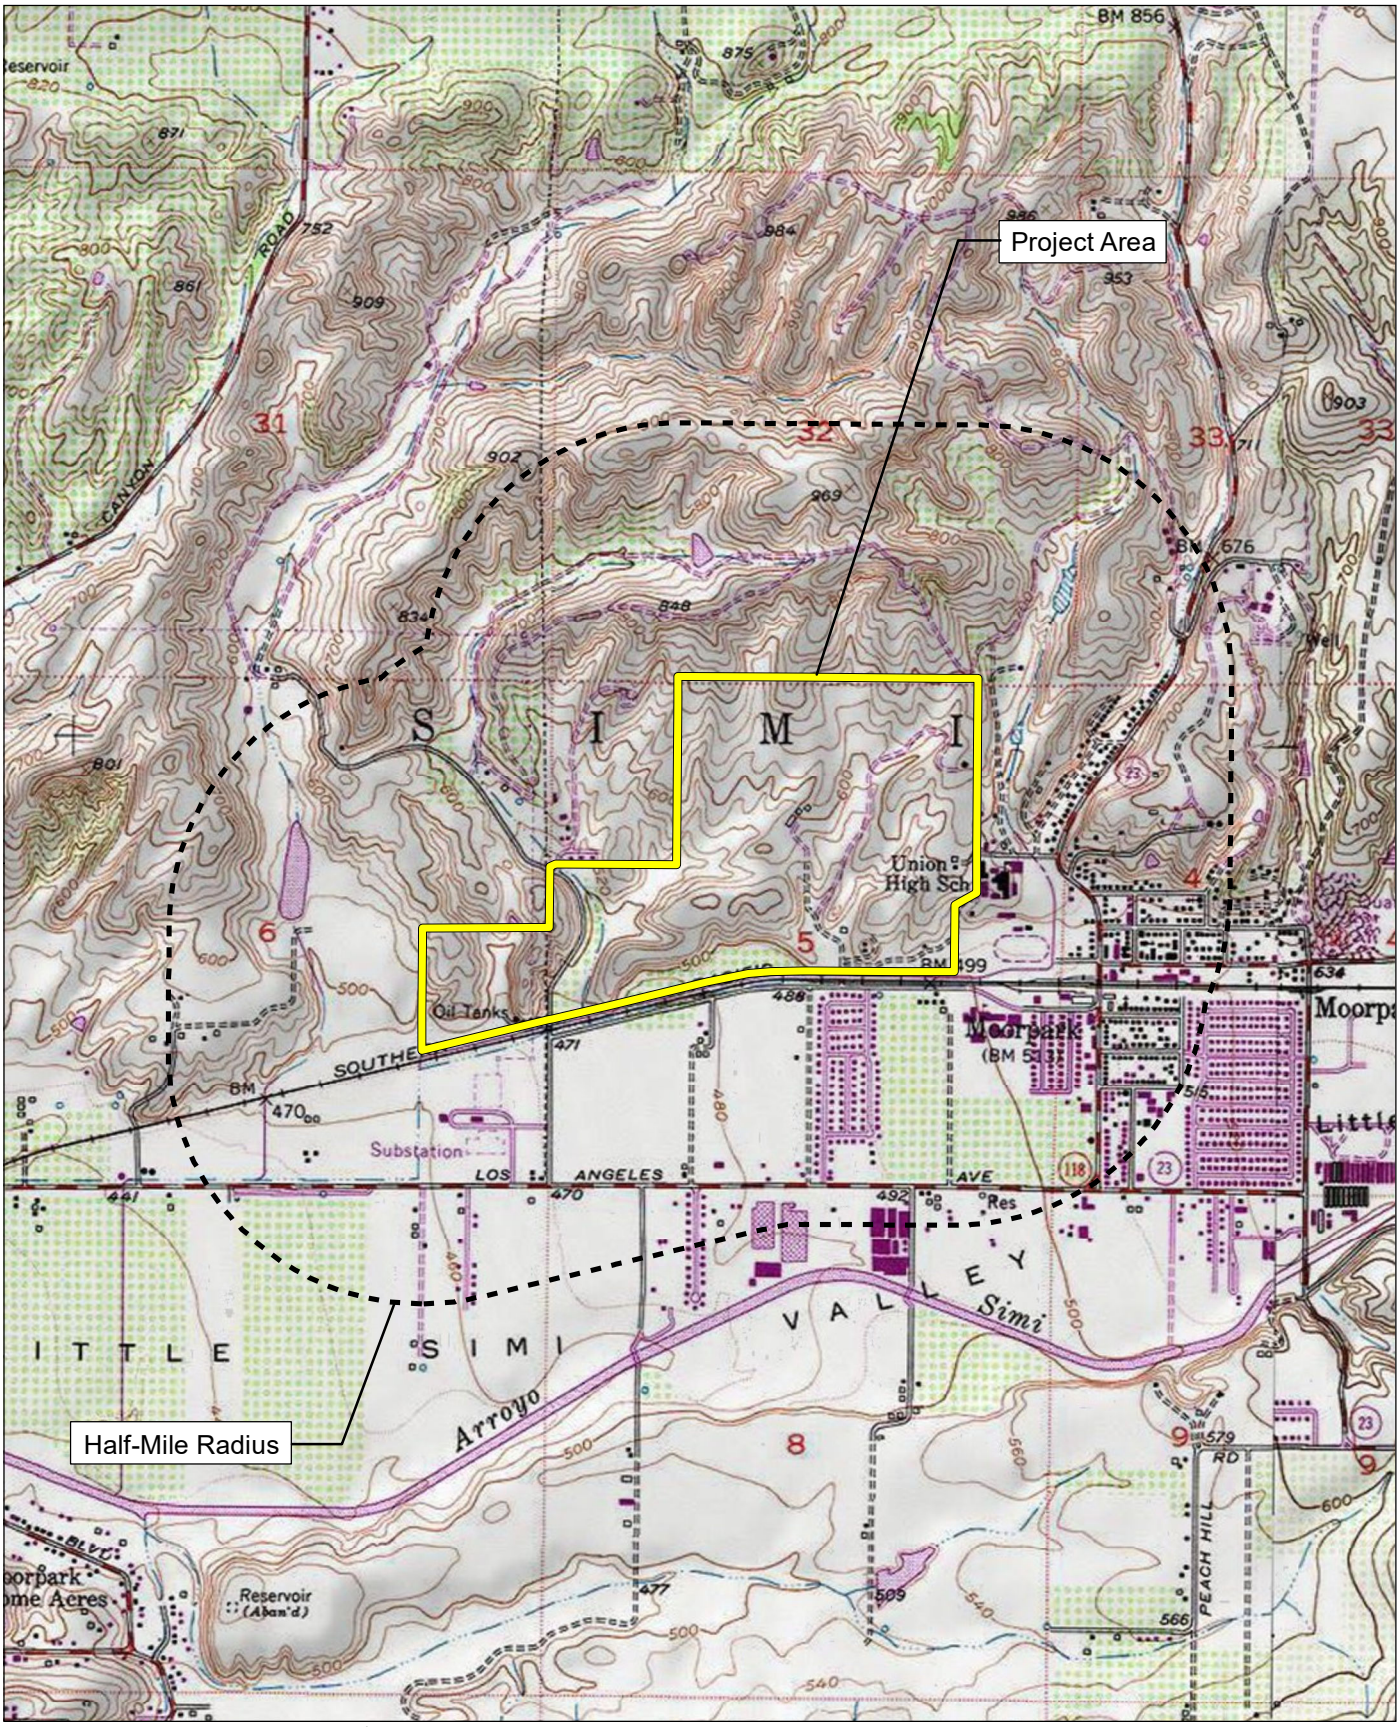
At the request of Comstock Homes, FirstCarbon Solutions (FCS) conducted an updated cultural resources records search and literature review for the Hitch Ranch Specific Plan (proposed project). An earlier cultural resources assessment was completed by W&S Consultants in 2003. Based on the age of the previous report and comments received from the City of Moorpark and a third party reviewer, it was determined that an updated records search and literature review would be sufficient to bring the report up-to-date and in compliance with California Environmental Quality Act (CEQA) Guidelines.

The purpose of this update is to identify the presence or absence of potentially significant cultural resources within the project area and if impacted by the proposed development, propose recommendations for mitigation. Completion of this overall investigation fulfills the requirements associated with CEQA Guidelines. This report update, in conjunction with the 2003 W&S assessment, fulfills the California Office of Historic Preservation (OHP) procedures for cultural resource surveys and the OHP Archaeological Resource Management Report (ARMR) format for archaeological reports. For the sake of clarity and consistency during the CEQA review process, this report update has been formatted to closely match a second FCS update addressing paleontological resources for the proposed project.

On February 26, 2020, an updated records search was conducted at the South Central Coastal Information Center (SCCIC) located at California State University, Fullerton for the project area and a 0.50-mile radius beyond the project boundaries. The results of the records search indicate that six resources have been recorded within 0.5 mile of the project area; none of which are located within the project area. In addition, 44 area-specific survey reports are on file with the SCCIC for the project area and its 0.50-mile search radius, 11 survey reports (S-00607, S-02852, S-02847, S-01656, S-02386, S-02741, S-02890, S-02390, S-03263, S-01329, S-02314) are completely or partially within the project area indicating that the immediate area has previously been surveyed for cultural resources.

The resources P-56-001503, P-56-001574, and P-56-100196 consist of three lithic scatters and a habitation site, potentially consisting of middens, house-floors, and/or burials. While none of the sites are located within or in close proximity to the project site boundary, their presence in the vicinity indicates a higher potential for undiscovered buried archaeological deposits within the project area. Two survey reports encompassing the entire project area (S-01329 and S-02314) are previous studies completed by W&S Consultants in 1994 and 2003. The results of both surveys were negative for historic or prehistoric resources; however, the report mentions that there appears to be a reasonable possibility that some historical remains may be present within the central portion of the study area.

To ensure that all Native American knowledge and concerns over potential Tribal Cultural Resources (TCRs) that may be affected by implementation of the proposed project are addressed, the City of Moorpark provided formal notification to applicable Native American Governments pursuant to Assembly Bill 52 (AB 52). Consultation results will be included in the Tribal Cultural Resources section of the Initial Study/Mitigated Negative Declaration (IS/MND).



Based on the results of the updated records search and literature review, FCS considers the potential for the proposed project to have an adverse effect on historic or prehistoric cultural resources to be moderate. FCS recommends that an Archaeologist who meets the Secretary of the Interior's Professional Qualification Standards for archaeology inspect the site once grubbing and clearing are complete, and prior to any grading or trenching into previously undisturbed soils. This should be followed by regular periodic or "spot-check" archaeological monitoring as determined by the Archaeologist. If the Archaeologist believes that a reduction in monitoring activities is prudent, then a letter report detailing the rationale for making such a reduction and summarizing the monitoring results may be provided to the City of Moorpark for concurrence. Additional procedures for the inadvertent discovery of human remains and cultural resources are provided below.

SECTION 2: INTRODUCTION

2.1 - Project Location and Description

The 270.64-acre project area is located in the City of Moorpark, in Ventura County, California on the *Moorpark*, United States Geological Survey (USGS) 7.5-minute Quadrangle (Exhibit 1). The project site lies within the southern limits of the Simi Hills, immediately to the north of the little Simi Valley, and immediately west of the town center of Moorpark proper, Ventura County, California. The Southern Pacific Railroad right-of-way forms the southern limits of the project site, while the eastern boundary runs approximately north-south immediately to the west of the old Union High School and the Moorpark Civic Center. The northern and western boundaries abut rural and semi-rural properties in the Simi Hills.

SECTION 3: PREVIOUS CULTURAL RESOURCES ASSESSMENT

In 2003 at the request of Impact Sciences, Inc., S&W Associates conducted an intensive Phase I Archaeological Survey for the proposed project (Appendix B). This cultural resources survey was intended to inventory and evaluate any known historical or prehistoric archaeological sites lying within the 270.64 gross acre parcel, and to identify and record previously unknown cultural resources. Based on the results, the report also assessed potential impacts to cultural resources pursuant to the CEQA Guidelines.

In addition to a thorough discussion of the natural setting, prehistoric and ethnographic background, and history of the project area, the Phase 1 Archaeological Survey primarily consisted of a records search and intensive pedestrian survey, the results of which are summarized below.

3.1 - Previous Records Search Results

In order to determine if the project site had been previously surveyed or found to contain historic or prehistoric cultural resources, S&W Associates commissioned the staff of the Archaeological Information Center (AIC) located at California State University, Fullerton, to conduct an archaeological record search on January 29, 2003. This search included a review of all recorded historic and prehistoric archaeological sites within a 0.25-mile radius of the project area as well as a review of all known cultural resource reports. According to the maps, site records, and reports on file at the AIC, no archaeological sites of any kind had been recorded within the project area, nor in the immediate vicinity of the project site.

Historical maps, consisting of the 1921 and 1942 USGS Piru 15-minute topographical quadrangles, were also examined in an effort to identify historical structures or features that might have existed on the property. None were found to exist within the project area, despite the development of the Moorpark Town Center by 1921. The records search also noted that the project area had been previously surveyed once before in 1994, with negative results.

3.2 - Intensive Pedestrian Survey Results

Unless otherwise noted, the following is taken directly from the Phase I Hitch Ranch Archaeological Survey authored by W&S Consultants in 2003.

> An intensive, Phase I archaeological field survey was conducted by S&W associates on the entire 285 gross acres Hitch Ranch study area between February 5-8, 2003. Field procedures involved spacing the crew of three surveyors at approximately 15 to 20 meter intervals and then walking the property in transects, generally following the contours of the local topography. The ground surface was examined during these transects to identify archaeological specimens in the form of worked artifacts, or archaeological indicators, which might consist of specimens of shellfish, bone or waste lithic material resulting from the tool-making process.

During the survey special attention was paid to geomorphological conditions that affect the preservation of archaeological remains. Road or bank-cuts that expose subsurface stratigraphy, for example, along with stable geomorphic and depositional environments, were carefully examined for evidence of cultural remains. Given the geomorphology of the current project area, these included saddles in particular, as likely spots for subsurface deposition, and broad ridgelines/knolltops as areas also likely to contain cultural resources. In contrast, slopes of greater than about 25% grade, where erosional and gravitational forces would preclude the preservation of archaeological remains, were less intensively examined both because of the negligible possibility that sites might be present on them, and for the safety of the crewmembers.

Conditions for the field survey of the Hitch Ranch study area were found to be, in general, fair. Groundcover was moderate but not heavy, thereby impeding ground surface visibility in some areas, but a network of dirt roads and rodent-hole backdirt piles enabled a thorough examination of the study area.

Recent/modern structures and structural remains were present within the study area, with cleared zones surrounding these features. In particular, what appears to have been a demolished house is present along the central-eastern boundary of the property, now consisting solely of a graded and recently grubbed pad, and a pile of modern household and demolition rubbish, with other remnants of modern remains scattered throughout the property. No evidence of a ·possible turn of the century homestead was found.

No evidence of prehistoric archaeological remains was discovered during the intensive Phase I survey. The absence of such remains can be presumed to correlate with the relative xeric conditions within the study area, the apparently low density of prehistoric archaeological sites in the Moorpark region, and the tendency for any such sites to cluster tightly around permanent water sources.

No cultural resources of any kind, accordingly, were discovered during the intensive Phase I archaeological survey, reflecting the fact that the property was peripheral to prehistoric and historical habitation and use of the Moorpark region. However, there appears to be a reasonable possibility that some historical remains may be present within the central portion of the study area.

SECTION 4: METHODS AND ANALYSIS

The methods employed in this updated Cultural Resources Assessment included an updated cultural resources records search and an updated literature search.

4.1 - Results of the Updated Records Search and Literature Review

On February 26, 2020, an updated cultural resources records search was conducted for the project area at the SCCIC located at California State University, Fullerton. The records search radius was expanded to a 0.50-mile radius beyond the project boundaries, as is now standard practice for CEQA compliant cultural resources assessments. The current inventories of the National Register of Historic Places (NRHP), the California Register of Historical Resources (CRHR), the California Historical Landmarks (CHL) list, the California Points of Historical Interest (CPHI) list, and the California Historical Resources Inventory (HRI) for Ventura County were also reviewed to determine the existence of previously documented local historical resources.

The updated records search indicate that six resources have been recorded within 0.5 mile of the project area, none of which are located within the project site. Of the six recorded resources, three are prehistoric and three are historic in nature. In addition, 44 area-specific survey reports are on file with the SCCIC for the project area and its 0.50-mile search radius. Eleven survey reports (S-00607, S-02852, S-02847, S-01656, S-02386, S-02741, S-02890, S-02390, S-03263, S-01329, S-02314) are completely or partially within the project area indicating that immediate area has previously been surveyed for cultural resources. Two survey reports encompassing the entire project area (S-01329 and S-02314) are previous studies completed by W&S Consultants in 1994 and 2003.

The tables below summarize previously recorded cultural resources and investigations conducted within a 0.5-mile search radius of the proposed project.

Table 1: Cultural Resources within a 0.5-mile Radius of the Project Area

Resource No.	Resource Description	Date Recorded

Source: SCCIC Records Search, February 26, 2020.			

Records search results from the SCCIC indicate that three prehistoric archaeological resources lie within 0.5 mile of the project site. The resources P-56-001503, P-56-001574, and P-56-100196 consist of three lithic scatters and a habitation site, potentially consisting of middens, house-floors, and/or burials. While none of the sites are located within or in close proximity to the project site boundary, their presence in the vicinity indicates a higher potential for undiscovered buried archaeological deposits within the project area.

4.2 - Native American Heritage Commission

Given that the previous cultural resource assessment did not include outreach to the Native American Heritage Commission (NAHC), and to ensure that all Native American knowledge and concerns over potential TCRs that may be affected by implementation of the proposed project are addressed, the City of Moorpark provided formal notification to applicable Native American Governments pursuant to AB 52. Consultation results will be included in the Tribal Cultural Resources section of the IS/MND.

SECTION 5: SUMMARY AND RECOMMENDATIONS

5.1 - Summary

At the request of Comstock Homes, FCS conducted an updated cultural resources records search and literature review for the proposed project. Results from the SCCIC indicate that three prehistoric cultural resources are located within the 0.5-mile search radius. The resources P-56-001503, P-56-001574, and P-56-100196 consist of three lithic scatters and a habitation site, potentially consisting of middens, house-floors, and/or burials. While none of the sites are located within or in close proximity to the project site boundary, their presence in the vicinity indicates a higher potential for undiscovered buried archaeological deposits within the project area.

Forty-four area-specific survey reports are on file with the SCCIC for the project area and its 0.50-mile search radius. Eleven survey reports (S-00607, S-02852, S-02847, S-01656, S-02386, S-02741, S-02890, S-02390, S-03263, S-01329, S-02314) are completely or partially within the project area indicating that the immediate area has previously been surveyed for cultural resources. Two survey reports encompassing the entire project area (S-01329 and S-02314) are previous studies completed by W&S Consultants in 1994 and 2003. The results of both surveys were negative for historic or prehistoric resources; however, the report mentions that there appears to be a reasonable possibility that some historical remains may be present within the central portion of the study area.

5.2 - Recommendations

5.2.1 - Cultural Resources Recommendations

Based on the results of the updated records search and literature review, FCS considers the potential for the proposed project to have an adverse effect on historic or prehistoric cultural resources to be moderate. FCS recommends that an Archaeologist who meets the Secretary of the Interior's Professional Qualification Standards for archaeology inspect the site once grubbing and clearing are complete, and prior to any grading or trenching into previously undisturbed soils. This should be followed by regular periodic or "spot-check" archaeological monitoring as determined by the Archaeologist. If the Archaeologist believes that a reduction in monitoring activities is prudent, then a letter report detailing the rationale for making such a reduction and summarizing the monitoring results may be provided to the City of Moorpark for concurrence. Additional procedures for the inadvertent discovery of human remains and cultural resources are provided below.

5.3 - Inadvertent Discovery Procedures

5.3.1 - Accidental Discovery of Human Remains

There is always the possibility that ground-disturbing activities during construction may uncover previously unknown buried human remains. Should this occur, Section 7050.5 of the California Health and Safety Code applies, and the following procedures shall be followed.

In the event of an accidental discovery or recognition of any human remains, Public Resource Code Section 5097.98 must be followed. In this instance, once project-related earthmoving begins and if there is accidental discovery or recognition of any human remains, the following steps shall be taken:

1. There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until the County Coroner is contacted to determine if the remains are Native American and if an investigation of the cause of death is required. If the coroner determines the remains to be Native American, the coroner shall contact the NAHC within 24 hours, and the NAHC shall identify the person or persons it believes to be the "most likely descendant" of the deceased Native American. The most likely descendant may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98, or
2. Where the following conditions occur, the landowner or his/her authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity either in accordance with the recommendations of the most likely descendent or on the project area in a location not subject to further subsurface disturbance:
   - The NAHC is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 48 hours after being notified by the commission;
   - The descendent identified fails to make a recommendation; or
   - The landowner or his authorized representative rejects the recommendation of the descendent, and the mediation by the NAHC fails to provide measures acceptable to the landowner.

5.3.2 - Accidental Discovery of Cultural Resources

It is always possible that ground-disturbing activities during construction may uncover previously unknown, buried cultural resources. In the event that buried cultural resources are discovered during construction, operations shall stop in the immediate vicinity of the find and a qualified Archaeologist shall be consulted to determine whether the resource requires further study. The qualified Archeologist and shall make recommendations to the Lead Agency on the measures that shall be implemented to protect the discovered resources, including but not limited to excavation of the finds and evaluation of the finds in accordance with Section 15064.5 of the CEQA Guidelines. Potentially significant cultural resources consist of but are not limited to stone, bone, fossils, wood, or shell artifacts or features, including hearths, structural remains, or historic dumpsites. Any previously undiscovered resources found during construction within the project area should be recorded on appropriate Department of Parks and Recreation (DPR) forms and evaluated for significance in terms of CEQA Guidelines.

If the resources are determined to be unique historic resources as defined under Section 15064.5 of the CEQA Guidelines, mitigation measures shall be identified by the Archaeological Monitor and recommended to the Lead Agency. Appropriate mitigation measures for significant resources could

include avoidance or capping, incorporation of the site in green space, parks, or open space, or data recovery excavations of the finds.

No further grading shall occur in the area of the discovery until the Lead Agency approves the measures to protect these resources. Any archaeological artifacts recovered as a result of mitigation shall be donated to a qualified scientific institution approved by the Lead Agency where they would be afforded long-term preservation to allow future scientific study.

Management Summary

An intensive Phase I archaeological survey was conducted for the Hitch Ranch study area, Moorpark, Ventura County, California. This involved background studies of the prehistory and ethnography of the area; an archival records search of relevant maps, site forms and documents; and an on-foot survey of the subject property. No cultural resources had been recorded within the study area, and none were noted during the intensive survey of it. Development of the property, therefore, does not have the potential to result in adverse impacts to cultural resources. No additional archaeological work is recommended for this property.

1.0 INTRODUCTION

At the request of Mr. Mark Austin, Impact Sciences, Inc., an intensive Phase I archaeological survey was conducted for the Hitch Ranch study area, City of Moorpark, Ventura County, California (Figure 1). This cultural resources survey was intended to inventory and evaluate any known historical or prehistoric archaeological sites lying within this 285 gross acres parcel, and to identify and record previously unknown cultural resources. Following the California Environmental Quality Act (CEQA), the purpose of this investigation was to provide baseline data from which a preliminary assessment of the adverse impacts to any such cultural resources could be made, should this property be developed, and to develop management recommendations for the further study or treatment of archaeological sites or localities identified within the subject property.

This study was undertaken by W & S Consultants, and was conducted on February 5-8, 2003. David S. Whitley, Ph.D., Joseph M. Simon and Tamara K. Whitley, M.A., were responsible for the field work portion of the study. This manuscript was prepared by Whitley and Simon.

A series of procedures and studies were conducted in order to adequately inventory and evaluate the cultural resources within the study area at the Phase I level. These included: a review of published reports and studies to establish the aboriginal cultural history of the region in question; an examination of historical reports and sources to determine the history of the subject property; a study of existing archaeological site records and files to identify known cultural resources within the subject property; and a field survey and assessment to identify previously unknown or unreported archaeological sites. This report summarizes the findings and conclusions of each of these aspects of the Phase I investigation.

We begin with an environmental overview of our study area, the 285 gross acres Hitch Ranch study area. We then turn to a summary of local cultural history, including both ethnography and prehistory. We also consider the previous archaeological research that has been conducted in inland Ventura County. Subsequently we summarize the results of an archaeological records search, conducted by the staff of

the California State University, Fullerton, Archaeological Information Center (AIC). Next we outline the field procedures we followed in conducting the survey of the study area, and then turn to the results of the field study. We conclude with management recommendations for the study zone.

2.0 ENVIRONMENTAL BACKGROUND

The 285 gross acres Hitch Ranch study area lies within the southern limits of the Simi Hills, immediately to the north of Little Simi Valley, and immediately west of the town center of Moorpark proper, Ventura County, California (Figure 1). The Southern Pacific railroad right-of-way forms the southern limits of the study area, while the eastern boundary runs approximately north-south immediately to the west of the old Union High School and the Moorpark Civic Center. The northern and western boundaries abut rural and semi-rural properties in the Simi Hills.

From a geomorphological perspective, this is an area of minor dissected fault scarps and intervening arroyos, creating a series of low, broad and generally north-south trending ridges, with round-bottomed arroyos in between. The ridges rise gently from the southern boundary, which sits on the flat alluvium created by Arroyo Simi and Little Simi Valley, to the higher foothills on the north. Elevation ranges from just under 500 feet a.s.l., at the south limits of the study area, to 700 feet a.s.l. along the northern edge of the property. Major drainages feeding the Arroyo Simi do not occur within the study area, although Walnut Canyon lies to the east, and the upper reaches of Grimes Canyon are located immediately west. Furthermore, no springs or active water-courses are present on the property.

Although historic and recent land-use changes have altered the environment considerably from what existed during prehistoric times, one major plant association probably characterized this area during the aboriginal period. This is the chaparral association (cf. Muntz 1974). Southern oak woodlands may also have been present within or near to the study area, while riparian environments clearly would have been present in the Arroyo Simi to the south.

The chaparral association covers steeper slopes with poorly developed soils and xeric conditions. It includes the following species: California sagebrush (Artemisia californica), white sage (Salvia mellifera), black sage (S. apliana), purple or white-leaved sage (S. Leucophylla), California encilia (Encilia californica), California buckwheat (Eriogonum fasciculatum), chamise (Adneostoma fasciculatum), buckbruch

(Ceanothus cuneatus), scrub oak (Quercus dumosa), toyon (Heteromeles arbutifolia), mountain mahogony (Cercocarpus betuloides), lemonade sumac (Rhus integrifolia) and sugar sumac (R. ovata).

The southern oak woodland may have been of primary aboriginal significance in the inland zones adjacent to the coastal strip. This results because of the great importance placed on the acorn as a food staple by Native Californians (Kroeber 1925), and the rarity of this resource on the coastal side of the Santa Monica Mountains. The association is characterized by the coast live oak (Quercus lobata) and the valley oak (Q. agrifolia), but also would have included various species of native grasses. Although currently restricted in distribution, this association was probably once much more widespread throughout the Simi Valley and Moorpark regions, which are near to the study area, and may have been present within the open flats of Little Simi Valley, south of the study area, as well as on the Mesa de Somis, immediately to the north.

Riparian habitats are localized and poorly diversified woodlands found in areas of perennial moisture. They include such species as arroyo willow (Salix lasiolepsi), mule fat (Baccharis glutinosa), willow dock (Rumex salicifolius), swamp knotweed (Polygonum coccineum), nettle (Urtica holosericea), cocklebur (Xanthium strumarium) and rabbitsfoot grass (Polypogon monspeiensis). Though this plant association is limited in distribution, it can still be considered to have had significant economic importance in aboriginal times, especially in terms of the acquisition of raw materials for items like baskets, cordage and netting. As noted above, originally it would have been present in Arroyo Simi, south of the study area.

Soils within the study zone are uniformally a heavy, expansive adobe soil, thinly-mantling sedimentary bedrock. Although the relationship between this soil type and specific plant associations have not yet been defined, our experience surveying in the inland Ventura County area suggests that prehistoric archaeological sites are rarely located on such soils, apparently signalling the fact that the specific plant associations found on such soils were not considered ideal for aboriginal exploitation and therefore inhabitation.

Because the above, idealized scenario applies to the region prior to modern ranching and development, much of the current vegetation within the Hitch Ranch study area is introduced or otherwise altered. It thereby varies considerably from what would have existed aboriginally or prehistorically. Essentially all of the study area has been disked, may have been grazed by livestock at some point, and may also have been farmed. The study area is now covered with introduced grasses and stands of mustard, precluding any definite reconstruction of original environmental conditions.

3.0 ETHNOGRAPHIC AND PREHISTORIC BACKGROUND

The Hitch Ranch study region, lying in southeastern Ventura County, California, is situated in a zone known prehistorically to have comprised a portion of the Canaliño culture area, and historically to have been a part of the Chumash ethnolinguistic sphere. In general archaeological terms the region of the Canaliño culture area is known to have first been occupied during the Early Millingstone period, which dates back to about 9000 years before B.P. (before present). During this period subsistence is posited to have emphasized plant resources, and site assemblages are dominated by large-sized and relatively crude chopping, grinding and pounding tools. At about 3500 years B.P. the prehistoric inhabitants of the region are said to have made a transition to a more hunting-oriented economy, which occurred during the duration of the Intermediate period, lasting to about A.D. 1200. Artifacts particularly diagnostic of this period include large, stemmed projectile points, probably used as spear or dart points, although smaller arrow points were introduced after about A.D. 500. The Intermediate period was replaced subsequently by the Late Prehistoric, or Canaliño period, per se, which lasted until the time of Spanish missionization during the last two decades of the 18th century. The Canaliño period witnessed a florescence of aboriginal culture which included a substantial growth in population, the establishment of permanent settlements on the coast, a high degree of sociopolitical complexity and the development of a very sophisticated maritime economy. It was during the Canaliño period that the ethnolinguistic group now known as the Chumash achieved levels of cultural and social sophistication perhaps unrivalled by hunter-gatherer groups anywhere else in the world (Wallace 1955; Landberg 1965).

The term "Chumash" strictly applies to a group of people united only by the use of a series of closely related Hokan languages, sharing a number of similar cultural traits, and stretching from Topanga Canyon inland to Mt. Piños and along the coast to the San Luis Obispo area (cf. Kroeber 1925). That is, it implies no necessary sociopolitical unity (as in a single 'tribe') and, in fact, a series of different Chumash languages and political units existed at the time of Spanish contact. In the southeasternmost region of the Chumash, including the immediate area of Moorpark, Ventureño Chumash was spoken.

Based on recent ethnohistoric reconstructions (cf. Whitley and Clewlow 1979; Whitley 1980; Whitley and Beaudry 1991), we now know that the Chumash were united into at least two major chiefdoms at the time of contact with the Spanish, and that these cross-cut linguistic boundaries between the various Chumashan-speaking groups. One of these political bodies, Lulapin, was governed from a village occupied by the paramount chief located near modern Point Mugu, at the mouth of the Calleguas Creek. Apparently this village controlled a series of smaller villages and village provinces within a large region stretching to the north of Santa Barbara at the time of Spanish contact. One of these 'controlled' or subordinate provinces was Humaliwo, which was governed by the historic village located at modern Malibu Beach. Logically, we can assume that whatever villages existed historically within the Moorpark/Simi Valley area would have been subordinate to the capital at Point Mugu as well.

While the specific region of the study area must be viewed within this general prehistoric and ethnohistoric context, it is nonetheless true that the reconstruction of Chumash prehistory and ethnohistory has largely been based on coastal evidence. That is, sites and minor regions inland from the coast obviously vary from those on the coastal strip (lacking, for example, access to coastal and maritime resources) and therefore exhibit not only some differences in terms of general site characteristics and adaptational trajectories, but in general chronological parameters too (W & S Consultants 1985; Whitley 1985).

The region in which the Hitch Ranch study area is located is an inland area generally referred to as the Simi Corridor. This comprises part of a series of east-west trending valleys and intervening hill systems lying northward (and therefore inland) of the Santa Monica Mountains and Conejo Corridor. It includes the Simi Valley proper, the Tierra Rejada, Little Simi and the Santa Rosa Valleys, all of which are tributary to the Calleguas Creek drainage. Although little archaeological research in the Simi Valley area and Simi Corridor has been published, it is probable that the prehistory of this area is similar to that of the adjacent Conejo Corridor, located immediately to the south. A relatively intensive period of research in this last area, resulting largely from development in the Thousand Oaks region and the cultural resources management studies that have been attendant to this development, has provided a fairly thorough indication of the

nature of the prehistoric record in this inland region, which appears applicable to the Simi Corridor as well.

If we may use the prehistory of the Conejo Corridor as a model, and unlike the Chumash region in a more general sense, the first indication of aboriginal occupation in this inland area appears to date to the beginning of the Intermediate period, or from about 3500 years B.P. (W & S Consultants 1985:69). This comprised the initial occupations of a series of what have been termed site complexes. These are agglomerations of small habitation and special purpose sites that tend to be localized in relatively restricted areas (Whitley 1979, 1980, 1985).

A series of site complexes have now been identified and studied in the Conejo Corridor region, and it is very probable that some exist in the Simi Corridor region as well. Almost without fail, each of these complexes contains deposits or components that represent the entire temporal span of inland occupation. As well, there is no clear functional or adaptational differentiation between earlier versus later temporal components of these complexes. That is, even while there is a general tendency towards more complexity in the nature and variability of the tool assemblages towards the present, it is now clear that even some of the earlier temporal components in the region exhibit subsistence emphasizes found in the later components (W & S Consultants 1984). And this is to say that, from the initial occupation of this inland region, a very generalized foraging strategy was followed, not necessarily by every site complex in the area, but certainly by the inland occupation when considered as a whole (ibid; Whitley 1985).

Thus, in the Conejo Corridor not only do we see early occupations exhibiting artifact assemblages that resemble more typically 'later' assemblages, with their heavy emphasis on hunting and hunting tools, but we also see late sites very much appearing like temporally 'earlier' sites, with a dominance of groundstone tools and chopping implements (ibid). The inference that results, consequently, is that the establishment of inland sites some 3500 years ago in the Conejo Corridor appears to represent an effort to exploit a variety of non-coastal environments, following a number of different subsistence strategies. This point of initial exploitation and occupation may correlate with a shift to the modern climatic regime, which also

appears to occur at this time (G. Smith, personal communication, 1990). Further, it is clear that no single subsistence strategy uniquely characterized any specific time period; instead, a generalized foraging pattern appears to have held for the entirety of the prehistoric occupation of the area.

4.0 HISTORICAL BACKGROUND

The Moorpark region, including the Hitch Ranch study area, was originally part of El Rancho Simí land grant (or, more properly, San José de Nuestra Señora de Altagracia y Simí), ceded by the Spanish crown to the Santiago de la Cruz Pico family in 1795 (Havens n.d.; Thompson and West 1883:49, 389) and headquartered at the 'Simi Adobe' (at modern Strathearn Historical Park). Although now in Ventura County, El Rancho Simí was placed under the ecclesiastical jurisdiction of Mission San Fernando (Cameron 1963:5), thus indicating that its original economic and social ties lay to the east, not the west.

Rancho Simí was evidently a successful enterprise until 1842, at which poin it was purchased by Don José de la Guerra y Noriega, who added it to his substantial holdings that were said to stretch from Santa Barbara to San Diego (Thompson and West 1883:44; Sheridan 1926:168). In 1862 this 113,009.21 acres parcel was ceded to Mr. Guerra by the U.S. Land Commission following the war with Mexico, and the property was patented on June 19, 1865 (Sheridan 1926:168; Allen 1987:3). Subsequently the rancho in general served principally for sheep grazing until purchased by eastern investors, involved in oil speculation. Because they failed to find oil, the Simi Land and Water Company was formed under the leadership of Thomas R. Bard, representing Thomas Scott of Pennsylvania, in 1887, and an effort was made to sell the land in parcels (Havens n.d.). In 1889, Robert Strathearn purchased 18,000 acres of Rancho Simí, including the eastern portion of what is now Moorpark. During the existence of the original Rancho Simí, however, it is apparent that the study area was a marginal zone (in fact, near the western boundary of the ranch) and did not figure in any historical incidents or developments.

The City of Moorpark, proper, portion of Rancho Simí, including the Hitch Ranch study area, apparently formed a portion of the Rancho Simí retained by the Simí Land and Water Company, of which Robert Poindexter was a major shareholder and member of the board of directors.

During the 1850s and 1860s, however, the first settlers moved into the Moorpark region (Cameron 1967:9), apparently on land peripheral to what would be the Strathearn Ranch. Whether these individuals

were squatters or not is unclear from existing records, although this is likely. Regardless, there is essentially no record of their activities and occupation of the area.

The first subdivision of Moorpark was known as Fremont or Fremontville (also sometimes referred to as Little Simí), apparently named after General Fremont, who was said to have passed through the area on his way to the Battle of Cahuenga Pass (ibid:2). Fremont was recorded in 1893 by Robert and Madeline Poindexter, presumably representing the Simí Land and Water Company. Although the map of Fremont shows the town area divided into lots of various sizes (ibid:24), there is essentially no indication that any of these were sold and/or occupied.

For reasons apparently related to the reorganization of the Simí Land and Water Company, Fremont was subdivided and recorded again in 1900. The Poindexters were again responsible for this subdivision, as well as for laying out the new township, including the planting of the California Pepper trees along High Street, and the establishment of a school site (ibid:3, 23), in anticipation of the appearance of the railroad, work for which began in 1899. Mr. Poindexter was also responsible for naming the town Moorpark, apparently after a variety of apricot that was then being cultivated in the area (ibid).

By 1901 a rail depot, warehouse, post-office, blacksmith shop, general store and barber shop had been established in Moorpark. In 1905 the school that had formerly stood on Peach Hill in Fremont was moved into town. Shortly thereafter, the Methodist Church that had been built in Epworth (to the north of town on Broadway) was moved to the corner of Walnut and Charles Streets, and the town quickly developed into an important farming community (ibid:24). By 1920 it had established itself as the apricot center of the county.

Moorpark remained a rural farming community into the latter half of this century: in 1957 the population had only reached 2463 people (ibid). However, since that time the town's growth has become increasingly related to the suburban development of the county as a whole. It was incorporated a decade ago and has grown rapidly ever-since.

According to the original subdivision map of Moorpark (ibid:24), the central portion of the current study area was under the ownership of E.J. Whitney in 1900, while the Gabbert Ranch apparently had been established to the west of the property at about the same time. However, this map does not indicate whether or not structures were placed within the property, and subsequent maps (see Record Search below) record no buildings or roads on the property in 1921 and 1942. Accordingly, our best interpretation is that the Hitch Ranch study area was peripheral to the historical events in the development of Moorpark, although it may have been used for farming and/or grazing as early as 1900. However, the possibility exists that a homestead was present on the property around the turn-of-the-century, and that it had been destroyed prior to the 1921 map, or simply omitted from it. That is, the background historical studies suggest that historical resources might be present within the Hitch Ranch study area.

5.0 ARCHAEOLOGICAL RECORD SEARCH

In order to determine both if the Hitch Ranch study area had ever been systematically surveyed by archaeologists, and whether or not prehistoric and/or historical archaeological sites were known to exist on the property, an archaeological records search of the CSUF Archaeological Information Center (AIC) site files and maps was commissioned. This record search was conducted by the AIC staff on 29 January 2003. We include a copy of their records search as Appendix A of this report.

According to the maps, site records and reports on file at the AIC, no archaeological sites of any kind had been recorded within the Hitch Ranch study area, nor in the immediate vicinity of the study area, despite the fact that the project area had been previously surveyed in 1994.

Historical maps, consisting of the 1921 and 1942 USGS Piru 15' topographical quadrangles, were also examined in an effort to identify historical structures or features that might have existed on the property. None were found to exist within the study area, although there was development of the Moorpark town center by 1921.

6.0 ARCHAEOLOGICAL FIELD SURVEY

An intensive, Phase I archaeological field survey was conducted on the entire 285 gross acres Hitch Ranch study area between February 5-8, 2003. David S. Whitley, Ph.D., Joseph M. Simon and Tamara K. Whitley, M.A., served as the survey crew during this study.

Field procedures involved spacing the crew at approximately 15 to 20 meter intervals and then walking the property in transects, generally following the contours of the local topography. The groundsurface was examined during these transects to identify archaeological specimens in the form of worked artifacts, or archaeological indicators, which might consist of specimens of shellfish, bone or waste lithic material resulting from the tool-making process.

During the survey special attention was paid to geomorphological conditions that affect the preservation of archaeological remains. Road or bank-cuts that expose subsurface stratigraphy, for example, along with stable geomorphic and depositional environments, were carefully examined for evidence of cultural remains. Given the geomorphology of the current project area, these included saddles in particular, as likely spots for subsurface deposition, and broad ridgelines/knolltops as areas also likely to contain cultural resources. In contrast, slopes of greater than about 25% grade, where erosional and gravitational forces would preclude the preservation of archaeological remains, were less intensively examined both because of the negligible possibility that sites might be present on them, and for the safety of the crewmembers.

7.0 SURVEY RESULTS

Conditions for the field survey of the Hitch Ranch study area were found to be, in general, fair. Groundcover was moderate but not heavy, thereby impeding groundsurface visibility in some areas, but a network of dirt roads and rodent-hole backdirt piles enabled a thorough examination of the study area.

Recent/modern structures and structural remains were present within the study area, with cleared zones surrounding these features. In particular, what appears to have been a demolished house is present along the central-eastern boundary of the property, now consisting solely of a graded and recently grubbed pad, and a pile of modern household and demolition rubbish, with other remnants of modern remains scattered throughout the property. No evidence of a possible turn of the century homestead was found.

No evidence of prehistoric archaeological remains was discovered during the intensive Phase I survey. The absence of such remains can be presumed to correlate with the relative xeric conditions within the study area, the apparently low density of prehistoric archaeological sites in the Moorpark region, and the tendency for any such sites to cluster tightly around permanent water sources.

No cultural resources of any kind, accordingly, were discovered during the intensive Phase I archaeological survey, reflecting the fact that the property was peripheral to prehistoric and historical habitation and use of the Moorpark region. However, there appears to be a reasonable possibility that some historical remains may be present within the central portion of the study area.

8.0 CONCLUSIONS AND RECOMMENDATIONS

An intensive Phase I archaeological survey of the Hitch Ranch study area, City of Moorpark, Ventura County, California, was conducted by W & S Consultants. This study involved a literature, maps and records review of the prehistory, history and status of archaeological research in the region, and an on-foot survey of the 285 gross acres property. The background studies indicated that no cultural resources of any kind were known to be present on the property, although a 1900 subdivision map indicated that there was some possibility that the remains of an early homestead might be present. The intensive field survey of the property, however, failed to discover any evidence of prehistoric or historical cultural resources within the study area.

Accordingly, the development and use of the Hitch Ranch study area will not result in any adverse impacts to known cultural resources of any kind. No additional archaeological work is recommended for this property.

RE: Record Search for the 285 acre Hitch Ranch, Moorpark, Ventura County, CA

Dear Dr. Whitley,

As per your request received on January 16, 2003, we have conducted a records search for the above referenced project. This search includes a review of all recorded historic and prehistoric archaeological sites within a one-quarter mile radius of the project area as well as a review of all known cultural resource reports. In addition, we have checked our file of historic maps, the California Points of Historical Interest (PHI), the listing of California Historical Landmarks (CHL), the California Register of Historic Places (CR), the National Register of Historic Places (NR), and the California State Historic Resources Inventory (HRI) for the referenced project area. The following is a discussion of our findings for the project area.

ARCHAEOLOGICAL RESOURCES:

No prehistoric archaeological sites have been identified within a one-quarter mile radius of the project area (see enclosed map). No prehistoric isolates have been identified within a one-quarter mile radius of the project area.

No historic archaeological sites have been identified within a one-quarter mile radius of the project area (see enclosed map). No historic isolates have been identified within a one-quarter mile radius of the project area.

HISTORIC RESOURCES:

No recorded historic built environments have been identified within a one-quarter mile radius of the project area.

Copies of our historic map – Piru (1921 and 1941) 15' USGS - are enclosed for your review.

The California Point of Historical Interest (1992) of the Office of Historic Preservation, Department of Parks and Recreation, lists no properties within a one-quarter mile radius of the project area.

The California Historical Landmarks (1990) of the Office of Historic Preservation, Department of Parks and Recreation, lists no properties within a one-quarter mile radius of the project area.

The California Register of Historic Places lists no properties within a one-quarter mile radius of the project area.

The National Register of Historic Places lists no properties within a one-quarter mile radius of the project area.

The California Historic Resources Inventory lists no properties that have been evaluated for historical significance within a one-quarter mile radius of the project area.

PREVIOUS CULTURAL RESOURCES INVESTIGATIONS:

Twenty-two studies (VN191, VN213, VN233, VN322, VN557, VN558, VN572, VN607, VN776, VN821, VN1059, VN1102, VN1153, VN1265, VN1329*, VN1471, VN1548, VN1589, VN1656, VN1680, VN2052 and VN2054) have been conducted within a one-quarter mile radius of the project area. Of these, one is located within the project area. There are eleven additional investigations located on the Moorpark 7.5' USGS Quadrangle that are potentially within a one-quarter mile radius of the project area. These reports are not mapped due to insufficient locational information.
A bibliography of these reports is available upon request.
(* = Located within the project area)

Please forward a copy of any reports from this project to our office as soon as possible. Due to the sensitive nature of archaeological site location data, we ask that you **do not include** records search maps in your report. If you have any questions regarding the results presented herein, please feel free to contact our office at 714.278.5395 Monday through Thursday 8:00 am to 3:30 pm.

Invoices are mailed approximately two weeks after records searches are completed. This enables your firm to request further information under the same invoice number. Please reference the invoice number listed below when making inquiries. Requests made after the invoicing will result in the preparation of a separate invoice with a $15.00 handling fee.

Sincerely,
SCCIC

Catharine M. Wood
Staff Archaeologist

FIRSTCARBON SOLUTIONS™

DANA DOUGLAS DePIETRO, PH.D.—Cultural Resources Lead (North)

OVERVIEW

- More than 15 Years' Experience in Archaeology and Cultural Resources

Education

- Ph.D., Near Eastern Art and Archaeology, University of California at Berkeley, 2012
- M.A., Near Eastern Art and Archaeology, University of California at Berkeley, 2005
- B.A., Archaeology and History (double major), University of California at San Diego, 2002

Fellowships and Awards

- Albright Institute Educational and Cultural Affairs Fellowship (2015)
- Katherine Davis Foundation Projects for Peace Prize (2012)
- International House Gateway Fellowship (2011-2012)
- The George Franklin Dales Foundation Fellowship for Archaeological Research (2011)
- CAORC Multi-Country Dissertation Research Fellowship (2010)

Dana DePietro, Ph.D. is a Registered Professional Archaeologist who meets the Secretary of Interior's standards for historic preservation programs in archaeology. Dr. DePietro has over 15 years of experience in all aspects of cultural resource management, including prehistoric and historic archaeology, paleontology, materials conservation, history of art and architecture, and community engagement. He has experience in compliance with the National Environmental Policy Act (NEPA), the California Environment Quality Act (CEQA), the National Historic Preservation Act (NHPA), and the Archaeological Resources Protection Act (ARAP). Dr. DePietro has completed cultural resource projects that have involved agency, client, Native American, and subcontractor coordination; treatment plans and research design development; archival research; field reconnaissance; site testing; data recovery excavation; construction monitoring; site recordation; site protection/preservation, mapping/ cartography; spatial analysis/GIS; laboratory analysis; materials conservation; artifact curation and exhibition; and report production. He has completed projects in California within the jurisdiction of the Bureau of Land Management (BLM) and other federal agencies requiring compliance with Section 106 of the NHPA. He has also completed projects throughout California under CEQA for state and local governments and municipalities, including the California Department of Transportation (Caltrans) and has worked with clients to insure deliverables meet and exceed the standards set by the State Historic Preservation Office (SHPO).

RELATED EXPERIENCE AND CLIENT SUMMARY

FirstCarbon Solutions

As the Lead Archaeologist/Cultural Resource Specialist for FCS, Dr. DePietro conducts evaluations and performs field documentation of historic and prehistoric cultural resources; prepares environmental impact reports (EIRs), cultural resources assessments (CRAs), DPR forms and Section 106 reports; conducts mapping, GIS analysis, and state and county record searches; leads archaeological surveys and field monitoring efforts; and coordinates with state, federal and tribal officials and institutions for a variety of FCS projects, including the following:

DANA DOUGLAS DePIETRO, PH.D.—Cultural Resources Lead (North)

- Atherton Baptist Homes Master Plan/Phase II, City of Alhambra, Los Angeles County
- Biological and Cultural Resources Assistance 140-Acre Project Site Woodcrest, Riverside County, CA
- Blanchard Road Industrial EIR Project, City of San Jose, Santa Clara County, CA
- Bonadelle Tract 6120 AQ/GHG and Bio Tech Studies, City of Clovis, Fresno County, CA
- CEQA Analysis for Mayhew Way Project, City of Walnut Creek, Contra Costa County
- 2268 El Camino Real, Mountain View—II CEQA Compliance Checklist Project, City of Mountain View, Santa Clara County
- CEQA Documentation for New Science Building, City of Fairfield, Solano County
- CEQA Services for Clover Spring Open Space Preserve Project, City of Cloverdale, Sonoma County
- Chico Walmart Expansion Project, City of Chico, CA
- Cultural Resources Services for Froom Ranch/El Villagio Specific Plan, City of San Luis Obispo, CA
- Cultural Resource & Historic Evaluation for Sacramento Dome Theatre, City of Sacramento, CA
- Cultural Resources Services for Haven Berryessa Block 7 & 8 San Jose Flea Market, San Jose, CA
- Caltrans NEPA/CEQA Documentation and Permitting for the Dogtown Road Bridges Replacement Projects (San Domingo Creek, French Gulch, and Indian Creek), Calaveras County, CA
- Due Diligence for Meadowlark Project in Pleasanton, CA
- Due Diligence Services for the Montalcino Property, Napa County, CA
- Due Diligence Site Review for Parcel APN 68-241-30 located at 260 Bartlett Way Santa Cruz, CA
- Due Diligence Level IA Entitlements for the Boscell Road Osgood Project, City of Fremont, CA
- Trellis Residential Project EIR, City of Walnut Creek, CA
- El Dorado Materials Recovery Facility Remodeling Project, El Dorado County, CA
- Farmstand IS/MND, City of Healdsburg, CA
- La Paloma Winery Demo Project IS/MND, City of Clovis, CA
- Kaiser Dublin Medical Center EIR, City of Dublin, California
- Merced Gateway Master Plan Project EIR, City of Merced, CA
- Phase 1 Cultural Resource Assessment for 44 acres TTM No. 19992, Rancho Cucamonga, CA
- Bonadelle Tract 6120 Cultural Resources Study, City of Clovis, CA
- Professional Services to Support the Development of a Preferred Development Plan and Associated Regulatory Strategies for the Solano 360 Project, Solano County, CA
- Tassajara Parks EIR, Contra Costa County, California

Other Relevant Experience

The Society for Humanitarian Archaeological Research and Exploration

Dr. DePietro is the Founder and Executive Director of The Society for Humanitarian Archaeological Research and Exploration. He manages the projects, staff, and the daily operation of this not-for-profit organization. Dr. DePietro likewise establishes relationships with partner universities and institutions, writes grant proposals, supervises fundraising projects, and maintains accounts, financial records, and the organization's online presence.

University of California at Berkeley

Dr. DePietro was a lecturer at the University of California, Berkeley from August 2003 to January 2015. During his tenure, he prepared University-level source and lectures in the history of the modern and ancient Middle East, performed student advising and evaluation, and university administrative duties. Dr. DePietro provided resources and opportunities that empower people to critically engage with other cultures as well as with their own communities.

DANA DOUGLAS DePIETRO, PH.D.—Cultural Resources Lead (North)

Penn State University—Tel Akko Total Archaeology Project

Dr. DePietro was the Director of Community Engagement from 2013 to 2014 at the Penn State University for the Tel Akko Total Archaeology Project. He developed and executed a community engagement program, supervised staff and community participants, taught excavation and conservation techniques to groups of young people in Akko, and performed outreach, dialogue, and program developments in partnership[with community leaders.

Harvard University—Leon Levy Expedition to Ashkelon, Israel

Dr. De Pietro was the excavation supervisor during the summers of 2007-2013 for the Harvard University—Leon Levy Expedition to Ashkelon, Israel. He supervised the excavation and stratagraphic interpretation and instructed students in excavation techniques, data collection, photography, analysis, and publication.

Early Iron Age Cemetery Excavation—Dhamar, Yemen

Dr. De Pietro was the Area Supervisor during the summer of 2004 for the Early Iron Age Cemetery Excavation in Dhamar, Yemen. He supervised the excavation and stratagraphic interpretation, taught excavation techniques, strategy and implementation, field conservation, surveying techniques, data collection and analysis, and site management.

Journal of Associated Graduates in Near Eastern Studies (JAGNES)

Dr. DePietro was the Associate Editor from August 2003 to May 2012 for the Journal of Associated Graduates in Near Eastern Studiers (JAGNES). He solicited and proofread submissions, fundraising, and advertisements.

"Travel Today: Egypt" Magazine

Dr. De Pietro was an Archaeological Correspondent from December 2002 to February 2005. He wrote magazine articles, conducted relevant interviews and research, and procured photos and images to compliment articles.

FIRSTCARBON SOLUTIONS™

J. D. STEWART, PHD—PRINCIPAL PALEONTOLOGIST

OVERVIEW

- More than 42 years of experience

Education

- Doctor of Philosophy, Systematics & Ecology, University of Kansas, 1984
- Master of Arts, Systematics & Ecology, University of Kansas, 1979

Training and Certifications

- Certified Paleontologist, Orange and Riverside counties, California
- Hazardous Waste Operations and Emergency Response 40 Hr.
- General Site Worker

Professional Affiliations

- Society of Vertebrate Paleontology

J.D. Stewart, PhD, is a Vertebrate Paleontologist with more than 40 years of experience in paleontology, and more than 30 years of experience in the geology and paleontology of California. He has been involved in the permitting or construction of more than 10 power plants, and has directed the paleontological monitoring and mitigation program for Path 15, a major transmission line project. His publications include more than 40 peer-reviewed articles in books and journals. His research specialties are fossil fishes and Pleistocene vertebrate faunas.

RELATED EXPERIENCE AND CLIENT SUMMARY

Representative FCS Projects

- Paleontological, Archaeological, and Monitoring and Reporting Services for the Los Angeles Regional Interoperable Communications Biological System (LA-RICS), Los Angeles County, CA
- Paleontological and Archaeological Services for the North Shore Solar Facility Project, City of Mecca, Riverside County, CA
- Anaheim Coves Cultural, Paleontological, and Biological Monitoring Services, City of Anaheim, CA
- Cadence Property Paleontological WEAP Training and Monitoring Plan, 309-400 Airport Boulevard, San Francisco, CA
- Basic Feasibility Services for the AT&T 140-Mile Fiber Optic Installation from Julian to Brawley, Multiple Locations, CA
- Rio Vista Specific Plan Project EIR, City of Jurupa Valley, CA
- Midpen Cypress Point Affordable Housing Project Paleontological Review, City of Moss Beach, CA
- Paleontological Peer Review Services for the City of Los Angeles, CA

J. D. STEWART, PHD—PRINCIPAL PALEONTOLOGIST

Other Relevant Experience

Tenaska Imperial Solar Energy Center (ISEC) West Project, Imperial Valley, CA

For the Tenaska Imperial Solar Energy Center West Solar Project, Dr. Stewart supervised paleontological monitoring activities on private lands.

BrightSource Sonoran West Solar Project, Blythe, CA

Dr. Stewart supervised paleontological surveys on the U.S. Bureau of Land Management (BLM) and private lands. He worked on the Application for Certification (AFC) and wrote the final report when the project was terminated.

TerraGen Project

Dr. Stewart performed pedestrian paleontological surveys of the TerraGen Project site and wrote the Paleontological Resources section for the AFC.

BrightSource Rio Mesa Solar Project, Blythe, CA

Dr. Stewart supervised paleontological surveys on BLM and private lands, and prepared the Paleontological Resources section for the AFC.

Pio Pico Energy Center, Otay Mesa, CA

The Pio Pico Energy Center is a 300 MW simple-cycle electrical generating facility that is contracted under a 25-year power purchase agreement with San Diego Gas & Electric. Pio Pico is located on a 10-acre site in Otay Mesa, an unincorporated area of San Diego County, California, approximately 15 miles southeast of downtown San Diego. Dr. Stewart supervised paleontological surveys and wrote the Paleontological Resources section for the AFC for this project.

Mesquite Nevada Replacement General Aviation Airport, Clark County, NV

Dr. Stewart prepared the Paleontological Resource Assessment for the Federal Aviation Administration.

Marsh Landing Generating Station Application for Certification, Contra Costa County, CA

Dr. Stewart performed a paleontological pedestrian survey of a project area in Contra Costa County and wrote the Paleontological Resources section of the AFC. He also served as the Paleontological Resource Specialist during construction and prepared the final report.

Imperial Valley Solar Application for Certification, Imperial Valley, CA

Dr. Stewart directed paleontological pedestrian surveys within a project area in San Bernardino County and wrote the Paleontological Resources section of the AFC.

Calico Solar Application for Certification, San Bernardino County, CA

Dr. Stewart participated in paleontological pedestrian surveys of the Calico Solar project area, edited the Paleontology section of the AFC, and served as the Paleontological Resource Specialist.

J. D. STEWART, PHD—PRINCIPAL PALEONTOLOGIST

Starwood Power-Midway, LLC Peaking Project Construction

Dr. Stewart wrote a mitigation plan for paleontological resources, oversaw paleontological monitoring during project construction, and wrote the final report.

Calnev Pipeline Project, San Bernardino County, CA and Clark County, NV

Dr. Stewart directed paleontological surveys of a 234-mile-long project area in San Bernardino County, California and Clark County, Nevada. He also prepared the paleontological assessment.

Willow Pass Generating Station Application for Certification, Contra Costa County, CA

Dr. Stewart participated in paleontological pedestrian surveys of a project area in Contra Costa County and wrote the Paleontological Resources section of the AFC.

San Joaquin One and Two Application for Certification, Fresno County, CA

Dr. Stewart directed paleontological pedestrian surveys of a project area in Fresno County and prepared the Paleontological Resources section of the AFC.

Carrizo Energy Solar Farm (Ausra) Application for Certification, Simmler, CA

Dr. Stewart participated in paleontological pedestrian surveys of the Carrizo Energy Solar Farm project area and edited the Paleontology section of the AFC.

Starwood Power-Midway, LLC Peaking Project Application for Certification

Dr. Stewart participated in the responses to the CEC Provisional Staff Assessments for Starwood Power-Midway, LLC's Peaking Project AFC.

Path 15 500-kV Power Transmission Line between Los Banos and Gates Substations, Los Banos, CA

Dr. Stewart supervised paleontological resource monitoring, excavations, specimen preparation, specimen identification, and report writing for this 80-mile-long power line.

7 February, 2003

Management Summary

An intensive Phase I archaeological survey was conducted for the Hitch Ranch study area, Moorpark, Ventura County, California. This involved background studies of the prehistory and ethnography of the area; an archival records search of relevant maps, site forms and documents; and an on-foot survey of the subject property. No cultural resources had been recorded within the study area, and none were noted during the intensive survey of it. Development of the property, therefore, does not have the potential to result in adverse impacts to cultural resources. No additional archaeological work is recommended for this property.

1.0 INTRODUCTION

At the request of Mr. Mark Austin, Impact Sciences, Inc., an intensive Phase I archaeological survey was conducted for the Hitch Ranch study area, City of Moorpark, Ventura County, California (Figure 1). This cultural resources survey was intended to inventory and evaluate any known historical or prehistoric archaeological sites lying within this 285 gross acres parcel, and to identify and record previously unknown cultural resources. Following the California Environmental Quality Act (CEQA), the purpose of this investigation was to provide baseline data from which a preliminary assessment of the adverse impacts to any such cultural resources could be made, should this property be developed, and to develop management recommendations for the further study or treatment of archaeological sites or localities identified within the subject property.

This study was undertaken by W & S Consultants, and was conducted on February 5-8, 2003. David S. Whitley, Ph.D., Joseph M. Simon and Tamara K. Whitley, M.A., were responsible for the field work portion of the study. This manuscript was prepared by Whitley and Simon.

A series of procedures and studies were conducted in order to adequately inventory and evaluate the cultural resources within the study area at the Phase I level. These included: a review of published reports and studies to establish the aboriginal cultural history of the region in question; an examination of historical reports and sources to determine the history of the subject property; a study of existing archaeological site records and files to identify known cultural resources within the subject property; and a field survey and assessment to identify previously unknown or unreported archaeological sites. This report summarizes the findings and conclusions of each of these aspects of the Phase I investigation.

We begin with an environmental overview of our study area, the 285 gross acres Hitch Ranch study area. We then turn to a summary of local cultural history, including both ethnography and prehistory. We also consider the previous archaeological research that has been conducted in inland Ventura County. Subsequently we summarize the results of an archaeological records search, conducted by the staff of

the California State University, Fullerton, Archaeological Information Center (AIC). Next we outline the field procedures we followed in conducting the survey of the study area, and then turn to the results of the field study. We conclude with management recommendations for the study zone.

2.0 ENVIRONMENTAL BACKGROUND

The 285 gross acres Hitch Ranch study area lies within the southern limits of the Simi Hills, immediately to the north of Little Simi Valley, and immediately west of the town center of Moorpark proper, Ventura County, California (Figure 1). The Southern Pacific railroad right-of-way forms the southern limits of the study area, while the eastern boundary runs approximately north-south immediately to the west of the old Union High School and the Moorpark Civic Center. The northern and western boundaries abut rural and semi-rural properties in the Simi Hills.

From a geomorphological perspective, this is an area of minor dissected fault scarps and intervening arroyos, creating a series of low, broad and generally north-south trending ridges, with round-bottomed arroyos in between. The ridges rise gently from the southern boundary, which sits on the flat alluvium created by Arroyo Simi and Little Simi Valley, to the higher foothills on the north. Elevation ranges from just under 500 feet a.s.l., at the south limits of the study area, to 700 feet a.s.l. along the northern edge of the property. Major drainages feeding the Arroyo Simi do not occur within the study area, although Walnut Canyon lies to the east, and the upper reaches of Grimes Canyon are located immediately west. Furthermore, no springs or active water-courses are present on the property.

Although historic and recent land-use changes have altered the environment considerably from what existed during prehistoric times, one major plant association probably characterized this area during the aboriginal period. This is the chaparral association (cf. Muntz 1974). Southern oak woodlands may also have been present within or near to the study area, while riparian environments clearly would have been present in the Arroyo Simi to the south.

The chaparral association covers steeper slopes with poorly developed soils and xeric conditions. It includes the following species: California sagebrush (Artemisia californica), white sage (Salvia mellifera), black sage (S. apliana), purple or white-leaved sage (S. Leucophylla), California encilia (Encilia californica), California buckwheat (Eriogonum fasciculatum), chamise (Adneostoma fasciculatum), buckbruch

(Ceanothus cuneatus), scrub oak (Quercus dumosa), toyon (Heteromeles arbutifolia), mountain mahogony (Cercocarpus betuloides), lemonade sumac (Rhus integrifolia) and sugar sumac (R. ovata).

The southern oak woodland may have been of primary aboriginal significance in the inland zones adjacent to the coastal strip. This results because of the great importance placed on the acorn as a food staple by Native Californians (Kroeber 1925), and the rarity of this resource on the coastal side of the Santa Monica Mountains. The association is characterized by the coast live oak (Quercus lobata) and the valley oak (Q. agrifolia), but also would have included various species of native grasses. Although currently restricted in distribution, this association was probably once much more widespread throughout the Simi Valley and Moorpark regions, which are near to the study area, and may have been present within the open flats of Little Simi Valley, south of the study area, as well as on the Mesa de Somis, immediately to the north.

Riparian habitats are localized and poorly diversified woodlands found in areas of perennial moisture. They include such species as arroyo willow (Salix lasiolepsi), mule fat (Baccharis glutinosa), willow dock (Rumex salicifolius), swamp knotweed (Polygonum coccineum), nettle (Urtica holosericea), cocklebur (Xanthium strumarium) and rabbitsfoot grass (Polypogon monspeiensis). Though this plant association is limited in distribution, it can still be considered to have had significant economic importance in aboriginal times, especially in terms of the acquisition of raw materials for items like baskets, cordage and netting. As noted above, originally it would have been present in Arroyo Simi, south of the study area.

Soils within the study zone are uniformally a heavy, expansive adobe soil, thinly-mantling sedimentary bedrock. Although the relationship between this soil type and specific plant associations have not yet been defined, our experience surveying in the inland Ventura County area suggests that prehistoric archaeological sites are rarely located on such soils, apparently signalling the fact that the specific plant associations found on such soils were not considered ideal for aboriginal exploitation and therefore inhabitation.

Because the above, idealized scenario applies to the region prior to modern ranching and development, much of the current vegetation within the Hitch Ranch study area is introduced or otherwise altered. It thereby varies considerably from what would have existed aboriginally or prehistorically. Essentially all of the study area has been disked, may have been grazed by livestock at some point, and may also have been farmed. The study area is now covered with introduced grasses and stands of mustard, precluding any definite reconstruction of original environmental conditions.

3.0 ETHNOGRAPHIC AND PREHISTORIC BACKGROUND

The Hitch Ranch study region, lying in southeastern Ventura County, California, is situated in a zone known prehistorically to have comprised a portion of the Canaliño culture area, and historically to have been a part of the Chumash ethnolinguistic sphere. In general archaeological terms the region of the Canaliño culture area is known to have first been occupied during the Early Millingstone period, which dates back to about 9000 years before B.P. (before present). During this period subsistence is posited to have emphasized plant resources, and site assemblages are dominated by large-sized and relatively crude chopping, grinding and pounding tools. At about 3500 years B.P. the prehistoric inhabitants of the region are said to have made a transition to a more hunting-oriented economy, which occurred during the duration of the Intermediate period, lasting to about A.D. 1200. Artifacts particularly diagnostic of this period include large, stemmed projectile points, probably used as spear or dart points, although smaller arrow points were introduced after about A.D. 500. The Intermediate period was replaced subsequently by the Late Prehistoric, or Canaliño period, per se, which lasted until the time of Spanish missionization during the last two decades of the 18th century. The Canaliño period witnessed a florescence of aboriginal culture which included a substantial growth in population, the establishment of permanent settlements on the coast, a high degree of sociopolitical complexity and the development of a very sophisticated maritime economy. It was during the Canaliño period that the ethnolinguistic group now known as the Chumash achieved levels of cultural and social sophistication perhaps unrivalled by hunter-gatherer groups anywhere else in the world (Wallace 1955; Landberg 1965).

The term "Chumash" strictly applies to a group of people united only by the use of a series of closely related Hokan languages, sharing a number of similar cultural traits, and stretching from Topanga Canyon inland to Mt. Piños and along the coast to the San Luis Obispo area (cf. Kroeber 1925). That is, it implies no necessary sociopolitical unity (as in a single 'tribe') and, in fact, a series of different Chumash languages and political units existed at the time of Spanish contact. In the southeasternmost region of the Chumash, including the immediate area of Moorpark, Ventureño Chumash was spoken.

Based on recent ethnohistoric reconstructions (cf. Whitley and Clewlow 1979; Whitley 1980; Whitley and Beaudry 1991), we now know that the Chumash were united into at least two major chiefdoms at the time of contact with the Spanish, and that these cross-cut linguistic boundaries between the various Chumashan-speaking groups. One of these political bodies, Lulapin, was governed from a village occupied by the paramount chief located near modern Point Mugu, at the mouth of the Calleguas Creek. Apparently this village controlled a series of smaller villages and village provinces within a large region stretching to the north of Santa Barbara at the time of Spanish contact. One of these 'controlled' or subordinate provinces was Humaliwo, which was governed by the historic village located at modern Malibu Beach. Logically, we can assume that whatever villages existed historically within the Moorpark/Simi Valley area would have been subordinate to the capital at Point Mugu as well.

While the specific region of the study area must be viewed within this general prehistoric and ethnohistoric context, it is nonetheless true that the reconstruction of Chumash prehistory and ethnohistory has largely been based on coastal evidence. That is, sites and minor regions inland from the coast obviously vary from those on the coastal strip (lacking, for example, access to coastal and maritime resources) and therefore exhibit not only some differences in terms of general site characteristics and adaptational trajectories, but in general chronological parameters too (W & S Consultants 1985; Whitley 1985).

The region in which the Hitch Ranch study area is located is an inland area generally referred to as the Simi Corridor. This comprises part of a series of east-west trending valleys and intervening hill systems lying northward (and therefore inland) of the Santa Monica Mountains and Conejo Corridor. It includes the Simi Valley proper, the Tierra Rejada, Little Simi and the Santa Rosa Valleys, all of which are tributary to the Calleguas Creek drainage. Although little archaeological research in the Simi Valley area and Simi Corridor has been published, it is probable that the prehistory of this area is similar to that of the adjacent Conejo Corridor, located immediately to the south. A relatively intensive period of research in this last area, resulting largely from development in the Thousand Oaks region and the cultural resources management studies that have been attendant to this development, has provided a fairly thorough indication of the

nature of the prehistoric record in this inland region, which appears applicable to the Simi Corridor as well.

If we may use the prehistory of the Conejo Corridor as a model, and unlike the Chumash region in a more general sense, the first indication of aboriginal occupation in this inland area appears to date to the beginning of the Intermediate period, or from about 3500 years B.P. (W & S Consultants 1985:69). This comprised the initial occupations of a series of what have been termed site complexes. These are agglomerations of small habitation and special purpose sites that tend to be localized in relatively restricted areas (Whitley 1979, 1980, 1985).

A series of site complexes have now been identified and studied in the Conejo Corridor region, and it is very probable that some exist in the Simi Corridor region as well. Almost without fail, each of these complexes contains deposits or components that represent the entire temporal span of inland occupation. As well, there is no clear functional or adaptational differentiation between earlier versus later temporal components of these complexes. That is, even while there is a general tendency towards more complexity in the nature and variability of the tool assemblages towards the present, it is now clear that even some of the earlier temporal components in the region exhibit subsistence emphasizes found in the later components (W & S Consultants 1984). And this is to say that, from the initial occupation of this inland region, a very generalized foraging strategy was followed, not necessarily by every site complex in the area, but certainly by the inland occupation when considered as a whole (ibid; Whitley 1985).

Thus, in the Conejo Corridor not only do we see early occupations exhibiting artifact assemblages that resemble more typically 'later' assemblages, with their heavy emphasis on hunting and hunting tools, but we also see late sites very much appearing like temporally 'earlier' sites, with a dominance of groundstone tools and chopping implements (ibid). The inference that results, consequently, is that the establishment of inland sites some 3500 years ago in the Conejo Corridor appears to represent an effort to exploit a variety of non-coastal environments, following a number of different subsistence strategies. This point of initial exploitation and occupation may correlate with a shift to the modern climatic regime, which also

appears to occur at this time (G. Smith, personal communication, 1990). Further, it is clear that no single subsistence strategy uniquely characterized any specific time period; instead, a generalized foraging pattern appears to have held for the entirety of the prehistoric occupation of the area.

4.0 HISTORICAL BACKGROUND

The Moorpark region, including the Hitch Ranch study area, was originally part of El Rancho Simí land grant (or, more properly, San José de Nuestra Señora de Altagracia y Simí), ceded by the Spanish crown to the Santiago de la Cruz Pico family in 1795 (Havens n.d.; Thompson and West 1883:49, 389) and headquartered at the 'Simi Adobe' (at modern Strathearn Historical Park). Although now in Ventura County, El Rancho Simí was placed under the ecclesiastical jurisdiction of Mission San Fernando (Cameron 1963:5), thus indicating that its original economic and social ties lay to the east, not the west.

Rancho Simí was evidently a successful enterprise until 1842, at which poin it was purchased by Don José de la Guerra y Noriega, who added it to his substantial holdings that were said to stretch from Santa Barbara to San Diego (Thompson and West 1883:44; Sheridan 1926:168). In 1862 this 113,009.21 acres parcel was ceded to Mr. Guerra by the U.S. Land Commission following the war with Mexico, and the property was patented on June 19, 1865 (Sheridan 1926:168; Allen 1987:3). Subsequently the rancho in general served principally for sheep grazing until purchased by eastern investors, involved in oil speculation. Because they failed to find oil, the Simi Land and Water Company was formed under the leadership of Thomas R. Bard, representing Thomas Scott of Pennsylvania, in 1887, and an effort was made to sell the land in parcels (Havens n.d.). In 1889, Robert Strathearn purchased 18,000 acres of Rancho Simí, including the eastern portion of what is now Moorpark. During the existence of the original Rancho Simí, however, it is apparent that the study area was a marginal zone (in fact, near the western boundary of the ranch) and did not figure in any historical incidents or developments.

The City of Moorpark, proper, portion of Rancho Simí, including the Hitch Ranch study area, apparently formed a portion of the Rancho Simí retained by the Simí Land and Water Company, of which Robert Poindexter was a major shareholder and member of the board of directors.

During the 1850s and 1860s, however, the first settlers moved into the Moorpark region (Cameron 1967:9), apparently on land peripheral to what would be the Strathearn Ranch. Whether these individuals

were squatters or not is unclear from existing records, although this is likely. Regardless, there is essentially no record of their activities and occupation of the area.

The first subdivision of Moorpark was known as Fremont or Fremontville (also sometimes referred to as Little Simí), apparently named after General Fremont, who was said to have passed through the area on his way to the Battle of Cahuenga Pass (ibid:2). Fremont was recorded in 1893 by Robert and Madeline Poindexter, presumably representing the Simí Land and Water Company. Although the map of Fremont shows the town area divided into lots of various sizes (ibid:24), there is essentially no indication that any of these were sold and/or occupied.

For reasons apparently related to the reorganization of the Simí Land and Water Company, Fremont was subdivided and recorded again in 1900. The Poindexters were again responsible for this subdivision, as well as for laying out the new township, including the planting of the California Pepper trees along High Street, and the establishment of a school site (ibid:3, 23), in anticipation of the appearance of the railroad, work for which began in 1899. Mr. Poindexter was also responsible for naming the town Moorpark, apparently after a variety of apricot that was then being cultivated in the area (ibid).

By 1901 a rail depot, warehouse, post-office, blacksmith shop, general store and barber shop had been established in Moorpark. In 1905 the school that had formerly stood on Peach Hill in Fremont was moved into town. Shortly thereafter, the Methodist Church that had been built in Epworth (to the north of town on Broadway) was moved to the corner of Walnut and Charles Streets, and the town quickly developed into an important farming community (ibid:24). By 1920 it had established itself as the apricot center of the county.

Moorpark remained a rural farming community into the latter half of this century: in 1957 the population had only reached 2463 people (ibid). However, since that time the town's growth has become increasingly related to the suburban development of the county as a whole. It was incorporated a decade ago and has grown rapidly ever-since.

According to the original subdivision map of Moorpark (ibid:24), the central portion of the current study area was under the ownership of E.J. Whitney in 1900, while the Gabbert Ranch apparently had been established to the west of the property at about the same time. However, this map does not indicate whether or not structures were placed within the property, and subsequent maps (see Record Search below) record no buildings or roads on the property in 1921 and 1942. Accordingly, our best interpretation is that the Hitch Ranch study area was peripheral to the historical events in the development of Moorpark, although it may have been used for farming and/or grazing as early as 1900. However, the possibility exists that a homestead was present on the property around the turn-of-the-century, and that it had been destroyed prior to the 1921 map, or simply omitted from it. That is, the background historical studies suggest that historical resources might be present within the Hitch Ranch study area.

5.0 ARCHAEOLOGICAL RECORD SEARCH

In order to determine both if the Hitch Ranch study area had ever been systematically surveyed by archaeologists, and whether or not prehistoric and/or historical archaeological sites were known to exist on the property, an archaeological records search of the CSUF Archaeological Information Center (AIC) site files and maps was commissioned. This record search was conducted by the AIC staff on 29 January 2003. We include a copy of their records search as Appendix A of this report.

According to the maps, site records and reports on file at the AIC, no archaeological sites of any kind had been recorded within the Hitch Ranch study area, nor in the immediate vicinity of the study area, despite the fact that the project area had been previously surveyed in 1994.

Historical maps, consisting of the 1921 and 1942 USGS Piru 15' topographical quadrangles, were also examined in an effort to identify historical structures or features that might have existed on the property. None were found to exist within the study area, although there was development of the Moorpark town center by 1921.

6.0 ARCHAEOLOGICAL FIELD SURVEY

An intensive, Phase I archaeological field survey was conducted on the entire 285 gross acres Hitch Ranch study area between February 5-8, 2003. David S. Whitley, Ph.D., Joseph M. Simon and Tamara K. Whitley, M.A., served as the survey crew during this study.

Field procedures involved spacing the crew at approximately 15 to 20 meter intervals and then walking the property in transects, generally following the contours of the local topography. The groundsurface was examined during these transects to identify archaeological specimens in the form of worked artifacts, or archaeological indicators, which might consist of specimens of shellfish, bone or waste lithic material resulting from the tool-making process.

During the survey special attention was paid to geomorphological conditions that affect the preservation of archaeological remains. Road or bank-cuts that expose subsurface stratigraphy, for example, along with stable geomorphic and depositional environments, were carefully examined for evidence of cultural remains. Given the geomorphology of the current project area, these included saddles in particular, as likely spots for subsurface deposition, and broad ridgelines/knolltops as areas also likely to contain cultural resources. In contrast, slopes of greater than about 25% grade, where erosional and gravitational forces would preclude the preservation of archaeological remains, were less intensively examined both because of the negligible possibility that sites might be present on them, and for the safety of the crewmembers.

7.0 SURVEY RESULTS

Conditions for the field survey of the Hitch Ranch study area were found to be, in general, fair. Groundcover was moderate but not heavy, thereby impeding groundsurface visibility in some areas, but a network of dirt roads and rodent-hole backdirt piles enabled a thorough examination of the study area.

Recent/modern structures and structural remains were present within the study area, with cleared zones surrounding these features. In particular, what appears to have been a demolished house is present along the central-eastern boundary of the property, now consisting solely of a graded and recently grubbed pad, and a pile of modern household and demolition rubbish, with other remnants of modern remains scattered throughout the property. No evidence of a possible turn of the century homestead was found.

No evidence of prehistoric archaeological remains was discovered during the intensive Phase I survey. The absence of such remains can be presumed to correlate with the relative xeric conditions within the study area, the apparently low density of prehistoric archaeological sites in the Moorpark region, and the tendency for any such sites to cluster tightly around permanent water sources.

No cultural resources of any kind, accordingly, were discovered during the intensive Phase I archaeological survey, reflecting the fact that the property was peripheral to prehistoric and historical habitation and use of the Moorpark region. However, there appears to be a reasonable possibility that some historical remains may be present within the central portion of the study area.

8.0 CONCLUSIONS AND RECOMMENDATIONS

An intensive Phase I archaeological survey of the Hitch Ranch study area, City of Moorpark, Ventura County, California, was conducted by W & S Consultants. This study involved a literature, maps and records review of the prehistory, history and status of archaeological research in the region, and an on-foot survey of the 285 gross acres property. The background studies indicated that no cultural resources of any kind were known to be present on the property, although a 1900 subdivision map indicated that there was some possibility that the remains of an early homestead might be present. The intensive field survey of the property, however, failed to discover any evidence of prehistoric or historical cultural resources within the study area.

Accordingly, the development and use of the Hitch Ranch study area will not result in any adverse impacts to known cultural resources of any kind. No additional archaeological work is recommended for this property.

RE: Record Search for the 285 acre Hitch Ranch, Moorpark, Ventura County, CA

Dear Dr. Whitley,

As per your request received on January 16, 2003, we have conducted a records search for the above referenced project. This search includes a review of all recorded historic and prehistoric archaeological sites within a one-quarter mile radius of the project area as well as a review of all known cultural resource reports. In addition, we have checked our file of historic maps, the California Points of Historical Interest (PHI), the listing of California Historical Landmarks (CHL), the California Register of Historic Places (CR), the National Register of Historic Places (NR), and the California State Historic Resources Inventory (HRI) for the referenced project area. The following is a discussion of our findings for the project area.

ARCHAEOLOGICAL RESOURCES:

No prehistoric archaeological sites have been identified within a one-quarter mile radius of the project area (see enclosed map). No prehistoric isolates have been identified within a one-quarter mile radius of the project area.

No historic archaeological sites have been identified within a one-quarter mile radius of the project area (see enclosed map). No historic isolates have been identified within a one-quarter mile radius of the project area.

HISTORIC RESOURCES:

No recorded historic built environments have been identified within a one-quarter mile radius of the project area.

Copies of our historic map – Piru (1921 and 1941) 15' USGS - are enclosed for your review.

The California Point of Historical Interest (1992) of the Office of Historic Preservation, Department of Parks and Recreation, lists no properties within a one-quarter mile radius of the project area.

The California Historical Landmarks (1990) of the Office of Historic Preservation, Department of Parks and Recreation, lists no properties within a one-quarter mile radius of the project area.

The California Register of Historic Places lists no properties within a one-quarter mile radius of the project area.

The National Register of Historic Places lists no properties within a one-quarter mile radius of the project area.

The California Historic Resources Inventory lists no properties that have been evaluated for historical significance within a one-quarter mile radius of the project area.

PREVIOUS CULTURAL RESOURCES INVESTIGATIONS:

Twenty-two studies (VN191, VN213, VN233, VN322, VN557, VN558, VN572, VN607, VN776, VN821, VN1059, VN1102, VN1153, VN1265, VN1329*, VN1471, VN1548, VN1589, VN1656, VN1680, VN2052 and VN2054) have been conducted within a one-quarter mile radius of the project area. Of these, one is located within the project area. There are eleven additional investigations located on the Moorpark 7.5' USGS Quadrangle that are potentially within a one-quarter mile radius of the project area. These reports are not mapped due to insufficient locational information.
A bibliography of these reports is available upon request.
(* = Located within the project area)

Please forward a copy of any reports from this project to our office as soon as possible. Due to the sensitive nature of archaeological site location data, we ask that you **do not include** records search maps in your report. If you have any questions regarding the results presented herein, please feel free to contact our office at 714.278.5395 Monday through Thursday 8:00 am to 3:30 pm.

Invoices are mailed approximately two weeks after records searches are completed. This enables your firm to request further information under the same invoice number. Please reference the invoice number listed below when making inquiries. Requests made after the invoicing will result in the preparation of a separate invoice with a $15.00 handling fee.

Sincerely,
SCCIC

Catharine M. Wood
Staff Archaeologist

Apartments Low Rise	193.00	Dwelling Unit	0.00	193,000.00	591
Apartments Mid Rise	135.00	Dwelling Unit	0.00	135,000.00	413
Single Family Housing	427.00	Dwelling Unit	215.33	768,600.00	1307

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.6	**Precipitation Freq (Days)**	31
Climate Zone	8			**Operational Year**	2030
Utility Company	Southern California Edison				
CO2 Intensity (lb/MWhr)	390.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Land uses per Project Description in EIR. 277.3-acre site with 55.2 undisturbed and 6.77 for city park

Construction Phase - Phase duration per project applicant.

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Trips and VMT - Trips (worker and vendor) during building construction and arch coating reflect proportion of project constructed during each phase. Grading material balanced on-site, no off-site hauling trips required.

Hitch Ranch Specific Plan - GHG Emissions - Ventura County APCD Air District, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

Grading - No import/export per project applicant for grading P1 and grading P3, balanced on-site. Other phases only fine grading for building pads.

Architectural Coating - Coating square footage distributed proportionately by amount of project being constructed per phase. VCAPCD Rule 74.2.

Vehicle Trips - Trip rates and VMT to match project traffic study.

Area Coating - VCAPCD Rule 74.2

Area Mitigation - VCPACPD Rule 74.2

Energy Mitigation - Compliance with 2019 Building Energy Efficiency Standards, which require on-site solar to meet 100% of electricity requirements for residential uses 3 stories or less, plus rooftop solar system for four-story building included in project design

Water Mitigation - Compliance with CALGreen requirements

1 SUMMARY

Amicus – Strategic Environmental Consulting (Amicus) was retained by Comstock Homes (Comstock) to conduct a Phase I Environmental Site Assessment (ESA) of the approximately 285-acre project property located in Moorpark, California (Figure 1). The property is being evaluated in association with a contemplated acquisition and residential development project.

The ESA was conducted in accordance with the EPA All Appropriate Inquiry (AAI) Final Rule (40 CFR, Part 312, § 312.10) and the ASTM International E 1527-13 Standard Practice for Environmental Site Assessments. As defined by AAI and ASTM, the purpose of a Phase I ESA is the discovery of Recognized Environmental Conditions (REC), facts indicative of a release or potential release of hazardous substances or petroleum products. In accordance with the AAI/ASTM protocol, Amicus staff obtained historic use-related documentation, inspected the property on foot, and interviewed available relevant parties for the purposes of evaluating environmental conditions and the potential for REC.

The project property is located about an hour northwest of Los Angeles east of the coastal community of Ventura in the City of Moorpark. The property is in an undeveloped state. Signs of prior occupation exist in the form of foundation slabs, fences and water production, conveyance and storage features. Nearby land is developed for single-family residential and light industrial/commercial uses in neighborhoods mostly east and south of the project property.

A small corral with stables was located on the property in 2017 with permission by the owner. The ranch runs cows within the fenceline of the project property. A water storage tank, watering trough and water well are present in the southwestern portion of the primary project parcel. Two several hundred gallon capacity manifolded poly tanks are present near the former hog husbandry buildings in the central property interior. A large steel water tank (no longer in use) remains in the northeastern portion of the primary assemblage.

Prior ESA were conducted in 1998 and 2006. The 1998 ESA recommended removal of observed dumped debris and the sampling and analysis of property soil to determine the presence/magnitude of residual pesticides and herbicides. The testing was conducted in 2006 by Applied Environmental Technologies, Inc. (AET) and while residual concentrations were measured in collected samples they were not of a magnitude that warranted concern of further testing.

Amicus observed no indication of a REC or an activity likely to cause a REC during the property inspection. No use or feature indicative of a current REC was noted in the review of environmental databases or historic project documentation. No additional evaluation is recommended. Amicus concurs with the AET recommendation for vigilance during grading and utility work, for as even though no REC was identified, underground features may be present and may be encountered during earth-disturbing activity.

2 INTRODUCTION

Amicus – Strategic Environmental Consulting (Amicus) was retained by Comstock Homes (Comstock) to conduct a Phase I Environmental Site Assessment (ESA) of an approximately 285-acre project property located in Moorpark, California (Figure 1). The land is presently vacant and undeveloped. The property is being evaluated in association with a contemplated acquisition and residential development project.

This ESA was conducted for the purposes of evaluating the environmental condition of the property in association with the contemplated transaction. The ESA was conducted in accordance with the EPA All Appropriate Inquiry (AAI) Final Rule (40 CFR, Part 312, § 312.10) and the ASTM International (formerly the American Society for Testing and Materials) E 1527-05 and updated/revised E 1527-13 Standard Practice for Environmental Site Assessments: Phase I ESA Process.

2.1 Purpose

The objective of this ESA is the identification of property environmental conditions for transactional purposes. Current standards of professional practice require Environmental Site Assessments to be conducted in accordance with AAI and the ASTM Standard E 1527-13 (which is fashioned after and follows AAI). As described by the ASTM standard, the objective of this ESA is to identify, to the extent practicable, "Recognized Environmental Conditions."

A Recognized Environmental Condition (REC) is defined by ASTM as "the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water on the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimus conditions that generally do not pose a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies."

2.2 Detailed Scope of Services

The scope of services for this ESA follows the ASTM Standard and includes the following activities:

Review of User-Provided Information – As deemed necessary for the analysis of property conditions, review of User-provided information regarding title and judicial records for environmental liens or activity and use limitations, actual or specialized knowledge or commonly known information regarding environmental conditions, readily available maps, environmental reports, and other environmental documents pertaining to the site, as available.

Records Review – Acquisition and review of records possibly including but not limited to federal, state, tribal, and local regulatory agency databases for the site and for properties located within a specified radius of the site; local regulatory agency files for the site and selected nearby properties of potential environmental concern; physical setting sources including topographic maps, geologic maps, and geologic and hydrogeologic reference documents; and historic land use information including aerial photographs, historical fire insurance rate maps, building department records, and city directories, as needed; that are reasonably ascertainable, publicly available, can be obtained within reasonable time and cost, and are practically reviewable.

Site Reconnaissance – A physical inspection to observe the Property and its condition.

Interviews – Interviews or review of records of interviews with site representatives including as necessary owners, occupants, and site managers regarding current and historic property use and condition.

Report – Compilation and presentation in this report of the methods and findings associated with the above-described tasks.

2.3 Significant Assumptions

The legal boundaries of the subject property are assumed to be as described in the materials provided to Amicus by Comstock. Amicus has performed no independent verification of the property boundaries and assumes that the boundaries described are accurate.

2.4 Limitations and Exemptions

The environmental services described in this report have been conducted in general accordance with the ASTM standard and the standard-of-care exercised by environmental professionals performing similar work. This document is intended to be used only in its entirety. The findings, conclusions, and recommendations expressed herein are based on an analysis of the observed site conditions and the referenced research and literature at the time the ESA was conducted.

2.5 Reliance

This report was prepared for use solely and exclusively by Comstock and parties to the currently contemplated transaction. No other use or disclosure is intended or authorized by Amicus. In the preparation of this ESA, Amicus has used the degree of care and skill ordinarily exercised by a reasonably prudent environmental professional in the same community and in the same time frame given the same or similar facts and circumstances. No other warranties are made to any third party, either express or implied.

2.6 Special Terms and Conditions

There are no special terms and conditions associated with this Phase I ESA.

3 SITE DESCRIPTION

3.1 Location

The project property is approximately 285 acres of land in eight parcels located on Poindexter Avenue in the City of Moorpark, in Ventura County, California.

Seven of the eight parcels together comprise the primary project assemblage; the eighth parcel is across and separated from the primary assemblage by Gabbert Road.

3.2 Environmental Setting

The project property is located about an hour northwest of Los Angeles east of the coastal community of Ventura in the City of Moorpark. Moorpark is a small city in a semi-rural setting about 15 miles east of the more densely developed Ventura and its surrounding cities and about 5 miles west of Simi Valley, also more densely developed.

Moorpark is situated in the rolling hills of the western Transverse Mountain Range. Property elevations range from approximately 475 feet above mean sea level (msl) in its southern portion near Poindexter Avenue to 720 feet near the northern property boundary. According to the 2006 ESA by Advanced Environmental Technologies, Inc. (AET), groundwater is encountered in unconsolidated sediments at approximately 10 feet below ground surface near the Arroyo Simi in the southern portion of the site and at depths greater than 100 feet in the higher elevations of the northern portion of the property. Seasonally wet arroyos and washes flow south to the concrete-lined drainage channel near the southern property line.

The Transverse Range is seismically active, with the Simi Fault mapped near the Los Osos Hills about three miles south of the project property (Treiman, 1998). A detailed examination of earthquakes and active faults is outside the scope of this ESA.

3.3 Site and Vicinity Characteristics

The property is in an undeveloped state. Signs of prior occupation exist in the form of foundation slabs, fences and water production, conveyance and storage features. Nearby land is developed primarily for single-family residential uses to the east and west. Residential neighborhoods and light industrial and commercial development is present south of Poindexter Avenue fronting on Poindexter north of East Los Angeles Avenue (Highway 23) further south.

3.4 Current Use of Property and Adjoining Property

The property is undeveloped though as described in this ESA was historically used by agricultural and livestock businesses for growing crops (primarily in orchards) and raising animals (hogs and cows). The southern property boundary extends for an approximate mile in an east-west direction north of Poindexter Avenue, a Southern Pacific railroad right

of way and a concrete storm water channel. Land immediately south of Poindexter Avenue from the project property is developed as a light industrial park to the west and a residential neighborhood to the east. Walnut Canyon Elementary School abuts the southeastern property line; single family residential parcels and undeveloped land adjoin the northeastern and western property boundaries. Land to the north is in an undeveloped state.

3.5 Description of Structures, Roads, Other Improvements

The property no longer contains permanent structural improvements for human or animal occupation. Those structures associated with prior agricultural and human habitation have been removed. A small corral with stables was located on the property in 2017 with permission by the owner. The ranch runs cows within the fenceline of the project property. A water storage tank and watering trough are present in the southwestern portion of the primary project parcel. Two several hundred gallon capacity manifolded poly tanks are present near the former hog husbandry buildings in the central property interior. One of the tanks is marked "Chlorine" and both contained liquid and were in good condition at the time of site reconnaissance. A large steel water tank (no longer in use) remains in the northeastern portion of the primary assemblage.

4 USER PROVIDED INFORMATION

The User is defined by ASTM E 1527-13 as "the party seeking to use Practice E 1527 to complete an environmental site assessment of the property." Here, the Comstock is the User.

4.1 User Supplied Reports

Comstock provided a Preliminary Title Report (PTR) dated June 13, 2016, a previously completed ESA and the 2012 Draft Hitch Ranch Specific Plan.

4.2 Environmental Liens or Activity and Use Limitations

No lien, use or activity limitation associated with an environmental impediment or concern that would qualify as a REC was reported to Amicus by Comstock or identified in the documentary record reviewed for this ESA.

4.3 Specialized Knowledge or Experience of the User

The User purchases and develops property and in association with this work has dealt with acquisition-related environmental conditions in the past. The User is knowledgeable of environmental conditions associated with properties such as the subject site, but had nothing material to add to this ESA.

4.4 Commonly Known or Reasonably Ascertainable Information

The User is not aware of any commonly known or reasonably ascertainable information within the local community that is material to RECs in connection with the property.

4.5 Valuation Reduction for Environmental Issues

The User reported no reduction in property valuation in association with environmental issues or REC.

4.6 Owner, Property Manager and Occupant Information

As listed in the PTR (Appendix A), title to the property is vested in:

Kimberley Jeanne Milligan, Trustee of the Kimberley J. Milligan Trust dated May 16, 1995 (as to an undivided 12.5% interest);

John R. Milligan, Trustee of the John R. Milligan Trust dated December 11, 1998 (as to an undivided 12.5% interest);

Lucy Milligan Wahl and Claire Catherine Milligan, as successor Co-Trustee of the MCM Trust II dated December 14, 1990 (as to an undivided 12.5% interest);

Julia Summers and Jim Summers, Co-Trustees of the Julia Summers 2013 Trust dated August 29,
2013 (as to an undivided 12.5% interest);

Carolyn Howarth, as Trustee of the Wesley J. Pomatto Trust Two, created January 2, 2012 (as to an undivided 6.25% interest);

Carolyn Howarth, as Trustee of the John J. Pomatto Trust Two, created January 2, 2012 (as to an undivided 6.25% interest);

The Richard H. Jones Ltd. Partnership, a Colorado Limited Partnership (as to an undivided 12.5% interest);

Susan C. Bavo, as Trustee of the Susan C. Bavo Trust, dated October 26, 1993 (as to an undivided 6.25% interest);

Palmyre L. Bavo, as Trustee of the Palmyre L. Bavo Trust dated September 10, 2001 (as to an undivided 9.375% interest) and

Nicole K. Bavo, as Trustee of the Nicole K. Bavo Trust dated September 7, 2001 (as to an undivided 9.375% interest)

The PTR provided by Comstock describes seven of the eight parcels shown on the APN map in the Specific Plan. It is noted that the PTR parcel numbers are slightly different than those shown in the Specific Plan. The PTR lists the following parcels and APN and shows the primary assemblage east of Gabbert Road:

"Parcel 1" – APN 511-0-020-170
"Parcel 2" – APN 511-0-020-110, 130, 160, 180
"Parcel 3" – APN 511-0-020-195
"Parcel 4" – APN 511-0-200-245

4.7 Reason for Performing This Assessment

This ESA was conducted for the purposes of identifying the presence of petroleum products, hazardous substances, and other site characteristics satisfying the ASTM/AAI definition of Recognized Environmental Condition (REC).

5 RECORDS REVIEW

As required by the ASTM standard, "the purpose of the records review is to obtain and review records that will help identify RECs in connection with the property." ASTM requires certain records be obtained and reviewed for the subject property and for properties within established distances from the subject site. ASTM requires review of what they describe as "Standard Source Information" as well as Additional Environmental Record Sources if, in the opinion of the Environmental Professional, an inspection of these records is necessary to enhance and supplement the Standard Sources.

5.1 Standard Environmental Record Sources

An environmental database was ordered from Environmental Data Resources (EDR), a regulatory agency database consolidator and provider. The December 7, 2017 EDR Radius Report presents a summary of sources required for review by the ASTM standard.

The sources of EDR Radius Report information are selected such that known environmental cases are identified (current or historic spill or release sites) and that an inventory is made of occupational uses capable of causing negative environmental conditions on the subject property or those within a defined radius of interest. A listing of the databases searched by EDR is presented in the EDR Radius Report (Appendix B).

The Radius Report shows 30 cases within a one-mile radius of the project property. Neither the property itself nor any neighboring property was shown by EDR to be listed as an environmental case. None of the mapped cases are in a location that would likely compromise the project parcel. The EDR Radius report therefore shows no recent or historic condition on the subject parcel or on neighboring parcels that would obviously compromise the environmental quality of the subject site or qualify as a REC.

5.2 Additional Environmental Record Sources

Preliminary Title Report

As noted above, Amicus was provided a PTR dated June 13, 2016 (Appendix A). The PTR describes a number of easements, none of which are for uses that would obviously affect property environmental condition or constitute a REC. No encumbrance for an environmental responsibility is noted. Several notices of non-compliance with County well ordinances are noted; these are not REC.

There was no indication in the PTR of any current or historic use on or adjacent to the project property indicative of REC.

State of California Regulatory Agency Databases

Amicus accessed and reviewed case files available on the State of California Geotracker (lists primarily Regional Water Quality Control Board and local agency environmental cases) and Envirostor (lists cases administered by the California Department of Toxic Substances Control) environmental project on-line databases.

There was no listing for the project property or neighboring properties on either Geotracker or Envirostor.

Division of Oil, Gas & Geothermal Resources – Well Finder

The California Department of Conservation, Division of Oil, Gas & Geothermal Resources (DOGGR) hosts an interactive web page showing the location of recorded oil and gas wells. The DOGGR well finder showed numerous wells in Ventura County but none on or immediately proximal to the project property.

Prior Environmental Site Assessments

Environmental Conditions

Comstock provided Amicus with a prior ESA, an ESA Addendum and an ESA Update. The February 13, 1998 ESA was prepared by Gradient Engineers for Impact Sciences as was the February 14, 2000 ESA Addendum. The ESA Addendum addresses ESA-related questions posed by City of Moorpark Community Development Department staff. The relationship between Impact Sciences and the City is not described in the project documents, though it appears as if the ESA was conducted in association with development planning. The October 16, 2006 ESA Update by AET was also prepared for Impact Sciences.

The 1998 ESA described historic property uses as agricultural (apricot orchard from the 1930s to 1948, a lemon orchard and wheat farming from 1948 to the 1970s), livestock husbandry (pig and cow) and horse training. The ESA reported site structural development at the time of Gradient inspection as limited to one single family residence along Poindexter Avenue and several structures associated with apricot processing in the central area of the property. Gradient documented the presence of debris in the vicinity of the agricultural

buildings and small quantities of dumped debris in discrete areas of the property. A number of small above-ground storage tanks (AST) were also noted. Gradient recommended the removal of the debris, the examination of the AST areas for obvious contamination, and the testing of property soil for the presence of agricultural chemicals (pesticides). The 2002 ESA update provided additional information on neighboring properties and the potential for activities on these properties to create an environmental condition on the subject parcel; no possibility was found to exist.

The 2006 ESA Update by AET reviewed the prior reports and documented changes in site use and condition in the period since the prior evaluation by Gradient. AET reported that the structures documented by Gradient were no longer present, and that the only observed structural improvement was a large steel above-ground water tank in the northeastern portion of the property. AET reported that the debris documented by Gradient was no longer present

AET conducted focused physical soil testing, collecting 15 shallow samples from a grid established within the area of the property historically occupied by orchards and directing these samples to the project laboratory for pesticide analysis (as recommended by Gradient in their 1998 ESA). Results of analysis showed traces of pesticide residue in all samples collected, though only a single sample contained a concentration that exceeded established screening levels for DDT and DDE. This sample (HA-15) was collected "from the flat southern portion of the site." AET noted that the sample was collected from an area not planned for residential development and that no additional evaluation for pesticides or any other potential issue appeared warranted. AET recommended vigilance during pre-construction grading, as remnant conditions or water wells may be encountered.

Water Wells

At the time of the site inspection for the 2006 ESA, AET reported the presence of three water wells (one of the three was said to be operational) located near and along the southern property boundary. In their ESA update, AET described their research of the Ventura County Water Resources Department (VCWRD) and their subsequent field inspection. AET reported the following:

AET contacted the VCWRD for information concerning the reported water wells located on the Site. Ms. Barbara Council of the VCWRD provided AET with a Table listing 16 wells identified by State Well Numbers and several aerial photo graphs showing the approximately location of the 16 water wells suspected of being on the Site. The Table also shows the Status and Revised Status of the wells. Six of the 16 wells are listed as "destroyed" (meaning properly removed and plugged), two wells are listed as "Non -Compliant Abandoned" (abandoned in this case means the well is not in use but is not yet destroyed), one well is listed as active, and seven wells are listed as "Can't Locate Indeterminable". According to Ms. Council, their records indicate that some of wells permitted on the Site were drilled but

were not cased (possibly because they were dry or low yielding); therefore, there is no well at that location that requires destruction. Most, if not all, of the indeterminable wells may have been un-cased core holes.

And,

During AET's Site visit, three wells were located: Well 5K1 (non-compliant) was observed with a pump located north of Poindexter Avenue on the flat land south east of the former residence; Well 5K2 (non-compliant) was observed on a concrete pad without a pump in bushes on the east side of the entrance road approximately 50 feet south of the gate; and "'Well 5F2 (active) was observed with a pump and electric panel at the location of Well 5F1 on the photograph (Plate 2). The well is located in trees approximately 200 feet east of the southeast corner of the rural residential neighborhood northwest of the Site.

Plate 2 from the AET report is modified and presented as Figure 3 of this ESA.

5.3 Historical Use Information for the Property

Historic use information for the project property was obtained through a review of aerial photographs and topographic maps ordered from EDR. These records are presented in Appendix B. No other records were deemed necessary for the purposes of determining the nature of historic occupation and use.

Sanborn Maps

From 1867 to 2007 the Sanborn Map Company created maps for assessing fire insurance liability. Map coverage was primarily provided primarily in urbanized areas, though in some instances Sanborn Maps were prepared for properties in rural settings. Sanborn Maps document features that would be of interest to insurance underwriters. Many of these features (such as the location of fuel storage tanks) are also of interest to environmental assessors.

Sanborn coverage has not been published for the project parcel or surrounding area.

Aerial Photographic Record

An aerial photographic record was ordered from EDR. The record included photographs made at roughly five to 10-year intervals beginning in 1938. The photographs are of generally good quality. It should be noted that the red property outline shown on the photographs is in an approximate, not precise, location.

The most recent aerial photographs provided by EDR were made in 2010 and 2012. These photographs depict the property in a condition similar to what is observed today, with the exception of the small ranching operation that moved onto the property in 2017.

The 1938 photograph depicts the property in its historic agricultural use. Orchards are visible in the eastern, central and southern areas of the property. The western remainder of the property does not contain orchards or crops, though may have been utilized for grazing. The land now occupied by the Walnut Canyon Elementary School appears as a contiguous part of the project parcel and is occupied by the orchard and what appears to be a residential structure. What appears to be a residential structure is also present on the hill just east of the main property entrance (the southern entrance in 1938 is in the same location as the Poindexter entrance today). A structure several hundred feet north of the southern entrance is observed adjacent to the orchard. This structure may have been associated with the agricultural operation (a barn). Land to the south across Poindexter is developed as an orchard similar to that observed on the project property.

The 1947 photograph is similar to 1938, with the exception of the appearance of structures in the center of the property in the locations of foundation slabs observed today. These structures are identified in the 1998 Gradient ESA as being historically used for apricot pitting, drying and storage. The large water tank in the northeast is first observed in this photograph.

The 1952 photo is similar to the 1947 photograph with the exception of the addition of buildings in the area described by prior assessors as used for hog husbandry. The 1959 photograph clearly shows these buildings; the barn near the southern entrance no longer appears to be present. Much of the land occupied by orchards has been cleared, as has the land now occupied by the substation across the railroad tracks from the western parcel west of Gabbert.

The 1969 photograph shows only the eastern portion of the property as in an orchard. The remainder of the property is cleared of crops; the hog and apricot-related buildings in the central area of the property remain. Electricity transmission towers and the substation are first observed in this photograph. Land to the south has been cleared and the community south of the eastern project property redeveloped for residential purposes. The western area is cleared but not yet redeveloped. The development of the residential lots along the northwestern property boundary is apparent. The 1978 photograph is similar to 1969 with the exception of the addition of structures and a cleared area (possible livestock enclosure) northeast of the apricot buildings in an area where slabs are observed today.

The project property configuration and use observed in the 1985 photograph is similar to that seen in 1979; the land south of the western project property is in the process of being redeveloped as the light industrial/commercial use observed today and the elementary school is present off-site to the east. The structures northeast of the apricot buildings are gone; the residential structure in the southeast is either gone or in a state of deterioration. This structure is no longer present in the 1994 photograph. The apricot and hog buildings also no longer appear to be present.

The residential structure near the southern gate is no longer present by 2005. The remainder of the property and the surrounding communities are developed in a manner substantially similar to what is observed today.

Topographic Maps

The United States Geological Survey (USGS) topographical map record as provided by EDR was reviewed. The earliest maps (1903 30-minute Camulos Quadrangle and 15-minute Piru Quadrangle) show the subject property as undeveloped. The Southern Pacific railroad corridor is present on both maps, though Poindexter Avenue is not apparent. The 1941 and 1944 Piru Quadrangle maps are similar in configuration, though the 1941 map includes symbols for orchards, with orchards occupying the subject property and surrounding parcels in a manner similar to that observed in the aerial photographic record.

The 1951, 1969 and 1971 Moorpark Quadrangle maps depict dirt roads and structures on the project property in locations similar to the features observed in the aerial record. The 2012 map shows project and surrounding land in a configuration similar to what is observed today.

No use or feature likely to have caused a REC on the project parcel or nearby land was observed in the aerial or topographic map record.

5.4 Historical Use Information for Adjoining Properties

Review of the photographs and maps as described above documents the gradual development of Moorpark from its agricultural roots to the mixed-use community observed today.

No adjoining-property use or feature indicative of an environmental concern or REC for the subject property was observed on the aerial photographs or topographic maps.

6 SITE RECONNAISSANCE

6.1 Methodology and Limiting Conditions

The purpose of the reconnaissance was the visual identification and photo documentation of site features, particularly those features indicative of a recent or historic use that may have resulted in an environmental impairment or REC. The property was visited by Markus Niebanck on Saturday December 9, 2017. Access was made by way of a locked gate off of Casey Road near the southeastern corner of the project property.

6.2 General Setting and Land Use

As described above, the project property is situated north of the developed downtown of the City of Moorpark. The property is not structurally developed and is being presently used for cattle grazing. A small corral is present in the south-central portion of the property north of the Poindexter gate. Land to the north is undeveloped; the eastern and

western sides of the property are occupied primarily by single family residential lots. Walnut Canyon Elementary School is located near the southeastern corner of the project property.

6.3 Subject Property – Features, Structures and Other Improvements

The site was observed from the dirt tracks and on foot. The parcel west of Gabbert Road was accessed on foot over the locked gate. Two ranch hands patrolled the property at the time of the site reconnaissance. Photographs of the property and its relevant features are provided as an attachment to this report.

Ungraded dirt tracks crisscross the property providing access to most areas of the site. Structural features on the project parcels include the small stable and corral in the south-central area, the watering trough, tank and dilapidated shed in the southwestern area, and the large above-ground water tank in the northeastern area of the property. A number of water wells associated with the historic agricultural use were reported to be present in the prior ESA but not inspected during this reconnaissance. Numerous valve boxes for the historic orchard irrigation system are present in concrete enclosures distributed about the site. Foundation slabs of historic agricultural buildings were observed in the north central portion of the property. A limited amount of debris was observed near the larger slabs on the flat just northwest and above the small corral and near the Casey gate; no drums or tanks or debris that would likely affect the environmental condition of the property was observed. The corral in the central portion of the property was constructed recently and is well kept and in good condition.

No structures or signs of structural improvement were observed on the western parcel. High-tension electricity transmission lines run along the western and northern edges of the western parcel; a sub-station is located across the railroad tracks to the south.

The property has varied topography, generally rising south to north with intervening small valleys and flats. Some slope breaks are gradual; most are fairly steep. Trees grow in places, most often in lower elevations near areas of seasonal water. Site vegetation is primarily scrub and tumbleweeds.

The most recent prior ESA did not identify a feature use or condition that had obviously caused or could potentially cause a REC. No indication of a current or recent practice or activity that could cause a REC was observed in the property interior during this site inspection. The boundaries of the property were inspected from the interior tracks during the reconnaissance for signs of dumping or trespass that could cause a REC. None was observed.

6.4 Description of Adjoining Property

The project parcels are bordered to the south by a concrete-lined drainage channel, then the railroad right-of-way, then Poindexter Avenue. From west to east parcels across Poindexter to the south are occupied by a power substation (on the west side of Gabbert), a light industrial/office park, and a residential neighborhood. Land west of Gabbert adjoining the northwestern property boundary of the main parcels is developed as single family residential lots. To the east the property is bordered by the elementary school, two individual residential lots, and open space. The land to the immediate north is undeveloped. No feature or activity that is likely to result in environmental impact to the project property was observed on any of the adjacent parcels.

7 INTERVIEWS

The 1998 Gradient ESA discussed several interviews conducted during their evaluation. The AET ESA Update did not include interviews. The Gradient interviews and the email questions and answers generated for this ESA are discussed below.

7.1 Interviews with Owner's Representative

The property owner completed a site assessment questionnaire for Gradient in 1998. Amicus reviewed this questionnaire and found it sufficiently thorough. A. A. Milligan, the property owner in 1998, knew of no use, feature or activity that may have detrimentally affected the environmental quality of the project parcel.

7.2 Interview with Site Manager

No site manager was interviewed for the prior or current ESA.

7.3 Interview with Occupants

Ranch hands were encountered during the site reconnaissance but due to the recent nature of their operation possessed no information regarding the use of the property in the years since the AET ESA.

7.4 Interview with Local Government Officials

Gradient interviewed several local government representatives during the conduct of their ESA. No REC was identified during these interviews. No condition was observed by Amicus during this ESA that warranted verification with a local agency. No file research other than that conducted using the on-line governmental resources described earlier in this ESA was deemed necessary at this time.

7.5 Interview with Others

Comstock introduced Amicus to Dennis Hardgrave of Development Planning Services, Inc. Mr. Hardgrave has been affiliated with the project property since approximately 1990 and knows of no activity or incident that may have affected site environmental quality in the period since the completion of the AET ESA in 2006.

8 ADDITIONAL SERVICES/NON-SCOPE CONSIDERATIONS/SPECIAL CONTRACT PROVISIONS

No additional services were requested or supplied; no non-scope items were considered. There were no special contractual provisions between Comstock and Amicus for the conduct of this ESA.

9 FINDINGS

As defined by AAI and ASTM, the purpose of a Phase I ESA is the discovery of Recognized Environmental Conditions (REC), facts indicative of a release or potential release of hazardous substances or petroleum products. In accordance with the AAI/ASTM protocol, Amicus staff obtained historic use-related documentation, inspected portions of the property on foot, and interviewed the knowledgeable persons for the purposes of evaluating environmental conditions and the potential for REC.

Amicus observed no activity or indication of a REC during the property inspection. No use or feature indicative of a current or historic REC was noted in the review of environmental databases or compiled project documentation.

10 OPINION

This all appropriate inquiry conducted in accordance with ASTM E 1527-13 and 40 CFR Part 312 has identified no conditions indicative of obvious releases or threatened releases of hazardous substances, pollutants, contaminants, petroleum and petroleum products, and controlled substances on, at, in, or to the subject property assemblage. No obvious REC was observed. No further evaluative action is recommended.

11 DATA GAPS

The documentary record was reasonably complete; no data gaps were identified.

12 CONCLUSIONS

The project property is comprised of approximately 285 acres of open land in Moorpark, California. The land has been in historic agricultural cultivation with areas also used for hog husbandry. Building foundations and historic irrigation system implements are present in places about the property. A small cattle ranch moved on-property in 2017. Their corral is well kept and clean.

The prior environmental consultants recommended sampling and analysis of property soil to determine the presence and magnitude of orchard-related agricultural chemicals (pesticides and herbicides). AET implemented this testing and described the results in their 2006 ESA update. As described in this report, pesticide residue below regulatory residential screening levels was detected in all but one sample. Given the generally low concentrations and the location of

the single exceedance AET found that no additional investigative or remedial activity was necessary.

The purpose of this ESA was the identification of REC potentially associated with historic or recent uses and practices. No current or historic REC was observed. No additional evaluative action is recommended. Amicus concurs with the AET recommendation for vigilance during grading and utility work, for as even though no REC was identified, underground features may be present and may be encountered during earth-disturbing activity.

13 DEVIATIONS

No deviations from ASTM Standard E 1527-05, ASTM E 1527-13, and EPA's AAI standards as set forth in § 312.10 of 40 CFR 312 occurred during the preparation of this report.

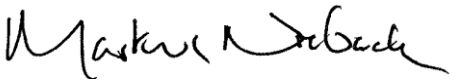
15 AFFIRMATION, SIGNATURE AND QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONAL



The following affirmation is required by 40 CFR 312.21(d):

Amicus has performed a Phase I Environmental Site Assessment of approximately 285 acres of land in Moorpark, California. Seven of the eight parcels comprising the project property are currently utilized for cattle grazing by a small rancher.

The ESA was conducted in conformance with the ASTM International (formerly the American Society for Testing and Materials) E 1527-13 Standard Practice for Environmental Site Assessments: Phase I ESA Process and the Environmental Protection Agency (EPA) All Appropriate Inquiry (AAI) Final Rule (40 CFR, Part 312, § 312.10). Any exceptions to or deletions from this practice are described in Section 13 (there are no exceptions, deletions deviations). This assessment has revealed no evidence of releases of hazardous substances or REC.

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312.

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

UPDATED PRELIMINARY REPORT

Dated as of June 13, 2016 at 7:30 a.m.

In response to the application for a policy of title insurance referenced herein, Lawyers Title Company hereby reports that it is prepared to issue, or cause to be issued, as of the date hereof, a policy or policies of title insurance describing the land and the estate or interest therein hereinafter set forth, insuring against loss which may be sustained by reason of any defect, lien or encumbrance not shown or referred to as an exception herein or not excluded from coverage pursuant to the printed Schedules, Conditions and Stipulations or Conditions of said policy forms.

The printed Exceptions and Exclusions from the coverage and Limitations on Covered Risks of said policy or policies are set forth in Attachment One. The policy to be issued may contain an arbitration clause. When the Amount of Insurance is less than that set forth in the arbitration clause, all arbitrable matters shall be arbitrated at the option of either the Company or the Insured as the exclusive remedy of the parties. Limitation on Covered Risks applicable to the CLTA and ALTA Homeowner's Policies of Title Insurance which establish a Deductible Amount and a Maximum Dollar Limit of Liability for certain coverages are also set forth in Attachment One. Copies of the policy forms should be read. They are available from the office which issued this report.

The policy(s) of title insurance to be issued hereunder will be policy(s) of **Commonwealth Land Title Insurance Company.**

Please read the exceptions shown or referred to below and the exceptions and exclusions set forth in Attachment One of this report carefully. The exceptions and exclusions are meant to provide you with notice of matters which are not covered under the terms of the title insurance policy and should be carefully considered. It is important to note that this preliminary report is not a written representation as to the condition of title and may not list all liens, defects, and encumbrances affecting title to the land.

This report (and any supplements or amendments hereto) is issued solely for the purpose of facilitating the issuance of a policy of title insurance and no liability is assumed hereby. If it is desired that liability be assumed prior to the issuance of a policy of title insurance, a Binder or Commitment should be requested.

SCHEDULE A

The form of policy of title insurance contemplated by this report is:

ALTA Owners 2006
ALTA Loan 2006

The estate or interest in the land hereinafter described or referred to covered by this report is:

A FEE

Title to said estate or interest at the date hereof is vested in:

Kimberley Jeanne Milligan, Trustee of the Kimberley J. Milligan Trust dated May 16, 1995 (as to an undivided 12.5% interest);

John R. Milligan, Trustee of the John R. Milligan Trust dated December 11, 1998 (as to an undivided 12.5% interest);

Lucy Milligan Wahl and Claire Catherine Milligan, as successor Co-Trustee of the MCM Trust II dated December 14, 1990 (as to an undivided 12.5% interest);

Julia Summers and Jim Summers, Co-Trustees of the Julia Summers 2013 Trust dated August 29, 2013 (as to an undivided 12.5% interest);

Carolyn Howarth, as Trustee of the Wesley J. Pomatto Trust Two, created January 2, 2012 (as to an undivided 6.25% interest);

Carolyn Howarth, as Trustee of the John J. Pomatto Trust Two, created January 2, 2012 (as to an undivided 6.25% interest);

The Richard H. Jones Ltd. Partnership, a Colorado Limited Partnership (as to an undivided 12.5% interest);

Susan C. Bavo, as Trustee of the Susan C. Bavo Trust, dated October 26, 1993 (as to an undivided 6.25% interest);

Palmyre L. Bavo, as Trustee of the Palmyre L. Bavo Trust dated September 10, 2001 (as to an undivided 9.375% interest) and

Nicole K. Bavo, as Trustee of the Nicole K. Bavo Trust dated September 7, 2001 (as to an undivided 9.375% interest)

The land referred to herein is situated in the County of Ventura, State of California, and is described as follows:

SEE EXHIBIT "A" ATTACHED HERETO AND MADE A PART HEREOF

EXHIBIT "A"

All that certain real property situated in the County of Ventura, State of California, described as follows:

Parcel 1:

Lots 14 and 16 and that portion of Lots 22 and 23, Fremont Subdivision of Rancho Simi, in the City of Moorpark, County of Ventura, State of California, as per map recorded in Book 3, Page 39 of Maps, in the Office of the County Recorder of said County, lying Northerly of the right of way of the Southern Pacific Railroad 100 feet wide, as described in deed recorded in Book 58, Page 590 of Deeds.

Assessor's Parcel No: 511-0-020-170

Parcel 2:

Part of Tract "S" and "T" of part of Tract "L" of Rancho Simi, in the City of Moorpark, County of Ventura, State of California, as per map showing the Townsite of Moorpark and Lands of Madeline R. Poindexter, a Re-Subdivision of Fremont Tract, as per map recorded in Book 5, Page 5 of Maps, in the Office of the County Recorder of said County, described as follows:

Beginning at a point which is common to the Northeast corner of Lot "S" and the Northwest corner of Lot "T"; thence, from said point of beginning.

1st: South 89°55' West 1320 feet along the North line of said Lot "S" to the Northeast corner of that certain Parcel of land conveyed to William Hedges, by deed dated March 3, 1909, recorded in Book 117, Page 217 of Deeds; thence,

2nd: South 1964.16 feet along the East line of said lands of William Hedges to the Northwest corner of Lot 14, as shown on map entitled "Map of Fremont" a Subdivision of Lot "L" of the Rancho Simi, Ventura Co., Cal." And recorded in Book 3, Page 39 of Maps; thence at right angles,

3rd: East 1320 feet along the North line of said Lot 14, to a point in the boundary line between said Lots "S" and "T"; thence, at right angles,

4th: South 660 feet along the boundary line between Lots 14 and 16 of said Fremont Tract, and Tract "T" above described to the Southeast corner of said Lot 16 of said Fremont Tract; thence at right angles,

5th: West 330 feet along the South line of said Lot 16 to the Northeast corner of Lot 23 of said Fremont Tract; thence, at right angles,

6th: South 429.66 feet along the East line of Lot 23 to a point in the North line of the right of way of the Southern Pacific Railroad; thence along same,

7th: Easterly along a curve to the right (the long chord of which bears North 88°3'7" East) 330.66 feet to a point; thence,

8th: East 990 feet along the North line of said railroad right of way to the Southwest corner of that certain Parcel of land conveyed to Alice N. Graham, by deed dated October 25, 1911 and recorded

in Book 130, Page 33 of Deeds; thence, still along the North line of the right of way of the Southern Pacific Railroad,

9th: East 588.06 feet to the Southwest corner of that certain Parcel of land as conveyed to Leonard C. Elver and Nellie B. Elver, his wife, by deed dated January 7, 1931, recorded in Book 340, Page 198 of Official Records; thence along the West and North lines of the lands so conveyed,

10th: North 696.96 feet to a 1 ¼" X 6" pipe; thence,

11th: North 61°30' East 258.72 feet to a 2 X 66" pipe; thence,

12th: North 2230.14 feet to a point in the North line of said Tract "T" in the South line of Lot 32, as the same is shown on Map entitled "Map of the Vallette Tract, being a Subdivision of Lot 2 of Block "L" of Rancho Simi, Ventura Co., Cal." And recorded in Book 3, Page 41 of Maps, and at the Northwest corner of the lands conveyed to Maxwell W. Wright, by deed dated September 10, 1914 recorded in Book 144, Page 283 of Deeds; thence,

13th: South 89°53' West 1805.166 feet along the South line of Vallette Tract, and along the North line of Tract "T" to the point of beginning.

Except those portions of land described as Estates 1, 2 and 3 in the Final Order of Condemnation, Case No. SC 16973, Superior Court of California, County of Ventura, a certified copy of which recorded December 18, 1997 as Document No. 97-172929 of Official Records.

Assessor's Parcel No: 511-0-020-110, 130, 160, 180

Parcel 3:

Portions of Lot "R" and "S" as shown on Map of a Part of Tract "L" of the Rancho Simi, in the City of Moorpark, County of Ventura, State of California, as per map recorded in Book 5, Page 5 of Maps, in the Office of the County Recorder of said County described as a whole as follows:

Beginning at a point on the West line of said Lot "S" distant North thereon 660 feet from the Southwest corner of said Lot "S"' thence along the West line of Lots "S" and "R",

1st: South 1617 feet to the North line of the 100-foot right of way of the Southern Pacific Railroad; thence, along said North line,

2nd: North 76°10' East 1703.46 feet to the Southeast corner of said Lot "R"; thence along the East line of said Lot "R",

3rd: North 551.76 feet to the Northeast corner of said Lot "R"; thence,

4th: West along the North lines of said Lot "R", 330 feet to the Southwest corner of Lot 16 of Fremont Tract, as per map recorded in Book 3, Page 39 of Maps, in the Office of the County Recorder of said County; thence,

5th: North along the West line of Lots 16 and 14 of said Fremont Tract, 660 feet to the Northwest corner of said Lot 14; thence,

6th: West 1320 feet to the point of beginning.

Except the interest in a strip of land 40 feet wide, as granted to Ventura County for "road purposes" in deed recorded in Book 127, Page 326 of Deeds.

Also except one half of all mineral, oil, gas an other hydrocarbon substances in and under said land without, however, any right of surface entry or any right of entry in and to the subsurface thereof at a depth of less than 500 feet beneath the surface of Official Records the development or removal of said substances, as reserved by Sena Bauer, a life estate, Walter W. Bauer, Charles E. Bauer,

Ellen Regina Bauer, Frances D. Arbogast Mericle, who acquired title as Frances B. Arbogast and Serena H. Bauer Cox, who acquired title as Serena H. Bauer, in deed recorded September 12, 1961 in Book 2045, Page 334 of Official Records.

Assessor's Parcel No: 511-0-020-195

Parcel 4:

The East half of the Southeast Quarter of Section 6, Township 2 North, Range 19 West, Rancho Simi, in the City of Moorpark, County of Ventura, State of California, as shown on map entitled "Map of the Land of Rancho Simi, in Ventura and Los Angeles counties, California", and recorded in Book 3, Page 7 of maps, in the Office of the County Recorder of said County, and particularly described as follows:

Beginning at a point in the centerline of that certain public road, 60 feet wide, locally known as and called "Los Angeles Avenue" at the corner common to Sections 5, 6, 7 and 8 of Township 2 North, Range 19 West, Rancho Simi, as shown on the above described map, said point of beginning being the Southwest corner of Tract "Q" as shown on map entitled "Map of Part of Tract "L" of Rancho Simi, Ventura County, California, showing the Townsite of Moorpark and Lands of Madeleine R. Poindexter, a Re-Subdivision of Fremont Tract" and recorded in Book 5, Page 5 of Maps, in the Office of the County Recorder of Ventura County; thence, from said point of beginning,

1st: North 2640 feet to the Southeast corner of Lot 56 of Vallette Tract, as per map recorded in Book 3, Page 41 of Maps, in the Office of the County Recorder of said County; thence, at right angles,

2nd: West 1320 feet to the Southwest corner of said Lot 56 of Vallette Tract, at the Northeast corner of that certain Parcel of land, conveyed to Mary Frances Estes, by deed dated October 22, 1902 and recorded in Book 87, Page 120 of Deeds; thence at right angles,

3rd: South 2640 feet along the East line of said lands of Mary Frances Estates to a point in the centerline of said Los Angeles Avenue; thence, along same,

4th: East 1320 feet to the point of beginning.

Except that portion lying Southerly of the Northerly line of that certain strip 100 feet wide described in the deed to the Southern Pacific Railroad Company, recorded November 13, 1899 in Book 58, Page 596 of Deeds.

Also except that portion lying within that certain strip 345 feet wide described in deed to Southern California Edison Company, recorded October 22, 2010 as Instrument No. 20101022-00163068 of Official Records.

Assessor's Parcel No: 511-0-200-245

cph

SCHEDULE B – Section A

The following exceptions will appear in policies when providing standard coverage as outlined below:

1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.

2. Any facts, rights, interests or claims that are not shown by the Public Records but that could be ascertained by an inspection of the Land or that may asserted by persons in possession of the Land.

3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.

4. Any encroachment, encumbrance, violation, variation or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.

5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b) or (c) are shown by the Public Records.

6. Any lien or right to a lien for services, labor or material not shown by the Public Records.

SCHEDULE B – Section B

At the date hereof Exceptions to coverage in addition to the printed exceptions and exclusions in said policy form would be as follows:

A. Property taxes, which are a lien not yet due and payable, including any assessments collected with taxes to be levied for the fiscal year 2016-2017.

B. The lien of supplemental or escaped assessments of property taxes, if any, made pursuant to the provisions of Chapter 3.5 (commencing with Section 75) or Part 2, Chapter 3, Articles 3 and 4, respectively, of the Revenue and Taxation Code of the State of California as a result of the transfer of title to the vestee named in Schedule A; or as a result of changes in ownership or new construction occurring prior to date of policy.

1. Water rights, claims or title to water, whether or not disclosed by the public records.

2. Right of entry and right of way over said land for the use of any system for the collection, conducting and distribution of the waters of the Rancho Simi, which may be adopted by the Simi Land and Water Company, or its assigns, as reserved in deed recorded January 3, 1890, in Book 29, page 500 of Deeds.

   The exact location and extent of said easement is not disclosed of record.

3. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Southern California Edison Company
Purpose:	public utilities
Recording Date:	January 16, 1931
Recording No:	in Book 339, Page 109 of Official Records
Affects:	portion of said land

4. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Southern California Edison Company
Purpose:	public utilities
Recording Date:	December 7, 1950
Recording No:	in Book 968, Page 442 of Official Records
Affects:	portion of said land

5. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Southern California Edison Company
Purpose:	public utilities
Recording Date:	May 31, 1951
Recording No:	in Book 1001, Page 544 of Official Records
Affects:	portion of said land

6. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Southern California Edison Company
Purpose:	public utilities
Recording Date:	May 31, 1951
Recording No:	in Book 1001, Page 550 of Official Records
Affects:	portion of said land

7. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Ventura County Flood Control District
Purpose:	Flood Control
Recording Date:	April 26, 1962
Recording No:	in Book 2141, Page 551 of Official Records
Affects:	portion of said land

8. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Ventura County Flood Control District
Purpose:	Flood Control
Recording Date:	April 26, 1962
Recording No:	in Book 2141, Page 556 of Official Records
Affects:	portion of said land

9. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Ventura County Flood Control District
Purpose:	Flood Control
Recording Date:	April 26, 1962
Recording No:	in Book 2141, Page 558 of Official Records
Affects:	portion of said land

10. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Southern California Edison Company
Purpose:	public utilities and roads
Recording Date:	July 1, 1963
Recording No:	in Book 2347, Page 225 of Official Records
Affects:	portion of said land

Limitations on the use, by the owners of said Land, of the easement area as set forth in the easement document shown hereinabove.

Reference is hereby made to said document for full particulars.

11. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Southern California Edison Company
Purpose:	roads
Recording Date:	January 4, 1968
Recording No:	in Book 3243, Page 379 of Official Records
Affects:	portion of said land

Limitations on the use, by the owners of said Land, of the easement area as set forth in the easement document shown hereinabove.

Reference is hereby made to said document for full particulars.

12. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Southern California Edison Company
Purpose:	roads and public utilities
Recording Date:	January 4, 1968
Recording No:	in Book 3243, Page 387 of Official Records
Affects:	portion of said land

Limitations on the use, by the owners of said Land, of the easement area as set forth in the easement document shown hereinabove.

Reference is hereby made to said document for full particulars.

13. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	A-B Properties, a California General Partnership
Purpose:	access road, utilities and slopes
Recording Date:	January 18, 2001
Recording No:	as Instrument No. 2001-012562 of Official Records

Limitations on the use, by the owners of said Land, of the easement area as set forth in the easement document shown hereinabove.

Reference is hereby made to said document for full particulars.

The exact location and extent of said easement is not disclosed of record.

and Re-Recording Date:	September 20, 2012
and Re-Recording No:	as Instrument No. 2012-167698 of Official Records

18. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Level3 Communication, LLC
Purpose:	Telecommunications and incidental purposes
Recording Date:	August 21, 2013
Recording No:	as Instrument No. 2013-146419 of Official Records
Affects:	along the railroad boundary adjacent to said land

Limitations on the use, by the owners of said Land, of the easement area as set forth in the easement document shown hereinabove.

Reference is hereby made to said document for full particulars.

19. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Sprint Communications Company, LP
Purpose:	Telecommunications and incidental purposes
Recording Date:	December 27, 2013
Recording No:	as Instrument No. 2013-205739 of Official Records
Affects:	along the railroad boundary adjacent to said land

Limitations on the use, by the owners of said Land, of the easement area as set forth in the easement document shown hereinabove.

Reference is hereby made to said document for full particulars.

20. Easement(s) for the purpose(s) shown below and rights incidental thereto, as granted in a document:

Granted to:	Quest Communications International Inc., et al
Purpose:	Telecommunications and incidental purposes
Recording Date:	January 30, 2014
Recording No:	as Instrument No. 2014-011258 of Official Records
Affects:	along the railroad boundary adjacent to said land

Limitations on the use, by the owners of said Land, of the easement area as set forth in the easement document shown hereinabove.

Reference is hereby made to said document for full particulars.

21. Any invalidity or defect in the title of the vestees in the event that the trust referred to herein is invalid or fails to grant sufficient powers to the trustee(s) or in the event there is a lack of compliance with the terms and provisions of the trust instrument.

If title is to be insured in the trustee(s) of a trust, (or if their act is to be insured), this Company will require a Trust Certification pursuant to California Probate Code Section 18100.5.

The Company reserves the right to add additional items or make further requirements after review of the requested documentation.

22. The search did not disclose any open mortgages or deeds of trust of record, therefore the Company reserves the right to require further evidence to confirm that the property is unencumbered, and further reserves the right to make additional requirements or add additional items or exceptions upon receipt of the requested evidence.

23. We find numerous items of record against one with the same or similar name RICHARD JONES. Please provide a statement of identity as soon as possible to clear these matters.

24. Matters which may be disclosed by an inspection and/or by a correct ALTA/ACSM Land Title Survey of said Land that is satisfactory to the Company, and/or by inquiry of the parties in possession thereof.

25. Any rights of the parties in possession of a portion of, or all of, said Land, which rights are not disclosed by the public records.

    The Company will require, for review, a full and complete copy of any unrecorded agreement, contract, license and/or lease, together with all supplements, assignments and amendments thereto, before issuing any policy of title insurance without excepting this item from coverage.

    The Company reserves the right to except additional items and/or make additional requirements after reviewing said documents.

26. Any easements not disclosed by the public records as to matters affecting title to real property, whether or not said easements are visible and apparent.

27. Discrepancies, conflicts in boundary lines, shortage in area, encroachments, or any other matters which a correct survey would disclose and which are not shown by the public records.

END OF SCHEDULE B EXCEPTIONS

PLEASE REFER TO THE "NOTES AND REQUIREMENTS SECTION" WHICH FOLLOWS FOR INFORMATION NECESSARY TO COMPLETE THIS TRANSACTION

REQUIREMENTS SECTION:

Req. No. 1: In order to complete this report, the Company requires a Statement of Information to be completed by the following party(s),

Party(s): ALL PARTIES

The Company reserves the right to add additional items or make further requirements after review of the requested Statement of Information.

NOTE: The Statement of Information is necessary to complete the search and examination of title under this order. Any title search includes matters that are indexed by name only, and having a completed Statement of Information assists the Company in the elimination of certain matters which appear to involve the parties but in fact affect another party with the same or similar name. Be assured that the Statement of Information is essential and will be kept strictly confidential to this file.

Req. No. 2: The Company will require that it be provided with either (i) a complete copy of the trust agreement and any amendments thereto certified by the trustee(s) to be a true and complete copy with respect to the hereinafter named trust, or (ii) a Certification, pursuant to California Probate Code Section 18100.5, executed by all of the current trustee(s) of the hereinafter named trust, a form of which is attached.

Trust(S): Kimberley Jeanne Milligan, Trustee of the Kimberley J. Milligan Trust dated May 16, 1995;

John R. Milligan, Trustee of the John R. Milligan Trust dated December 11, 1998;

Lucy Milligan Wahl and Claire Catherine Milligan, as successor Co-Trustee of the MCM Trust II dated December 14, 1990;

Julia Summers and Jim Summers, Co-Trustees of the Julia Summers 2013 Trust dated August 29, 2013;

Carolyn Howarth, as Trustee of the Wesley J. Pomatto Trust Two, created January 2, 2012;

Carolyn Howarth, as Trustee of the John J. Pomatto Trust Two, created January 2, 2012;

The Richard H. Jones Ltd. Partnership, a Colorado Limited Partnership;

Susan C. Bavo, as Trustee of the Susan C. Bavo Trust, dated October 26, 1993;

Palmyre L. Bavo, as Trustee of the Palmyre L. Bavo Trust dated September 10, 2001 and

Nicole K. Bavo, as Trustee of the Nicole K. Bavo Trust dated September 7, 2001

Req. No. 3: The Company will require the following documents for review prior to the issuance of any title insurance predicated upon a conveyance or encumbrance from the limited partnership named below:

Name: THE RICHARD H. JONES LTD, a limited partnership

a) Satisfactory evidence that the partnership was validly formed, is in good standing and that there have been no amendments to the partnership agreement

The Company reserves the right to add additional items or make further requirements after review of the requested documentation.

Req. No. 4: The Company requires a Statement of Information from the parties named below in order to complete this report, based on the effect of documents, proceedings, liens, decrees, or other matters which do not specifically describe said Land, but which, if any do exist, may affect the title or impose liens or encumbrances thereon. After review of the requested Statement(s) of Information, the Company may have additional requirements before the issuance of any policy of title insurance.

No names were furnished with the application. Please have the buyers furnish the Statement of Information as soon as possible.

The Company reserves the right to add additional items or make further requirements after review of the requested documentation.

NOTE: The Statement of Information is necessary to complete the search and examination of title under this order. Any title search includes matters that are indexed by name only, and having a completed Statement of Information assists the Company in the elimination of certain matters which appear to involve the parties but in fact affect another party with the same or similar name. Be assured that the Statement of Information is essential and will be kept strictly confidential to this file.

INFORMATIONAL NOTES SECTION

Note No. 1: The information on the attached plat is provided for your convenience as a guide to the general location of the subject property. The accuracy of this plat is not guaranteed, nor is it a part of any policy, report or guarantee to which it may be attached.

Note No. 2: California insurance code section 12413.1 regulates the disbursement of escrow and sub-escrow funds by title companies. The law requires that funds be deposited in the title company escrow account and available for withdrawal prior to disbursement. Funds deposited with the company by wire transfer may be disbursed upon receipt. Funds deposited with the company via cashier's check or teller's check drawn on a California based bank may be disbursed on the next business day after the day of deposit. If funds are deposited with the company by other methods, recording and/or disbursement may be delayed. All escrow and sub-escrow funds received by the company will be deposited with other escrow funds in one or more non-interest bearing escrow accounts of the company in a financial institution selected by the company. The company may receive certain direct or indirect benefits from the financial institution by reason of the deposit of such funds or the maintenance of such accounts with such financial institution, and the company shall have no obligation to account to the depositing party in any manner for the value of, or to pay to such party, any benefit received by the company. Those benefits may include, without limitation, credits allowed by such financial institution on loans to the company or its parent company and earnings on investments made with the proceeds of such loans, accounting, reporting and other services and products of such financial institution. Such benefits shall be deemed additional compensation of the company for its services in connection with the escrow or sub-escrow.

For wiring Instructions please contact your Title Officer or Title Company Escrow officer.

Note No. 3: Lawyers Title is a division of Commonwealth Land Title Insurance Company. The insurer in policies of title insurance, when issued in this transaction, will be Commonwealth Land Title Insurance Company.

ATTACHMENT ONE

4-2-15 CA & NV

CALIFORNIA LAND TITLE ASSOCIATION

STANDARD COVERAGE POLICY – 1990

EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys' fees or expenses which arise by reason of:

1. (a) Any law, ordinance or governmental regulation (including but not limited to building or zoning laws, ordinances, or regulations) restricting, regulating, prohibiting or relating (i) the occupancy, use, or enjoyment of the land; (ii) the character, dimensions or location of any improvement now or hereafter erected on the land; (iii) a separation in ownership or a change in the dimensions or area of the land or any parcel of which the land is or was a part; or (iv) environmental protection, or the effect of any violation of these laws, ordinances or governmental regulations, except to the extent that a notice of the enforcement thereof or a notice of a defect, lien, or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy.
   (b) Any governmental police power not excluded by (a) above, except to the extent that a notice of the exercise thereof or notice of a defect, lien or encumbrance resulting from a violation or alleged violation affecting the land has been recorded in the public records at Date of Policy.
2. Rights of eminent domain unless notice of the exercise thereof has been recorded in the public records at Date of Policy, but not excluding from coverage any taking which has occurred prior to Date of Policy which would be binding on the rights of a purchaser for value without knowledge.
3. Defects, liens, encumbrances, adverse claims or other matters:
   (a) whether or not recorded in the public records at Date of Policy, but created, suffered, assumed or agreed to by the insured claimant;
   (b) not known to the Company, not recorded in the public records at Date of Policy, but known to the insured claimant and not disclosed in writing to the Company by the insured claimant prior to the date the insured claimant became an insured under this policy;
   (c) resulting in no loss or damage to the insured claimant;
   (d) attaching or created subsequent to Date of Policy; or
   (e) resulting in loss or damage which would not have been sustained if the insured claimant had paid value for the insured mortgage or for the estate or interest insured by this policy.
4. Unenforceability of the lien of the insured mortgage because of the inability or failure of the insured at Date of Policy, or the inability or failure of any subsequent owner of the indebtedness, to comply with the applicable doing business laws of the state in which the land is situated.
5. Invalidity or unenforceability of the lien of the insured mortgage, or claim thereof, which arises out of the transaction evidenced by the insured mortgage and is based upon usury or any consumer credit protection or truth in lending law.
6. Any claim, which arises out of the transaction vesting in the insured the estate of interest insured by this policy or the transaction creating the interest of the insured lender, by reason of the operation of federal bankruptcy, state insolvency or similar creditors' rights laws.

EXCEPTIONS FROM COVERAGE - SCHEDULE B, PART I

This policy does not insure against loss or damage (and the Company will not pay costs, attorneys' fees or expenses) which arise by reason of:

1. Taxes or assessments which are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the public records.
   Proceedings by a public agency which may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the public records.
2. Any facts, rights, interests, or claims which are not shown by the public records but which could be ascertained by an inspection of the land or which may be asserted by persons in possession thereof.
3. Easements, liens or encumbrances, or claims thereof, not shown by the public records.
4. Discrepancies, conflicts in boundary lines, shortage in area, encroachments, or any other facts which a correct survey would disclose, and which are not shown by the public records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b) or (c) are shown by the public records.
6. Any lien or right to a lien for services, labor or material not shown by the public records.

CLTA HOMEOWNER'S POLICY OF TITLE INSURANCE (12-02-13)
ALTA HOMEOWNER'S POLICY OF TITLE INSURANCE

EXCLUSIONS

In addition to the Exceptions in Schedule B, You are not insured against loss, costs, attorneys' fees, and expenses resulting from:

1. Governmental police power, and the existence or violation of those portions of any law or government regulation concerning:
   a. building;
   b. zoning;
   c. land use;
   d. improvements on the Land;
   e. land division; and
   f. environmental protection.

   This Exclusion does not limit the coverage described in Covered Risk 8.a., 14, 15, 16, 18, 19, 20, 23 or 27.
2. The failure of Your existing structures, or any part of them, to be constructed in accordance with applicable building codes. This Exclusion does not limit the coverage described in Covered Risk 14 or 15.
3. The right to take the Land by condemning it. This Exclusion does not limit the coverage described in Covered Risk 17.
4. Risks:
   a. that are created, allowed, or agreed to by You, whether or not they are recorded in the Public Records;
   b. that are Known to You at the Policy Date, but not to Us, unless they are recorded in the Public Records at the Policy Date;
   c. that result in no loss to You; or
   d. that first occur after the Policy Date - this does not limit the coverage described in Covered Risk 7, 8.e., 25, 26, 27 or 28.
5. Failure to pay value for Your Title.
6. Lack of a right:
   a. to any land outside the area specifically described and referred to in paragraph 3 of Schedule A; and
   b. in streets, alleys, or waterways that touch the Land.

   This Exclusion does not limit the coverage described in Covered Risk 11 or 21.
7. The transfer of the Title to You is invalid as a preferential transfer or as a fraudulent transfer or conveyance under federal bankruptcy, state insolvency, or similar creditors' rights laws.
8. Contamination, explosion, fire, flooding, vibration, fracturing, earthquake, or subsidence.
9. Negligence by a person or an Entity exercising a right to extract or develop minerals, water, or any other substances.

LIMITATIONS ON COVERED RISKS

Your insurance for the following Covered Risks is limited on the Owner's Coverage Statement as follows:

- For Covered Risk 16, 18, 19, and 21 Your Deductible Amount and Our Maximum Dollar Limit of Liability shown in Schedule A.

The deductible amounts and maximum dollar limits shown on Schedule A are as follows:

	Your Deductible Amount	Our Maximum Dollar Limit of Liability
Covered Risk 16:	1.00% of Policy Amount Shown in Schedule A or $2,500.00 (whichever is less)	$ 10,000.00
Covered Risk 18:	1.00% of Policy Amount Shown in Schedule A or $5,000.00 (whichever is less)	$ 25,000.00
Covered Risk 19:	1.00% of Policy Amount Shown in Schedule A or $5,000.00 (whichever is less)	$ 25,000.00
Covered Risk 21:	1.00% of Policy Amount Shown in Schedule A or $2,500.00 (whichever is less)	$ 5,000.00

2006 ALTA LOAN POLICY (06-17-06)

EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or expenses that arise by reason of:

1. (a) Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to
   (i) the occupancy, use, or enjoyment of the Land;
   (ii) the character, dimensions, or location of any improvement erected on the Land;
   (iii) the subdivision of land; or
   (iv) environmental protection;
   or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5.
   (b) Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 6.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters
   (a) created, suffered, assumed, or agreed to by the Insured Claimant;
   (b) not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
   (c) resulting in no loss or damage to the Insured Claimant;
   (d) attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 13 or 14); or
   (e) resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.
4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing-business laws of the state where the Land is situated.
5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury or any consumer credit protection or truth-in-lending law.
6. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction creating the lien of the Insured Mortgage, is
   (a) a fraudulent conveyance or fraudulent transfer, or
   (b) a preferential transfer for any reason not stated in Covered Risk 13(b) of this policy.
7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching between Date of Policy and the date of recording of the Insured Mortgage in the Public Records. This Exclusion does not modify or limit the coverage provided under Covered Risk 11(b).

The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

EXCEPTIONS FROM COVERAGE

Except as provided in Schedule B - Part II, this policy does not insure against loss or damage, and the Company will not pay costs, attorneys' fees or expenses, that arise by reason of:

PART I

The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

1. (a) Taxes or assessments that are not shown as existing liens by the records of any taxing authority that levies taxes or assessments on real property or by the Public Records; (b) proceedings by a public agency that may result in taxes or assessments, or notices of such proceedings, whether or not shown by the records of such agency or by the Public Records.
2. Any facts, rights, interests, or claims that are not shown by the Public Records but that could be ascertained by an inspection of the Land or that may be asserted by persons in possession of the Land.
3. Easements, liens or encumbrances, or claims thereof, not shown by the Public Records.
4. Any encroachment, encumbrance, violation, variation, or adverse circumstance affecting the Title that would be disclosed by an accurate and complete land survey of the Land and not shown by the Public Records.
5. (a) Unpatented mining claims; (b) reservations or exceptions in patents or in Acts authorizing the issuance thereof; (c) water rights, claims or title to water, whether or not the matters excepted under (a), (b), or (c) are shown by the Public Records.
6. Any lien or right to a lien for services, labor or material not shown by the Public Records.

PART II

In addition to the matters set forth in Part I of this Schedule, the Title is subject to the following matters, and the Company insures against loss or damage sustained in the event that they are not subordinate to the lien of the Insured Mortgage:

2006 ALTA OWNER'S POLICY (06-17-06)

EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy, and the Company will not pay loss or damage, costs, attorneys' fees, or expenses that arise by reason of:

1. (a) Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to
   (i) the occupancy, use, or enjoyment of the Land;
   (ii) the character, dimensions, or location of any improvement erected on the Land;
   (iii) the subdivision of land; or
   (iv) environmental protection;
   or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5.
   (b) Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 6.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters
   (a) created, suffered, assumed, or agreed to by the Insured Claimant;
   (b) not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
   (c) resulting in no loss or damage to the Insured Claimant;
   (d) attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 9 and 10); or
   (e) resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Title.
4. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction vesting the Title as shown in Schedule A, is
   (a) a fraudulent conveyance or fraudulent transfer; or
   (b) a preferential transfer for any reason not stated in Covered Risk 9 of this policy.
5. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching between Date of Policy and the date of recording of the deed or other instrument of transfer in the Public Records that vests Title as shown in Schedule A.

The above policy form may be issued to afford either Standard Coverage or Extended Coverage. In addition to the above Exclusions from Coverage, the Exceptions from Coverage in a Standard Coverage policy will also include the following Exceptions from Coverage:

EXCEPTIONS FROM COVERAGE

This policy does not insure against loss or damage, and the Company will not pay costs, attorneys' fees or expenses, that arise by reason of:

7. Variable exceptions such as taxes, easements, CC&R's, etc. shown here.

ALTA EXPANDED COVERAGE RESIDENTIAL LOAN POLICY (12-02-13)

EXCLUSIONS FROM COVERAGE

The following matters are expressly excluded from the coverage of this policy and the Company will not pay loss or damage, costs, attorneys' fees or expenses which arise by reason of:

1. (a) Any law, ordinance, permit, or governmental regulation (including those relating to building and zoning) restricting, regulating, prohibiting, or relating to
   (i) the occupancy, use, or enjoyment of the Land;
   (ii) the character, dimensions, or location of any improvement erected on the Land;
   (iii) the subdivision of land; or
   (iv) environmental protection;
   or the effect of any violation of these laws, ordinances, or governmental regulations. This Exclusion 1(a) does not modify or limit the coverage provided under Covered Risk 5, 6, 13(c), 13(d), 14 or 16.
   (b) Any governmental police power. This Exclusion 1(b) does not modify or limit the coverage provided under Covered Risk 5, 6, 13(c), 13(d), 14 or 16.
2. Rights of eminent domain. This Exclusion does not modify or limit the coverage provided under Covered Risk 7 or 8.
3. Defects, liens, encumbrances, adverse claims, or other matters
   (a) created, suffered, assumed, or agreed to by the Insured Claimant;
   (b) not Known to the Company, not recorded in the Public Records at Date of Policy, but Known to the Insured Claimant and not disclosed in writing to the Company by the Insured Claimant prior to the date the Insured Claimant became an Insured under this policy;
   (c) resulting in no loss or damage to the Insured Claimant;
   (d) attaching or created subsequent to Date of Policy (however, this does not modify or limit the coverage provided under Covered Risk 11, 16, 17, 18, 19, 20, 21, 22, 23, 24, 27 or 28); or
   (e) resulting in loss or damage that would not have been sustained if the Insured Claimant had paid value for the Insured Mortgage.
4. Unenforceability of the lien of the Insured Mortgage because of the inability or failure of an Insured to comply with applicable doing-business laws of the state where the Land is situated.
5. Invalidity or unenforceability in whole or in part of the lien of the Insured Mortgage that arises out of the transaction evidenced by the Insured Mortgage and is based upon usury, or any consumer credit protection or truth-in-lending law. This Exclusion does not modify or limit the coverage provided in Covered Risk 26.
6. Any claim of invalidity, unenforceability or lack of priority of the lien of the Insured Mortgage as to Advances or modifications made after the Insured has Knowledge that the vestee shown in Schedule A is no longer the owner of the estate or interest covered by this policy. This Exclusion does not modify or limit the coverage provided in Covered Risk 11.
7. Any lien on the Title for real estate taxes or assessments imposed by governmental authority and created or attaching subsequent to Date of Policy. This Exclusion does not modify or limit the coverage provided in Covered Risk 11(b) or 25.
8. The failure of the residential structure, or any portion of it, to have been constructed before, on or after Date of Policy in accordance with applicable building codes. This Exclusion does not modify or limit the coverage provided in Covered Risk 5 or 6.
9. Any claim, by reason of the operation of federal bankruptcy, state insolvency, or similar creditors' rights laws, that the transaction creating the lien of the Insured Mortgage, is
   (a) a fraudulent conveyance or fraudulent transfer, or
   (b) a preferential transfer for any reason not stated in Covered Risk 27(b) of this policy.
10. Contamination, explosion, fire, flooding, vibration, fracturing, earthquake, or subsidence.
11. Negligence by a person or an Entity exercising a right to extract or develop minerals, water, or any other substances.

Notice of Available Discounts

Pursuant to Section 2355.3 in Title 10 of the California Code of Regulations Fidelity National Financial, Inc. and its subsidiaries ("FNF") must deliver a notice of each discount available under our current rate filing along with the delivery of escrow instructions, a preliminary report or commitment. Please be aware that the provision of this notice does not constitute a waiver of the consumer's right to be charged the filed rate. As such, your transaction may not qualify for the below discounts.

You are encouraged to discuss the applicability of one or more of the below discounts with a Company representative. These discounts are generally described below; consult the rate manual for a full description of the terms, conditions and requirements for such discount. These discounts only apply to transactions involving services rendered by the FNF Family of Companies. This notice only applies to transactions involving property improved with a one-to-four family residential dwelling.

FNF Underwritten Title Company
LTC – Lawyers Title Company

FNF Underwriter
CLTIC – Commonwealth Land Title Insurance Co.

Available Discounts

DISASTER LOANS (CLTIC)
The charge for a Lender's Policy (Standard or Extended coverage) covering the financing or refinancing by an owner of record, within 24 months of the date of a declaration of a disaster area by the government of the United States or the State of California on any land located in said area, which was partially or totally destroyed in the disaster, will be 50% of the appropriate title insurance rate.

EMPLOYEE RATE (LTC and CLTIC)
No charge shall be made to employees (including employees on approved retirement) of the Company or its underwritten, subsidiary or affiliated title companies for policies or escrow services in connection with financing, refinancing, sale or purchase of the employees' bona fide home property. Waiver of such charges is authorized only in connection with those costs which the employee would be obligated to pay, by established custom, as a party to the transaction.

FIDELITY NATIONAL FINANCIAL
PRIVACY NOTICE

At Fidelity National Financial, Inc. and its majority-owned subsidiary companies (collectively, "FNF", "our" or "we"), we value the privacy of our customers. This Privacy Notice explains how we collect, use, and protect your information and explains the choices you have regarding that information. A summary of our privacy practices is below. We also encourage you to read the complete Privacy Notice following the summary

Types of Information Collected. You may provide us with certain personal information, like your contact information, social security number (SSN), driver's license, other government ID numbers, and/or financial information. We may also receive information from your Internet browser, computer and/or mobile device.	**How Information is Collected.** We may collect personal information directly from you from applications, forms, or communications we receive from you, or from other sources on your behalf, in connection with our provision of products or services to you. We may also collect browsing information from your Internet browser, computer, mobile device or similar equipment. This browsing information is generic and reveals nothing personal about the user.
Use of Your Information. We may use your information to provide products and services to you (or someone on your behalf), to improve our products and services, and to communicate with you about our products and services. We do not give or sell your personal information to parties outside of FNF for their use to market their products or services to you.	**Security Of Your Information**. We utilize a combination of security technologies, procedures and safeguards to help protect your information from unauthorized access, use and/or disclosure. We communicate to our employees about the need to protect personal information.
Choices With Your Information. Your decision to submit personal information is entirely up to you. You can opt-out of certain disclosures or use of your information or choose to not provide any personal information to us.	**When We Share Information.** We may disclose your information to third parties providing you products and services on our behalf, law enforcement agencies or governmental authorities, as required by law, and to parties with whom you authorize us to share your information.
Information From Children. We do not knowingly collect information from children under the age of 13, and our websites are not intended to attract children.	**Privacy Outside the Website.** We are not responsible for the privacy practices of third parties, even if our website links to those parties' websites.
Access and Correction. If you desire to see the information collected about you and/or correct any inaccuracies, please contact us in the manner specified in this Privacy Notice.	**Do Not Track Disclosures.** We do not recognize "do not track" requests from Internet browsers and similar devices.
The California Online Privacy Protection Act. Certain FNF websites collect information on behalf of mortgage loan servicers. The mortgage loan servicer is responsible for taking action or making changes to any consumer information submitted through those websites.	**International Use.** By providing us with your information, you consent to the transfer, processing and storage of such information outside your country of residence, as well as the fact that we will handle such information consistent with this Privacy Notice.
Your Consent To This Privacy Notice. By submitting information to us and using our websites, you are accepting and agreeing to the terms of this Privacy Notice.	**Contact FNF.** If you have questions or wish to contact us regarding this Privacy Notice, please use the contact information provided at the end of this Privacy Notice.

FNF respects and is committed to protecting your privacy. We pledge to take reasonable steps to protect your Personal Information (as defined herein) and to ensure your information is used in compliance with this Privacy Notice.

This Privacy Notice is only in effect for information collected and/or owned by or on behalf of FNF, including collection through any FNF website or online services offered by FNF (collectively, the "Website"), as well as any information collected offline (e.g., paper documents). The provision of this Privacy Notice to you does not create any express or implied relationship, nor create any express or implied duty or other obligation, between FNF and you.

Types of Information Collected

We may collect two types of information: Personal Information and Browsing Information.

Personal Information. The types of personal information FNF collects may include, but are not limited to:

- contact information (*e.g.*, name, address, phone number, email address);
- social security number (SSN), driver's license, and other government ID numbers; and
- financial account or loan information.

Browsing Information. The types of browsing information FNF collects may include, but are not limited to:

- Internet Protocol (or IP) address or device ID/UDID, protocol and sequence information;
- browser language;
- browser type;
- domain name system requests;
- browsing history;
- number of clicks;
- hypertext transfer protocol headers; and
- application client and server banners.

How Information is Collected

In the course of our business, we may collect *Personal Information* about you from the following sources:

- applications or other forms we receive from you or your authorized representative, whether electronic or paper;
- communications to us from you or others;
- information about your transactions with, or services performed by, us, our affiliates or others; and
- information from consumer or other reporting agencies and public records that we either obtain directly from those entities, or from our affiliates or others.

We may collect *Browsing Information* from you as follows:

- Browser Log Files. Our servers automatically log, collect and record certain Browsing Information about each visitor to the Website. The Browsing Information includes only generic information and reveals nothing personal about the user.
- Cookies. From time to time, FNF may send a "cookie" to your computer when you visit the Website. A cookie is a small piece of data that is sent to your Internet browser from a web server and stored on your computer's hard drive. When you visit the Website again, the cookie allows the Website to recognize your computer, with the goal of providing an optimized user experience. Cookies may store user preferences and other information. You can choose not to accept cookies by changing the settings of your Internet browser. If you choose not to accept cookies, then some functions of the Website may not work as intended.

Use of Collected Information

Information collected by FNF is used for three main purposes:

- To provide products and services to you, or to one or more third party service providers who are performing services on your behalf or in connection with a transaction involving you;
- To improve our products and services;

and

- To communicate with you and to inform you about FNF's products and services.

When We Share Information

We may share your Personal Information (excluding information we receive from consumer or other credit reporting agencies) and Browsing Information with certain individuals and companies, as permitted by law, without first obtaining your authorization. Such disclosures may include, without limitation, the following:

- to agents, representatives, or others to provide you with services or products you have requested, and to enable us to detect or prevent criminal activity, fraud, or material misrepresentation or nondisclosure;
- to third-party contractors or service providers who provide services or perform other functions on our behalf;
- to law enforcement or other governmental authority in connection with an investigation, or civil or criminal subpoenas or court orders; and/or
- to other parties authorized to receive the information in connection with services provided to you or a transaction involving you.

We may disclose Personal Information and/or Browsing Information when required by law or in the good-faith belief that such disclosure is necessary to:

- comply with a legal process or applicable laws;
- enforce this Privacy Notice;
- investigate or respond to claims that any information provided by you violates the rights of a third party; or
- protect the rights, property or personal safety of FNF, its users or the public.

We make efforts to ensure third party contractors and service providers who provide services or perform functions on our behalf protect your information. We limit use of your information to the purposes for which the information was provided. We do not give or sell your information to third parties for their own direct marketing use.

We reserve the right to transfer your Personal Information, Browsing Information, as well as any other information, in connection with the sale or other disposition of all or part of the FNF business and/or assets, or in the event of our bankruptcy, reorganization, insolvency, receivership or an assignment for the benefit of creditors. You expressly agree and consent to the use and/or transfer of this information in connection with any of the above-described proceedings. We cannot and will not be responsible for any breach of security by any third party or for any actions of any third party that receives any of the information that is disclosed to us.

Choices With Your Information

Whether you submit your information to FNF is entirely up to you. If you decide not to submit your information, FNF may not be able to provide certain products or services to you. You may choose to prevent FNF from using your information under certain circumstances ("opt out"). You may opt out of receiving communications from us about our products and/or services.

Security And Retention Of Information

FNF is committed to protecting the information you share with us and utilizes a combination of security technologies, procedures and safeguards to help protect it from unauthorized access, use and/or disclosure. FNF trains its employees on privacy practices and on FNF's privacy and information security policies. FNF works hard to retain information related to you only as long as reasonably necessary for business and/or legal purposes.

Information From Children

The Website is meant for adults. The Website is not intended
or designed to attract children under the age of thirteen (13). We do not collect Personal Information from any person that we know to be under the age of thirteen (13) without permission from a parent or guardian.

Privacy Outside the Website

The Website may contain links to other websites, including links to websites of third party service providers. FNF is not and cannot be responsible for the privacy practices or the content of any of those other websites.

International Users

Because FNF's headquarters is located in the United States, we may transfer your Personal Information and/or Browsing Information to the United States. By using our website and providing us with your Personal Information and/or Browsing Information, you understand and consent to the transfer, processing and storage of such information outside your country of residence, as well as the fact that we will handle such information consistent with this Privacy Notice.

Do Not Track Disclosures

Currently, our policy is that we do not recognize "do not track" requests from Internet browsers and similar devices.

The California Online Privacy Protection Act

For some websites which FNF or one of its companies owns, such as the Customer CareNet ("CCN"), FNF is acting as a third party service provider to a mortgage loan servicer. In those instances, we may collect certain information on behalf of that mortgage loan servicer, including:

- first and last name;
- property address;
- user name and password;
- loan number;
- social security number - masked upon entry;
- email address;
- security questions and answers; and
- IP address.

The information you submit is then transferred to your mortgage loan servicer by way of CCN. **The mortgage loan servicer is responsible for taking action or making changes to any consumer information submitted through this website. For example, if you believe that your payment or user information is incorrect, you must contact your mortgage loan servicer.**

CCN does not share consumer information with third parties, other than those with which the mortgage loan servicer has contracted to interface with the CCN application. All sections of this Privacy Notice apply to your interaction with CCN, except for the sections titled Choices with Your Information, and Access and Correction. If you have questions regarding the choices you have with regard to your personal information or how to access or correct your personal information, contact your mortgage loan servicer.

Access and Correction

To access your Personal Information in the possession of FNF and correct any inaccuracies, please contact us by email at privacy@fnf.com or by mail at:

Fidelity National Financial, Inc.

Jacksonville, Florida 32204
Attn: Chief Privacy Officer

Your Consent To This Privacy Notice

By submitting Personal Information and/or Browsing Information to FNF, you consent to the collection and use of information by FNF in compliance with this Privacy Notice. We reserve the right to make changes to this Privacy Notice. If we change this Privacy Notice, we will post the revised version on the Website.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 09/13/2017 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
HUDSON PLATING WORKS	***11941 HERTZ ST***	***SSW 1/8 - 1/4 (0.139 mi.)***	***B11***	***27***

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 09/13/2017 has revealed that there are 5 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 07/31/2017 has revealed that there are 2 ENVIROSTOR sites within approximately 1 mile of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 09/13/2017 has revealed that there are 3 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto site within approximately 0.125 miles of the target property.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 19593.9

Owner/Op start date: Not reported
Owner/Op end date: Not reported

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D000

Registry ID: 110012183760

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Completed Info:

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Site Screening
Completed Date:	10/27/1994
Comments:	CalSites Validation Program confirms NFA for DTSC.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Preliminary Endangerment Assessment Report
Completed Date:	06/30/1991
Comments:	Based on the information provided in the PEA and the addendum reports, the contamination at the site may not constitute a threat to human health and environment. Therefore, the Dept concurs with the PEA recommendation that no further action is needed at the site at this time.

WALNUT CANYON TRACT (Continued) **S100204264**

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Site Screening
Completed Date:	12/20/1990
Comments:	Did not address the surface water and groundwater targets, did not put in any monitoring wells. Residential house in proximity. Few groundwater wells within one mile radius. Did not address metal contamination and did not take any deep soil samples to confirm petroleum hydrocarbon migration Medium priority PEA recommended.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 05/30/2017

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 05/30/2017

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

US ENG CONTROLS: Engineering Controls Sites List

A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

Date of Government Version: 08/10/2017
Date Data Arrived at EDR: 08/30/2017
Date Made Active in Reports: 10/13/2017
Number of Days to Update: 44

Source: Environmental Protection Agency
Telephone: 703-603-0695
Last EDR Contact: 11/27/2017
Next Scheduled EDR Contact: 03/12/2018
Data Release Frequency: Varies

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Date of Government Version: 08/10/2017

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

Date of Government Version: 08/30/2013

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 07/28/2017

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.
Public Schools

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

HITCH RANCH
POINDEXTER AVENUE AT GABBERT ROAD
MOORPARK, CA 93021

TARGET PROPERTY COORDINATES

Latitude (North):	34.289704 - 34° 17' 22.93''
Longitude (West):	118.892291 - 118° 53' 32.25''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	325830.9
UTM Y (Meters):	3795703.8
Elevation:	611 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5630753 MOORPARK, CA
Version Date:	2012
East Map:	5630771 SIMI VALLEY WEST, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

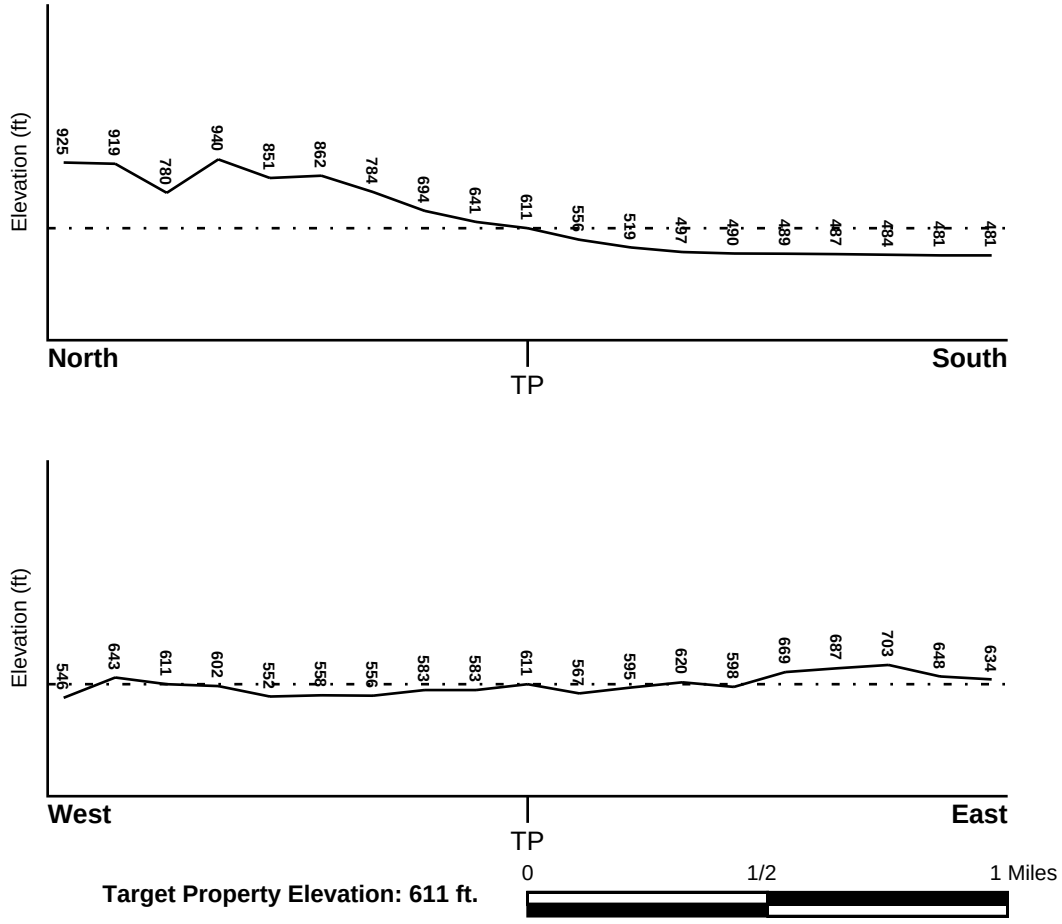
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06111C0817E	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type

06111C0819E	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
MOORPARK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: CHESTERTON

Soil Surface Texture: coarse sandy loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	9 inches	coarse sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 6.5 Min: 5.6
2	9 inches	25 inches	sandy clay	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 0.42 Min: 0.01	Max: 6.5 Min: 5.5
3	25 inches	35 inches	indurated	Not reported	Not reported	Max: Min:	Max: Min:
4	35 inches	59 inches	sandy loam	Not reported	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 4 Min: 1.4	Max: 7.8 Min: 7.4

Soil Map ID: 2

Soil Component Name: SAN ANDREAS

Soil Surface Texture: sandy loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	20 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 6.5 Min: 5.1
2	20 inches	37 inches	sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 5.6 Min: 5.1
3	37 inches	59 inches	loamy coarse sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 5.6 Min: 5.1

Soil Map ID: 3

Soil Component Name: GARRETSON

Soil Surface Texture: loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Low

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	22 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay. FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 14 Min: 4	Max: 7.3 Min: 6.1
2	22 inches	59 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 7.8 Min: 6.1

Soil Map ID: 4

Soil Component Name: METZ

Soil Surface Texture: loamy sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Somewhat excessively drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	7 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.4
2	7 inches	59 inches	stratified sand to sandy loam	Granular materials (35 pct. or less passing No. 200), Stone Fragments, Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 141 Min: 42	Max: 8.4 Min: 7.4

Soil Map ID: 5

Soil Component Name: SOPER

Soil Surface Texture: gravelly loam

Hydrologic Group: Class C - Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	11 inches	gravelly loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 14 Min: 4	Max: 6.5 Min: 5.6
2	11 inches	40 inches	very gravelly clay loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Gravels, Gravels with fines, Clayey Gravel	Max: 4 Min: 1.4	Max: 7.8 Min: 6.1
3	40 inches	44 inches	weathered bedrock	Not reported	Not reported	Max: 0 Min: 0	Max: Min:

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish & Game
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Amicus were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1926 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

Attention: Paul Calderwood, Senior Project Manager

Subject: Phase I Environmental Site Assessment, Hitch Ranch, Moorpark Specific Plan No. 1, Moorpark, California 93021

Gradient Engineers, Inc. (Gradient), completed this Phase I Environmental Site Assessment (ESA) for the subject property. The work was performed in accordance with our proposal of January 21, 1998, and your written authorization of March 11, 1998. The report was formatted in accordance with section X2 of ASTM Practice E 1527-97.

We appreciate the opportunity to continue to serve your environmental needs. If you have any questions regarding this report, please do not hesitate to contact me at your convenience.

Respectfully submitted,

EXECUTIVE SUMMARY

Gradient Engineers, Inc. (Gradient) performed a Phase I Environmental Site Assessment (ESA) at the subject site. The ESA was performed for Impact Sciences, Inc. (Impact Sciences). The purpose of this ESA was to identify recognized environmental conditions on the site. The scope of work for this assessment included records review, site reconnaissance, interviews, and report. The report was formatted in accordance with section X2 of ASTM Practice E 1527-97.

The site consists of approximately 282 acres (Moorpark Specific Plan Number 1) of undeveloped, hilly land (Figure 2 – Site Map). Site elevations range from 470 feet above mean sea level in the southwest to 720 feet in the north. A north/south trending paved road, Gabbert Road, crosses the west portion of the site. The site is covered with a moderate to thick growth of, grasses, bushes, pepper trees, and eucalyptus trees. Several south trending ephemeral streams drain into the flood control culvert at the south of the site.

The site is bounded on the north by an eucalyptus tree line, fence line, and undeveloped land. The site is bounded on the east by an eucalyptus tree line, a fence line, residential property, a construction site, and undeveloped land. The site is bounded on the south by a storm culvert, railroad tracks, and Poindexter Avenue. The site is bounded on the southwest by a storm culvert, railroad tracks, and a Southern California Edison substation. There are commercial and industrial properties located to the south of Poindexter Avenue. The site is bounded to the northwest by homes and horse ranches. The site is bounded on the west by agricultural, residential, and undeveloped land.

Based on information obtained during this assessment from sources including aerial photographs, topographic maps, and interviews, the past site usage was as apricot and lemon orchards; a hog farm; a horse farm; and for dairy cow grazing.

The review of environmental database records indicates that 19 mapped sites were found in the appropriate ASTM search of available ("reasonably ascertainable") government records either on the subject property or within the ASTM search radius around the subject property. None of the mapped sites are likely to have a negative impact on the subject site except Site #3, Agrow Co., located approximately 1000 feet north of the western side of the subject property. This up-gradient site may have the potential to adversely impact groundwater and soils at the subject site.

Based upon the findings of the ESA, Gradient recommends the following:

- Before the buildings are removed, suspect building materials and painted surfaces should be checked for asbestos and lead based paint;
- Empty identifiable and unidentifiable containers located in and around structures at the site should be removed and disposed of properly, and the underlying areas checked for contamination;
- Empty paint, an automotive car battery, and other debris located in wash east of Gabbert Road, should be disposed of properly and verified to not have leaked and contaminated the surrounding area;
- Horticultural and landscaping debris dumped in wash west of Gabbert, should be disposed of properly and verified to not have impacted the surrounding area;
- Pile of orchard heaters in southern portion of site, should be disposed of properly and the underlying area checked for contamination;

- The area around and under the pile of orchard heaters should be checked carefully for evidence of propellants and projectiles from gunfire, if evidence of gunfire is found the area should be checked for lead contamination;
- The area of the former AST's, should be closely inspected during the Casey Road extension, for evidence of contamination from smudge pot oil;
- Abandoned vehicles on site should be removed so that the contents of their fuel and or storage tanks do not contaminate the site. As they are being removed the underlying area should be inspected for contamination;
- The location of the construction fuel AST should be identified as to whether it is on the subject property or not. The AST should be bermed to contain any spillage and the protected soil covered with plastic to avoid contamination from spillage.
- Abandoned agricultural equipment should be removed so that the contents of their fuel and or storage tanks does not contaminate the site. As they are being removed the underlying area should be inspected for contamination;
- The contents of the former septic tank, should be identified prior to its removal.
- Prior to grading in areas used as orchards or for farming, all valley and level areas, and the northeast and east portions of the site, samples should be collected and screened for herbicides and pesticides.

APPENDICES

Appendix A – References and Aerial Photographs
Appendix B – Vista Report, dated March 9, 1998
Appendix C – Phase I Environmental Site Assessment Transaction Screen Questionnaire

1. INTRODUCTION

1.1 Authorization

Gradient Engineers, Inc. (Gradient) completed a Phase I Environmental Site Assessment (ESA) at the subject site. This work was performed in accordance with the scope, terms and conditions of our proposal, No. P98300-012 dated January 21, 1998. This report is formatted in accordance with section X2 of ASTM Practice E 1527-97.

1.2 Purpose

The standard purpose of a Phase I ESA is to identify recognized environmental conditions on a site. The term *recognized environmental conditions* is defined by ASTM Standard E 1527-97 as "The presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property, or into the ground, ground water, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimis* conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies."

1.3 Scope of Work

The scope of work was performed in accordance with Gradient's proposal and included the following tasks:

- Record Review;
- Site Reconnaissance;
- Interviews; and
- Report.

This assessment did not include subsurface or geotechnical evaluation of the site; air, soil, and/or ground-water sampling and analysis; consideration of possible future contamination of the site from adjacent or surrounding facilities or properties; or investigations for asbestos, lead, or radon.

1.4 Limitations and Exceptions

The findings and professional opinions presented in this report are based on the information made available to Gradient (in most cases from previous reports and from public records) and could change if additional information becomes available. In performing our professional

services, Gradient applied present engineering and scientific judgment and used a level of effort consistent with the standard of practice measured on the date of this report and in the vicinity of the project site for projects of similar scope. Gradient makes no warranties, either express or implied, concerning the completeness of the data made available to us for this study. Gradient specifically withholds certification of any type concerning the absence of contamination at the site.

1.5 Limiting Conditions and Methodology

The methodology used during this assessment conforms with current standard of care in the performance of Phase I ESAs in southern California. The list of references used for this study is included as Appendix A. Gradient, using Vista Information Solutions, Inc.'s, Starview™ Real Estate software, version 2.5.1, conducted a search of available environmental records. A copy of the database report is included as Appendix B.

Government records documenting the history of hazardous materials in this area are generally reliable for only the past ten years or less; therefore, undocumented sites or events may exist, and early records of the site may not have been made available by the agencies for review.

The scale of the historic aerial photographs preclude detailed observations of small-scale features on the site.

The following conditions at the property during the site reconnaissance limited our observations of the property:

- The thick vegetation limited our range of reconnaissance.

2. SITE DESCRIPTION

2.1 Site Location

The site is undeveloped land located to the northwest of the intersection of Poindexter Avenue and Walnut Canyon Road, in Moorpark, California (Figure 1 - Site Location Map). The site is located in the western portion of the former Rancho Simi land grant area. The site is located in the southern half of the southeast ¼ of Section 6, T2N and R19W, and the North ½ of Section 5, T2N, R19W, of the San Bernardino Baseline and Meridian, in the former Rancho Simi.

2.2 Site and Vicinity Characteristics

The site consists of approximately 282 acres (Moorpark Specific Plan Number 1) of undeveloped land with rolling hills and valleys (Figure 1 – Site Location Map). Site elevations range from 470 feet above mean sea level in the southwest to 720 feet in the north. A north/south trending paved road, Gabbert Road, crosses the west portion of the site. The site is covered with a moderate to thick growth of, grasses, bushes, pepper trees, and eucalyptus trees. Several south trending ephemeral streams drain into the flood control culvert at the south of the site.

The site is bounded on the north by an eucalyptus tree line, fence line, and undeveloped land. Further to the north, off of Broadway, are citrus and avocado orchards. The site is bounded on the east by an eucalyptus tree line a fence line, some residential property, a construction site, and undeveloped land. The site is bounded on the south by a storm culvert, railroad tracks, and Poindexter Avenue. The site is bounded on the southwest by a storm culvert, railroad tracks, and a Southern California Edison substation. There are commercial and industrial properties located to the south of Poindexter Avenue. The site is bounded to the northwest by homes and horse ranches. The site is bounded on the west by agricultural, residential, and undeveloped land.

- The site is covered with a moderate to thick growth of grasses, bushes, pepper trees, and eucalyptus trees.

The vicinity is of similar topography and consists of ranches, agricultural, orchards, and undeveloped land.

2.3 Onsite Structures and Improvements

A paved north/south trending road, Gabbert Road, is present in the west portion of the site. Gabbert Road originates at Los Angeles Avenue and crosses the site to the north. A storm water culvert runs along the entire south property line.

A gated, dirt, north/south trending road, is present in the central portion of the site. The road originates at Poindexter Avenue and crosses the railroad tracks to a locked gate, driveway, and beyond to the northeast portion of the site. Several dirt roads are located on the site most of which originate from the dirt road off of Poindexter Avenue.

Utilities on site are:

- Electricity - service is provided by Southern California Edison;
- Potable Water - supplied by the Callegus Municipal Water District; and
- Natural Gas - provided by the Gas Company.

The structures located on site include:

- A workshop, three wooden structures, animal staging area and a corral are located in the middle of the easterly portion;
- A single family home, 537 Poindexter Avenue; and
- Two water well shelters (one in the northwest, one in the southeast), and an Above Ground Storage Tank (AST) for water in the northeast corner;

Evidence of several other structures were identified on the central and eastern portions of the site:

- Footings and concrete slabs; and
- Piles of timber

2.4 Current Uses of the Property

The property is currently undeveloped, however, the house at 537 Poindexter Avenue is occupied. The property has reportedly been fallow since the early 1980's.

2.5 Past Uses of the Property

Based on information obtained during this assessment from sources including aerial photographs, topographic maps, and interviews, the site was predominately used as:

- An apricot orchard;
- Lemon orchard;
- Wheat farming;
- Hog farm;
- Horse training; and
- Dairy cow grazing.

2.6 Current and Past Uses of Adjoining Properties

The property to the north is undeveloped. Further north over the hill the land is being used as citrus orchards. Properties to the northwest are residential and horse ranches. West of the site are orchards and a composting facility. South of the site is a mixed industrial/commercialarea. South and southeast of the site is residential. Northeast of the site are several ranches and east of the site is a school.

The surrounding area has been predominately undeveloped or used for agricultural purposes since the early 1900's. The area to the south and southeast has become increasingly more residential. The areas further to the west and north are still being used as orchards or remain undeveloped.

3. RECORDS REVIEW

3.1 Standard Environmental Record Sources

Gradient, using Vista Information Solutions, Inc.'s Starview™ Real Estate software, version 2.5.1, conducted a search of available environmental records. The search met the specific requirements of ASTM Standard E1527-97 associated with government databases, search distances, and data currency. The review of environmental database records indicates that 19 mapped sites were found in the appropriate ASTM search of available ("reasonably ascertainable") government records either on the subject property or within the ASTM search radius around the subject property. A copy of the database report is included as Appendix B. None of the mapped sites are likely to have a negative impact on the subject site except possibly the following:

- *Agrow Co.*, Map ID #3, is listed in the Emergency Response Notification System database.. The substances reported spilled are "GASOLINE, 10.00 (GAL); OIL, 30.00 (GAL)." The affected media was reported as a "Land Release." The site is located approximately 1,000 feet north of the western side of the subject property. This suspected up-gradient site may have the potential to adversely impact groundwater and soils beneath the subject site.

The Unmapped Sites List describes 20 sites that, due to poor or inadequate address information (incorrect zip code, etc.) can not be plotted on the map; the unmapped sites do not appear to currently represent any potential environmental concerns to the subject site.

3.2 Physical Setting

The U.S.G.S. 7.5-Minute topographic map, Moorpark, California Quadrangle, 1951 (photorevised 1969, photoinspected 1974) was reviewed. This U.S.G.S. map is used as the base map for Figure 1 - Site Location Map. Site topography, elevations, and certain cultural features are depicted in Figure 1.

The following items were noted on the map as of 1951:

- Structures are mapped on the site;
- Four "Oil Tanks" are located west of Gabbert Road;
- An AST is located in the northeast portion of the site; and
- Several unimproved dirt roads to the center and east portions of the site.

The 1969 photorevision showed the following changes:

- Extension of the unimproved dirt roads to the north and northeast.

The 1974 photoinspection showed the following changes:

- "No major culture or drainage changes observed."

Based on the topographic map review, no environmental concerns on the site or in the immediate vicinity of the site were noted except the following:

- On the southwest corner of the site, the topographic map shows four "Oil Tanks."

3.3 Historical Use Information - Aerial Photographs

Selected years of aerial photographs were examined to develop a history of the previous uses of the property and surrounding area, in order to help identify the likelihood of past uses having led to recognized environmental conditions in connection with the property. Aerial photographs were reviewed for the following years: 1938, 1952, 1981, 1993 (Appendix A).

1938

The site is being used for agricultural purposes and as an orchard. There are several buildings located directly north of Poindexter Avenue and several structures off of Casey Road. There are several AST's, two on the western side of the site just north of the railroad tracks, and one on the northeastern side. The surrounding areas and vicinity are being used as ranches and orchards. Several locations are being prepared for use as an orchard.

1952

The site is still being used for agricultural purposes and as an orchard. Several structures have been constructed in the center of the property. An intricate irrigation system has been added, including two water wells and an AST for water. Most of the level surfaces of the property have now been converted into an orchard. The wash, east of Gabbert Road, had an orchard planted in it. Several AST's have been relocated near the orchard areas. The AST's near Gabbert Road are in the same location as 1938.

1981

The property is no longer being used as an orchard. The west side AST's are no longer visible. A stable and riding area are now present in the northwest portion of the site. There are several structures on the western portion of the site. High tension power lines are visible originating from the substation to the south and continuing north over the site. A storm culvert is visible just north of the railroad tracks.

1993

The property appears undeveloped. A commercial or industrial park is visible south of the site.

3.4 Oil Field Records

A review of oil field maps (DOGGR, 1997) indicates that the closest documented oil wells is over 2,000 feet from the site.

3.5 Previous Reports

Gradient requested copies of any environmental related reports from Impact Sciences and the property owner. Paul Calderwood, Impact Sciences, stated "we have no reports which document environmental concerns at the site." The property owner, A. A. Milligan, stated "I know of no past reports."

4. SITE RECONNAISSANCE

On March 10, 1998, Gradient visited the site to assess current site utilization, to locate possible surface contamination source areas, and to look for indications of potential subsurface contamination.

4.1 Hazardous Substances in Connection with Identified Uses

We observed no evidence of potentially hazardous substances in connection with identified uses.

4.2 Hazardous Substances Containers and Unidentified Substance Containers

We observed two automotive batteries dumped on the site. One was in the wash, east of Gabbert Road, the other battery was in the former accounting building at the center of the site.

We observed approximately 20-25 unmarked empty containers near or around the buildings in the central portion of the site.

4.3 Storage Tanks

No Underground Storage Tanks (UST's) or evidence of former UST's were observed on the site.

There is currently one AST on the northeastern portion of the site. We observed this AST to be a water AST.

4.4 Polychlorinated Biphenyls (PCBs)

We observed no evidence of PCB-containing pad or pole mounted transformers, fluorescent light ballasts, or other PCB-containing equipment.

4.5 Indications of Solid Waste Disposal

Three locations on the site show evidence of dumping:

- We observed an empty gallon paint can, an automotive battery, and a couch dumped in the wash, east of Gabbert Road;
- We observed piles containing PVC pipes, automobile tires, and plant flats, dumped in the wash, west of Gabbert; and
- We observed approximately 30-40 orchard heaters in southern portion of site, north of Poindexter Avenue and west of the central dirt road.

5. INTERVIEWS

On February 23, 1998, Gradient spoke with Paul Calderwood, Senior Project Manager with Impact Sciences, Inc. Calderwood stated "in order to get the name and phone number of the current owner of the site you should call Gordon Jenewein, Development Planning Services." Gradient asked Calderwood if any previous reports regarding environmental concerns have been produced. Paul Calderwood stated "there are no previous reports."

On March 9, 1998, Gradient spoke with Jenewein about the Phase I ESA Transaction Screen Questionaire, he stated "that all correspondence to the property owner be directed through me."

On March 11, 1998, Gradient spoke with Gordon Jenewein, Development Planning Services, he stated "you can contact A. A. Milligan, the property owner, directly, and fax him the questionnaire."

On March 11, 1998, Gradient faxed Milligan the Phase I ESA Transaction Screen Questionaire.

On March 11, 1998, Gradient spoke with Shauna Perry, Senior Fire Inspector with the Ventura County Fire Department, Fire Prevention (VCFD). Gradient described the site to Perry as "Hitch Ranch, Moorpark Specific Plan No. 1, 537 Poindexter Avenue, anything on Poindexter Avenue, Gabbert Road, or Casey Road." Perry stated "that VCFD has no records or permits for any hazardous materials storage, spills, UST's, and AST's at that site." Perry stated "I am not aware of any permits for an AST in the nearby area." Perry reported that "structures on Casey Road had been destroyed in a VCFD training exercise."

On March 11, 1998, Gradient spoke with Heather Colbern, Records Search Coordinator with the Ventura County Health Department (VCHD). Gradient described the site to Colbern as "Hitch Ranch, Moorpark Specific Plan No. 1, 537 Poindexter Avenue, anything on Poindexter Avenue, Gabbert Road, or Casey Road." Colbern stated "VCHD has no records of any hazardous materials storage or spills at the site." Colbern stated "VCHD has records for 5300 and 5027 Gabbert Road." Colbern replied "the site at 5027 Gabbert Road has had case closure and the site at 5300 Gabbert Road is still open."

On March 12, 1998, a Phase I Environmental Site Assessment Questionnaire was completed by Mr. Milligan. A copy of the completed questionnaire is included as Appendix C.

On March 12, 1998, Gradient spoke with Mr. Milligan, Owner of the site. He Sated the following:

- Around 1940 the site was deeded to my Uncle from the Hitch family
- The Hitch's continued lease the land from us and worked it until the 1970's;
- The site was used as an apricot orchard from the 1930's to sometime around 1948;
- The apricots were removed in 1948 and lemons planted lemon orchard from 1948 to around 1970;
- We put the water wells and water lines in for the lemon trees, sometime around 1948;
- The tank were used for fuel storage by the Hitch family;
- The tanks were removed sometime around 1960; and
- To the best of my knowledge no pesticides or herbicides were used at the site.

Milligan stated "I know of no adverse environmental conditions at the site." Milligan recommended we contact Lowell Withington who still leased a portion of the property.

On March 12, 1998, Gradient spoke with Lowell Withington, leasee of the site. Withington stated the following:

- Apricot orchard from the 1930's to 1948-49;
- Hogs were penned from the 1930's until sometime in the 1960's;
- Lemon orchard from 1948-49 to the 1970's;
- Three water wells drilled: one on the northwest (~600'), one on the southeast(~700'), and one on the northeast (~1400');
- The well on the northeast was unsuitable for their purposes; and
- To the best of his knowledge no pesticides or herbicides were used at the site.

He described what the existing buildings located on site were used for:

- The large building on the site map was for pitting apricots;
- The wooden building east of it was used for drying the apricots with sulfur compounds;
- The sheetmetal building was the shop;
- The wooden building east of the shop was used for dried fruit storage; and
- The metal and wood building south of the shop was for accounting purposes.

Withington stated "that the concrete and brick structures were used for hog farming, and the existing corral was one of many hog pens." Withington also stated "the area northwest of the buildings had been used for horses." Withington remarked that the site was used as pasture land for dairy cows from the 1970's to the 1990's. gradient asked Withington "if he knew of any herbicides or pesticides used on the site?" Withington responded "I am not a bug man, I know of no past or present use of those things at the site."

On March 12, 1998, Gradient spoke with Fire Engineer Magdalena, Ventura County Fire Department, Station 42. Magadalena communicated "in my 25 years with the department, I do not recall any unusual activities at the site, other then the training exercises."

6. FINDINGS AND RECOMMENDATIONS

6.1 Findings

Gradient identified the following environmental concerns at the subject site (see Figure 2 for corresponding locations):

- Suspect building materials used in structures located on site (location #1).

All structures located on the site have been identified to have been constructed before 1978, most have been constructed before 1948. These structures may contain asbestos building materials and have been painted with lead based paint.

- Empty identifiable and unidentifiable containers located in and around structures at the site (location #2).

The buildings in the central portion of the site contained several empty identifiable and unidentifiable containers: Empty oil containers and one empty hydraulic drum labeled "Shell Spirax HD SAE 85W/140;" Empty container of "Lexol," a leather preservative; Several empty plastic bottles of "Prepodyne Solution," a livestock antibacterial solution; Automotive battery; Used automotive oil filters; and many unidentifiable metal and plastic containers. The well shelter located on the southeast portion of the site has a fifty five gallon drum of "Chevron O. C. Turbine Oil," the drum was on its side and appeared to be empty.

- Empty paint, automotive car battery, and other debris located in wash east of Gabbert Road (location 3#).

In the wash, east of Gabbert Road, an empty paint can, automotive battery, and a couch have been dumped or washed down out of the canyon northwest of the site.

- Horticultural and landscaping debris dumped in wash west of Gabbert (location #4).

In the wash on the westerly portion of the site, piles of debris dumped in the wash contained PVC pipes, automobile tires, plant flats, and possibly other materials which could not be seen on the surface.

- Pile of orchard heaters in southern portion of site (location #5).

North of Poindexter Avenue and west of the central dirt road was a pile of "Riverside Sheet Metal Works" orchard heaters, these originally contained smudge pot oil.

- Bullet holes in orchard heaters located in southern portion of site (location #6).

May have led to a release of smudge pot oil to the environment, and lead contamination to surrounding areas.

- Former location of AST's, as identified on U.S.G.S. topographic map (location #7).

AST's reportedly containing smudge pot oil were removed around 1960 with no records or regulatory agency interface. AST's were reportedly shot at and released smudge pot oil to the environment sometime in the 1950's.

- Abandoned vehicles on site (location #8).

On the central dirt road a four door International pick up type truck has been abandoned, the fuel tank still had an odor of gasoline. On the westerly portion of the site there are pieces of an automobile strewn about, potentially releasing chemicals to the environment.

- Diesel Fuel AST (location #9).

On the east portion of the site, off of Casey Road, is a five hundred gallon construction diesel fuel AST. The AST is not properly bermed for containment or permitted per Ventura County Fire Department Guidelines. The AST was observed to have leaked as staining was still visible. It was not evident if this tank is on the subject property.

- Abandoned Agricultural Equipment (location #10).

Several kinds of agricultural equipment have been abandoned or stored on the site. This equipment includes three dozers, several mobile tanks, spreaders, and a till. Vegetation has completely grown around this equipment and staining was not observed.

- Former Septic Tank (location #11).

A septic tank has been reported to be in the vicinity of the buildings in the central portion of the site, its location contents should be identified.

- The site has been used for many different agricultural and orchard purposes.

Properties used as orchards and farm land may contain herbicides and or pesticides, such as DDT.

6.2 Recommendations

Gradient recommends the following in regards to our findings:

- Suspect building materials used in structures located on site.

Before the buildings are removed suspect building materials and painted surfaces should be checked for asbestos and lead based paint.

- Empty identifiable and unidentifiable containers located in and around structures at the site.

These containers should be removed and disposed of properly, and the underlying areas checked for contamination.

- Empty paint, automotive car battery, and other debris located in wash east of Gabbert Road.

These items should be disposed of properly and verified to not have leaked and contaminated the surrounding area. As the area is cleared, caution should be exercised as more containers may be located within the wash.

- Horticultural and landscaping debris dumped in wash west of Gabbert.

These items should be disposed of properly and verified to not have leaked. As the area is cleared, caution should be exercised as more containers may be located within the wash.

- Pile of orchard heaters in southern portion of site.

The orchard heaters should be disposed of properly and the underlying area checked for contamination.

- Bullet holes in orchard heaters located in southern portion of site.

The area around and under the pile of orchard heaters should be checked carefully for evidence of propellants and projectiles from gunfire. If evidence is found the area should be checked for lead contamination.

- Former location of AST's, as identified on U.S.G.S. topographic map.

The area where the former AST's, as shown on Figure 1, should be closely inspected during the Casey Road extension, for evidence of contamination from the smudge pot oil.

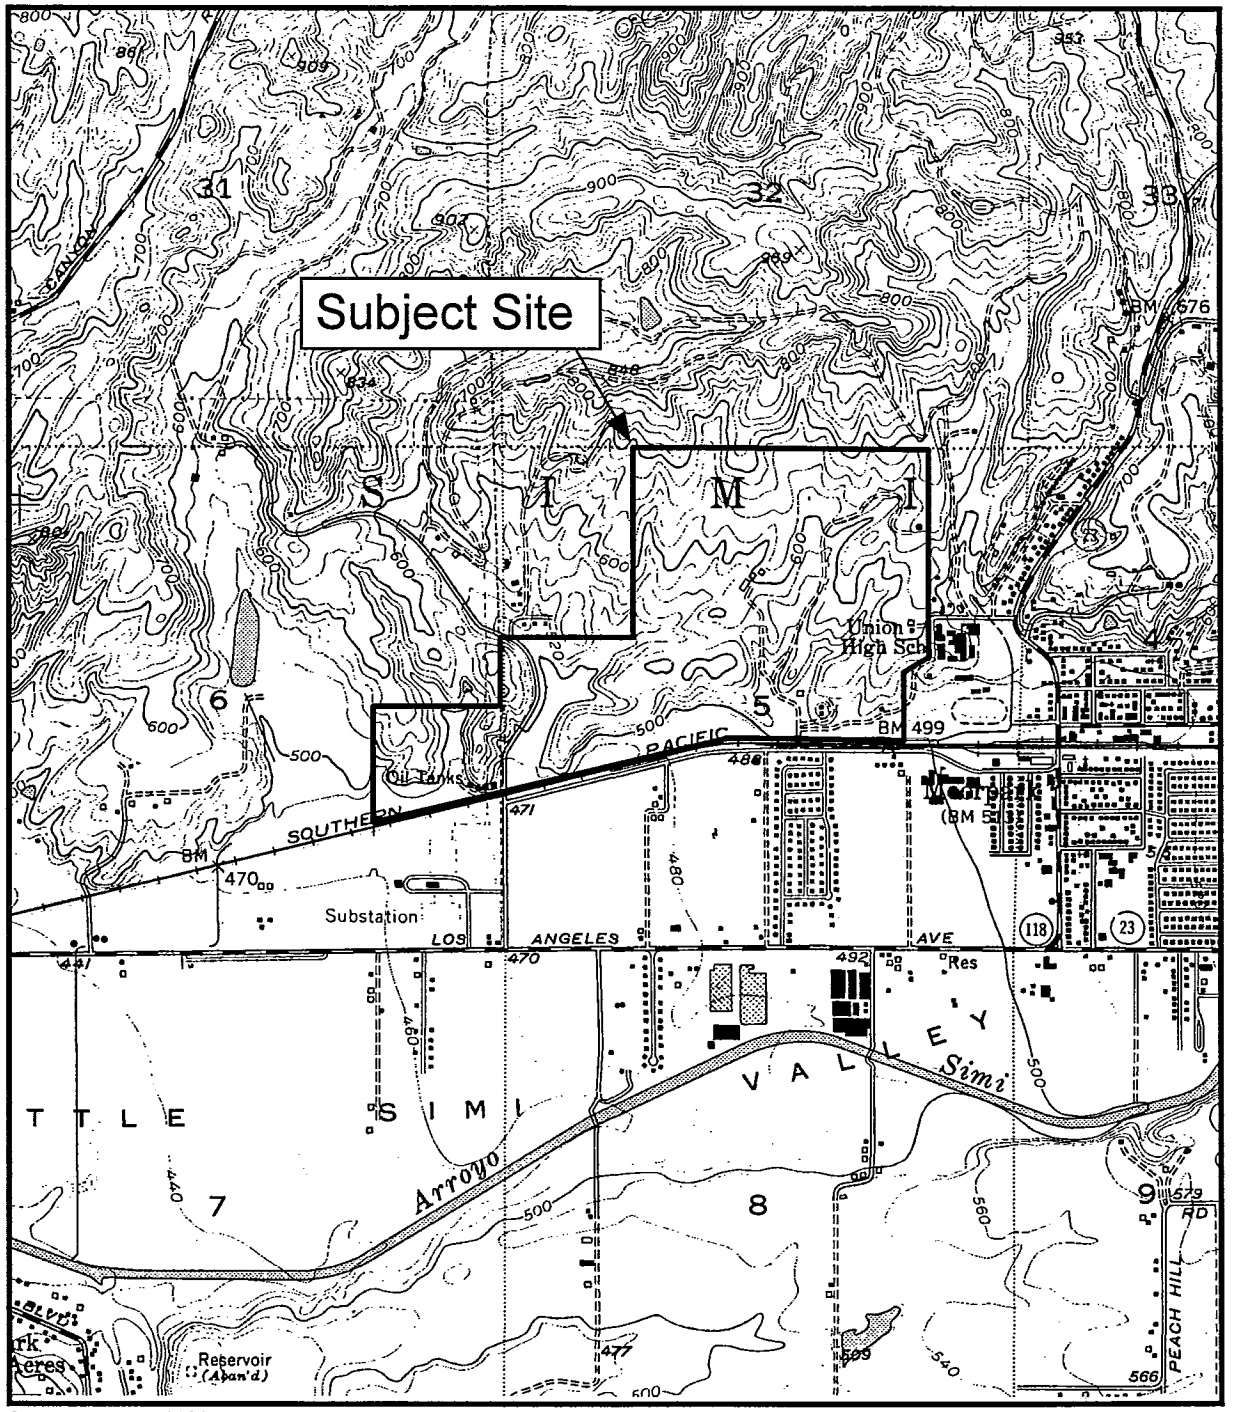
- Abandoned vehicles on site.

The vehicles should be removed so that the contents of their fuel and or storage tanks do not contaminate the site. As they are being removed the underlying area should be inspected for contamination.

- Diesel Fuel AST.

The location of the construction fuel AST should be identified as to whether it is on the subject property or not. The AST should be bermed to contain any spillage and the protected soil covered with plastic to avoid contamination from spillage.

- Abandoned Agricultural Equipment.



The equipment should be removed so that the contents of their fuel and or storage tanks does not contaminate the site. As they are being removed the underlying area should be inspected for spills.

- Former Septic Tank.

The contents of the former septic tank, should be identified prior to its removal.

- The site has been used for many different agricultural and orchard purposes.

Prior to grading in areas used as orchards or for farming, all valley and level areas, and the northeast and east portions of the site, samples should be collected and screened for herbicides and pesticides.

SITE ASSESSMENT REPORT
(PROPERTY BOUNDRY EXTENDED 1/2 MILE)

DESCRIPTION OF DATABASES SEARCHED

A) DATABASES SEARCHED TO 1 MILE

NPL
SRC#: 3622

VISTA conducts a database search to identify all sites within 1 mile of your property.
The agency release date for NPL was January, 1998.

The National Priorities List (NPL) is the EPA's database of uncontrolled or abandoned hazardous waste sites identified for priority remedial actions under the Superfund program. A site must meet or surpass a predetermined hazard ranking system score, be chosen as a state's top priority site, or meet three specific criteria set jointly by the US Dept of Health and Human Services and the US EPA in order to become an NPL site.

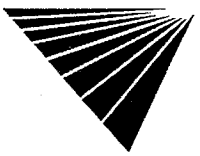
SPL
SRC#: 4233

VISTA conducts a database search to identify all sites within 1 mile of your property.
The agency release date for Calsites Database: Annual Workplan Sites was October, 1997.

This database is provided by the Cal. Environmental Protection Agency, Dept. of Toxic Substances Control. The agency may be contacted at: 916-323-3400.

SCL
SRC#: 4232

VISTA conducts a database search to identify all sites within 1 mile of your property.
The agency release date for Calsites Database: All Sites except Annual Workplan Sites (incl. ASPIS) was October, 1997.



This database is provided by the Department of Toxic Substances Control. The agency may be contacted at: .

The CalSites database includes both known and potential sites. Two- thirds of these sites have been classified, based on available information, as needing "No Further Action" (NFA) by the Department of Toxic Substances Control. The remaining sites are in various stages of review and remediation to determine if a problem exists at the site. Several hundred sites have been remediated and are considered certified. Some of these sites may be in long term operation and maintenance.

CORRACTS
SRC#: 4244

VISTA conducts a database search to identify all sites within 1 mile of your property.
The agency release date for HWDMS/RCRIS was October, 1997.

The EPA maintains this database of RCRA facilities which are undergoing "corrective action". A "corrective action order" is issued pursuant to RCRA Section 3008 (h) when there has been a release of hazardous waste or constituents into the environment from a RCRA facility. Corrective actions may be required beyond the facility's boundary and can be required regardless of when the release occurred, even if it predates RCRA.

B) DATABASES SEARCHED TO 1/2 MILE

CERCLIS
SRC#: 4457

VISTA conducts a database search to identify all sites within 1/2 mile of your property.
The agency release date for CERCLIS was January, 1998.

The CERCLIS List contains sites which are either proposed to or on the National Priorities List(NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL. The information on each site includes a history of all pre-remedial, remedial, removal and community relations activiies or events at the site, financial funding information for the events, and unrestricted enforcement activities.

NFRAP
SRC#: 4458

VISTA conducts a database search to identify all sites within 1/2 mile of your property.
The agency release date for CERCLIS-NFRAP was January, 1998.

NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly, or the contamination was not serious enough to require Federal Superfund action or NPL consideration.

RCRA-TSD
SRC#: 4244

VISTA conducts a database search to identify all sites within 1/2 mile of your property.
The agency release date for HWDMS/RCRIS was October, 1997.

The EPA's Resource Conservation and Recovery Act (RCRA) Program identifies and tracks hazardous waste from the point of generation to the point of disposal. The RCRA Facilities database is a compilation by the EPA of facilities which report generation, storage, transportation, treatment or disposal of hazardous waste. RCRA TSDs are facilities which treat, store and/or dispose of hazardous waste.

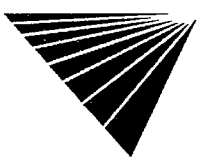
SWLF
SRC#: 4424

VISTA conducts a database search to identify all sites within 1/2 mile of your property.
The agency release date for Ca Solid Waste Information System (SWIS) was January, 1998.

This database is provided by the Integrated Waste Management Board. The agency may be contacted at: 916-255-4021.

The California Solid Waste Information System (SWIS) database consists of both open as well as closed and inactive solid waste disposal facilities and transfer stations pursuant to the Solid Waste Management and Resource Recovery Act of 1972, Government Code Section 2.66790(b). Generally, the California Integrated Waste Management Board learns of locations of disposal facilities through permit applications and from local enforcement agencies.

LUST
SRC#: 4231



VISTA conducts a database search to identify all sites within 1/2 mile of your property.
The agency release date for Region #3-Central Coast Region SLIC List was November, 1997.

This database is provided by the Regional Water Quality Control Board, Region #3. The agency may be contacted at: 805-542-4639.

LUST
SRC#: 4319

VISTA conducts a database search to identify all sites within 1/2 mile of your property.
The agency release date for Region #4-SLIC List was November, 1997.

This database is provided by the Regional Water Quality Control Board, Region #4. The agency may be contacted at: 916-266-7582.

LUST
SRC#: 4324

VISTA conducts a database search to identify all sites within 1/2 mile of your property. **The agency release date for Lust Information System (LUSTIS) was October, 1997.**

This database is provided by the California Environmental Protection Agency. The agency may be contacted at: 916-445-6532.

C) DATABASES SEARCHED TO 1/4 MILE

UST's
SRC#: 573

VISTA conducts a database search to identify all sites within 1/4 mile of your property. **The agency release date for Fullerton Underground Storage Tank List was June, 1992.**

This database is provided by the Fullerton Fire Department. The agency may be contacted at: ; Caution-Many states do not require registration of heating oil tanks, especially those used for residential purposes.

UST's
SRC#: 1612

VISTA conducts a database search to identify all sites within 1/4 mile of your property. **The agency release date for Underground Storage Tank Registrations Database was January, 1994.**

This database is provided by the State Water Resources Control Board, Office of Underground Storage Tanks. The agency may be contacted at: 916-227-4337; Caution-Many states do not require registration of heating oil tanks, especially those used for residential purposes.

UST's
SRC#: 3945

VISTA conducts a database search to identify all sites within 1/4 mile of your property. **The agency release date for Alameda County UST List was June, 1997.**

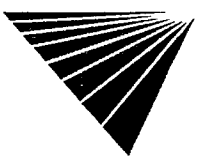
This database is provided by the Department of Environmental Health. The agency may be contacted at: 510-567-6713; Caution-Many states do not require registration of heating oil tanks, especially those used for residential purposes.

UST's
SRC#: 4415

VISTA conducts a database search to identify all sites within 1/4 mile of your property. **The agency release date for San Bernardino County UST List was December, 1997.**

This database is provided by the San Bernardino County Fire Department, Hazardous Materials Division. The agency may be contacted at: 909-387-3200; Caution-Many states do not require registration of heating oil tanks, especially those used for residential purposes.

UST's
SRC#: 4417



VISTA conducts a database search to identify all sites within 1/4 mile of your property. **The agency release date for Ventura County "BWT" (Business, Waste, Tanks) List was November, 1997.**

This database is provided by the Ventura County Environmental Health Division. The agency may be contacted at: 805-654-2813; Caution-Many states do not require registration of heating oil tanks, especially those used for residential purposes.

UST's
SRC#: 4418

VISTA conducts a database search to identify all sites within 1/4 mile of your property. **The agency release date for San Francisco Current Active UST List was December, 1997.**

This database is provided by the San Francisco Department of Health. The agency may be contacted at: 415-252-3900; Caution-Many states do not require registration of heating oil tanks, especially those used for residential purposes.

UST's
SRC#: 4419

VISTA conducts a database search to identify all sites within 1/4 mile of your property.
The agency release date for Sutter County UST Owner List was November, 1997.

This database is provided by the Sutter County Agricultural Department. The agency may be contacted at: 916-822-7504; Caution-Many states do not require registration of heating oil tanks, especially those used for residential purposes.

UST's
SRC#: 4431

VISTA conducts a database search to identify all sites within 1/4 mile of your property.
The agency release date for Riverside County UST List was January, 1998.

This database is provided by the Riverside County Environmental Health. The agency may be contacted at: 909-358-5055; Caution-Many states do not require registration of heating oil tanks, especially those used for residential purposes.

UST's
SRC#: 4434

VISTA conducts a database search to identify all sites within 1/4 mile of your property.
The agency release date for Kern County Sites and Tanks Listing was December, 1997.

This database is provided by the Kern County Environmental Health Department. The agency may be contacted at: 805-862-8700; Caution-Many states do not require registration of heating oil tanks, especially those used for residential purposes.

UST's
SRC#: 4441

VISTA conducts a database search to identify all sites within 1/4 mile of your property.
The agency release date for Los Angeles County UST "Street Number" Book was November, 1997.

This database is provided by the Los Angeles County Department of Public Words, Environmental Programs. The agency may be contacted at: 818-458-3514; Caution-Many states do not require registration of heating oil tanks, especially those used for residential purposes.

AST's
SRC#: 4320

VISTA conducts a database search to identify all sites within 1/4 mile of your property.
The agency release date for Aboveground Storage Tank Database was December, 1997.

This database is provided by the State Water Resources Control Board. The agency may be contacted at: 916-227-4364.

D) DATABASES SEARCHED TO 1/8 MILE

ERNS
SRC#: 4144

VISTA conducts a database search to identify all sites within 1/8 mile of your property.
The agency release date for was September, 1997.

The Emergency Response Notification System (ERNS) is a national database used to collect information on reported releases of oil and hazardous substances. The database contains information from spill reports made to federal authorities including the EPA, the US Coast Guard, the National Response Center and the Department of transportation. A search of the database records for the period October 1986 through September 1997 revealed information regarding reported spills of oil or hazardous substances in the stated area.

RCRA-LgGen
SRC#: 4244

VISTA conducts a database search to identify all sites within 1/8 mile of your property.
The agency release date for HWDMS/RCRIS was October, 1997.

The EPA's Resource Conservation and Recovery Act (RCRA) Program identifies and tracks hazardous waste from the point of generation to the point of disposal. The RCRA Facilities database is a compilation by the EPA of facilities which report generation, storage, transportation, treatment or disposal of hazardous waste. RCRA Large Generators are facilities which generate at least 1000 kg./month of non-acutely hazardous waste (or 1 kg./month of acutely hazardous waste).

RCRA-SmGen
SRC#: 4244

VISTA conducts a database search to identify all sites within 1/8 mile of your property.
The agency release date for HWDMS/RCRIS was October, 1997.

The EPA's Resource Conservation and Recovery Act (RCRA) Program identifies and tracks hazardous waste from the point of generation to the point of disposal. The RCRA Facilities database is a compilation by the EPA of facilities which report generation, storage, transportation, treatment or disposal of hazardous waste. RCRA Small and Very Small generators are facilities which generate less than 1000 kg./month of non-acutely hazardous waste.

Site Address: 537 Poindexter Avenue				
City: Moorpark	**State: CA 93021**			
QUESTION	**YES**	**NO**	**UNK**	**COMMENTS**
1. Is the *property* or any *adjoining property* used for an industrial use?		X		
2. To the best of your knowledge, has the *property*, or any *adjoining property* been used for an industrial use in the past?		X		
3. Is the *property* or any *adjoining property*, used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility?		X		
4. To the best of your knowledge has the *property*, or any *adjoining property* been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility?		X		
5. Are there currently, or to the best of your knowledge, have there been previously, any damaged or discarded automotive or industrial batteries, or pesticides, paints, or other chemicals in individual containers of greater than 5 gal (19 ℓ) in volume or 50 gal (190 ℓ) in the aggregate, stored on or used at the *property* or at the facility?		X		
6. Are there currently, or to the best of your knowledge, have there been previously, any industrial *drums* (typically 55 gal. (208 ℓ)) or sacks of chemicals located on the property or at the facility?		X		
7. Has *fill dirt* been brought onto the property that originated from a contaminated site or that is of an unknown origin?		X		
8. Are there currently, or to the best of your knowledge have there been previously, any *pits, ponds, or lagoons* located on the *property* in connection with waste treatment or waste disposal?		X		

(continued from page 1)

QUESTION	YES	NO	UNK	COMMENTS
9. Is there currently, or to the best of your knowledge, has there been previously, any stained soil on the *property*		X		
10. Are there currently, or to the best of your knowledge, have there been previously, any registered or unregistered storage tanks (above or underground) located on the *property?*	X			WEST OF GABBERT ROAD, TANKS FOR FUEL FOR FARMING TRACTORS (GONE SINCE ABOUT 1960)
11. Are there currently, or to the best of your knowledge, have there been previously, any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the *property* or adjacent to any structure located on the *property.*		X		
12. Are there currently, or to the best of your knowledge, have there been previously, any flooring, drains, or walls located within the facility that are stained by substances other than water or are emitting foul odors?		X		
13. If the *property* is served by a private well or non-public water system, have contaminants been identified in the well or system that exceed guidelines applicable to the water system or has the well been designated as contaminated by any government environmental/health agency?		X		
14. Does the *owner or occupant* of the *property* have any knowledge of *environmental liens* or governmental notification relating to past or recurrent violations of environmental laws with respect to the *property* or any facility located on the *property*		X		
15. Has the *owner or occupant* of the *property* been informed of the past or current existence of *hazardous substances or petroleum products* or environmental violations with respect to the *property* or any facility located on the *property*		X		

(continued from page 2)

QUESTION	YES	NO	UNK	COMMENTS
16. Does the *owner or occupant* of the *property* have any knowledge of any *environmental site assessment* of the *property or facility* that indicated the presence of *hazardous substances or petroleum products on,* or *contamination of,* the *property* or recommended further assessment of the *property*		✓		
17. Does the *owner or occupant* of the *property* know of any past, threatened, or pending lawsuits or administrative proceedings concerning a release or threatened release of any *hazardous substance or petroleum products* involving the *property* by any owner or occupant of the *property?*		X		
18. Does the *property* discharge waste water on or adjacent to the *property* other than storm water into a sanitary sewer system?		X		
19. To the best of your knowledge, have any *hazardous substances or petroleum products,* unidentified waste materials, tires, automotive or industrial batteries or any other waste materials been dumped above grade, buried and/or burned on the *property?*		X		
20. Is there a transformer, capacitor, or any hydraulic equipment for which there are any records indicating the presence of PCBs?		X		

UNK = Unknown
Table is based on ASTM Standard E 1528-93.

2000 Addendum to Phase I Environmental Site Assessment

GRADIENT
ENGINEERS INC.
Construction, Engineering ?0
Environmental Services

February 14, 2000

Project No. 983034-002
983034-003

To: Impact Sciences, Inc.
30343 Canwood Avenue, Suite 210
Agoura Hills, California 91301

Attention: Mark Austin

Subject: Addendum to Phase I Environmental Site Assessment, Hitch Ranch, Moorpark Specific Plan No. 1, Moorpark, California 93021.

Introduction

February 1998 Impact Sciences, Inc. retained Gradient Engineers, Inc. (Gradient) to provide a Phase I Environmental Site Assessment (ESA) for the subject property (Gradient, 1998).

August 5, 1999, Impact Sciences received a memorandum from John Libiez, City of Moorpark Community Development Department, listing "special concerns we need to address:"

I. 0 Map undergroundfitel tank location. Determine impacts to development site.
2. 0 Investigate, verify, map and quantify the suspected illegal/abandoned solid waste disposal site. Map extent, verifyfills, determine ifhazardous materials were dumped there, assess impacts, and recommend mitigation.
3. 0 lyfap the water wells and determine mitigationfor them.

Impact Sciences authorized Gradient, November 16, 1999, to address the above "special concerns."

1.0 UNDERGROUND FUEL TANK LOCATION AND IMPACTS

The Underground Storage Tank (UST) of concern was identified as Prudential Overall Supply (POS) at 5300 Gabbert Road. The POS site was identified previously in Gradient's ESA (Gradient 1998) as part of the Vista Site Assessment Report (Report ID 998300-012, dated March 9, 1998). The Vista Report listed the site (Map ID 4B) as having one registered 10,000 gallon UST. As of the date of the Vista Report, March 9, 1998, the POS site was not reported as having had a release.

17781 Cowan, Suite 140, Irvine, CA 92614
Lie.# A734297
(949) 477-0555
FAX (949) 250-1114
e-mail: gradient@gradient.com

The Ventura County Environmental Health Division (VCEHD), Underground Tank Closed Sites List, dated August 26, 1999, lists the POS site as closed. A copy of the VCEHD Underground Tank Closed Sites List is included as Attachment 1. The Vista Report map showing the location of the POS site is included as Figure 2.

2.0 INVESTIGATE IMPACT OF WALNUT CANYON TRACT LANDFILL

November 16, 1999, Mark Austin, Impact Sciences, and Michael S. Catton, Gradient, traveled to the County of Ventura, Environmental Health Department (VCEHD), to review department files on the Walnut Canyon Tract Landfill. A copy of the VCEHD file is included as Attachment 2. The file indicated that:

> *Since the LEA (VCEHD) does not have regulatory authority for cleanup or for soil from contaminated sites, we are referring this case to the California Department of Health Services.*

December 1, 1999, Gradient interviewed Barry Marczuk (BM), VCEHD. BM stated that the county gave closure only in regards to non-hazardous solid waste. BM stated that the area of concern was not extensive and was located right next to the highway (State Highway 23). BM stated that he personally witnessed the cleanup of non-hazardous solid waste and that the site was cleaned up satisfactorily.

December 1, 1999, Gradient Contacted the California Department of Toxic Substances Contr l\DTSC), formerly the California Department of Health Services Toxic Substances Control Program, regarding the Walnut Canyon Tract Landfill. December 6, 1999, Glen Castillo, Office Technician Public Records Office DTSC, informed Gradient that "After a thorough review of our files, we have found that we have records pertaining to some of the sites/facilities referenced in your request. Those records are being reviewed by staff for confidential status. Upon completion of the review, you will be contacted to set an appointment for review at our office."

December 10, 1999, Gradient reviewed DTSC's file regarding the Walnut Canyon Tract Landfill. A copy of portions of the DTSC file is included as Attachment 3. Reports in the file reviewed included the following:

- Harding Lawson Associates, 1990, Closure Report, Walnut Canyon Tract, Moorpark California, dated October 19, 1990.
- Department of Health Services Toxic Substances Control Program, 1991, Preliminary Endangerment Assessment Report Review for Walnut Canyon Tract, Moorpark, California, dated May 31, 1991.
- Harding Lawson Associates, 1991, Preliminary Endangerment Assessment Closure Report, Walnut Canyon Tract Site, Moorpark California, dated July 15, 1991.
- Harding Lawson Associates, 1991, PEA Closure Report Addendum PEA Screening Calculations, Walnut Canyon Tract, Moorpark California, dated July 24, 1991.
- Department of Toxic Substances Control, 1991, Preliminary Enqangerment Assessment Report - Walnut Canyon Tract, Moorpark, California, dated August 14, 1991.

DTSC reviewed the Closure and Preliminary Endangerment Assessment (PEA) Reports, as submitted by Harding Lawson and Associates, and issued the following:

The Department of Toxic Substances Control (Department) has completed the review of the Preliminary Endangerment Assessment (PEA) Report of the site Walnut Canyon Tract, Moorpark, California.

Based on the information provided, the site shows no evidence of contamination that may pose a threat to human health and the environment. Therefore, the Department concurs with your recommendation that No Further Action is appropriate at the subject site.

Based on the review of the VCEHD and DTSC files it is Gradients opinion that the Walnut Canyon Tract Landfill poses no environmental concern at this time.

3.0 SITE WATER WELLS

November 16, 1999, Gradient contacted Glen Luscombe (GL), County of Ventura Water Resources (VCWR) about the status of water wells on the subject site. GL stated that there are many wells on the site and that he would make the records available for review but would not issue conditions for well destruction at that time. December 1, 1999, a Gradient representative reviewed the VCWR records. February 14, 2000, a Gradient Representative revisited VCWR to obtain minimum abandonment requirements for the wells listed below:

Water Well ID	Total Depth	Current Status	Mitigation
5A-1	1450	Abandoned 7/10/50	None
5B-1	764	Unknown	See 3.1
5B-2	743	Abandoned 10/3/50	None
5B-3	Unknown	Unknown	See 3.1
SC-2	Unknown	Unknown	See 3.1
5E-1	506	Unknown	See 3.1
5E-2	Unknown	Unknown	See 3.1
5E-3	365	Abandoned 5/6/65	None
5F-1	Unknown	Unknown	See 3.1
5F-2	647	Unknown	See 3.1
5F-3	253	Unknown	See 3.1
50-1	Unknown	Unknown	See 3.1
5J-3	500	Unknown	See 3.1
5K-1	Unknown	Unknown	See 3.1
5K-2	250	Unknown	See 3.1

VCWR did not have records for wells 5B-3, 5C-2, 5E-2, 5F-1, 50-1, and 5K-1, however, VCWR did issue minimum conditions for well destruction (See Section 3.1). The VCWR map showing the location of the above water wells is included as Figure 3.

3.1 Water Well Mitigation

Glen Luscombe, VCWR, issued the following minimum conditions for well destruction:

1. Pump and motor shall be removed, and the interior of the well shall be filled with inert material (clean sand or gravel) from total depth to within 40 feet of ground surface or remove debris in well casing to a depth of 40 feet.

2. Well casing shall be perforated at least every foot opposite the sealing zone from a depth of 40 feet to within 10 feet of finish grade. Perforations shall be placed on alternating sides of the casing.

3. Neat cement sealing material shall be applied from a depth of 40 feet to within 5 feet of finish grade by means of a grout pipe placed within 2 feet of the base of the sealing zone. If static water level is deeper than 40 feet, grout pipe is not necessary.

4. Casing shall be removed to a depth of 5 feet below finish grade, and work area backfilled with native materials.

5. County of Ventura Public Works Inspector shall be present during casing perforation work and placement of all sealing material. 24 hour advance notice is required for Public Works Inspections.

6. All work shall be performed by a well contractor licensed in the State of California and registered with the County of Ventura.

we appreciate this opportunity to continue to serve your environmental needs. If you have any questions, please contact me at your convenience.

Respectfully submitted,

WALNUT CANYON TRACT, MOORPARK SITE CHARACTERIZATION AND REMEDIAL ACTION PLAN

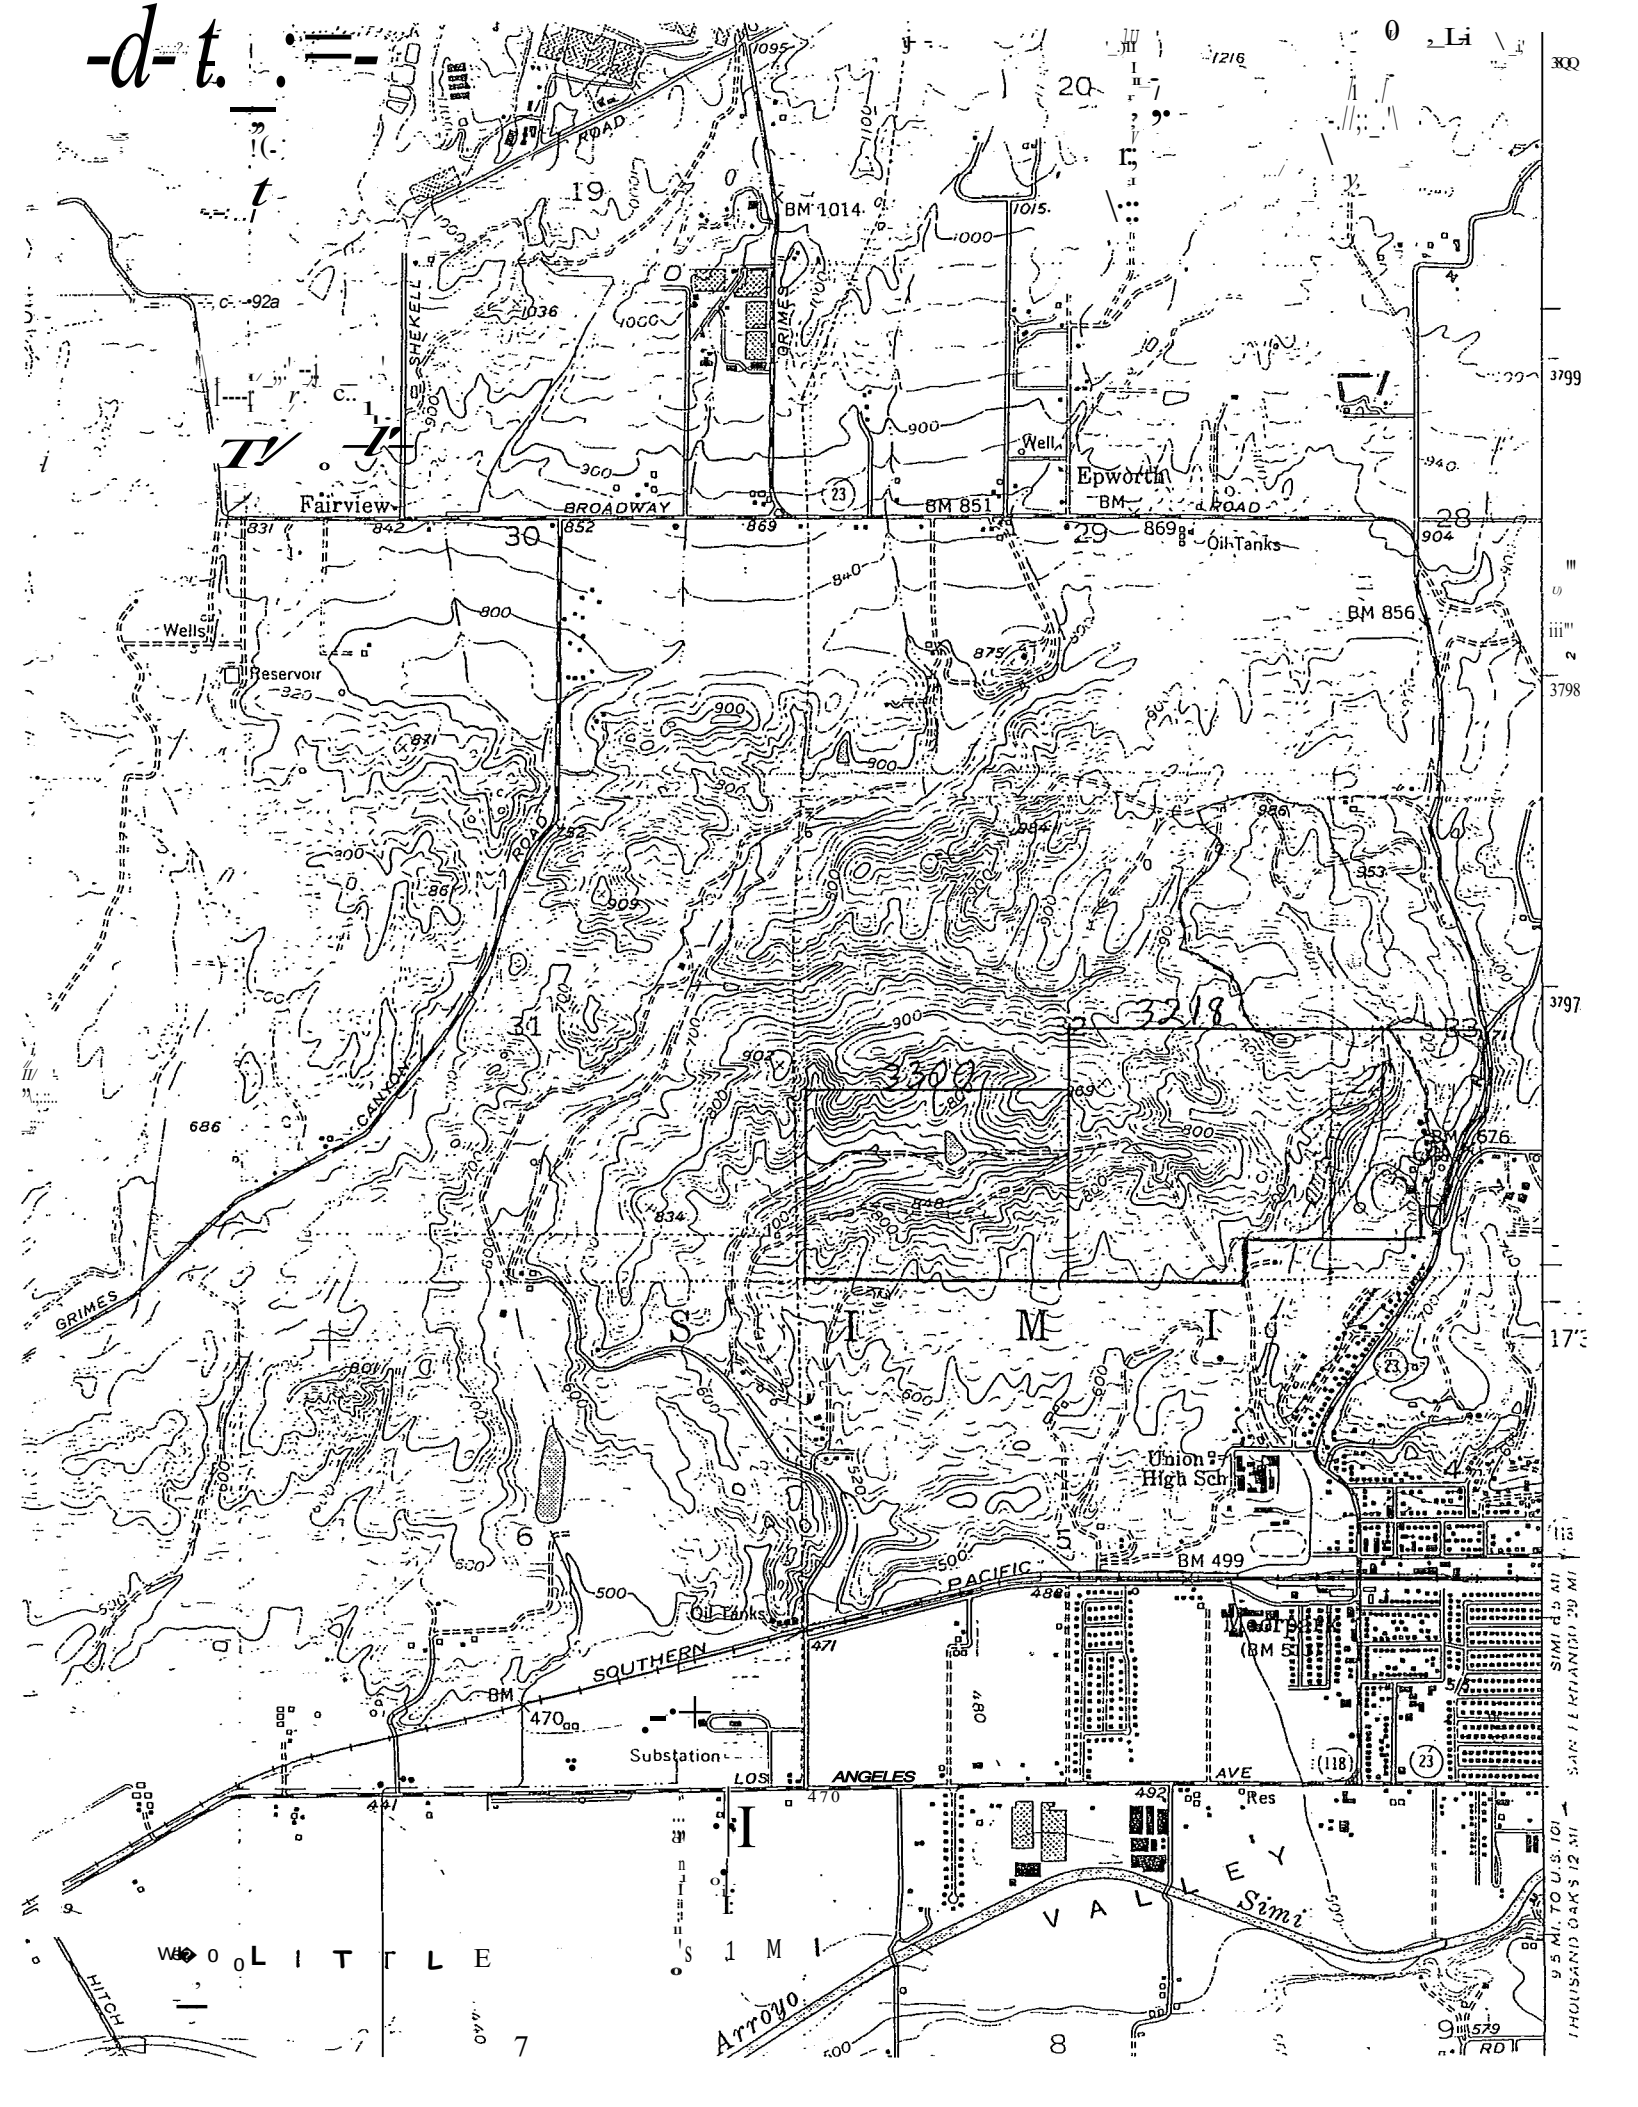
This Division, as the Local Enforcement Agency (LEA), cannot approve Section 4.2 of the Remedial Action Plan dated January 25, 1990, as it applies to the bioremediation of contaminated soil.

Approval is granted for the disposal options of nonhazardous solid waste, as delineated in Sections 4.1 and 4.2 of the Remedial Action Plan.

Since the LEA does not have regulatory authority for cleanup or for soil from contaminated sites, we are referring this case to the California DeparJment of Health Services. Their address is:

Department of Health Services
Toxic Substances Control Division (Region 3)
Site Mitigation Unit
1405 N. San Fernando Blvd., Suite 300
Burbank, CA 91504
(818) 567-3000

The LEA will work closely with you for the remediation of nonhazardous solid waste.



If you have any questions, you may call Barry Marczuk at 654-2859.

County of Ventura
Environmental Health Department -
Solid Waste Division
Ventura, California 93003

Attention: Mr. Barry Marczek

Gentlemen:

Attached for your review are the analytical results for the four soil samples collected on February 16, 1990 at the Walnut Canyon site in Moorpark, California. Samples were collected from areas containing the most visibly contaminated soils at the northern (S-23, S-24) and southern (S-25, S-26) concrete pads located in the former vehicle maintenance[1] area on the property. Our client is currently considering clean-up alternatives for the site. We will notify you of the planned remediation upon selection of the most viable alternative.

If you have any questions, please call.

Very truly yours,

HARDING LAWSON ASSOCIATES

Attention: Mr. Terry Gilday

Gentlemen:

Site Characterization
and Remedial Action Plan
Walnut Canyon Tract
Moorpark, California

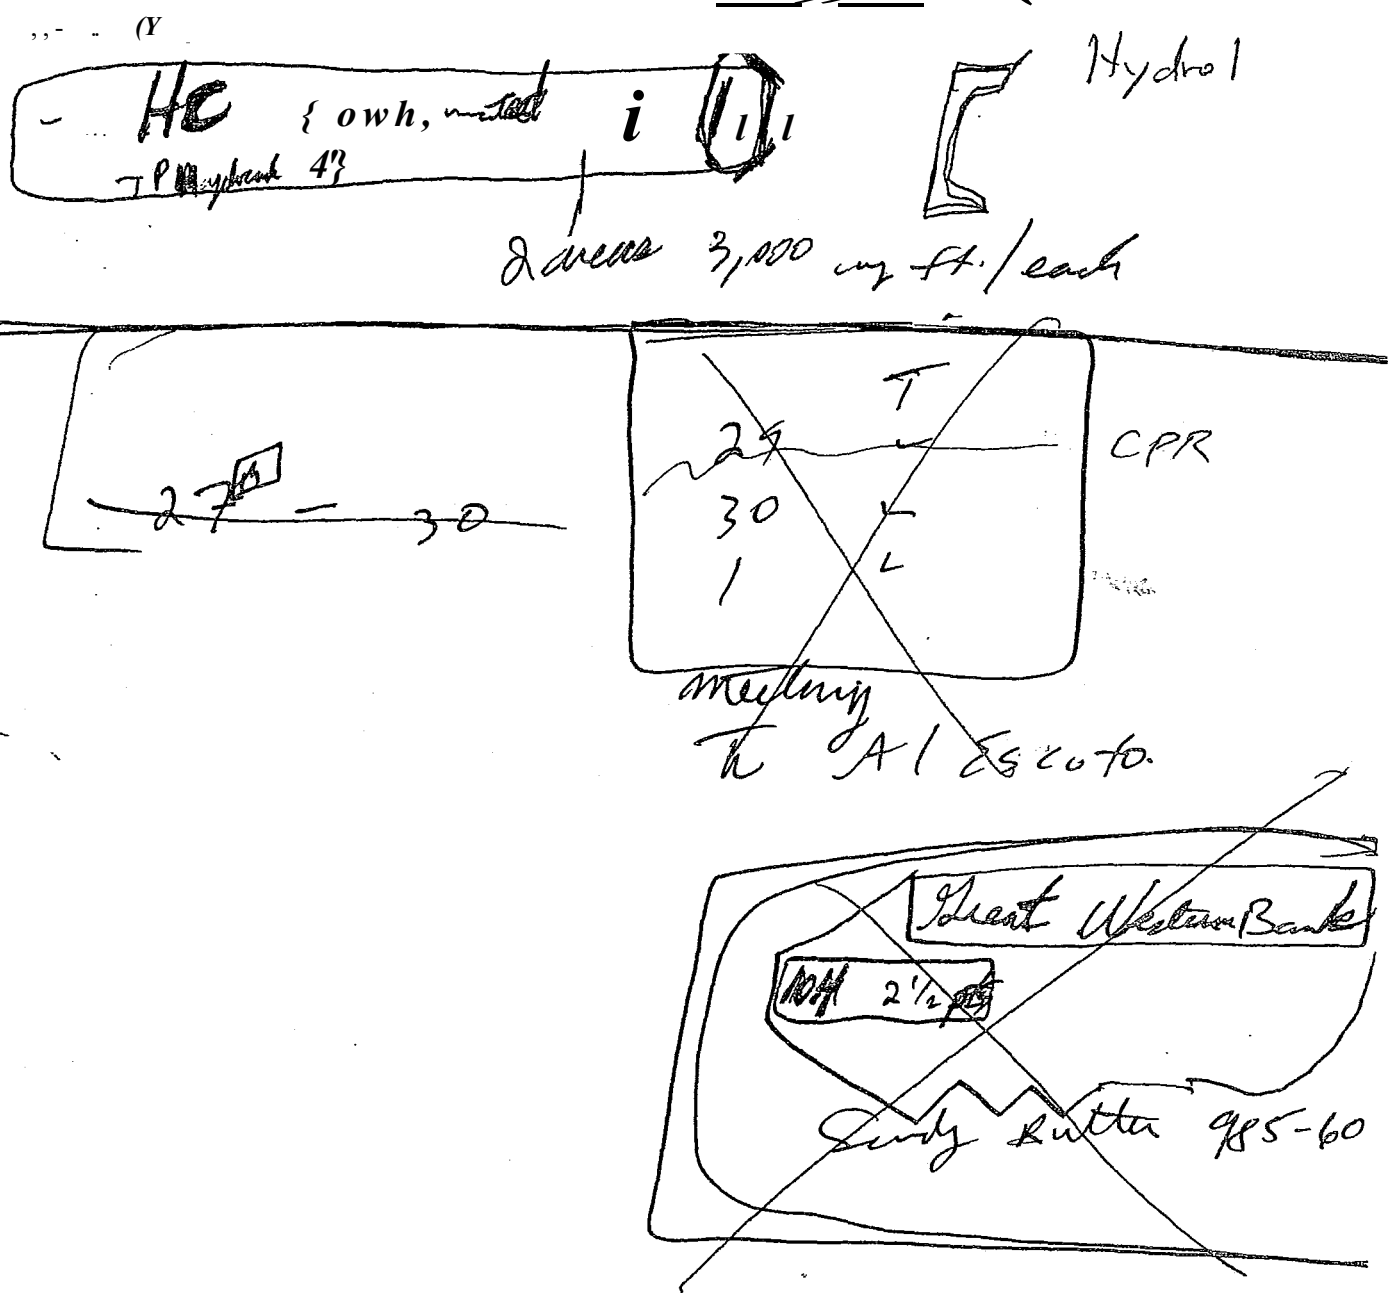
Enclosed are 3 copies of the Site Characterization and Remedial Action Plan for the Walnut Canyon Tract located approximately one-half mile north of Moorpark, California. This report has been prepared by Harding Lawson Associates (HLA) on behalf of Walnut Canyon Associates in order to obtain a land reclamation/closure permit for the property. The attached report presents a summary of HLA's site characterization activities and the remedial action plan developed from the subsequent findings.

Land clearing is currently in progress to remove, segregate and dispose of debris located in one of the two canyons onsite. In the other canyon, a proposed remediation program has been developed for the excavation and bioremediation of approximately 300 cubic yards of hydrocarbon contaminated soils. Miscellaneous debris, vehicles, oil containers, and drums are also scheduled for removal and disposal. Following completion of the site remediation, an assessment will be performed to confirm completion of the remediation activities. A closure report will be issued documenting the remediation activities, volumes and types of debris removed, method(s) of treatment and/or disposal, and associated analytical results.

The property is currently in escrow. The transfer cannot be completed until remediation is complete. Your timely response would be greatly appreciated in order to expedite the remediation program and complete the transfer of the property.

We trust that this document provides sufficient information concerning the remediation activities proposed to issue land remediation/closure permits for this property. If you have any questions, please call.

Very truly yours,



HARDING LAWSON ASSOCIATES

EXECUTIVE SUMMARY

Harding Lawson Associates (HLA) conducted a Site Characterization Investigation and prepared a Remedial Action Plan (RAP) on behalf of Walnut Canyon Associates, owners of a 350-acre parcel located approximately one-half mile north of Moorpark, California. The investigation was conducted to evaluate the types, character, and extent of waste materials; research locations, and abandonment techniques of the on-site water and oil wells; and to formulate a RAP based on the above findings.

The site characterization plan was based on a review of readily available aerial photographs, review of pertinent reports, discussions with selected individuals, a review of governmental agency records, a site reconnaissance, limited subsurface exploration, and limltecFsoil and construction debris sampling and analyses. This information has been used to develop the RAP.

The Canyon 1 and Canyon 2 areas have been subject to unauthorized dumping activities for at least 10 years. The deeply incised Canyon 1 area has been found to contain an estimated 1,200 to 2,000 cubic yards of debris which primarily consists of landscape debris and demolition debris (lumber, plasterboard, and piping) with lesser amounts of broken concrete and asphaltic concrete, automobile parts, tires, and household-type rubbish. This material is currently being excavated for transport and disposal at a Class III municipal landfill.

A limited amount of asbestos containing materials (ACM) were identified in the Canyon 1 area. The ACM was detected in transite piping. Because of the non-friable condition of the piping and the limited amount on-site (approximately 25 to.50 pounds), it is our opinion that the ACM does not present a significant obstacle to the proposed development. However, the ACM will require careful and specialized handling and disposal procedures.

The Canyon 2 area contains a limited amount of landscape and demolition debris reportedly from the destruction of several buildings that previously existed in the area. More recently, however, a portion of the area was apparently used for vehicle and truck maintenance. Several 55-gallon motor oil drums and 5-gallon freon cans, some empty and some partially full, as well as several 5-gallon buckets of spent motor oil were located in the maintenance area. An area of approximately 2,700 square feet of hydrocarbon-stained soil has also been delineated at the surface. Laboratory analysis of soil samples obtained from the backhoe trenches detected total petroleum hydrocarbons (TPH), and lesser concentrations of various solvents including methylethylketone (MEK), methyl isobutyl ketone (MIBK), and trichloroethane (TCA). The laboratory data and field evidence suggest that the majority of the hydrocarbon contaminated soils are limited to within 1 foot of the surface, lesser contamination was detected in samples at a depth of 1.5 and 3 feet. Samples at a depth of 5 feet contained nondectable concentrations of TPH. Based on the field and lab.ci'fdtor1 data, the estimated depth of contaminants range from approximately 1 to 3 feet based on observations of several test pits excavated in the area. An approximate volume of 300 cubic yards of hydrocarbon contaminated soil is estimated for remediation purposes! A program has been developed for the removal of the debris, oil and freon containers, and remediation of hydrocarbon contaminated soils.

Six abandoned water wells and one abandoned oii exploration test hole are located on the site. The six water wells have been located. Attempts to locate and expose the abandoned oil exploration test hole as required by California Department of Oil and Gas (DOG) regulations have been unsuccessful to date. Documents obtained from the DOG indicate that the well was abandoned as approved by the DOG in June 1960. Destruction of the water wells and confirmation of the proper abandonment of the oil exploration test well, is beyond the scope of the remediation plan. It *is* anticipated that these will be completed at a later time as part of the building permit process.

1.0 INTRODUCTION

1.1 PROJECT DESCRIPTION

Harding Lawson Associates (HLA) has conducted a site characterization investigation and prepared a Remedial Action Plan (RAP) on behalf of Walnut Canyon Associates, the owners of a 350-acre parcel located one-half mile north of Moorpark, California (Plate 1). HLA's services were authorized by Mr. Richard Fausset of Walnut Canyon Associates on September 26, 1989. As discussed during our telephone conversations with Mr. Barry Marczuk of the County of Ventura Environmental Health Department (VERD), we have prepared this preliminary report documenting the findings of our site characterization and presenting a RAP for review by VERD.

This preliminary report provides a brief description of the project background, site reconnaissance findings, subsurface exploration, and laboratory analytical results. This information has been used *to* develop the RAP for the remediation of the Walnut Canyon Tract. After remediation of the site, HLA will prepare a final report documenting remediation for the entire project.

1.2 BACKGROUND

The Walnut Canyon Tract is located just north of Moorpark within Sections 32 and 33 of Township 3 North, Range 19 West, San Bernadina Baseline and is bounded on the east by Walnut Canyon Road (Plate 1). The 350-acre parcel of property consists of hilly terrain with two north-south trending canyons representing the major topographical features. The larger of the two canyons, designated herein as Canyon 1, is located in the central area of the parcel; Canyon 2 is located along the eastern boundary of the property. A siltation basin is located

in Canyon 1 near the southern property boundary. Canyon 1 also contains an intermittent stream with an earthen dam. However, no evidence of flowing or standing water was observed on the site during the site reconnaissance.

The property remains undeveloped and is covered by chaparral and natural grasses. Vegetation in the canyon bottoms is dominated by scrub willow. Pepper trees and eucalyptus trees have been planted along Walnut Canyon and the southern property boundary.

The Canyon 1 and Canyon 2 areas have been the site of unauthorized rubbish and debris disposal since at least 1978. The Canyon 1 area is an incised canyon area in which primarily landscape and demolition debris have been discarded along with lesser amounts .of rubbish, tires, abandoned vehicles, and appliances. The Canyon 2 area is the site of discarded rubbish, demolition and landscape debris, and an abandoned vehicle maintenance area.

1.3 SCOPE OF WORK

The objective of HI.A's services was to evaluate the site conditions and subsequently develop a RAP for the affected areas. Four phases of activities were identified to accomplish this objective. The activities for each of the phases are described in the following sections:

1.3.1 Phase 1

Phase 1 included the characterization of the site to evaluate the types, character, and extent of waste materials, and to research the locations and abandonment techniques of the water and oil wells. Activities included:

- Performing a background search of available geologic, and ground-water information,
- Collecting available information to locate one abandoned oil well and several unused water wells reported to be onsite,
- Performing a detailed site reconnaissance to estimate the extent, volume, and character of wastes at each of the two areas,
- Performing limited subsurface exploration to further evaluate character and volume of wastes in both areas and to obtain soil samples for chemical analysis in the Canyon 2 area,
- Collecting representative samples of potential asbestos containing material (ACM) and analyzing for asbestos content, and
- Preparing a report documenting our findings.

A review of site history which typically consists of historical aerial photograph review, review of public agency files, and discussions with persons knowledgeable of the site, was previously conducted by another consultant. This information was reviewed and used to develop the scope of work for the project.

1.3.2 Phase 2

Phase 2 included development of a RAP based on the information collected during the Phase 1 Site Characterization. The RAP, presented in Section 4.0 herein, provides a description of the site remediation techniques and is presented to appropriate regulatory agencies for their approval.

1.3.3 Phases 3 and 4

Phase 3 consists of site remediation and monitoring, while Phase 4 consists of the confirmation assessment to properly document site remediation. Waste removals will be observed and wastes classified for proper disposal/treatment alternatives. The confirmation site assessment will consist of collecting and analyzing representative soil samples exposed in the bottom of the excavations to check for the presence of hazardous/toxic materials at the sampling locations. Phase 3 and 4 activities and results will be documented in a formal report for submittal to regulatory agencies.

2.0 INVESTIGATION

HLA's investigation began August 18, 1989, and was directed towards evaluating site conditions and developing a RAP. The following sections describe the site characterization program.

2.1 REVIEW OF EXISTING DATA

The following County and State agencies were contacted for background information regarding the site:

- California Department of Conservation, Division of Oil and Gas (DOG) Ventura Branch Office - information regarding an abandoned oil exploration test hole well located on the property and proper well abandonment requirements;
- Ventura County Public Works Department, Flood Control and Water Resource Division (VCFCD) - information regarding on-site water wells and ground water information for the area,
- The California Department of Water Resources (DWR) - supplemental information on the existence and location of the six on-site water wells and regional ground water information,
- Ventura County Public Works Agency - review of black and white aerial photographs dated 1962 and 1945,
- U.S. Geological Survey (USGS) - topographic map.

Background geologic information was obtained through review of published and consultant reports. Additional background information collected by a prior consultant was acquired from Walnut Canyon Associates. A list of references is attached.

2.2 FIELD EXPLORATION

HLA conducted a site reconnaissance, a well location survey, and subsurface exploration between October 11 and 17, 1989. Additional soil samples were collected and analyzed on December 20, 1989. Activities for each area are described below.

2.2.1 Canyon 1 Area

The field investigation of the Canyon 1 area included the following activities:

- Conducting a site reconnaissance,
- Mapping the estimated extent of debris on a base map at a scale of inch equals 100 feet,
- Excavating nine backhoe trenches and performing an electromagnetic geophysical (EM-31) survey to estimate the extent of the partially buried concrete and metallic debris at the north end of the main canyon,
- Estimating the volumes of various types of debris within and adjacent to the canyon, and
- Collecting eight samples of potential ACM and submitting five for analysis of asbestos content.

Nine backhoe trenches were excavated at the locations shown on Plate 2 to evaluate the extent of partially buried wastes along the western fringe of the northern end of the canyon. The trenches were excavated to depths of 3 to 4 feet below ground surface and were logged by an HLA geologist. The materials encountered are summarized in the trench logs presented in Appendix C.

The electromagnetic geophysical survey was performed along the flat area near the northwest end of the canyon to investigate the presence of either the steel well casing, cellar or drilling mud sumps which may be associated with oil exploration test well. A description of the geophysical program is included in the Appendix A

Four samples of potential ACM were selected for asbestos analysis from the Canyon 1 area. The materials collected included plasterboard containing fibrous material (ASB-2), roofing paper (ASB-3), nonfibrous plasterboard and insulation material (ASB-4), and transite piping (ASB-7). Sample ASB-1 was obtained from the Walnut Canyon area; samples ASB-5, ASB-6, and ASB-8 consisted of plasterboard samples similar to samples ASB-2 and ASB-4 and were not submitted for analysis. The samples submitted for testing were judged to be representative of the varying types of exposed on-site materials suspected of containing asbest?s. Samples were collected under the guidance of an engineer and industrial hygienist trained 'irf asbestos management. Samples were placed in polyethylene bags which were sealed, labeled, and transported to a State-certified laboratory under chain-of-custody protocol for analyses. The asbestos test results are presented in Appendfa: B.

2.2.2 Canvon 2 Area

The field investigation of the Canyon 2 area included the following activities:

- Conducting a site reconnaissance,
- Mapping the estimated extent and location of debris on a base map at a scale of 1 inch equals 100 feet,
- Collecting soil samples from backhoe trenches for analysis of hydrocarbons in an area previously used for vehicle maintenance,
- Collecting a sample of suspected ACM and analyzing for asbestos, and
- Estimating the volumes of various types of debris, within and adjacent to the area.

Subsurface exploration in the Canyon 2 area included the initial collection and analysis of 10 soil samples from 8 backhoe-excavated trenches ranging from 3 to 5 feet in depth. Trenches were logged for general information including soil type and evidence of hydrocarbons. A second field program was performed to collect and analyze an additional 13 soil samples at 16 trench locations. The second sampling program was conducted to evaluate the extent of hydrocarbons in soils in a vehicle maintenance area. The trenches were backfilled with the excavated material if it appeared free of hydrocarbon staining. Otherwise, they were backfilled with clean native material and the excavated material was stockpiled on plastic sheeting on a concrete pad in the area. Trench locations are shown on Plate 3 and trench logs, including a catalog of soil samples collected for chemical analyses, are presented in Appendix C.

The soil samples were collected in 100 milliliter glass jars. The samples were scanned for the presence of volatile organic vapors with a photoionization detector (PID). The containers were capped with aluminum foil-lined caps, and sealed with electrical tape. Samples were stored in an ice-chilled cooler for transport to a State-certified analytical laboratory under chain-of-custody protocol. The laboratory analytical program is described in Section 2.3.

A single sample (ASB-1) of suspected ACM (fiberglass cloth) was selected for asbestos analysis (Plate 2). The sample was collected under the guidance of an engineer trained in asbestos management using the sample procedures detailed in Section 2.2.1. The samples were transported to a State-certified laboratory under chain-of-custody protocol.

2.2.3 Abandoned Oil Exploration Test Hole

Available information regarding the abandoned oil exploration test hole was acquired from the DOG (Appendix D). The location coordinates provided on the DOG well log were surveyed by a licensed surveyor in an attempt to locate the drill site. The location coordinates

correspond to a point on the hillside west of the main valley. The reported location coordinates are not considered valid because of physical constraints imposed by the topography of the location.

The available information, including the DOG well site map and the reported wellhead elevation, indicates that the drill site was located approximately as shown on Plate 2; however, no surface expression of the test hole has been found. The area around the location noted has been leveled and a road graded to provide access from the south (Plate 2). Further attempts to locate the actual survey plat or contact knowledgeable sources at the drilling company were unsuccessful.

An electromagnetic (EM-31) geophysical survey was performed in the leveled a<q µear the location shown on Plate 2 in an attempt to locate the metal casing or evidence of a drilling mud sump. The geophysical methods, which are described in Appendix A, were inconclusive apparently as a result of interference from buried debris in the Canyon 1 area. A magnetometer sur,ey was also performed but was unsuccessful due to interference from the buried metallic debris in the area and from solar activity as explained in Appendix A As previously noted, additional attempts to locate the abandoned oil exploration test hole are not within the scope of this investigation.

2.2.4 Water Wells

The DWR and VCFCD were contacted to obtain information regarding water wells located on the property. Six wells and a dry hole (which was not completed as a well) were found to be located on the property (Plate 2). Information acquired included locations, well lgs for all but one of the wells, and water quality data for seve°ral of the wells. The available information is compiled in Appendfa: E.

After review of the information obtained from the DWR and VCFCD, the well locations were verified in the field. The area was also reconnoitered to locate unreported wells. Each well was observed anq sounded to evaluate whether pumps were still in place and to check the open depth of the well. All but one well was plugged (3N/19W-33Ml) near the surface. The one open well was sounded and found to be open to a depth of 72 feet and dry.

2.3 LABORATORY TESTING

2.3.1 Soils

Ten soil samples collected on October 17, 1989 from the Canyon 2 area were submitted for analysis of total petroleum hydrocarbons (TPH) using EPA Test Method 418.1. .The sample estimated to contain the highest level of contamination, based on physical evidence, was selected from each of the three areas for analysis of volatile organic compounds (VOCs) using EPA Test Method 8240. Samples were transported to CRL-Enseco Analytical Laboratories in Ventura, California for analysis.

Based on the results of the initial analytical results, additional soil samples were collected at the former vehicle maintenance area iri Canyon 2 to further evaluate the horizontal and vertical extent of hydrocarbons in soils and the nature of the contamination. Thirteen soil samples were submitted for analysis of TPH; 2 samples were submitted for analysis of California Code of Regulations Title 26 metals; and 3 samples were submitted for analysis of VOCs. These samples were submitted to Del Mar Analytical in Irvine, California for analysis.

Laboratory analytical results are summarized in Table 1. The laboratory reports and chain-of-custody forms are presented in Appendix B-1.

2.3.2 Asbestos Testing Program

The samples of suspect ACM were transported to Applied Petrography, Inc. of Santa Fe Springs, California. Samples were analyzed using PLM with dispersion staining in accordance with the EPA "Interim Method of the Determination of Asbestos in Bulk Insulation Samples" (40 CFR 763). The laboratory test reports and chain-of-custody documents are presented in Appendix B-2.

3.0 SITE CONDITIONS

3.1 SITE HISTORY

Available background information indicates that the site has primarily been used for livestock (cattle and horses) grazing from at least 1945 to the present. Orchards were noted in 1945 aerial photographs in the valleys and along hillsides throughout most of the property. Conversations with Mr. Peters, adjacent property owner, confirmed the presence of the "apricot" orchards in the area. Mr. Peters stated that the orchards were abandoned over 20 years ago. This claim is substantiated by the absence of the orchards in the 1962 aerial photographs. Mr. Peters also stated that the valley and hillsides west of Canyon 1 were graded for planting rye for horse feed; however, this crop was unsuccessful. He·,r'rHt?rts that dumping in the Canyon 1 area has been occurring for over 20 years, evidence of dumping was not apparent in the 1962 aerial photographs.

Two rectangular buildings and one large circular aboveground tank (believed to be a water tank) in the Canyon 2 area were observed in the 1945 aerial photographs. These structures were located on the southeast fringe of the property. The western-most building appears to be a house and the other a barn. The structures do not appear in the 1962 aerial and are not present today. Concrete slabs and debris are· the only remaining evidence of their existence.

Presently most of the site remains in its natural state. Exceptions are the Canyon 1 area in which unauthorized dumping has reportedly occurred for 10 to 20 years. The debris includes landscape and demolition debris with lesser amounts of household-type paper and plastic rubbish. The results of a detailed reconnaissance are described in Section 3.3.1.

A portion of the Canyon 2 area has more recently been used for vehicle maintenance, limited dumping of debris, and storage of miscellaneous items including tractor trailers, water trucks, a boat and boat mold, and tractor implements. Associated with the maintenance activities is

the presence of numerous 5-gallon and 55-gallon motor oil drums, aboveground transmission fluid storage tanks, freon cans, and other miscellaneous containers. A 4-inch-diameter steel pipe, believed to be an abandoned water line, also runs through the area. A limited area of hydrocarbon contaminated soils has also been observed in the area. The contents of the area are described in Section 3.3.2.

Six water wells and a dry water well boring, which was never completed as a well, are located in the Canyon 2 area as shown on Plate 2. In addition, two wells are reported just south of the property line in Canyon 2 and two other wells are located south of the property along the southern extension of Canyon 1 (Plate 2). An abandoned oil exploration test hole, drilled in June 1960 by the Petan Company is located approximately in the area indicated on Plate 2. Documents obtained from the DOG indicate that the well was drilled to 4,200 feet but did not encounter productive zones. The well was subsequently abandoned according to specifications of the DOG, who authorized the abandonment in a document dated June 16, 1960 (Appendix D). Attempts by HLA to contact knowledgeable parties at the Petan Company found that they no longer had any records of the oil exploration operations and that portion of their business was sold several years ago.

3.2 GEOLOGIC AND GROUND-WATER CONDITIONS

3.2.1 Site Geology

The site lies within the eastern portion of the Ventura Basin within the Western Transverse Ranges geomorphic province of southern California (Dibblee, 1982). The property is underlain by older alluvium (Qoal) consisting of yellow-brown to dark brown sand with varying percentages of clay and silt (Gorian, 1978). Cobble-sized gravels are also present over most of the ground surface. The site lies on the southeast side of the Moorpark anticline which is inferred from oil well log data (CDMG, 1973). The older alluvium is, however, mostly structureless and massive with no distinct bedding orientation (Gorian, 1978).

3.2.2 Ground-Water Occurrence

Ground-water information for the Canyon 1 and Canyon 2 areas was obtained from DWR and VCFCD files. According to the drillers' logs, ground water was typically encountered at 95 to 140 feet below ground surface in the Canyon 2 area at the time of drilling (1946 to 1949). Similarly, water levels at the south end of Canyon 1 were reported at approximately 110 feet when the wells were installed in December 1949. The open well (3N/19W-33M1) was sounded to a total depth of 75 feet and found to be dry. The offsite wells were not sounded.

3.3 INVENTORY OF ON-SITE MATERIALS

3.3.1 Canyon 1 Area

The estimated extent of debris within the Canyon 1 area is shown on Plate 2. The site characterization activities indicate that the majority of debris consists of landscape debris (wood chippings, tree cuttings, and tree stumps). In addition to the landscape debris, a large volume of demolition debris is located in the canyon. This includes old lumber, plasterboard, asphalt and concrete, roofing paper, PVC and metal piping, and wire. Lesser amounts of rubbish, appliances, furniture, and automobile bodies, parts, and tires are also scattered throughout the canyon. Based upon our visual observations, approximate estimates of the volumes of various types of debris are presented in Table 2. These volumes represent estimated bulk volumes to be stockpiled for processing and/or disposal off site. Equivalent tonnage is estimated at 1 ton per cubic yard average.

A small area of partially buried construction debris has been identified at the northern end of the canyon (Plate 2). This area appears to primarily contain broken concrete debris with minor amounts of asphaltic concrete, plasterboard, metal piping, and plastic debris. Along the

western edge of this area, the materials were found to extend to a depth of approximately 2 to 4 feet. The total depth within the central portion of the area was found to range from approximately 5 to 15 feet during excavation.

3.3.2 Canvon 2 Area

The site characterization activities indicate the debris in the Canyon 2 area includes an abandoned boat, abandon motor vehicles, containers of various types and sizes, corrugated siding, culvert piping, furniture, miscellaneous auto parts, and other miscellaneous items. The containers included 5- and 55-gallon drums motor oil, 1-gallon or 1-quart antifreeze containers, and 5-gallon cans of freon. Most of the drums and containers were sound to be empty, however, some were found *to* contain spent motor oil or water which collected in the open containers. Lesser amounts of construction debris (concrete, lumber, concrete and cinder block bricks) and landscaping debris (branches and clippings) are also scattered throughout the Canyon 2 area. Most of the debris is located along the side canyon as shown on Plate 2. The extent of debris in the Canyon 2 area itself is not shown on Plate 2, however, it is generally restricted to the areas near the concrete pads. Based upon visual observations, HLA estimated approximate volumes of the various types of debris are presented in Table 3. The volumes in Table 3 represent estimated bulk volumes of surficial landscape and construction debris to be stockpiled for disposal off site. Equivalent tonnage is estimated at 1 ton per. cubic yard average. The underground pipeline is believed to be a former water line which connected the various water wells to the former water tank.

3.4 SOIL SAMPLING RESULTS

Chemical analysis of the selected soil samples from the Canyon 2 area indicate that hydrocarbons are present in the near-surface soils adjacent to the two concrete pads and the aboveground storage tanks. In general, high concentrations of TPH were detected in the surface samples, where the soil was noticeably stained with hydrocarbons within 3 to 6 inches

of the ground surface. In general, samples analyzed at a depth of 1.5 to 5 feet below ground surface, where no visual evidence was noted, contained low to nondetectable levels of hydrocarbons. A summary of the analytical results is presented on Table 1 with the complete results contained in Appendix B-1. Trench locations are shown on Plate 3.

3.4.1 Northern Concrete Pad

Hydrocarbon-stained surficial soils were observed in a 5 to 15 foot wide perimeter around the northern concrete pad (Plate 2). Backhoe trenches around the perimeter indicated dark brown, slightly odorous (hydrocarbon) stained soils were restricted to within 3 to 6 inches of the surface. The underlying soils, which consisted of hard cemented sands with silt, displayed no noticeable physical evidence of contamination.

Monitoring with the PID did not detect volatile organic vapors in the surficial or underlying soils. TPH concentrations ranging from 8,700 to 43,000 milligrams per kilogram (mg/kg) were detected at the surface (3- to 6-inch sample depth) in samples collected from Trenches T-WC1 through T-WC3 along the east and west sides. of the northern concrete pad. .A.nalysis of the sample from Trench T-WC3 (S-3), collected just below the surface (3 inch depth) southeast of the northern concrete pad, also detected carbon disulfide (230 micrograms per kilogram (ug/k:g]) and toluene (9 ug1kg). Samples collected at a depth of 1.5 feet below the surface from Trenches T-WC1 and T-WC3, located immediately west and east of the northern concrete pad, had TPH concentrations of 8 and 520 mg/kg, respectively.

Analyses of near-surface samples from Trenches T-WC9, T-WClO, T-WC13, and T-WC15 detected TPH at concentrations ranging from 100 to 130 mg/kg. Sample NSB-1, collected at a depth of 3-inches adjacent to the Sample S-3 (Trench T-WC3), detected TPH at 520 mg/kg and toluene at 0.75 mg/kg; no other volatile organics were detected. Analysis of a sample

collected at a depth of 3 feet from Trench T-WC11 detected 6.4 mg/kg TPH, analysis of a sample from a depth of 5 feet in this trench found non-detectable concentrations of TPH and VOCs.

Sample S-14 was collected in an area where several full 5-gallon containers and an empty 55-gallon motor oil container was located. A TPH concentration of 12 mg/kg was detected.

The analysis of sample NSB-1 for Title 26 metals indicated that none of the constituents exceeded the Total Threshold Limit Concentration (TTLC) established by Title 26, Section 66699, California Code of Regulations.

3.4.2 Aboveground Storage Tanks

Lightly stained soils were detected in the upper 3 inches of Trench T-WC6 near the location of the three aboveground 350 gallon tanks (Plate 2) while the underlying soils showed no physical evidence of hydrocarbons. Analyses of samples from this trench detected TPH concentrations of 41,000 mg/kg at the surface and 55 mg/kg at a depth of 1.5 feet. In addition, analysis of the near-surface sample detected trichloroethane (TCA), 4-methyl-2-pentanone (MIBK), 2-butanone (MEK), benzene, toluene, ethylbenzene, and total xylenes.

Analysis of near-surface samples from Trenches T-WC16, T-WC17, and T-WC18 detected TPH at concentrations 7.5, 25, and 98 mg/kg, respectively.

3.4.3 Southern Concrete Pad

Stained soils were noted along the west, north and east sides of the southern-most concrete pad as shown on Plate 2. The stained soils along the west and north sides are approximately 6 inches thick and overlie the pad itself. Along the east edge, a thin band of stained soils approximately 5 feet wide and several inches deep was observed.

Samples collected form Trenches T-WC7 and T-WC7A at depths of 0.25 feet were found to contain appreciable quantities of TPH (23,000 to 29,000 mg/kg). Analysis of VOCs in the sample from Trench T-WC7 detected carbon disulfide, toluene, and xylene. Analyses of near-surface sample NSB-2 detected TPH at 480 mg/kg and toluene at 1.30 mg/kg; no other VOCs were detected. A sample from Trench T-WC20 at a depth of 0.5 feet was found to contain 430 mg/kg TPH; analysis of samples at the same depth from Trenches T-WC19 and T-WC21 detected 58 and 13 mg/kg TPH, respectively. No physical evidence of hydrocarbons was detected visually or with the PID in Trenches T-WC5 and T-WC22.

The analysis of Sample NSB-2 for Title 26 metals indicated that none of the constituents exceeded the TTLC.

A narrow band of darkly stained soils (approximately 1 feet wide and 10 foot long) was found immediately east of the southern concrete pad. Stained soils were observe to extend to a depth of approximately 1.5 feet in Trench T-WC4 in this area. Analysis of a sample was collected at a depth of approximately 1 foot below the ground surface from this trench detected 28,000 mg/kg TPH.

Trench T-WC22 was excavated in a shallow depression southeast of the concrete pad. No evidence of hydrocarbons was noted and consequently a sample was not submitted for analysis.

3.5 ABANDONED OIL EXPLORATION TEST HOLE

According to records obtained from the DOG (Appendix D), Petan Company drilled an exploratory well in the vicinity of Canyon 1 in April of 1960. However, the well never produced, and it was reportedly abandoned as directed by the DOG. Evidence of this well was not located during the site investigation. Additional attempts to locate the well are beyond the scope of this investigation.

3.6 GROUND-WATER WELLS

Six ground-water wells and one dry well were identified from information on file at the VCFCD and located onsite (Plate 2). Additional wells are located south of the southern property boundary. The field check of these wells found that most are filled within a few feet of the ground surface with debris. One well (designated as 3N/19W-33M3, Plate 2) was found open to a depth of 75 feet.

3.7 ACM TEST RESULTS

Analysis of the resinated fiberglass (ASB-1), two samples of plasterboard (ASB-2, ASB-4) and roofing paper (ASB-3) for ACM were negative. The sample of the transite pipe (ASB-7) tested positive for asbestos. Approximately 25 to 50 pounds of nonfriable transite pipe were located in the Canyon 1 area and have been segregated for disposal.

4.0 REMEDIAL ACTION PLAN

4.1 CANYON 1 AREA

Reclamation of the Canyon 1 area will include the removal and segregation of waste types from the canyon area. Material will be removed using track-mounted loaders, segregated, and then either loaded into end dumps for transport offsite, or stockpiled on the level ground surface west of the canyon or near the dam at the south end of the canyon (Plate 1). The partially buried demolition debris will be excavated by loaders or bulldozers. Manual segregation may be necessary to separate small or individual pieces of debris. Materiar will be segregated according to the following general groups based on disposal options:

1. Landscape debris including wood chips, leaf piles, tree cuttings, large stumps, and lumber,
2. Aggregate demolition debris including broken concrete, asphaltic concrete, and bricks,
3. **Tires,**
4. Miscellaneous debris and trash including demolition debris (metal piping, loose rebar, asphaltic roofing paper and shingles, dry wall, wire, etc.), refuse (paper and plastic), appliances, furniture, and amomobile bodies and pans, and
5. Transite piping (ACM).

Debris Type 2 will be temporarily stockpiled on site for processing and possibly for placement within specified fills. Waste Types 1, 3, and 4 will be excavated for disposal at a Class 3 landfiil. Non-friable Type 5 waste will be transported to the Ventura Regional Sanitation District Toland Road landfill for disposal pending authorization from the Ventura County Sanitation District. Potentially hazardous materials(including friable ACM), if exposed during

removal operations, will be handled and disposed as appropriate. Periodic site visits will be performed by HLA to observe operations and monitor the types of wastes exposed during removal for potentially hazardous materials.

Depending upon the development plans, and with the approval of the design geotechnical engineer, we believe that some of the Type 2 debris can be either processed and incorporated in fill placed on site in areas that will be designated as open space and not support structures. In addition, with processing, some of these materials might be suitable for incorporation into engineered fill. The design geotechnical engineers should be consulted regarding suitable areas for placement and allowable limits of organics, particle size, etc. of materials for use in engineered fill. They should also approve the specific materials prior to incorporation within engineered fill.

4.2 CAtWON 2 AREA

Based upon the results of our site assessment, the apparent correlation between contaminant and TPH levels, and the anticipated development of the site for residential use, we propose that soils be remediated to 100 mg/kg TPH as measured by EPA Test Method 418.1 and to levels below detection for the VOCs. It is estimated that approximately 300 cubic yards of scil will require remediation. Considering the types and levels of contaminants identified, and the estimated volume of soils requiring remediation, on-site bioremediation has been selected to remediate the hydrocarbons in soils.

The miscellaneous debris, equipment, vehicles and containers will be removed from the site. The debris, including broken concrete, lumber, landscape debris, plastic and paper rubbish, and miscellaneous demolition debris will be disposed at a licensed Class 3 landfill as described for the Canyon 1 area. Vehicles and equipment will be removed by the responsible persons.

Empty containers will be crushed for disposal along with the debris; partially full containers will be emptied and flushed prior to disposal. A waste oil service company will be contacted for disposal of waste oil fluids.

4.2.1 Bioremediation

The available data indicates that bioremediation can be performed to remediate hydrocarbon-containing soils. We recommend that the contaminated material be excavated and bioremediated in a temporary treatment area constructed on-site. The bioremediation process will consist of the following:

- Collect and analyze samples to evaluate appropriate microbial-enriching "nutrients to be applied.
- Construct a treatment area nearby consisting of a low permeability liner (Visqueen or similar) covered with a protective layer of sand and rimmed by a minimum 3 foot-high earthen dike.
- E1:cavate and spread contaminated soils on to treatment pad to an approximate thickness of 1 foot.
- Collect and analyze soils samples from the excavation to confirm that the soils with TPH levels above 100 mg/kg have been removed.
- Add and mix nutrients into the soil for treatment on a regular (2 to 3 times per week) basis, as required. Mixing will be accomplished with disks, hand operated rototillers, or with shovels.
- Periodically monitor soils with a PID and perform laboratory analyses to check the bioremediation progress.
- Upon completion of treatment (3 to 4 month) collect one sample for each 50 cubic yards of remediated soils and analyze for TPH using EPA Test Method 418.1 and volatile organics by EPA Test Method 8240 to check the results of treatment.

- o Upon removal of the treatment pad, collect one sample of soil underlying the treatment pad for each 2,000 square feet of treatment area and analyze for TPH and volatile organics to evaluate potential leakage of the liner.

Following completion, the soils subjected to bioremediation will be used to backfill the onsite excavations unless laboratory analyses indicate detectable concentrations of TPH and volatile organics. If detected, the affected soils will be transported and disposed off site at a permitted facility and either imported soils or soils borrowed from the site will be used for backfill. Backfill will be compacted to at least 90 percent relative compaction referencing the maximum dry density determined by ASTM D1557 (Modified Proctor) test procedures. All work will be performed in compliance with applicable California OSHA regulations.

4.3 ABAL'IDONED OIL EXPLORATION TEST HOLE

Available records (Appendix D) indicate that the oil exploration test hole was abandoned and that the abandonment was approved by the DOG in June 1960. Abandonment reportedly included cementing the lower portion of the 10-3/4-inch-diameter steel casing at a depth of 515 to 473 feet, placing a 10-foot cement plug at the surface, and welding a 3/8-inch-thick steel plate on top of the casing. The top of the casing is believed to be approximately 4 feet beneath present grade. Additional attempts to locate the test well in compliance with DOG requirements is not within the scope of this investigation and will be performed at a later date.

4.4 WATER WELLS

Si,'{ abandoned water wells have been located in the Canyon 2 area. These wells will need to be abandoned according to Ventura County requirements, h9wever, this will be addressed at a later date.

5.0 CONFIRMATION PROGRAM

5.1 CANYON 1 AREA

After removal of the debris from the canyon, HLA will observe the exposed soils and collect soil samples for confirmation chemical analysis. We anticipate that the sampling program, which will be adjusted if necessary based on the findings during removal, will include the following analyses:

- o TPH by EPA Method 418.1; five samples estimated,
- o If TPH concentrations are detected above 100 mg/l then analyze selected soil samples for volatile organic compounds by EPA Method 8240,
- o Title 26, California Code of Regulations (CCR), metals; five samples estimated, and
- o Asbestos by PLM; five samples estimated.

If total metals concentrations exceed the Soluble Threshold Limit Concentrations (STLCs) specified in Title 26, then extraction tests will be conducted to evaluate the concentrations of soluble metals. If any free liquids or leachate are encountered, then samples will be collected and analyzed as appropriate.

Samples will be collected by hand augering or backhoe trenching to depths of 5 to 10 feet. Samples will be selected from the near surface and below the vertical extent of suspected contamination. Appropriate decontamination, sample collection and storage, and chain-of-custody procedures will be implemented.

The analytical results will be reviewed prior to backfilling within the canyon. The detection of elevated concentrations of petroleum hydrocarbons, VOCs, metals or asbestos will be evaluated and the need for remediation addressed.

5.2 CANYON 2 AREA

The confirmation program for the Canyon 2 area will consist of collecting and analyzing samples from the base of the excavation to evaluate whether hydrocarbon concentrations above the designated remediation levels remain. The soils subject to bioremediation treatment will be analyzed to evaluate whether the process has been completed to the accepted levels. In addition, soils samples from beneath the treatment pad will be analyzed to evaluate potential leakage.

In all cases, samples will be collected using a drive sampler or by grab sampling. Appropriate decontamination, sample handling and chain-of-custody protocol will be impl U]-ented. Samples will be analyzed for TPH (EPA Test Method 418.1) and volatile organics (EPA Test Method 8240).

5.3 FINAL REPORT

Upon completion of the various remediation programs and confirmation sampling, a final report will be issued. The report will document the site characterization activities, volume and types of debris removed, method of disposal, remediation activities, and analytical results.

APPENDIX A

GEOPHYSICAL SURVEY

APPENDIX A
GEOPHYSICAL SURVEY

GEOPHYSICAL METHODS

HLA used two geophysical methods during this investigation: Electromagnetics (EM), and magnetics.

The electromagnetic method involves transmitting a primary signal that is inductively coupled to the earth. Secondary signals are generated in the ground, and both the primary and secondary fields are detected by the EM receiver. The ratio of the two signal strengths yields information on soil conductivity and the presence of buried conductors. Metal pbjects, such as a steel well casing, are electrically conductive as compared to native soil and ',therefore produce anomalous readings in measured conductivity values.

A Geonic Model EM31-D terrain conductivity meter, which can inductively rheiasure subsurface conditions to a depth of approximately 20 feet, was used in this investigation. Two components of the EM signal can be measured: the quadrature component, which is sensitive to changes in soil conductivity, and the in-phase component, which is insensitive to changes in soil conductivity but is ver-; sensitive to the presence of buried metal.

The magnetic method uses a proton precession magnetometer to measure the total intensity of the earth's magnetic field in gammas. The magnetic sensor is a vessel filled with a proton-rich source such as kerosene or decane. Protons behave as small spinning magnets that orient themselves parallel to the earth's magnetic field. A reading is initiated when electrical current is passed through a wire coil around the vessel. Tne current generates its own magnetic field and the protons readily align themselves with the new field. The polarization is instantaneous, after which the applied field is removed, causing the protons to precess about the direction of

the magnetic field much like a spinning top precesses about the gravity field. This proton precession generates a small electrical signal in the sensor coil and the frequency of that signal is proportional to the earth's total magnetic field intensity.

The total magnetic field is simply the ambient field at each measurement location. The ambient field, in turn, is the net effect (vector sum) of several factors, which include: 1) the earth's magnetic field at the latitude of the survey work, and 2) the regional geology of the area (structure of subsurface rocks). It may also contain the effect of iron-bearing rocks (primarily magnetite), the presence of nearby ferrous metallic metal objects, and the periodic fluctuations in the earth's field, such as diurnal drift and magnetic storms caused by solar flares.

For the purposes of this survey, distortions in the magnetic field can be assumed to be caused by the presence of ferrous metal objects. Magnetic anomalies due to nearby concentrations of buried metal, such as a steel well casing, have a much larger amplitude and a narrower "width" than what we would expect from geologic variations. Our experience has shown that an isolated steel well casing buried at a depth of 10 feet can produce an anomaly of approximately 100 gammas over a width of about 50 feet. The magnetometer employed in this investigation is an EG & G Geometrics, Inc., Model G-856, with a sensitivity of 1 gamma.

FIELD PROCEDURES

After a walking reconnaissance of the area of investigation, the following work tasks were performed:

1. An extensive walkaround EM survey was performed over the area of investigation and on the hillside where the report place the well. Survey spacing was approximately 10 feet. Transects were oriented in both north-south and east-west directions. The survey was performed twice to observe the instrument response for both the conductivity and in-phase modes.

2. A magnetometer survey was conducted along a 350-foot baseline transect established down the centerline of an unpaved road passing through the site. Total magnetic field measurements were taken every 10 feet along this transect. Twenty additional readings were obtained along two 100-foot cross lines at either end of the baseline transect.

RESULTS

EM survey data indicate that the average conductivity of subsurface materials at the site is approximately 40 millimhos per meter (mmhos/m). This moderately high value is typical for silty and clayey soils.

Tne in-phase component of the EM signal was carefully monitored during the EM31-D survey to detect indications of buried metal. High-amplitude responses, indicative of buried metal, were observed along the central portion of the edge of the canyon. Isolated anomalous in-phase responses indicative of buried metal were observed in the flat level area north of the canyon. The locations of these anomalies were marked with red paint sprayed on the ground surface and on nearby vegetation.

The magnetometer survey was unable to locate concentrations of ferrous metal. Persistent high amplitude (100 gammas or more) variations in the total magnetic field measurements were observed in repeated readings taken at the same location. Likely causes were deemed to be instrument malfunction or fluctuations in the earth's magnetic field caused by solar flares. As either possibility would render a magnetometer survey meaningless, the magnetometer survey was abandoned. Later tests showed the magnetometer to be in good working order, and queries to staff at Geometrics, Inc., who maintain a magnetometer base station at their office in Sunnyvale, California, revealed that there were disturbans;es in the earth's magnetic field on October 21, 1989, the day our magnetic survey was attempted.

CONCLUSIONS

The magnetometer was not an effective tool for locating the abandoned well. A magnetic storm on Saturday October 21, 1989, the day the magnetic survey was attempted, produced large fluctuations in magnetic measurements that masked the effects of any nearby buried ferrous metal objects.

The EM survey was successful in locating several areas showing indications of buried and/or surface metal. It was not possible, however, to discriminate between these anomalous areas in order to identify the location of the abandoned well.

Laboratory Report

ENSECO CRL VENTURA
2810 BUNSEN AVENUE, UNIT A
VENTURA, CA 93003
ATTN: MR. LEO RAAB

Analysis No.: G-8929312-002
Date Sampled: 17-0CT-1989
Date Sample Rec'd: 20-0CT-1989
Date Analyzed: 2-NOV-1989
Sample Type: SOLID

Project: (92911314) HARDING LAWSON ASSOCIATES
Sample ID: (92911314-07) S-6

Purgeable Organics, EPA 8240

Units: ug/kg

Parameter	Result	Blank	Detection Limit
Chloromethane	ND	ND	10
Bromomethane	ND	ND	10
Vinyl Chloride	ND	ND	10
Chloroethane	ND	ND	10
Methylene Chloride	7.*	ND	5
Acetone	76.	ND	10
Carbon Disulfide	ND	ND	5
1,1-Dichloroethene	ND	ND	5
1,1-Dichloroethane	ND	ND	5
trans-1,2-Dichloroethene	ND	ND	5
Chloroform	10.	ND	5
1,2-Dichloroethane	ND	ND	5
2-Butanone	80.	ND	10
1,1,1-Trichloroethane	8.	ND	5
Carbon Tetrachloride	ND	ND	5
Vinyl Acetate	ND	ND	10
Bromodichloromethane	ND	ND	5
1,2-Dichloropropane	ND	ND	5
trans-1,3-Dichloropropene	ND	ND	5
Trichloroethene	ND	ND	5
Dibromochlorornethane	ND	ND	5
1,1,2-Trichloroethane	ND	ND	5
Benzene	5.	ND	5
cis-1,3-Dichloropropene	ND	ND	5
2-Chloroethylvinyl ether	ND	ND	10
Bromoform	ND	ND	5
4-Methyl-2-pentanone	77.	ND	10
2-Hexanone	ND	ND	10
Tetrachloroethene	ND	ND	5
1,1,2,2-Tetrachloroethane	ND	ND	5
Toluene	220.	"ND	5
Chlorobenzene	ND	ND	5
Ethylbenzene	6.	ND	5
Styrene	ND	ND	5
Xylenes, Total	34.	ND	5

* The analytical results for Methylene Chloride should not be considered reliable unless the concentration in the sample exceeds five times the detection limit.

LABORATORY ANALYTICAL RESULTS - POTENTIAL ASBESTOS CONTAINING MATERIAL

Applied Petrography, Inc

November 3, 1989

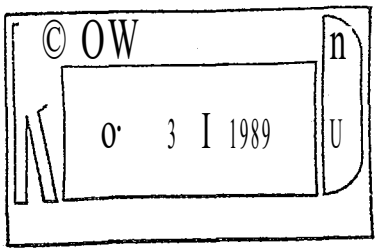
Harding Lawson Associates
2804 Camino Dos Rios, Suite 207
Newberry Park, CA. 91320

Dear Janis Medler:

As per your phone conversation with James Haskins in reference to Job #19513001.16 on 11/2/89 the sample numbers have been, changed as follows;

9291124201-07	has been	changed to	9291124201-07	(AS871)
9291124202-07	has been	changed to	9291124202-07	(ASB-2)
9291124203-07	has been	changed to	9291124203-07	(ASB-3)
9291124204-07	has been	changed to	9291124204-07	(ASB-4)

We apologize for any inconvience this may have caused you.



Sincerely Yours,

Tom Hibner
Laboratory Analyst

Subject: Asbestos Bulk Sample Analysis

Purchase Order Number: E-7155

Laboratory Number: 910122

Date: 10/24/89

4 samples of suspected asbestos-containing material from Job#HARDING LAWSON ASSOC were submitted to the laboratory for analysis. The analyses were performed using the polarized-light microscopy method described in 40 CFR, Chapter 1, part 763, subpart F, Appendix A. The laboratory is accredited by the National Voluntary Laboratory Accreditation Program (NV P #1730) for the analysis of fri<;:tble bulk asbestos samples. The results of the analyses are enclosed.

We appreciate the opportunity to perform analytical work for you. If you have any questions, please call.

Respectfully submitted,
APPLIED PETROGRAPHY, INC.

APPENDIX C

TRENCH LOGS

Table C-1.
Summary of Materials Encountered in Exploratory Trenches -
Canyon 1 Area

Trench Number	Depth (feet)	Materials Encountered
T-1	0 - 4	Native Soil - dark brown silty sand with gravel, dense, dry
T-2	0 - 2	Trash Fill - decomposed plasterboard, concrete, soil
	2 - 3	Native Soil - dark red-brown silty sand, dense, dry
T-3	0 - 2.5	Trash Fill - asphaltic concrete, miscellaneous rubbish including, plastic, pipe, wood, plasterboard
	2.5 - 4	Native Soil - dark red-brown silty sand, dense, dry
T-4	0 - 4	Trash Fill - concrete, rubbish, pipes rebar, wood. Refusal at 4 feet on concrete block
T-5	0 - 4	Trash Fill - concrete, plastic, pipe, dry wall, miscellaneous rubbish. Refusal at 4 feet
T-6 through T-9	0 - 4	Native Soil - red-brown silty sand, dense, dry

Table C-2
Summary of Materials Encountered in Exploratory Trenches - Canyon 2 Area

Trench Numher	Depth (feet)	Materials Encountered	Sample Number	Sample Depth (feet)
T-WC1	0 - 2	Dark brown to light gray brown SILTY SAND, very dense, dry. Hydrocarbon (HC) staining from O to 6 inches, none to slight odor, no Voes detected by PIO. Decayed organic matter at surface.	S-1 S-1A	0.25 1.5
	2 - 3	Brown, CLAYEY SAND, very dense, slightly moist, no BC staining or odor.		
T-WC2	0 - 0.25	Dark hrown, SILTY SAND, very dense, dry. Slight HC staining, no volatile organic compounds (VOCs) detected with photoionization detector (PID).	S-2	0.25
	0.25 - 2.0	Gray brown to dark brown, SILTY SAND, very dense, slight moist. No HC staining or odor.		
T-WC3	0 - 0.25	Dark brown, SILTY SAND, very dense, slightly moist. Slight HC staining, slight to no odor. No voes detected by PID. Decaying organics.	S-3	0.25
	0.25 - 2.25	Light gray brown, SILTY SAND with gravels, dense, dry, cemented. No HC stain ,or odor.	S-3A	1.50
	2.25 - 3.0	Dark brown CLAYEY SAND with gravels, very dense, dry. No HC odor or staining.		

Table C-2
Summary of Mate.rials Encountered in Exploratory Trenches - Canyon 2 Al·ea (continued)

Trench Numher	Depth (feet)	Materials Encountered	Sample Number	Sample Depth (feet)
T-WC4	0 - 1.5	Brown, SAND, loose to medium dense, dry. HC staining and slight odor. No VOCs detected with PID.	S-4	1.0
	1.5 - 3.5	Gray, SAND, loose to medium dense, dry. No HC stain or odor.		
T-WC5	0 - 4.0	Light brown, SILTY SAND, medium dense, d_{ry}. No HC staining or odor. No VOCs detected.		
T-WC6	0 - 0.25	Brown, SILTY SAND, very dense, dry. HC staining, slight to· no odor. No VOCs detected with PID.	S-6	0
	0.25 - 3	Light gray brown, SILTY SAND, very dense, dry. No HC stain or odor.	S-6A	1.5
T-WC7	0 - 0.5	Brown, SILTY SAND, loose, d_{ry}. Dark I-IC staining, slight odor, No VOCs detected.	S-7	0.25
	0.5	Concrete pad.		
T-WC7A	0 - 0.5	Brown, SILTY SAND, Jpose, dry. Dark HC staining, slight odor. No VOCs detected.	S-7A	0.25
T-WC8	0 - 1	Brown, SILTY SAND, medium dense, no HC staining or odor, no trash fill encountered.		

Table C-2
Summary of Materials Encountered in Exploratory Trenches - Canyon 2 Area (continued)

Trench Number	Depth (feet)	Materials Encountered	Sample Number	Sample Depth (feet)
T-WC9	0 - 3.0	Drown, SILTY SAND, dense, dry. Laminated in upper 1 feet, with roots to 9". No VOCs detected with PID. No HC stain or odor. Color changes to dark brown at the bottom of the trench.	S-9	0.5
T-WClO	0 - 1.0	Brown GRAVELLY SAND, medium dense, dry. Laminated silty zone with buried lrash. No VOCs detected with **PIO.**	S-10	**0.5**
	1.0 - 2.5	Dark Brown, SILTY SAND, dense, dry. No HC stain or odor.		
T-WC11	0 - 1.0	Dark Brown SILTY SAND, loose, dry. No VOCs detected with PID.		
	1.0 - 5	Brown SILTY SAND, dense, dry with clayey zones, roots and some gravel. No VOCs detected with PID. No odor on samples but slight odor in trench. No HC stain.	S-11A S-11B	3.0 5.0
T-WC12	0 - 1.0	Light Brown to Brown ilty SAND, loose, dly with roots and some gravel. No VOCs detected with PID.	S-12	**0.5**
	1.0 - 2.0	Brown SILTY SAND, dense, dry, with fine sand. No HC stain or odor.		

Table C-2
Summary of Materials Encountered in Exploratory Trenches - Canyon 2 Area (continued)

Trench Number	Depth (feet)	Materials Encountered	Sample Number	Sample Depth (feet)
T-WC13	0 - 0.5	Brown SILTY SAND, dense, dry, with roots and some gravel. No VOCs detected with PID. HC staining. No odor.	S-13	0.5
	0.5 - 2.0	Brown SILTY SAND, dense, dry. No HC stain or odor.		
T-WC14	0 - 2	Light Drown SANDY SILT, moderately stiff, dry. No VOCs detected with PID. No odor. I-IC staining from 0.25 - 0.5.	S-14	0.25
	2.0 - 2.5	Light Brown SAND with some silt, loose, dly. No HC staining or odor.		
T-WC15	0 - 3.0	Brown Silly SAND medium dense, dry, with trace gravel. No VOCs detected with PID. No I-IC staining or odor.	S-15	0.5
T-WC16	0 - 3.0	Brown lo Dark Brown SILTY SAND, dense, dry. No VOCs.		
T-WC17	0 - 3.0	Brown SILTY SAND, d!:!nse, dry with gravel. No VOCs detected with-PIO. No HC staining or odor.	S-17	0.5

DIVISION OF OIL AND GAS

Notice of Intention to Abandon Well

This notice must be given at least five days before work is to begin; one copy only SANTA PAULA, CALIFORNIA

Bakersfield, Calif. June 13, 19 60

DIVISION OF OIL AND GAS

In compliance with Division 3, Public Resources Code, notice is hereby given that: it is our intention to abandon

Well No. 1 Peta frJ Sec. 13, T 3N

R. 19W, S B B. & M., Ventura field, Ventura Coull cy.

commencing work on June 13 19 60

THE PRESENT CONDITIOX OF THE WELL IS:

1. Total Depth: 4500 r

2. Complete casing record, including plugs:

10-3/4" C -495'

3. Last Produced Never 11
(Duo) (Oil, B/D) (Water, B/D)

ADDITIONAL DATA FOR DRY HOLE

4. Oil or Gas showings :ind results of tests:

No showings

5. Stratigraphic markers rid ;depths:

Top Sespe above 495'

6. Geologic age ac·b;tcom: Sespe

7. Base of fresh wat:er sands: above 495'

THE PROPOSED WORK IS

1) Fill hole with heavy mud

2) Plug 515 to 475' with cement - Division of Oil and Gas to witness location and hardness.

3) Place 10' cement plug at cellar floor. Division of Oil & Gas to witness placement.

Preseil C cop.dition of well: 10 3/L" ce.ri 1:95', T.D. 45°0:)', Plugged With cement 515' - u7; and l!.:'- ll'

The 0£eratio;15 'le e performed for the purpose of Plugging the hole in the process of .,b;::mcorr.cnt.

Mr. Cook reported:

1. A 8 J/4" hole "-as drilled frcm 3810' to 4500' (total depth).
2. No commercial oil or gas shows were encountered in drilling t!ie' well.
3. The hole 'tmS left full of 77 lb. drillinB fluid.
4. On Tune 13, 1960, 50 sacks of cement -was pur.tped into t.'le hole through 4 1/2" drill pipe hanginr:; at 515', filling to 1.t73'.

'l'he Enginscr noted that the cenent ;_)lug at the reported depth o:f 473' supported 4 points of the 1-v-e:lsht of the drill pipe.

On June lh, 1960 Hr. Cook reported by telephone:

1. The hole ;.iasbridged w:it..'pli;ler sacks 10' below the cellar floor.
2. D'i.1.lk cer-::ent was dumped on the bridge ,, filling the 10 3/4n casing to the cellar floor, -which is lt' below ground level.
3. A steel plate was r.--elde<l at the cellar floor.

THE PL;JGGn G OPF:lATIO".IS AS R£PDRTr::D AND 1117TTNESSfil> ARE APPROVED.

Site Characterization
and Remedial Action Plan
Walnut Canyon Tract
Moorpark, California

Enclosed are 3 copies of the Site Characterization and Remedial Action Plan for the Walnut Canyon Tract located approximately one-half mile north of Moorpark, California. This report has been prepared by Harding Lawson Associates (HLA) on behalf of Walnut Canyon Associates in order to obtain a land reclamation/closure permit for the property. The attached report presents a summary of HLA's site characterization activities and the remedial action plan developed from the subsequent findings.

Land clearing is currently in progress to remove, segregate and dispose of debris located in one of the two canyons onsite. In the other canyon, a proposed remediation program has been developed for the excavation and bioremediation of approximately 300 cubic yards of hydrocarbon contaminated soils. Miscellaneous debris, vehicles, oil containers, and drums are also scheduled for removal and disposal. Following completion of the site remediation, an assessment will be performed to confirm completion of the remediation activities. A closure report will be issued documenting the remediation activities, volumes and types of debris removed, method(s) of treatment and/or disposal, and associated analytical results.

The property is currently in escrow. The transfer cannot be completed until remediation is complete. Your timely response would be greatly appreciated in order to expedite the remediation program and complete the transfer of the property.

We trust that this document provides sufficient information concerning the remediation activities proposed to issue land remediation/closure permits for this property. If you have any questions, please call.

Very truly yours,

HARDING LAWSON ASSOCIATES

Gentlemen:

PEA Closure Report Addendum
PEA Screening Calculations
Walnut Canyon Tract Site
Moorpark, California

INTRODUCTION

This letter transmits the results of the Preliminary Endangerment Assessment (PEA) screening calculations performed as requested by Mr. Mukul Agarwal of the California Department of Health Services (DHS) in our telephone conversation on July 17, 1991. This information supports the documentation provided in the PEA Closure Report[1] prepared by Harding Lawson Associates (HLA) on behalf of Walnut Canyon Associates for the Walnut Canyon site located near Moorpark, California.

The PEA Closure Report presented the results of confirmation testing performed at the site as agreed to in a meeting with the DHS and r presentatives of Walnut Canyon Associates on May 31, 1991. The results of the confirmation testing indicated that only one of the constituents analyzed (arsenic in one sample) exceeded 1) levels detected in a background sample, 2) the laboratory detection limits, and 3) the PEA Screening Level. In order to complete the PEA process to the satisfaction of the DHS, the screening calculations, as described in Appendix A of the DI-IS PEA Guidance Document (dated June 22, 1990) have been performed using the confirmation test results reported in the PEA Closure Report.

PEA SCREENING CALCULATIONS

As agreed with Mr. Agarwal, the results of the confirmation tests were reviewed to select the test result which detected the highest concentration of each constituent analyzed. This test result was used as the sample concentration for performing the PEA screening calculations. As

[1] Harding Lawson Associates, 1991, Preliminary Endangerment Assessment Closure Report, Walnut Canyon Tract, Moorpark, California, Report dated July 15, 1991.

instructed in the PEA Interim Guidance Document[2], where a constituent was not detected, the sample concentration was assumed to be one-half the laboratory detection limit.

Tables 1 through 4 present a summary of the calculations. Each table lists the sample which had the highest concentration (C.) of each respective constituent analyzed, along with the PEA Screening Level (SL.) and the results of the calculation. According to the PEA Interim Guidance Document, if the quotient (CJSL.) is greater than unity (e.g. the sample concentration exceeds the Screening Level), then further assessment may be required. If the result is less than one, then no additional assessment is required. The results of the screening calculations are summarized below.

- Metals - Of the 10 near-surface soil samples tested for metals, only one constituent (arsenic) in one sample (VS-CYN2-03) was detected at a concentration higher than the respective PEA Screening Level and the concentration detected in a background sample (Table 1). Two other metals (barium and vanadium) were detected at concentrations greater than the PEA Screening Level; however, the highest detected concentration of these metals were in a background sample, indicating that the indigenous levels of these metals are higher than the PEA Screening Levels. Although not detected in any of the samples analyzed, the reported laboratory detection limit for antimony (Sb) in seven of the samples analyzed is greater than twice the Screening Level for Sb, which results in a *CJSL.* quotient greater than unity.

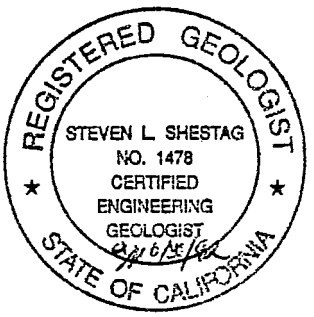
- Organics - No aromatic hydrocarbons (Table 2), semi-volatile organic compounds (Table 3) nor halogenated volatile organic compounds (Table 4) were detected in any of the samples analyzed. However, the PEA Screening Levels for 15 semi-volatile organic compounds and 1 halogenated volatile organic compound are less (and in some cases significantly less) than one-half the laboratory detection limit.

The results of the PEA screening analysis indicate that the *CjSL.* quotient exceeds unity for 20 constituents. However, in only one case (arsenic in Sample No. VS-CYN2-03) did the test result exceed the constituent level detected in a background sample. For 17 of the remaining 19 constituents where the *CjSL.* quotient for these constituents exceeded unity, the constituent was not detected: the *CjSL,* quotient exceeded unity only because the laboratory detection level was greater than twice the corresponding Screening Level. Based upon conversations with the analytical laboratory personnel, the reported detection levels are those commonly reported and near the limits of production laboratory capability. For the remaining two constituents where the *CjSL,* quotient exceeded unity, the highest constituent levels were detected in a background

[2] California Department of Health Services, 1990, Interim Guidance for Preparation of a Preliminary Endangerment Assessment Report, June 22, 1990.

sample, indicating that these constituents are indigenous at levels exceeding their respective PEA Screening Levels.

The presence of arsenic in one sample at a concentration exceeding the PEA Screening Level is judged to be of limited concern because 1) arsenic was not detected in any of the other nine samples analyzed, 2) arsenic was detected at a concentration only slightly above the laboratory detection limit, 3) arsenic is not typically associated with the types of wastes found at the site and, in fact, occurs naturally, and 4) arsenic is relatively immobile in soil.



On the basis of our analyses and the PEA Screening Calculations, we judge that the results do not indicate that a potential hazard exists at the site or that further investigation is necessary.

CLOSURE

If you have any questions, please contact either of the undersigned at (805) 494-7725, or the client representative, Mr. Curt Uritz of Fairfield, McDonald and Strauss at (805) 644_7458.

Very truly yours,

HARDING LAWSON ASSOCIATES

California Department of Health Services
Toxic Substances Control Division,
Region 3 - Site Mitigation Unit
1405 N. San Fernando Boulevard, No. 300
Burbank, California 91504

Attention: Mr. Mukul Agarwal

Gentlemen:

Preliminary Endangerment Assessment
Closure Report
Walnut Canyon Tract Site
Moorpark, California

Attached for your review are two copies of the subject report for the Walnut Canyon Tract site located just north of Moorpark, California (Plate 1). This information is presented in response to the conditions established for completion of the Preliminary Endangerment Assessment (PEA) as discussed in our meeting on May 31, 1991.

To satisfy the conditions requested by the California Department of Health Services (DHS), HLA performed the following:

- Additional analysis of the soils treated during the remediation program,
- Additional sampling and analysis of soil samples from Canyon 1,
- Removal of the two concrete pads in Canyon 2 to collect and analyze soil samples from beneath the pads,
- Evaluation of the potential for groundwater being impacted as a result of the identified near-surface hydrocarbon-impacted soils in Canyon 2 and the debris in Canyon 1, and
- Preparation of the attached PEA Closure Report.

M-C

July 15, 1991
19513,001.16
Mr. Mukul Agarwal
California Department
of Health Services
Page 2

As documented in the attached PEA Closure Report, it is our conclusion that these conditions have been satisfied and the respective analyses have proven negative. Walnut Canyon Associates requests that, upon your review and approval, the DHS provide written documentation stating that there is no currently known hazard and that no further action is required for additional site characterization, further remediation or notification

We would appreciate your prompt attention to this matter so that the respective conditions of the Tentative Tract Map for the subject property can be satisfied. If you have any questions or require further information, please contact either of the undersigned at (805) 494-7725, or the client representative, Mr. Curt Uritz of Fairfield, McDonald and Strauss at (805)644-7458.

Very truly yours,

HARDING LAWSON ASSOCIATES

PRELIMINARY ENDANGERMENT .ASSESSMENT REPORr REVIEW FOR WAINUI' CANYON 'ffiACT, M:ORPARK, CALIFORNIA

Dear Mr. Shestag:

'Ille Department of Health Services, Toxic SUbstances Control Prcgrarn (Cepartment) has completed the review of the reports you submitted to the Prcgrarn in place of a Prel.iminaJ:y Errlangerment Assessment (PEA) for the site Walnut Canyon Tract, Moorpark, Ventura, CA. In addition, your correspondence of November 7, 1990 was also reviewed. 'Ille documents provided require further data an:i infonnation in several areas. At this tirre the Department does not concur with your recammerx]ation of No Further Action required. Please review our attached o:::mments. 'lhe Department considers the PEA as completed arrl a further action is recamnended.

If you have any questions or suggestions regarding the above subject, please contact Mr. Mukul K. AgaJ:Wal at (818) 567-3074 or Mr. Johnson P. Abraham at (818) 567-3082.

Sincerely,

Miguel Monroy

m1MEN'I'S ON 'IHE PEA FOR WAINU1' CANYON' TRACT, MJORPARK.CA

General Comments

'Ihe Preliminal:y Endangennent Assessment (PEA) is a new constituent of the Site Mitigation Process. 'Ihe Department issued a guideline "'Ihe Interim Guidance for Preparation of a Preliminary Errlangerment Assessment Report" to make it as a fonnatted document an:l we review that document according to that Guidance Manual. 'Ihe following comments were compiled to give the parties involved guidance to be used to revise/modify the PEA and provide the infonnation the Department needs prior to making a final detennination. 'Ille Department that most of these comments can be taken care of utilizin;r infonnation available in reports that have been written to document findings of previous preliminary characterization investigations.

1) 'Ihe provided doa.mlents were not prepared as described in the "Interim Guidance for Preparation of a PFA Report[1] published by Department of Health SeJ::vices, Toxic SUbstances Control Program. However, it is necessacy to address all the infonnation provided according to the PEA manual.

2) Provide a map of the site location arrl the area with.in one mile radius of the site.

3) Provide the parcel nurnber(s) an:l include a copy of the county assesser's plat map for the parcel(s) where the site is located.

4) Provide all the approvals and certifications referenced in this report. (F.g: ''Mr. Bany Marczels of Ventura County Solid Wasted Department observed the cleanout area and fcurxi it acceptable" referenced on page 13 of the Closure Report) •

5) 'Ihe Department would like to know the official status of the Groundwater Claracterization for the whole site from the Regional Water Quality Control Board. Please furnish a letter from :the Board as an attach:rment. Geologic cross-sections showing approx:ilnate depths of wastes and um.erlyin:J aquifers should also be included. 'Ihe Department recommends one cross-section corresponi to each parcel of the site.

6) Please submit the aerial photographs mentioned in the report to the Department for further evaluation (from 1945 through 1990).

7) 'Ihe total area described in Site OlaracterizationjRemedial Action Plan is 350 acres and in the Preacquisition Site Assessment it is 220 acreso More explanation is required.

8) Did anybcdy fran this Deparbnent reviewred or approved the Hazard Ranking system (HRS) package before the clean up of the site? 'IlleHRS package submitted which is only ranked for the canyon 2 area and the final 7.6 score assigne:l. is inaccurate and misleading aa:orcling to cur analysis.

9) 'Illeproperty is a.rrrently owned. by Mr. Richard Fausset and is from 1978 onwards. Accorcli.nq to the Site 01aracterization and Remediru. Action Plan (SC/RAP) anl the Site Assessnelt Report the unauthorized dumping was mainly happened during this period.

Site Specific Comments

You submitted the Site Olaracterization ani Remedial Action Plan (SC/RAP), HRS Package, Site Assessment and a Closure Report. Accorcling to the Interm Guidance Manual for PEA., following site specific infonra.tion are also required to complete the PEA. report. We were reviewed the Site 01.aracterization and Remedial Action Plan as the key report and the unavailable infonnation which we analyzed from the other report;:s you submitted to the Deparbnent and concluded in the following canunents.

Page 2 of SC/RAP, SUbsection 1.2, Background.

- Please identify the past activities of the flowing water. When was that water dried out am clarify any reason for that dry out?

Page 2, Paragraph 2.

- 'Ihe report shows more than 10 years of unauthorized. durrping at the Sllbject location. If the owner of the property complained it to the County Environmental Health Depart:Jnent, why is it abstain from the County records?

- Is there any *PVC,* FCBs, Heavy netals or any other hazardous materials identified. on the site? Aey sampling corrlucted in the site to identify these materials?

- Who operated the abarrloned vehicle maintenance area, what was their operation and what are the type of chemicals they used.? More explanation is necessaxy.

Page 3, Paragraph 2, Fh.ase 1.

- Please submit the aerial photographs with this report for cur evaluation (from 1945-1990).

- Why did the site was previously comucta:1 an investigation by another consultant? Identify the consultant and explain the reason for the investigation and the ultimate result.

Page 5, SUbsection 2.1, Review of Existing Data.

- Written dca.nnentation from all other agencies required. File seardJ. required from the california Integrated Waste Management Board too.

Page 7, SUbsection 2.2.1, canyon 1 Area.

- Asbestos samples ASB-5, ASB-6 and ASB-8 were not submitted to the I.ab for analysis. Why?

Page 7, Iast Paragraph.

- Explain how did you collected soil samples from backhoes trenches.

Page 10, SUbsection 2.2.4, Water Wells.

- More explanation is required of the ground water. Depth to the ground water, use of graurrl water and submit the seasonal well log. Did you put any m::mitoring wells? Please explain hCM many grournwa_ wells with in one mile radius and its use (dr.mking or agricultural pul:pJSe). Please identify the up gradient and down gradient well from the site.

Page 10, SUbsection 2.3.1, Soils. I.al:orato:ry Testing.

- Ten soil samples were collecte::l on October 17, 1989 from the canyon 2 area (none collected from canyon 1 area). Sa:q)les selected from each of the three areas for analysis, specify which area are they?

J?age_..12,_SUbsection3.1, Site History.

- 'Ille.Department recognizes that Mr. Ricrard Fausset is the primacy responsible party for this site. However, as outlined on pages 18 and 3..9of the Guidance entitled "Interim Guidance for the Preparation of a PEA Report" the information needed here is all past and present property (including their nest recent address) and all past and present person or co:rporations which owned arrljor operated business at the site. Title search required to detenni.ne the past and present ownership and operations at the site. Specifically who was operated the vehicle maintenance area on canyon 2?

- Furth.er record search required to get the infonnation regarding the oil drillin:f.

Page 14, SUbsection 3.2.2, Groundwater Occurrence.

- We need a data of groundwater wells with in three mile radius of the site.

Page 14, SUbsection 3.3.1, Inventory Materials in canyon 1 Area.

o According to the provided PEA report the wastes found in the area were plaster board, asphalt and concrete, roofing paper, PVC and metal piping and wire. Arry *PVC,* PCB or metal contamination sampled or detected at the area?

Page 15, SUbsection 3.3.2, canyon 2 Area.

o 'Ihe urrlerground pipeline is believed to be a fonner water line. Why didn't you examine or inspect it to confinn a water pipeline or not? Confinnation is necessary regarding this water line.

Page 15, SUbsection 3.4, Soil Sampl,im Results.

o No sarrples taken fran the canyon 1 area, why?

Page 19, SUbsection 3.7, ACM Test Results.

o Approximately 25 to 50 pounds of non-friable pipe (ASB-7 tested and detected positive for Asbestcs) -were located in canyon 1 area. But this data is not included in Table 2 - F.st.bnated volume of debris - canyon 1 area.

Page 20, SUbsection 4.1, Remedial Action Plan.

o 'Ihe provided PEA report sher.vs no sampling was corrlucted in canyon 1 area and according to the visual examination concluded the final detennination. Is there any PVC, FCBs, heavy metals or organics in that area? Confinnation required.

Page 22, SUbsection 4.2.1, Bioremediat:fon·.

o Acco to our urrlerstarrling, Ventura County Envi.rormental Health Ceparbnent (VCEHD) didn't gave any approval of the Remedial Action Plan (Bioremediation) of contaminated soil. 'Ihey granted the approval for the disposal options of non-hazardous solid waste only. 'Ihen where from you get the approval of Rsme::lial Action Plan for hazanious waste (Bioremediation)? If VCEHD issued a pennit for Biorem:diation, attach a copy of the approval with the report.

Page 23, SUbsection 4.3, Abandoned Oil Exploration Test Hole.

o Re-abarrlornnent of Oil Wells is also required under the current COG regulations and locate the lllllldsump which may contain hazardous substances. 'Ihat was also not addressed. in the closure plan.

Page 23, SUbsection 4. 4, Water Wells.

o Address about the water wells and its aban:lornnent done properly or not. 'Illatwas not addressed in the Closure Plan.

C'CXMMENTS ON HAZARD RANKING SYSTEM (HRS).

More evidence is needed prior to elimination of the surface water pathway. 'The site is a canyon am therefore, it is reasonable to assume that the contaminants have 1:een released to the environment through this pathway. According to the surface Water Route Stwlemental Guidelines for HRS purpose, Page 19, "surface Water'' definition is as folla.vs:-

-all perennial streams am rivers
-isolated but perennial porns or lakes
-man-made ditdles that perennially flew into other surface water
-inte.nnittent streams only in areas with less than 20 inches annual precipitation

Route characteristics evaluated only if there is not an observed release to surface water. Provide an irrlication of the likeliliocd that uncontaminated materials will move along the surface water pathway.

Documentation required for:

1. surface water use
2. Distance to the nearest surface water
3. Distance to the endangered species

Accorc:lirg to our analysis of HRS package grourrl water route score alone is more than 15. Is this HRS package approved by IHS prior to the clean up? You totally ignored the surface water target.

PFA MANUAL

According to the PEA manual follc,winJ infonnation also required for the finalization of this report:-

1) Mailing Address
2) !hone Number
3) other names of the site
4) EPA Identification Number
5) Abandoned Site Program Infonnation system (AS) Database Number
6) Assessor's Parcel Number and Maps.
7) Section am Meridian (Provided the Township am Range)
8) Map of site location (Give a demarkation of one mile radius)

9) Describe any evidence of environmental ilrpacts fran a release at the site.

10) t'escribe the penneability of the soils in the tmsaturated zone and identify the least penneable continuous layer of soil under the site and the penneability of that layer.

11) Describe the surface slope at the site. Also, provide the slope of any inteJ::vening terrain between the site and the nearest downhill surface-water body. If the site is in a closed basin or actually located in surface water, this fact should be stated.

12) Describe the stability of the soils and seismic corrlitions for the site.

13) Describe accessibility to the site in terms of both natural and man-made features or structures which currently restrict human access to the site.

14) Describe any measures which have been taken to contain or prevent direct contact with hazardous substance/wastes in or on the soil at the site.

15) Provide the distance and location to the nearest residential area, school, business, day care center, nursing home, senior citizen comm..mity, or hospital with in one mile of the site.

16) Provide the distance and location to the nearest critical habitat for sensitive or en::1aI"Bered species.

17) Factors related to water pathways (See page 27 of the PEA manual)

18) Factors related to air pathways (See page 30 of the PFA manual)

19) PEA Sampling Activities (See page 34 of the PFA manual)

a. Sample Plan Preparation

b. Sample collection and analysis

20} calculate the screening values: 'Ihe contamination level of Barium, copper, lead and nickel is greater than the screening value in both of the sanples analyzed for metals. 'Ihe concentration of these metals is greater that STD: and the backgrouni level is not provided within this report. So it is necessary to calculate the contamination level of each dlemical according to Page 35 of PEA Manual, last paragraph (See page 35 of the PEA manual) •

21) Characteristics of the hazardous substances or wastes (See page 38 of the PEA manual) •

22) Environmental threat assessrrent (See page 39 of the PEA manual). Provide a summary of the assessments undertaken to evaluate human health an:1 the environrnent posed by the site.

23) In conclusion, the evidence shows that a release of hazardous substances has occurred during the past site activities and warrants a further action recammendation. A Site Characterization is required to dete:nnine if No Further Action (NFA) is needed or if a Removal or Renrledial Action is required to protect the public health and the environment. Further actions are subject to the Department's fee-for-service basis for the administrative oversight as provided in the Health & Safety Cede Section 25343.

October 19, 1990

1.0 INTRODUCTION

1.1 PROJECT DESCRIPTION

This closure report has been prepared by Harding Lawson Associates (HLA) on behalf of Walnut Canyon Associates, the owners of a 350-acre parcel located one-half mile north of Moorpark, California (Plate 1). HLA's services were authorized by Mr. Richard Fausset of Walnut Canyon Associates on September 26, 1989. The property is currently in escrow which is scheduled to close on October 31, 1990. JBH Development Company, Incorporated (JBH) is the purchasing group. Gorian and Associates is providing engineering services to JBH.

The closure report describes the remediation program which was completed at the site. A brief description of the project background and previous investigations is also included.

1.2 SITE DESCRIPTION

The Walnut Canyon Tract is located just north of Moorpark in the northeast quarter of Section 33 of Township 3 North, Range 19 West, San Bernadine Meridian, and is bounded on the east by Walnut Canyon Road (Plate 1). The 350-acre parcel of property is characterized by rolling hills with two north-south trending canyons representing the major topographical features. The larger of the two canyons, designated herein as Canyon 1, is located in the eastern portion of the parcel; Canyon 2 is located along the eastern boundary of the property (Plate 2). The former sump is located in Canyon 2 near the southern property boundary.

The property remains undeveloped and is covered by chaparral and native grasses. Vegetation in the canyon bottoms is dominated by scrub willow. Pepper trees and eucalyptus trees have been planted in the Canyon 2 area and along the southern property boundary.

The Canyon 1 and Canyon 2 areas have been the site of unauthorized rubbish and debris disposal since at least 1978. The Canyon 1 area is an incised canyon area in which primarily landscape and demolition debris have been discarded along with lesser amounts of rubbish, tires, abandoned vehicles, and appliances. The Canyon 2 area is the site of discarded rubbish, demolition and landscape debris, and an abandoned vehicle maintenance area where soils were contaminated apparently by limited surficial spills of waste oil.

1.3 SCOPE OF WORK

The objective of HLA's services was to evaluate the site conditions and then develop and implement a remedial action plan (RAP) for the affected areas. Four phases of activities were identified in HL\.'s proposal dated May 3, 1989 to accomplish this objective. The activities for each of the phases are described in the following section.

1.3.1 Phase 1 - Site Characterization

Phase 1 consisted of a site characterization to evaluate the types, character, and extent of.waste materials, and to research the locations and abandonment techniques of onsite water and oil wells. A review of site history, which typically consists of historical aerial photograph review, review of public agency files, and discussions with persons knowledgeable of the site, was previously conducted by another consultant. This information was reviewed and used to develop the scope of work for the project. The results of the Phase 1 program were described in a previous report (HLA, 1990).

1.3.2 Phase 2 - Remedial Action Plan

Phase 2 included development of a RAP based on the information collected during the Phase 1 Site Characterization. The RAP (HLA, 1990) provided a description of the site remediation techniques to be implemented for remediation of the affected areas.

1.3.3 Phase 3 - Remediation Monitoring

Phase 3 consisted of site remediation and monitoring activities. This included observation and documentation of waste removal operations which took place between October and December 1989 and in August and September 1990.

1.3.4 Phase 4 - Verification Program

Phase 4 consisted of the verification and documentation of the site remediation program. The verification program consisted of collecting and analyzing representative soil samples from the base of the excavations in the Canyon 2 area to confirm that soils exceeding the designated remediation limits had been excavated for treatment. In the Canyon 1 area, samples were taken from the soils exposed in the canyon bottom after debris removal operations were completed to evaluate whether hazardous concentrations of metals were present.

2.0 SITE CONDITIONS

A detailed description of the site conditions, prior to remediation, was presented in the site characterization/remedial action plan (SC/RAP) report (HLA,1990). This information is summarized in the following sections as background data for the remediation activities described herein.

2.1 SITE HISTORY

Available background information indicates that the site has primarily been used for livestock (cattle and horses) grazing from at least 1945 to the present. Orchards, reportedly apricots and walnuts, were located in the valleys and along the lower portions of the hillsides throughout most of the property prior to 1945. The orchards were removed sometime before 1962 based on review of aerial photographs. The valley and hillsides west of Canyon 1 were reportedly graded for planting rye and barley for horse feed between 1975 and 1980 (approximately).

Presently most of the site remains in its natural state. Exceptions include the Canyon 1 area in which unauthorized dumping has reportedly occurred for the past 10 to 20 years. The debris primarily included landscape and demolition debris with lesser amounts of household-type paper and plastic debris and scattered appliances, furniture, and automobile bodies and parts. An inventory of the debris types and volumes based on our site reconnaissance was presented in the SC/RAP report (HLA, 1990).

Two rectangular buildings and one large circular aboveground tank (believed to be a water tank) in the Canyon 2 area were observed in the 1945 aerial photographs. These structures were located on the southeast fringe of the property. The western-most building appears to be a house and the other a barn. The structures do not appear in the 1962 aerial photograph and are not present today. Two concrete slabs and scattered debris in the Canyon 2 area are located as shown on Plate 2. These are the only remaining evidence of the former development.

A portion of the Canyon 2 area was apparently used for vehicle maintenance, limited dumping of debris, and storage of miscellaneous items including tractor trailers, water trucks, a boat and boat mold, and tractor implements. Associated with the maintenance activities were numerous 5-gallon and 55-gallon drums labeled as containing motor oil, aboveground transmission fluid storage tanks, 5-gallon freon cans, and other miscellaneous containers. An inventory of the debris types and estimated volumes, based upon our site reconnaissance, is presented in the SC/RA.P report (HLA, 1990). A limited area of hydrocarbon contaminated soils was also detected in the area. Additional information on the extent and concentrations of hydrocarbons in soils is presented in Section 3.2.2 of this report.

Seven water wells and a boring, which was never completed as a well, were drilled in the Canyon 2 area as shmvn on Plate 2. Steel water lines which apparently connected the wells were also noted in the area. In addition, two wells are reported just south of the prop rty line in Canyon 2 and two other wells are located south of the property along the southern extension of Canyon 1 (Plate 2). Available water well logs were presented in the SC/RAP report (HLA, 1990).

An abandoned oil exploration test hole, drilled in June 1960 by the Petan Company, is located approximately in the area indicated on Plate 2. Documents obtained from the California Department of Oil and Gas (DOG) indicate that the well was drilled to 4,200 feet but did not encounter productive zones. DOG records indicate that the well was subsequently abandoned according to specifications of the DOG, who approved the abandonment in a document dated June 16, 1960. HLA performed limited trenching and geophysical surveys in an attempt to locate the well but were unsuccessful as described in the SC/RAP report (HLA, 1990). Attempts by HLA to contact knowledgeable parties at the Petan Company found that they no longer had any records of the oil exploration operations and that the oil exploration portion of their business was sold several years ago. Available oil well records were presented in the SC/RAP report (HLA, 1990).

Abandonment of the water wells and additional attempts to locate the oil well are not within the scope of HLA's investigation and are expected to be performed by others at a later date.

2.2 GEOLOGIC AI'ffi GROUNDWATER CONDITIONS

2.2.1 Site Geology

The site lies within the eastern portion of the Ventura Basin within the Western Transverse Ranges geomorphic province of southern California (Dibblee, 1982). The property is underlain by older alluvium (Qoal) consisting of yellow-brown to dark brown sand with varying percentages of clay and silt (Gorian, 1978). Cobble-sized gravels are also present at the ground surface throughout the site. The site lies on the southeast side of the Moorpark anticline which is inferred from oil well log data (CDMG, 1973). The older alluvium is, however,. mostly structureless and massive with no distinct bedding orientation (Gorian, 1978).

2.2.2 Groundwater Occurrence

Groundwater information for the Canyon 1 and Canyon 2 areas was obtained from the California Department of Water Resources (DWR) and Ventura County Flood Control District (VCFCD) files. According to the well drillers' logs, groundwater was typically encountered at 95 to 140 feet below ground surface in the Canyon 2 area at the time of drilling (1946 to 1949). Similarly, water levels at the south end of Canyon 1 were reported at approximately 110 feet when the wells were installed in December 1949. Well 3N/19W-33M1 was sounded to a total depth of 75 feet and found to be dry. The other onsite wells were found to be blocked with debris at a depth of approximately five feet below the surface and thus were not sounded. No reconnaissance or sounding of the offsite wells was conducted as part of the investigation.

3.0 REMEDIATION ACTIVITIES

3.1 CANYON 1 AREA

Previous site characterization activities indicated that the majority of debris consisted of landscape debris (wood chippings, tree cuttings, and tree stumps). In addition to the landscape debris, a large volume of demolition debris. was located in the canyon. This material included old lumber, plasterboard (drywall), asphaltic concrete and concrete, roofing paper, PVC and metal piping, and wire. Lesser amounts of rubbish, appliances, furniture, and automobile bodies, parts, and tires were also scattered throughout the canyon. A small area of partially buried construction debris was identified at the northern end of the canyon (Plate 2). The debris within this area contained broken concrete debris with minor amounts of asphaltic concrete, plasterboard, metal piping, and plastic debris. A small quantity of asbestos containing} ransite pipe (approximately 200 to 400 pounds) was also located in the Canyon.

Essentially all of the identified foreign debris, including the buried debris at the head of the canyon, was removed from the canyon and stockpiled on the flat areas adjacent to the canyon. The plasterboard material, dirt, and miscellaneous debris (pipes, trash, landscape debris, etc.) was removed to the extent practical and then stockpiled onsite. Concrete and asphaltic concrete debris were segregated, broken into pieces less than 3-feet in size and exposed rebar was trimmed and removed. The rebar was disposed of offsite and the concrete and asphaltic concrete were stockpiled and left onsite. Removals were performed using a Caterpillar 977 loader equipped with a Peterson demolition bucket. The loader was occasionally assisted by a Caterpillar D-7 bulldozer.

Except for the remaining stockpiles of concrete, asphaltic concrete, plasterboard debris, excavated materials were removed in trucks for disposal at the Chiquita Canyon Landfill near Valencia, California, and Calabasas Landfill, near Calabasas, California. A total of approximately 3,025 tons of debris was removed for offsite disposal. A limited amount of scattered debris

(scattered trash. landscape debris. pipes, etc.) remains within the stockpiled material and the canyon area which is scheduled to be removed manually during future grading operations. The transite piping was manifested as non-hazardous waste and disposed of at the Ballard Landfill in Ventura, California.

The area in which debris was removed from Canyon 1 is shown on Plate 2. Periodic site visits were made by an HLA engineer or geologist to observe cleanout operations and the types of materials encountered and removed; The rubbish unearthed was found to be generally consistent with the types and relative volumes reported in the SCP/RAP report (HLA, 1990).

3.2 CANYON 2 AREA

3.2.1 Debris Removal

The debris in the Canyon 2 area was cataloged during the site characterization (HLA, 1990) ar.d included an abandoned boat, abandoned motor vehicles, containers of various types and sizes, corrugated siding, culvert piping, furniture, auto parts, and other miscellaneous items. The containers included 5- and 55-gallon drums labeled as containing motor oil, 1-gallon and 1-quart antifreeze containers, and 5-gallon freon cans. Most of the drums and containers were found to be empty, however, some were found to contain spent motor oil or water which had collected in the open containers. Lesser amounts of construction debris (concrete, lumber, and cinder block bricks) and landscaping debris (branches and clippings) are also scattered throughout the Canyon 2 area. Underground 2- and 4-inch-diameter pipes, believed to be water lines connecting water wells to the former water tank, were also observed in the area. An inventory of the debris types and quantities was presented in the SC/RAP report (HLA, 1990).

The debris and rubbish were removed in August and September 1990. Removal, stockpiling, and disposal operations were similar to those methods described for the Canyon 1 area. Empty drums were crushed prior to disposal. HLA representatives observed the removal operations to

confirm that the materials encountered were similar to those described during the site characterization activities. The debris, approximately 50 tons, were taken to the Calabasas Landfill for disposal. Remnant waste oil, approximately 8 gallons, was removed by L and H Consulting, Inc. for disposal at an oil recycling facility.

At the request of Mr. Glen Aalbers, representing JBH, HLA verified that exposed piping in the Canyon 2 area was part of the water well system on the site and is not connected to an underground storage tank; the exposed piping has been removed from the site.

3.2.2 Contaminated Soil Remediation

During site characterization activities, soils containing elevated levels of hydrocarbons were encountered in four areas near the concrete pads in the Canyon 2 area (Plate 3). The extent of affected soils, evidenced by surficial staining, is shown on Plate 3.

Selected soil samples from the Canyon 2 area were submitted for chemical analysis during the site characterization program. Results indicated that hydrocarbons were present in the near-surface soils adjacent to the two concrete pads (Areas 1, 4, and 5) and the area where the aboveground storage tanks were previously located (Area 3). Limited surficial staining adjacent to 5-gallon buckets of waste oil was noted in Area 2. In general, high concentrations of total petroleum hydrocarbons (TPH) were detected in the surface samples, where the soil was noticeably stained with hydrocarbons to depths of 3 to 6 inches below the ground surface. Samples analyzed at depths of 1.5 to 5 feet below ground surface, where no visual evidence was noted, typically contained low to nondetectable levels of hydrocarbons. A detailed description of the soil analytical results was presented in Section 3.4 of the SC/RAP report (HLA, 1990). A summary of the analytical results from the SC/RAP is presented in Table 1. Laboratory test reports are included in Appendix B of the SC/RAP report. Sampling locations are shown on Plate 3.

The selected remediation method (based on the options presented in the SCRAP report, [HLA, 1990]) was enhanced soil biodegradation (ESB). Soils with TPH concentrations above 100 miiligrams per kilogram (mg/kg) were excavated for treatment within an ESB treatment cell. After treatment, treated soils will be placed as subgrade below paved roads during the proposed grading operations.

The generalized construction details of the ESB treatment cell are shown on Plate 4. Prior to construction, the ground surface underlying the cell was graded to remove vegetation and sharp objects. Background samples were obtained from the soils approximately 3 to 6 inches below grade for laboratory analysis of TPH. Approximate locations of the background samples are shown on Plate 4. Results are summarized in Table 2, and laboratory test reports, with chain-of-custody documentation are presented in Appendix A As noted in Table 2, the native soils conrain TPH concentrations of 6 to 24 mg/kg which apparently occurs as natural organic material. Two layers of 6-mil thick polyethylene sheeting were then placed on thi ground surface and covered with 3 to 6 inches of protective soil.

Identified soils containing TPH concentrations in excess of 100 mg/kg were excavated to depths of 1 to 4 feet below ground surface as shown on Plate 5. Prior to excavation, vegetation was removed from the surface by scraping it free with the tractor. The vegetation (dry weeds) was removed during subsequent debris clearing operations. Excavation was performed using a Case 580 backhoe operated by L and H Consulting, Inc. of Ventura, California. Operations were observed by an HLA engineer or geologist. Once excavated, contaminated soil was transferred to the onsite treatment cell in Zones A through D. Approximately 150 cubic yards of material was transferred to the cell. The soil was mixed within the ESB cell using a Kubota Model No. 1640-A rototiIIer until it reached a near uniform thickness of approximately 0.75 feet and clods were broken down. Rocks, trash, plant material, metal, etc. were hand picked from the soil. Water was applied periodically to help mix the material and.suppress dust.

Previous site characterization investigation data indicated that soils from 0 to 6 inches in depth in areas along the east and west sides of the northern concrete pad and the north side of the south pad (see Plate 3) contained significantly higher TPH levels than the majority of the other soils. These soils, consisting of approximately 7 cubic yards, were selectively excavated based on evidence of staining and stockpiled on the concrete pad for further testing. Two samples were submitted to ABB Laboratories in Camarillo, California for analysis of TPH by EPA Test Method 418.1 (waste oil) and modified 8015 (diesel). Results are summarized in Table 3: laboratory test reports and chain-of-custody documents are presented in Appendix B. Concentrations of TPH as waste oil in the stockpiled material were 2260 mg/kg and 5220 mgtkg for the two samples analyzed. No TPH was detected as diesel.by modified EPA Test Method 8015. Based on the analytical results, the selectively excavated materials were transferred to the ESB cell but were placed in Zone E and segregated from the remaining soils in the treatment cell.

Treatment began on August 1, 1990 and consisted of applying nutrients dissolved in water once a week and rototilling the soils three times a week. This process continued for 4 weeks. Th nutrient mix consisted of approximately 100 pounds of phosphate and 300 pounds ammonium nitrate mixed with approximately 1,500 gallons of water. Approximately 10 pounds of lime was applied on September 7, 1990 and again on September 14, 1990 to raise the pH level of the soils. Beginning on the fifth week, rototilling and watering was reduced to a weekly schedule and the application of nutrients was ceased.

Soil samples from the ESB were collected for analysis of TPH by EPA Test Method 418.1 on August 1, 23, and September 20, 1990 to evaluate ESB progress. Samples were collected from each of five designated zones (A through E, Plate 4). Samples from each zone consisted of composites from 4 locations in Zones A through D and 3 locations in Zone E. In addition, a split sample from each of the four composited samples collected in Zone D was analyzed at each sampling event to evaluate the variability of the composite sampling process. Sampies were collected from approximately 6 inches below the surface, mixed in a stainless steel tray and

placed in glass jars. Results are summarized in Table 4; laboratory test reports and chain-of-custody documents are contained in Appendfa: C.

The results of the soil samples from the ESB cell indicate that TPH levels decreased significantly after excavation, mixing and initial treatment in the ESB cell, but that subsequent treatment has not yielded substantial decreases below 100 mg/kg TPH based on analytical data through September 25, 1990 (Table 1). The average TPH concentrations in Cells A through D, including the composite and individual samples for samples collected on August 1, 23, and September 25, 1990 is 85 mg/kg. The standard deviation of the sample population is 43. The results of a Students t-test analysis on the sample data indicates a 90 to 95 percent level of confidence that a given sample has a concentration less than 100 mg/kg. Soils containing elevated levels of TPH in Zone E decreased from 2,260 and 5,220 mg/kg after initial excavation, to 767 mg/kg and 333 mg/kg after 4 and 8 weeks of treatment, respectively. Treatment will continue for the soils in Cell E will continue until October 31, 1990 to further reduce TPH concentrations to\within the range of the four other zones. If the TPH levels do not decrease, they will be removed for offsite disposal.

4.0 CONFIRtv1ATION SALvIPLING

4.1 CALWON 1 AREA

Following completion of debris removal from the Canyon 1 area, an HLA geologist observed the area to verify that the debris had been excavated from the canyon. The areas of the cleanout are shown on Plate 2. Based on our observations, all identified material scheduled for offsite disposal has been removed from the site. Following excavation of the debris, Mr. Barry Marczek of the Ventura County Solid Waste Division (VCSWD) observed the area on August 31, 1990 and found it acceptable. The VCSWD authorized use of the plasterboard debris, concrete, and asphaltic concrete as onsite fill subject to approval of the soils engineer (Gorian: and Associates).

The cleanout and stockpiled material remaining at the site was also observed on September 9, 1990 and found to be acceptable by Mr. Richard Fausset, Walnut Canyon Associates; rvfr. Glenn Aalbers, JBH; and Mr. Scott Simmons, Gorian and Associates.

Following cleanup operations, soil samples were collected from five locations at the bottom of the Canyon 1 area (Plate 2) for confirmation chemical analysis. Samples were submitted either from areas where the most abundant accumulations of metallic debris were observed during the site characterization, or in areas at the junctions of the side canyons and main canyon where metals may have accumulated as a result of transport from intermittent stream runoff. Samples were submitted for analysis of Title 26, California Code of Regulations (CCR) metals. The analytical tests did not detect any total metal concentration exceeding the designated hazardous levels (total threshold limit concentration, TTLC) of CCR, Title 26. Analytical reports, with chain-of-custody documentation are presented in Appendix D. The analytical program specified in the SC/RAP report (HLA, 1990) was amended to exclude analysis of TPH and asbestos because HLA did not encounter evidence of such substances during the excavation. This modification to the program was authorized by Mr. Fausset (Walnut Canyon Associates) and Mr. Aalbers (JBH).

4.2 CANYON 2 AREA

4.2.1 Debris Removal

Following cleanup operations, the area was observed by an HLA geologist to check that the removal was complete. The remediated areas are shown on Plate 2. One small stockpile of broken concrete was left onsite for use during future grading operations. The two concrete pads and remnants of the former foundations were left in place.

Mr. Barry Marczek of the VCSWD observed the cleanout area and found it acceptable. The cleanout area also observed and approved by Mr. R. Fausset (Walnut Canyon Associates) and Mr. G. Aalbers (JBH), and Mr. S. Simmons (Gorian and Associates).

4.2.2 Soil Remediation

Soil samples were collected from the excavation subgrade to check that the TPH levels in soils left inplace were below 100 mg/kg as recommended in the SC/RAP report (HLA, 1989). Sampling locations are shown on Plate 5. Grab samples were collected at depths of approximately 6 inches below the subgrade elevation and placed in labeled lass jars. Discrete and composite samples were collected from the four areas as shown on Plate 6. Samples were stored in ice-chilled coolers for transport to ABB Laboratories in Camarillo, California for analysis of TPH (EPA Test Method 418.1). Selected samples were analyzed for purgeable organics by EPA Test Method 8010/8020. Results are summarized in Table 6; laboratory analytical reports and chain-of-custody documents are contained in Appendix **E.**

The results indicate that soils at most sampling locations within the excavation subgrade contain TPH as waste oil at concentrations below the laboratory detettion level (Table 5). Four samples collected along the eastern and southern edges of the northern concrete pad at depths of 2.5 to 3.5 feet below the former ground surface had TPH concentrations ranging from 6.7 to 53 mg/kg.

It is possible that these represent natural organic material (Table 5). No purgeable organics were detected in samples from the excavation subgrade.

5.0 SUMMARY AND CONCLUSIONS

A summary of the results of the remedial action plan implemented at the Walnut Canyon Site is provided as follows:

- The Canyon 1 and 2 debris removals have been completed to the satisfaction of HLA and representatives of the Ventura County Solid Waste Division, Walnut Canyon Associates, JBH Development Company, Inc. and the geotechnical engineers, Gorian and Associates,

- A total of approximately 3,076 tons of debris was excavated and disposed offsite at municipal (Class 3) landfills,

- Stockpiles of concrete, asphaltic concrete and plasterboard debris have been left onsite for use during future grading operations with the agreement of the aforementioned parties. We suggest that, to avoid potential nuisance, stockpiled plasterboard debris should either be mixed with clean soils to yield non-discernable concentrations of plasterboard debris and/or be buried in fill areas such that the potential for future exposure is minimized,

- Laboratory analyses of verification soil samples taken after removal of debris from Canyon 1 did not detect hazardous levels of metals[1],

- Soils in the Canyon 2 area which contained elevated levels of hydrocarbons (TPH over 100 mg/kg) have been excavated and treated using ESB techniques. Soils from Zones A through D of the ESB have been treated to reduce average TPH concentrations to below 100 mg/kg. Treatment of soils in Zone E of the ESB cell (consisting of approximately 7 cubic yards) will continue until TPH levels are reduced to average concentrations less than 100 mg/kg, or they will be disposed offsite at an appropriately licensed landfill,

- To reduce potential future liabilities, we recommended that treated soils from the ESB cell be placed as subgrade below paved roads or covered with a minimum of 3 feet of clean soil to isolate them from potential human and animal contact during and after site development,

[1]Hazardous levels of metals defined by California Code of Regulations, Title 26, Section 66699.

- At the agreement of the aforementioned parties, the soils underlying the two concrete pads in the Canyon 2 area, and the concrete itself, were not tested to evaluate the presence of hydrocarbons. Based on visual observation of soils along the perimeter of the pads and the condition of the concrete, the potential for encountering significant concentrations of hydrocarbons is considered low,

- Caution should be used during future grading operations with respect to the abandoned oil well casing. Efforts should be taken to identify its location after stockpiled material is removed from the area of the well site,

- The onsite water wells should be properly abandoned prior to development, and

- It is our judgement that the debris removal and soil remediation has been conducted in accordance with standards contained in all applicable laws and regulations. Based upon our investigation of the subject property, HLA is unaware of any additional hazardous or toxic materials on the property.

Phase I Environmental Site Assessment Update and
Limited Phase II Soil Screening for Organochlorine Pesticides
Hitch Ranch, Moorpark Specific Plan No. 1, Moorpark, California, 93021

1.0 INTRODUCTION

Applied Environmental Technologies, Inc. (AET) is please to present this report of a Phase I Environmental Site Assessment – Update (ESA – Update) and a Limited Phase II Soil Screening Assessment (soil sampling and selected analysis) for the approximate 282 acres of undeveloped, hilly land known as the Hitch Ranch (Moorpark Specific Plan No. 1). The property is generally located north of Poindexter Avenue, east of Gabbert Road (with a portion to the west of Gabbert Road), and west of the properties located along the west side of Moorpark Avenue/Walnut Canyon Road (Highway 23) in northwest Moorpark, California (Site, Plate 1). The ESA was performed for Impact Sciences of Camarillo, California.

Fifteen or 16 water wells are reportedly located on the Site, based on a July 26, 2004, Memorandum from the Ventura County Public Works Agency Water Resources Division (VCWRD). One well is listed as active, four are listed as destroyed and two are listed as abandoned (but not destroyed). The locations of the remaining wells are listed as unknown. AET reviewed the status of the water wells and included the findings in this report.

Impact Sciences provided a document to AET titled: *Phase I Environmental Site Assessment, Hitch Ranch, Moorpark Specific Plan No. 1, Moorpark, California, 93021,* dated February 13, 1998, prepared by Gradient Engineers, Inc. of Westlake Village, California. According to the previous Phase I ESA, portions of the Site were historically developed with orchards. Based on the identification of orchards on the Site, AET performed a limited Phase II Soil Assessment in order to confirm or deny significant impacts to the Site from the potential historic use of organochlorine pesticides on the orchards.

The objective of the Phase I ESA Update is to identify recognized environmental conditions at the Site that may have occurred since the date of the previous Phase I ESA. The ESA was performed in accordance with the scope of work contained in the American Society for Testing and Materials (ASTM) Designation E 1527-00. As defined, recognized environmental conditions include "the

presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimis conditions that generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate government agencies. Conditions determined to be de minimis are not recognized environmental conditions."

The Phase I ESA Update and Limited Phase II Soil Screening Assessment (SSA) was performed in accordance with the scope of work provided in AET's proposal dated October 5, 2005. The work on the Phase I ESA Update was put on hold for a time. The ESA was performed under the direction of a California Registered Environmental Assessor qualified to perform the work. The Limited Phase II SSA was performed under the direction of a Professional Geologist qualified to perform the work. Details of the methods of investigation, findings, and conclusions are provided herein.

2.0 SITE DESCRIPTION

2.1 Property Description

The Site is an irregular shaped parcel of vacant land consisting of approximately 282 acres of land (Plate 1). The Site is generally located in the north half of Section 5, and the northeast quarter of the southeast quarter of Section 6, Township 2 North, Range 19 West, San Bernardino Base and Meridian. The southern boundary of the Site extends for approximately 5,280 feet (one mile) along the north side of a concrete lined storm water channel, a railroad right-of-way, and Poindexter Avenue, with residential and commercial properties south of Poindexter Avenue. West of the Site boundary are vacant land and an area of residential properties in a rural setting. Gabbert Road crosses the western portion of the Site and provides access to the residential properties northwest of the Site. A fence line and a eucalyptus tree row are along the northern boundary of the Site with generally undeveloped land (range land) to the north. East of the Site are residential properties, a school, and vacant land. The north/south trending Walnut Canyon Road (also known as Moorpark Road and State Highway 23) is located between 1,000 and 1,500 feet east of the Site. At the time of AET's site visit, the only structures on the Site were an above ground water tank located in the northeast portion of the Site; footings and concrete floor slabs located in the central portion of the Site (reportedly former apricot pitting and drying buildings, and hog pens); and three water wells generally located near and along the southern boundary of the Site. Photographs showing the current development of the Site and vicinity are provided as Attachment A.

2.2 Physiographic Description

The Site is located on the south flank of the Oak Ridge/Big Mountain hills within the central Transverse Ranges physiographic province of southern California. The Site elevation ranges from approximately 720 feet above mean sea level (msl) in the northern portion of the Site to

approximately 475 feet above msl in the southern portion of the Site as measured from the United States Geological Survey, Moorpark, California 7.5 Minute Topographic Quadrangle Map (1955, Photorevised 1974). The topographic gradient is toward the south. South flowing intermittent streams and gullies on the Site drain southward to the concrete channel along the south boundary of the Site. The nearest surface water drainage is the west flowing Arroyo Simi located approximately 0.56 mile south of the Site. The Arroyo Simi flows westerly to the Pacific Ocean.

2.3 Geology/Hydrogeology

The Site is underlain by uplifted and eroded Quaternary age alluvium and terrace deposits that overlie Plio-Pleistocene age loosely consolidated sandstone, shale, and gravel. The Site is located in the eastern portion of the South Las Posas Groundwater Basin. The depth to groundwater ranges from greater than 100 feet in the northern portion of the Site to approximately 10 feet near the Arroyo Simi, south of the Site. The water quality is generally poor, with total dissolved solids greater than 1,000 milligram per kilogram. The groundwater in areas of the basin has been impacted by nitrate (Ventura County Public Works Agency Hydrologic Data, 1986).

3.0 INVESTIGATION METHODOLOGY AND FINDINGS

3.1 Summary of Previous Phase I ESA

AET reviewed the previous Phase I ESA dated February 13, 1998, and an Addendum to Phase I ESA dated February 14, 2000, prepared by Gradient Engineers (GE). The Phase I ESA identified the past uses of various portions of the Site as: an apricot orchard (1930s to 1948); hog farming (1930s to 1960s); lemon orchard (1948 to 1970s); wheat farming; dairy cow grazing; and horse training. Structures identified on the Site in 1998 by GE included: a single family residence at 537 Poindexter Avenue (in the southeastern portion of the Site); a workshop, three wooden structures, an animal staging area and corral, and footings and concrete slabs in the central portion of the Site (reportedly used for apricot pitting and drying operations, an office, and hog pens); a large, round, above ground steel water tank in the northeast portion of the Site; and three water wells. Except for the occupied residence, the Site was reported to have been fallow since the early 1980s. No underground storage tanks (USTs) were observed on the Site and none were identified as having been historically located on the Site.

In the Phase I ESA, GE identified eleven areas of potential concern (APCs) at the Site: 1) suspect asbestos containing building material in Site buildings; 2) empty containers located in and around structures on the Site; 3) empty paint cans, a car battery, and other debris located in a wash east of Gabbert Road; 4) landscape debris dumped in a small valley west of Gabbert Road; 5 and 6) orchard heaters (smudge pots) in the southern portion of the Site, some with bullet holes; 7) former above ground oil tanks located along the southern boundary west of Gabbert Road (identified as such on a 1951 topographic map and observed in 1938 and 1952 aerial photographs); 8) two locations with abandoned vehicles; 9) an above ground, 500-gallon diesel tank located near the end of Casey Road at the east boundary of the Site with the following notation: "It is not evident if this tank is on the subject property"; 10) abandoned agricultural equipment on the Site; and 11) a reported septic

system in the central part of the Site. Copies of the Site Location Map, and Site Map with the numbered locations of the APCs (findings) are provided as Attachment B.

The Phase I ESA report included the following recommendations: removal of the trash, junk and debris with soil sampling as needed; survey of the structures for asbestos and lead based paint; soil sampling in the areas of the orchard heaters and above ground storage tank; and soil sampling in the orchard areas for agricultural chemicals.

The Addendum Report (February 2000) prepared by GE was in response to concerns of the City of Moorpark Community Development Department following a review of the 1998 Phase I ESA Report. The Addendum addressed the location and status of active and leaking USTs located off-Site within the Site vicinity; the status of an adjacent property north and northeast of the Site with un-permitted solid waste disposal area (identified as The Walnut Canyon Tract Landfill); and the status of the on-Site water wells. GE reviewed agency reports including those submitted to the California Department of Toxic Substances Control (DTSC) for the clean up of the Walnut Canyon Landfill; reviewed UST and Leaking UST lists at Ventura County Environmental Health Division (VCEHD); and reviewed water well information for 15 potential water wells on the Site at the VCWRD. The Addendum Report concluded that the off-Site active USTs, leaking USTs, and the Walnut Canyon Tract Landfill did not pose an "environmental concern at this Site". A list of the 15 potential on-Site water wells was provided with nine of the wells having a depth of casing, and three of the nine were listed as abandoned (the status of the water wells is further discussed in Section 3.4, below). The VCWRD provided GE with the mitigation measures for any water well (currently identified or discovered during future grading).

3.2 Federal and State Database Review

A government database report, prepared by Environmental Data Resources (EDR) of Southport, Connecticut of available federal, state and county agency databases was reviewed to identify government regulated properties having known recognized environmental conditions and potential environmental concerns within the vicinity of the Site. Because of the size of the Site, the radii of investigation for the Federal and State agency lists were extended up to 2.0 miles. A description of the government databases reviewed is detailed in the EDR report. Also included in the EDR report are maps illustrating the location of listed properties relative to the location of the Site. A complete copy of the EDR report, dated November 11, 2005 that was ordered shortly after the original start work date, is provided as Attachment C.

A summary of properties that could not be mapped by EDR but were identified as potentially within the Site vicinity (orphan properties) is also included in the EDR reports. Of the listed unmappable properties, none are identifiable as being located adjacent to the Site. The pertinent findings of the government database review are summarized below.

The Site is not identified in the EDR report.

The Site is not located with 1.0 mile of a federal Superfund property.

There are three properties located cross or up gradient of the Site listed in the database report. Michael Harris at 6086 Gabbert Road (west of the Site) is listed on the UST List as having an inactive underground storage tank and on the HAZNET List as a generator of hazardous waste (used oil). Two properties, located at 11905 and 11855 Darlene Lane (northwest of the Site) are listed on the RCRA Small Quantity Generator List as generators of hazardous wastes with no violations found. Having a registered UST or being a registered generator of hazardous waste does not indicate that a release has occurred on the property.

A listing on the Emergency Response Notification System (ERNS) List was identified as 6061 Gabbert, near the west part of the Site. No additional information is provided; however, releases of fuel at an accident or spills on a roadway are typically identified on the list when an emergency response agency (police or fire department) reports the incident and provides for the cleanup.

There are seventeen properties located south and down gradient of the Site listed on the RCRA Small Quantity Generator List, and 30 properties located south and down gradient of the Site listed on the HAZNET List as generators of small quantities of hazardous wastes. Being a registered generator of hazardous waste does not indicate that a release has occurred on the property.

There are nine properties located down gradient of the Site listed on the Leaking Underground Storage Tank (LUST) List that are also listed on the Cortese List. Seven of the properties have received a case closure from the regulatory agency. According to the State GeoTracker database, the eighth property received a case closure from the regulatory agency in August 2005. The ninth property, Summit Energy Gas Station located approximately 0.9 mile southeast of the Site at 50 West Los Angeles Avenue, is an open case. The leak was reported in 2001, and after soil and groundwater assessments were performed, remediation of the property began in January 2005 and continues today. Based on the status of the eight properties (case closed) and the distance and down gradient location of the one active property that is undergoing remediation, there is low probability that the listed properties have impacted the Site.

Based on the database review, there is a low probability that the listed off-site properties in the Site vicinity have impacted the Site due to their regulatory status (case closed, waste generators); their down gradient locations from the Site; and their distances from the Site.

3.3 Oil and Gas Development

The Munger Map Book of California-Alaska Oil and Gas Fields, 2003 Edition, was reviewed to assess the presence of known active or abandoned oil and gas wells within the Site vicinity. Based on the review, there are no active or abandoned oil wells on the Site. The nearest productive oil wells are in the very small Moorpark and Moorpark West oil fields located approximately 1 mile

northwest and northeast of the Site. Most, if not all, of the wells have been abandoned. The Site has not been impacted by oil and gas production.

3.4 Ventura County Water Resources Department

AET contacted the VCWRD for information concerning the reported water wells located on the Site. Ms. Barbara Council of the VCWRD provided AET with a Table listing 16 wells identified by State Well Numbers and several aerial photographs showing the approximately location of the 16 water wells suspected of being on the Site. The Table also shows the Status and Revised Status of the wells. Six of the 16 wells are listed as "destroyed" (meaning properly removed and plugged), two wells are listed as "Non-Compliant Abandoned" (abandoned in this case means the well is not in use but is not yet destroyed), one well is listed as active, and seven wells are listed as "Can't Locate Indeterminable". According to Ms. Council, their records indicate that some of wells permitted on the Site were drilled but were not cased (possibly because they were dry or low yielding); therefore, there is no well at that location that requires destruction. Most, if not all, of the indeterminable wells may have been un-cased core holes.

During AET's Site visit, three wells were located: Well 5K1 (non-compliant) was observed with a pump located north of Poindexter Avenue on the flat land south east of the former residence; Well 5K2 (non-compliant) was observed on a concrete pad without a pump in bushes on the east side of the entrance road approximately 50 feet south of the gate; and Well 5F2 (active) was observed with a pump and electric panel at the location of Well 5F1 on the photograph (Plate 2). The well is located in trees approximately 200 feet east of the southeast corner of the rural residential neighborhood northwest of the Site.

A copy of the Well Table is provided as Attachment D. The VCWRD provided a recent aerial photograph showing the best estimate of the well locations (Plate 2).

3.5 Aerial Photograph Review

Copies of aerial photographs for the years 1938, 1945, 1959, 1964, 1970, 1977, 1989, 1994, and 2002; and Historical Topographic Maps for the years 1903, 1944, and 1951 available through EDR, were reviewed by AET for historical land use identification. Two individual adjacent photographs for each year were provided to cover the area of the Site. Based on the review of available aerial photographs and maps, the historical development of the Site and vicinity was evaluated and is summarized below.

The 1903 Camulos Topographic Map (1" = 125,000") shows the Site to be undeveloped land. The Southern Pacific Railroad track and a road that predated Los Angeles Avenue (Highway 118) are present south of the Site. Gabbert Road is not present; however, dirt roads extend north from Los Angeles Avenue on the east and west sides of the Site.

The 1938 aerial photograph (Fairchild, 1" = 500') shows the Site to be developed with agriculture. Gabbert Road is present running northward across the west portion of the Site.

Two small structures, young orchards, and undeveloped land are present northwest of the Site along Gabbert Road. The west portion of the Site appears to be fallow or grazing land. The east and south-central portions of the Site have established orchards with both young and more mature trees. An area in the central portion of the Site may be planted in hay or wheat. The main entrance to the Site is on the south side in the same location as it is today. A dirt road extends north from the present Poindexter Avenue, over the railroad track and into a small valley with low hills to the east and west. Approximately 450 feet north of the entrance, the valley forms a Y (one valley goes west-northwest and one goes north-northeast). At the Y was a ranch building, possibly a barn approximately 50 feet long on each side. On the hill east of the entrance is a ranch house with an access road around the south and east sides of the hill. A small structure is located approximately 600 feet east of the ranch house. A second ranch house is located near the eastern boundary of the current Site with an access road of the end of Casey Road. Casey Road extends west from Walnut Canyon Road. Several buildings are located east of the Site and south of Casey Road that are identified as Union High School on the 1951 topographic map.

The 1944 Piru 15-Minute Quadrangle Topographic Maps shows the Site and vicinity to be little changed since the 1903 map (the on-Site orchards and structures are not noted on the map).

The 1945 aerial photograph (Fairchild, 1" = 400') shows several changes to the Site since the 1938 photograph. Trees are present in the valley east of Gabbert Road, and a small shed and four round objects (possible above ground storage tanks) are located approximately 160 feet west of Gabbert Road along the south boundary of the Site. On a ridge in the central portion of the Site are several rectangular buildings reported to be for apricot pitting and drying (GE Report, 1998). The Site vicinity is little changed since the 1938 photograph.

The 1951 Moorpark 7.5 Minute Quadrangle Topographic Map shows the Site orchards and structures to be present on the east and southern portions of the Site, as seen in the aerial photographs. A round tank is located approximately 800 feet south of the north property boundary and 100 feet west of the east property boundary in the orchard (observed by AET and others to be a water storage tank currently on the Site). The four round tanks west of Gabbert Road that were observed on the 1945 photograph are identified as "oil tanks" (the GE Report discussed the storage of oil in the above ground tanks for use in orchard heaters).

The 1959 aerial photograph (Robinson, 1" = 555') shows the Site and Site vicinity to be little changed since the 1945 photograph. The ranch building (barn) located in Y-valley north of the entrance road is gone. Electric transmission poles (towers) are present on the west side of the Site along Gabbert Road. Five additional small structures are located northeast of the buildings on the central portion of the Site (identified as hog pens in the GE Report). The area of the Site planted in orchards is approximately half of the original area. Several long rectangular buildings are located northwest of the Site (off-Site) on the north side of Gabbert Road. More development is present at the High School and along Walnut Canyon Road, east of the Site.

The 1964 aerial photograph (Mark Hurd, 1"=666') shows the Site to be little changed since the 1959 photograph. Orchards are only present in the northeast corner of the Site, along the east side of Gabbert Road, and in a small area along the south boundary of the Site. The area of the Site west of Gabbert Road is fallow and the four above ground tanks are gone. The ranch house at the end of Casey Road is still present, but development east of the ranch house has increased.

The 1970 aerial photograph (Mark Hurd, 1" = 333') shows the Site to be little changed since the 1964 photograph. The power poles on the west portion of the Site have been replaced by twin legged steel towers. A new alignment of steel towers is under construction along the southern Site boundary west of Gabbert Road and a Southern California Edison Company Substation is under construction south of the western portion of the Site, south of the railroad tack and the extension of Poindexter Avenue. There are more structures (rural dwellings) on the land northwest of the Site along Gabbert Road.

The 1977 aerial photograph (Teledyne, 1" = 666') shows the Site to be little changed since the 1970 photograph. Residential neighborhoods are present south of Poindexter Avenue and in the community of Moorpark southeast of the Site.

The 1989 and 1994 aerial photographs (USGS, 1"= 666') show little change to the Site since the 1977 photograph except that all orchard areas are gone and the Site appears fallow. Commercial buildings are present off-Site on previously vacant land south of Poindexter Avenue and east of Gabbert Road, and more rural residential development has occurred on the land northwest of the Site.

The 2002 aerial photograph (USGS, 1"=666') shows that the ranch house located off Casey Road is gone and the school property has expanded west. The location of the old ranch house west of the end of Casey Road is now shown to be off-Site. The dirt roads that have existed on the Site since the 1930s are still clearly visible in the photograph. The Site is fallow grass/brush land with occasional single and multiple trees.

Based on the historic aerial photograph and topographic map review, the Site has been developed with agriculture (orchards and hog farming) since the 1930s through the 1980s, and has been generally fallow since the 1980s.

3.6 Site Reconnaissance

On May 16, 2006, an AET representative visited the Site to observe Site conditions. The Site was accessed from the main entrance road off Poindexter Avenue and across the railroad tracks and the concrete lined storm water channel. The entrance was approximately 1,000 feet west of the southeast corner of the Site (Plate 1). AET was provided the combination to the locked gate to gain access to the vacant Site. All portions of the Site were observed from existing on-Site dirt roads or on foot. In late 2003, a large fire burned approximately 80,000 acres of land in and around the Simi

Valley and Moorpark. Evidence of a fire on the Site was observed, as no wooden structures remained, and a number of dead trees with charred trucks and trees with new growth were observed at the Site.

The location of one of the former water-wells (5K2) was observed in brush approximately 10 feet east of the entrance road, and 50 feet north of a storm drain. The location of the former ranch house located on the hill just east of the entrance was accessed on foot. No structures were observed on the location. A gas meter pipe was observed on the northeast part of the hill. From the hill, a water- well (5K1) with a pump was observed on the flat land below (Attachment A, Photograph 1). The entire southeast portion of the Site was covered with dry grasses.

Observations were made to the north on the dirt road in the small valley and then toward the northeast up a hill to the location of the dead end of Casey Street, the adjacent school property, and residential properties east of the Site. Continuing north along the east perimeter road, several rusted farm vehicles and farm equipment were observed (Photograph 2). Further north a large steel above ground water tank was observed (several bullet holes were present in the sides of the tank and the tank was empty). An old couch and other minor debris were observed around the tank (Photograph 3).

The road continued to the northeast corner of the Site near the 700-foot elevation, one of the highest points on the Site. The land to the east of the northeast corner and along the entire north boundary of the Site was vacant (Photographs 4 and 5). On a ridge in the central portion of the Site six concrete slabs and an apparent brick barbeque were observed. The larger, southern most, concrete slab was the assumed location of the former apricot pitting barn. Some minor debris and hundreds of rusty nails (result of a fire) were lying on the slab. A rectangular slab with foundations was north of the large slab (Photograph 6). At least three concrete slabs, some with concrete troughs (assumed to be the former hog pens) were observed in a row northeast of the large slab (Photograph 7). At several locations, apparent water pipes were observed extending from the ground. No indications of underground or above ground storage tanks, a toilet facility and septic system, or stained soil were observed in the area.

The topographic slopes in the northwest portion of the Site were less steep than in the northeast portion. Rural residential dwellings were observed west of the northwest corner of the Site (Photograph 8). A clump of small trees and brush were observed just east of the point where the Site again extended west (south of the residential properties). A water-well (identified as 5F1 on the VCWRD photograph) was observed with a pump and electric panel in the trees (Photograph 9). The metal pump shed was on its side nearby. The area south of the residential properties to Gabbert Road had been plowed for weed control. The road along the low land east of Gabbert Road was in poor condition and ended at the service road for the concrete lined channel at the southern Site boundary. North of the service road and east of Gabbert Road was a long flat area where GE had observed the orchards heaters in 1998. No orchard heaters, debris, or stained soil was observed in the area by AET.

The western most portion of the Site (approximately 35 acres) was accessed from an open gate on the west side of Gabbert Road. The dirt service road continued west along the concrete lined channel and the southern Site boundary. Several utility easements for overhead electric transmission towers and poles were observed on the western most portion of the Site (Photograph 10). No soil staining was observed in the area where the four former above ground tanks had been located (reported to have stored heater oil for the orchard heaters). At several locations along the dirt road, light-gray colored (charcoal) soil was observed, the result of a fire.

In summary, at the time of the Site visit no underground storage tanks, above ground fuel tanks, pits, ponds, stressed vegetation, significant debris or stained soil was observed on the Site. No structures were observed on the Site, except for an empty water tank in the northeast portion of the Site, the concrete slabs and some charred wood in the central portion of the Site, and three water well locations along the southern portion of the Site.

No evidence of the former orchards, or most of the APCs identified by GE in the 1998 Phase I ESA Report were observed by AET during the 2006 Site visit. However, in AET's opinion, the potential use of organochlorine pesticides in the areas of the Site formerly developed with orchards (such as DDT that has a long half-life in shallow soil) remained an APC at the Site.

3.7 Adjacent Property Reconnaissance

Adjacent properties around the Site were observed by AET for evidence of recognized environmental conditions. West and northwest of the Site was undeveloped land and an area of rural dwellings accessed from Gabbert Road. South of the Site were a drainage channel, a railroad track, Poindexter Avenue, followed by a residential neighborhood (southeast) and commercial businesses (southwest) across Poindexter Avenue. A Southern California Edison Substation was observed south of the western most portion of the Site. Poindexter Avenue terminated at Gabbert Road. East of the Site from south to north, AET observed a school, the end of Casey Road, residential properties, and undeveloped land. North of the Site was undeveloped land. No recognized environmental conditions were observed on the adjacent properties.

4.0 LIMITED PHASE II SOIL ASSESSMENT

In order to confirm or deny significant impacts to the shallow soil from the potential use of organochlorine pesticides in the former orchards, AET established an approximate grid pattern with 15 locations in the east and south portions of the Site where most of the orchards observed on the aerial photographs had been located. The approximate locations of the 15 soil samples are shown on Plate 3.

4.1 Field Methods

On August 18, 2006, a geologist from AET collected 15 shallow soil samples (one soil sample from each of the 15 grid locations) for analysis of organochlorine pesticides. Soil samples were collected using hand-operated soil sampling equipment in 6-inch-long brass sleeves from the

interval of approximately 1 inch to 7 inches below ground surface (bgs). The ends of the sleeves were covered with Teflon sheets and plastic end caps sealed with paraffin tape. The samples were labeled and were placed in an ice chest with blue ice.

4.2 Laboratory Methods

The samples were submitted to American Scientific Laboratories in Los Angeles with Chain-of-Custody documentation. Each sample was analyzed for Organochlorine Pesticides using EPA Test Method 8081A.

4.3 Results

Five pesticide compounds were detected: Dichlorodiphenyltrichloroethane (DDT), its two daughter products Dichlorodiphenyldichloroethylene (DDE) and Dichlorodiphenyldichloroethane (DDD), Alpha Chlordane, and Gamma Chlordane. The laboratory results are summarized on Table 1, and the Laboratory Report and Chain-of-Custody documentation are provided as Attachment E

- Alpha and Gamma Chlordane were detected only in Sample HA-1 at 0.073 milligrams per kilogram per kilogram (mg/kg), and 0.53 mg/kg, respectively.

- DDT was detected in 14 of the 15 samples ranging from 1.7 mg/kg in Sample HA-15 to 0.01 mg/kg in Samples HA-5 and HA-11. The second highest concentration was 0.111 in Sample HA-2. DDT was <u>not</u> detected in Sample HA-3. The average concentration (using the reporting limit of 0.004 for the ND sample) is 0.141 mg/kg. Eliminating Sample HA-15 (1.7 mg/kg), the remaining 14 samples had an average DDT concentration of 0.03 mg/kg.

- DDE was detected in all 15 samples ranging from 4.96 mg/kg in Sample HA-15 to 0.005 mg/kg in Sample HA-3. The second highest concentration was 0.497 mg/kg in Sample HA-14. The average concentration is 0.41 mg/kg. Eliminating Sample HA-15 (4.96 mg/kg), the remaining 14 samples had an average DDE concentration of 0.084 mg/kg.

- DDD was only detected in Sample HA-9 at 0.045 mg/kg.

AET reviewed soil screening levels for the detected compounds from two sources: the United States Environmental Protection Agency (US EPA) 2004 Preliminary Remediation Goals (PRGs) for evaluating and cleaning up contaminated Sites; and, the California Regional Water Quality Control Board (RWQCB) San Francisco Region 2005 Interim Final Environmental Screening Levels (ESLs) for environmental concerns at Sites with contaminated soil and groundwater. The PRG values and the ESL values for the detected compounds for both residential and commercial/industrial soil are provided with the laboratory results on Table 1.

All detected values for Chlordane, DDT, DDE and DDD at the Site are at or below the PRG values for both residential and commercial/industrial land use.

All detected values for Chlordane, DDT, DDE and DDD at the Site are below the ESL values for both residential and commercial/industrial land use except for the DDT and DDE values in Sample HA-15, collected from the flat southern portion of the Site (Plate 3). Sample HA-15 exceeded the ESLs for residential land use for both DDE and DDT, and exceeded the commercial/industrial ESL for DDE.

The average Site-wide values are well below both PRG and ESL values.

AET understands that the area where Sample HA-15 was collected (the flat southern portion of the Site north the concrete channel and railroad track, and between the entrance gate on the east and Gabbert Road on the west) is not planned for residential development and may be the location of the westward extension of High Street from Moorpark Avenue to Gabbert Road. There is no impact from organochlorine pesticides along the southern portion of the Site provided that the area is not developed with residential units. Based on the sampling results collected to date, there is no impact from residual organochlorine pesticide concentrations in the shallow soil for residential development on the remainder of the Site.

5.0 SUMMARY

The following is a summary of the findings presented in this report.

- Based on historical aerial photographs and maps, the Site has been used for agriculture (orchards, hay or wheat, hog farming, and grazing prior to the mid-1930s until the late 1970s. The Site has been generally fallow since.

- The Site is not within 1.0 mile of a state or federal Superfund property (NPL).

- Properties listed on agency databases with environmental conditions within the Site vicinity have a low probability to impact the Site due to their regulatory status, down gradient locations, and/or their distance from the Site.

- On May 16, 2006, AET personnel observed the Site. At the time of the Site visit, no underground storage tanks, above ground fuel tanks, pits, ponds, stressed vegetation, significant debris, previously observed orchard heaters, or stained soil was observed on the Site. Except for an empty water tank in the northeast portion of the Site, concrete slabs and some charred wood in the central portion of the Site, and three water wells located in the southern portion of the Site, no buildings were observed. No evidence of the former ASTs or orchards was observed. No evidence of the former orchards, or most of the APCs identified by GE in the 1998 Phase I ESA Report were observed by AET during the 2006 Site visit. However, in AET's opinion, the potential use of organochlorine pesticides in the areas of the Site formerly developed with orchards (such as DDT that has a long half-life in shallow soil) remained an APC at the Site.

- According to records at the VCWRD, there are 16 water wells suspected of being on the Site. Six of the 16 wells are listed as "destroyed", two wells are listed as "Non-Compliant Abandoned" (abandoned means the well is not in use but is not yet destroyed), one well is listed as active, and seven wells are listed as "Can't Locate Indeterminable". According to Ms. Council, records indicate that some of wells permitted on the Site were drilled but were not cased (possibly because they were dry or low yielding). Because the test holes were not cased, there is no well that requires destruction. Most, if not all, of the indeterminable wells may have been un-cased test holes. During AET's Site visit, three wells were located on the Site.

- On August 18, 2006, in order to confirm or deny significant impacts from organochlorine pesticides, AET personnel collected 15 soil samples from the areas of the Site where former orchards were observed on aerial photographs. At the time of sampling, no evidence of the orchards was observed. Residual concentrations of five pesticides: Alpha and Gamma Chlordane (one sample), DDT (in all but one sample), DDE (in all samples) and DDD (in one sample) were detected. All values at the Site are at or below both the residential and commercial/industrial PRG values. All detected values for Chlordane, DDT, DDE and DDD at the Site are below both the residential and commercial/industrial ESLs except for the DDT and DDE values in Sample HA-15. Sample HA-15 exceeded the ESLs for residential land use for both DDE and DDT, and exceeded the commercial/industrial ESL for DDE. The average Site-wide soil values are well below both PRG and ESL values.

5.1 Remaining Areas of Potential Concern

Three of the APCs identified during the 1998 Phase I ESA remain following AETs Phase I Update ESA. The first is the presence of residual DDT and DDE concentrations in one sample from the flat area located along the southern boundary of the Site east of Gabbert Road and west of the main Site entrance. The second is the potential for petroleum hydrocarbons to be encountered at various locations during Site grading. The third is the suspected septic system in the central portion of the Site (however, it is likely that restroom facilities for seasonal workers would have utilized a cesspool, not a septic tank and leach field). The existing water wells (identified and unidentified) are not considered to be APCs; however, the wells will require proper destruction in accordance with a permit for the VCWRD.

Based on laboratory results and field observations, it is AET's opinion that the identified APCs have not significantly impacted the Site.

5.2 Mitigations Measures for the Identified APCs and Water Wells

- Mitigation for the one area on the Site with residual DDT and DDE concentrations above state ESLs for residential soil could include commercial development in the area, or construction of the extension of High Street through the area.

- Mitigation for potential soil impacted with petroleum hydrocarbons from past use and storage on the Site that may be encountered during grading operations, if any, can be properly handled at the time by following the procedures set out in a subsurface Workplan.

- Mitigation for the suspected septic system or cesspool, if encountered during grading, would include filling the cesspool with sand, or removal of the septic tank and leach field, and removal and disposal of any impacted soil. Because it is more likely that restroom facilities for seasonal workers would have utilized a cesspool, not a septic tank and leach field, if a cesspool is discovered during grading, it should be filled in with sand, or removed (depending on the final grade at the location).

- Mitigation for the three identified water wells on the Site would be the destruction of the identified wells (and any other wells that may be encountered during Site grading) by a licensed well driller in accordance with a permit from the VCWRD and State regulations.

6.0 CONCLUSION

Based on the information presented above, it is AET's opinion that there are no recognized environmental conditions (as previously defined) at the Site, except for one area of the Site with a residual concentration of the organochlorine pesticide DDE in the shallow soil that exceeds residential soil screening levels.

7.0 LIMITATIONS

This report has been prepared for Impact Sciences and its designated parties as a Phase I Environmental Site Assessment Update and a Limited Phase II Assessment of the approximate 282-acre Hitch Ranch property (Moorpark Specific Plan Number 1) located in Moorpark, California. In performing the professional services, AET applied present engineering and scientific judgment and used a level of effort consistent with the standard of practice measured on the date of this report and in the locale of the project Site for similar type studies. Applied Environmental Technologies, Inc., makes no warranty, expressed or implied, in fact or by law, whether of merchantability, fitness for any particular purpose, or otherwise, concerning any of the materials or "services" furnished by Applied Environmental Technologies, Inc., to the client.

Inferences with respect to potential subsurface contamination are based on a review of readily available government and historical records, Site reconnaissance, and limited soil sampling. The findings and interpretations in this report have been developed based on the review of existing information pertaining to the subject Site. It should be recognized that subsurface contamination can vary laterally and with depth below a given Site.

If you have any questions or require additional information, please call.

Yours very truly,
Applied Environmental
Technologies, Inc.

Wallace A. Jensky, II, PG, REA
Principal Geologist

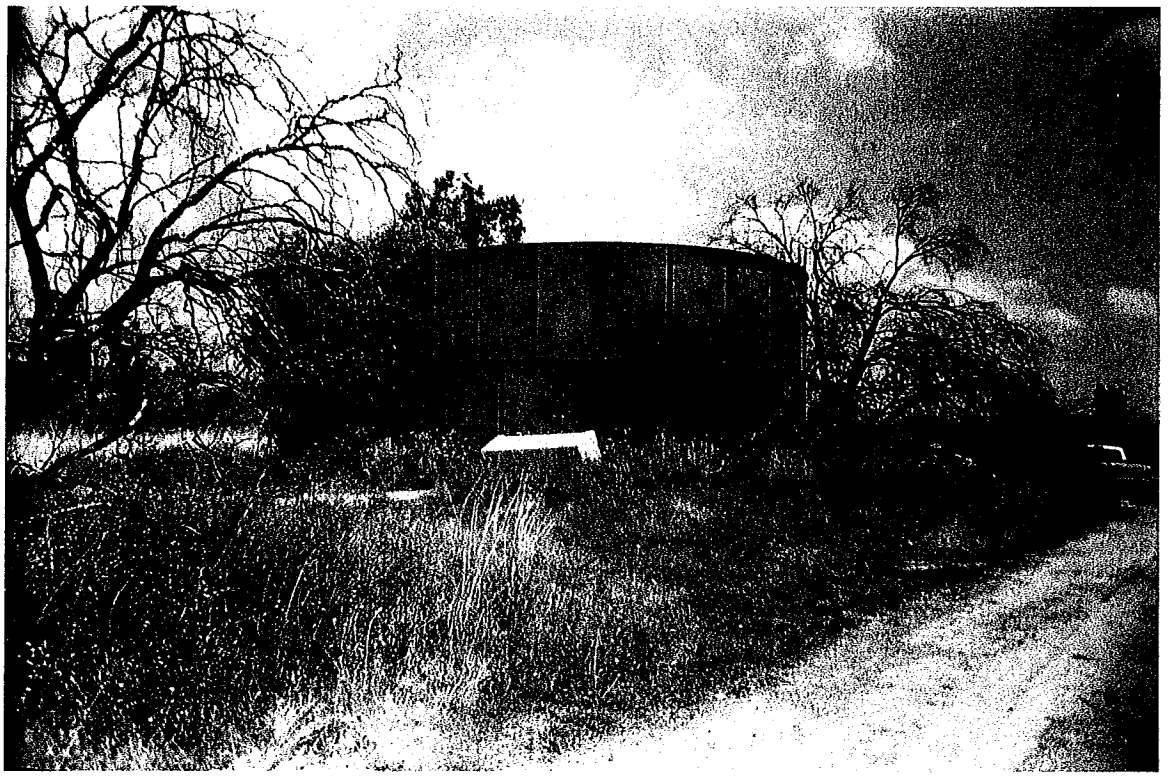
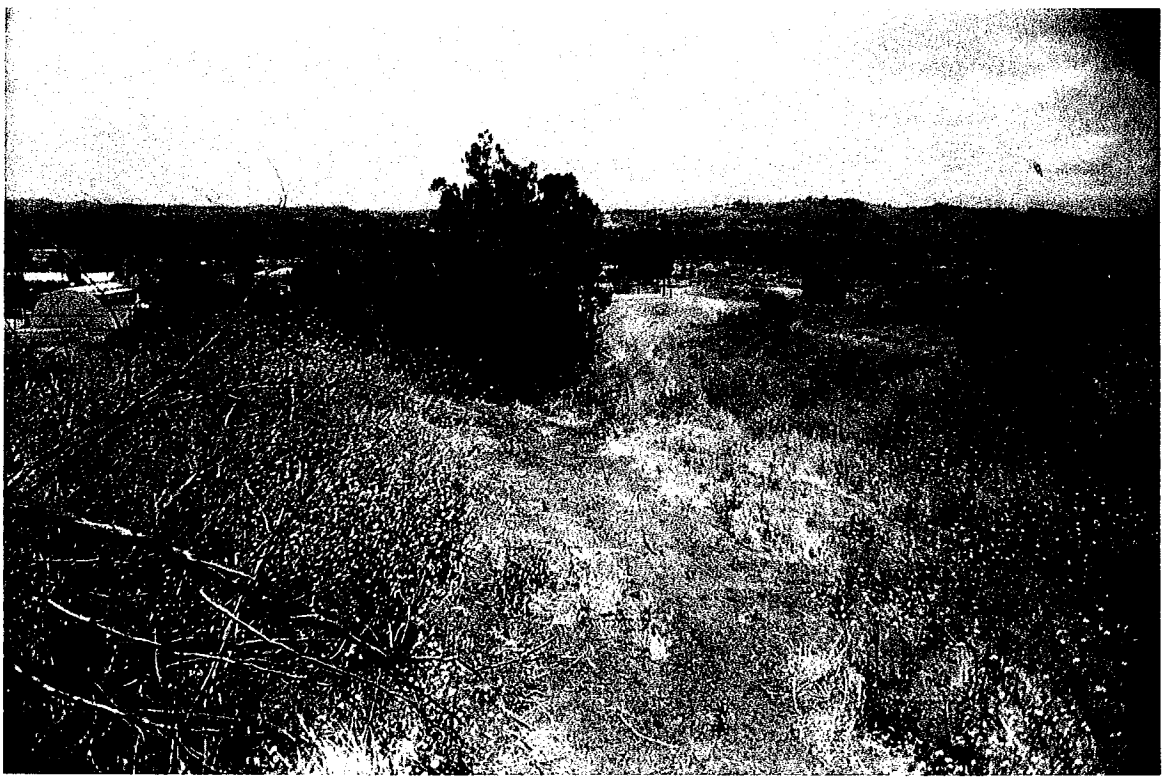
ATTACHMENT A

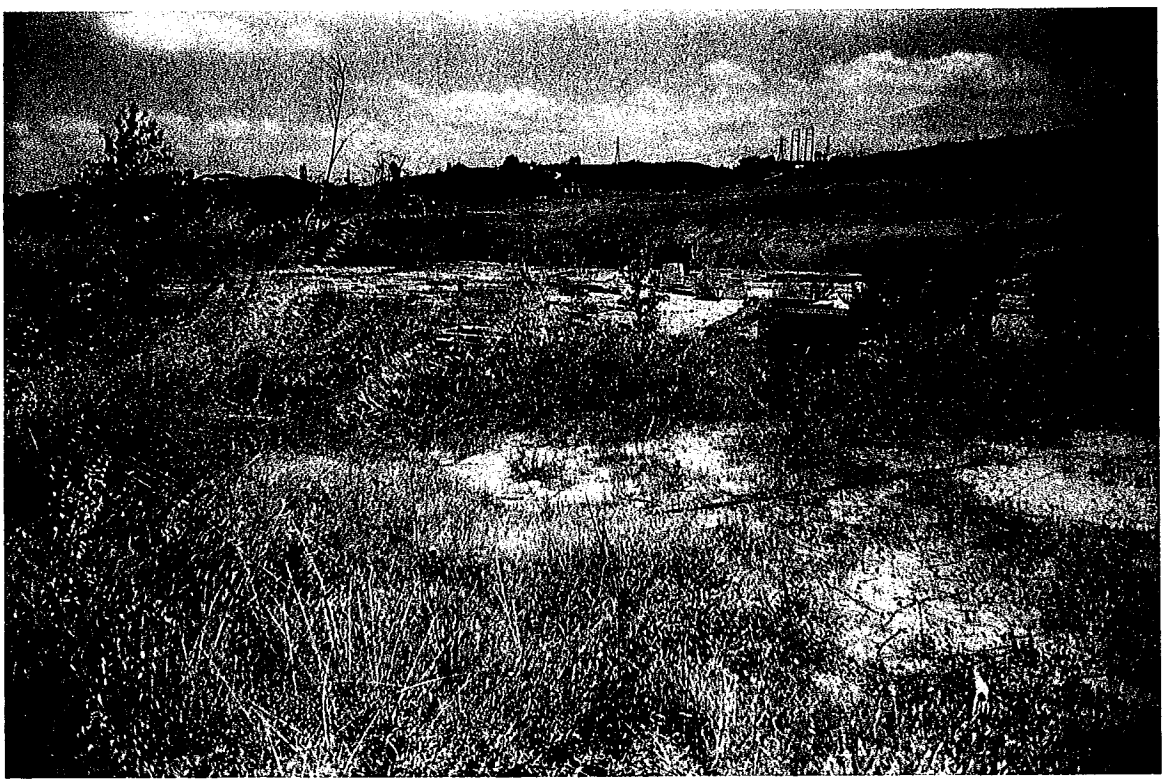


Current Site Photographs



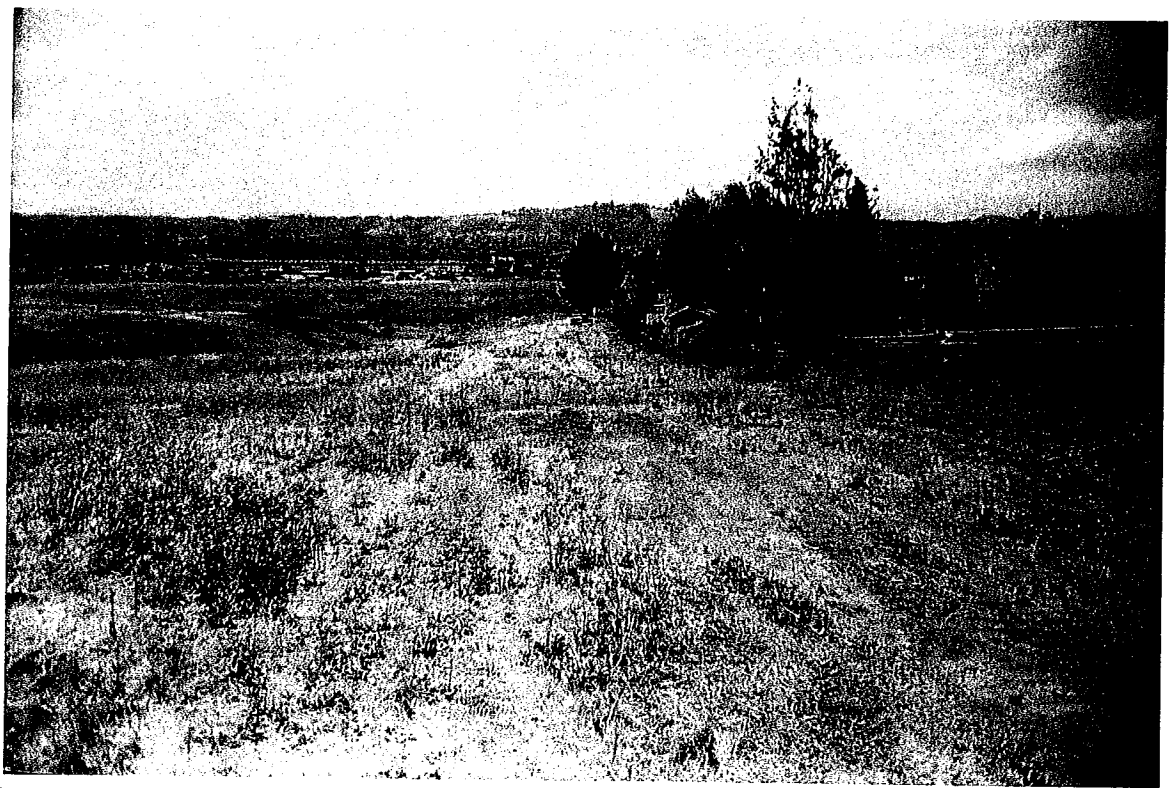
PHOTOGRAPH 1 - View looking southeast at the southeast corner of the Site from the location near the former Ranch House. One of the on-Site water wells (5K1) is seen the center of the photograph. The south boundary of the Site is along the dirt road, followed by a concrete lined storm water channel, a railroad right-of-way, and Poindexter Avenue.

PHOTOGRAPH 2 – View looking north along the east Site boundary located in the trees on the right. Abandoned farm equipment was present along the dirt road. No hazardous materials or soil staining were observed under or around the equipment. A water tank is seen in the upper left of the view (see Photograph 3).



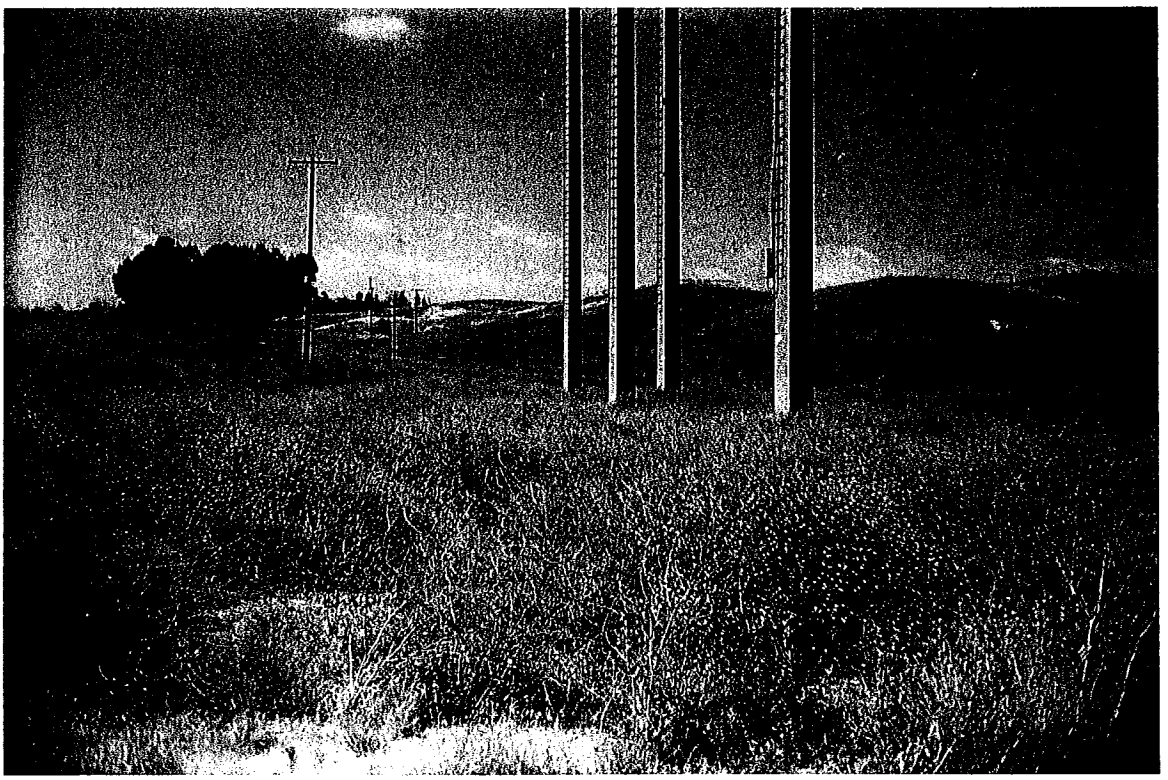
PHOTOGRAPH 3 - View looking northeast at the above ground water tank in the northeast portion of the Site. The area around the tank was formerly an orchard. Evidence of a fire is seen on the side of the tank and on the dead trees. No hazardous materials or soil staining were observed under or around the abandoned junk dumped near the tank.

PHOTOGRAPH 4 - View looking south from the northeast corner of the Site. Off-Site buildings east of the Site are seen beyond the trees along the Site boundary.



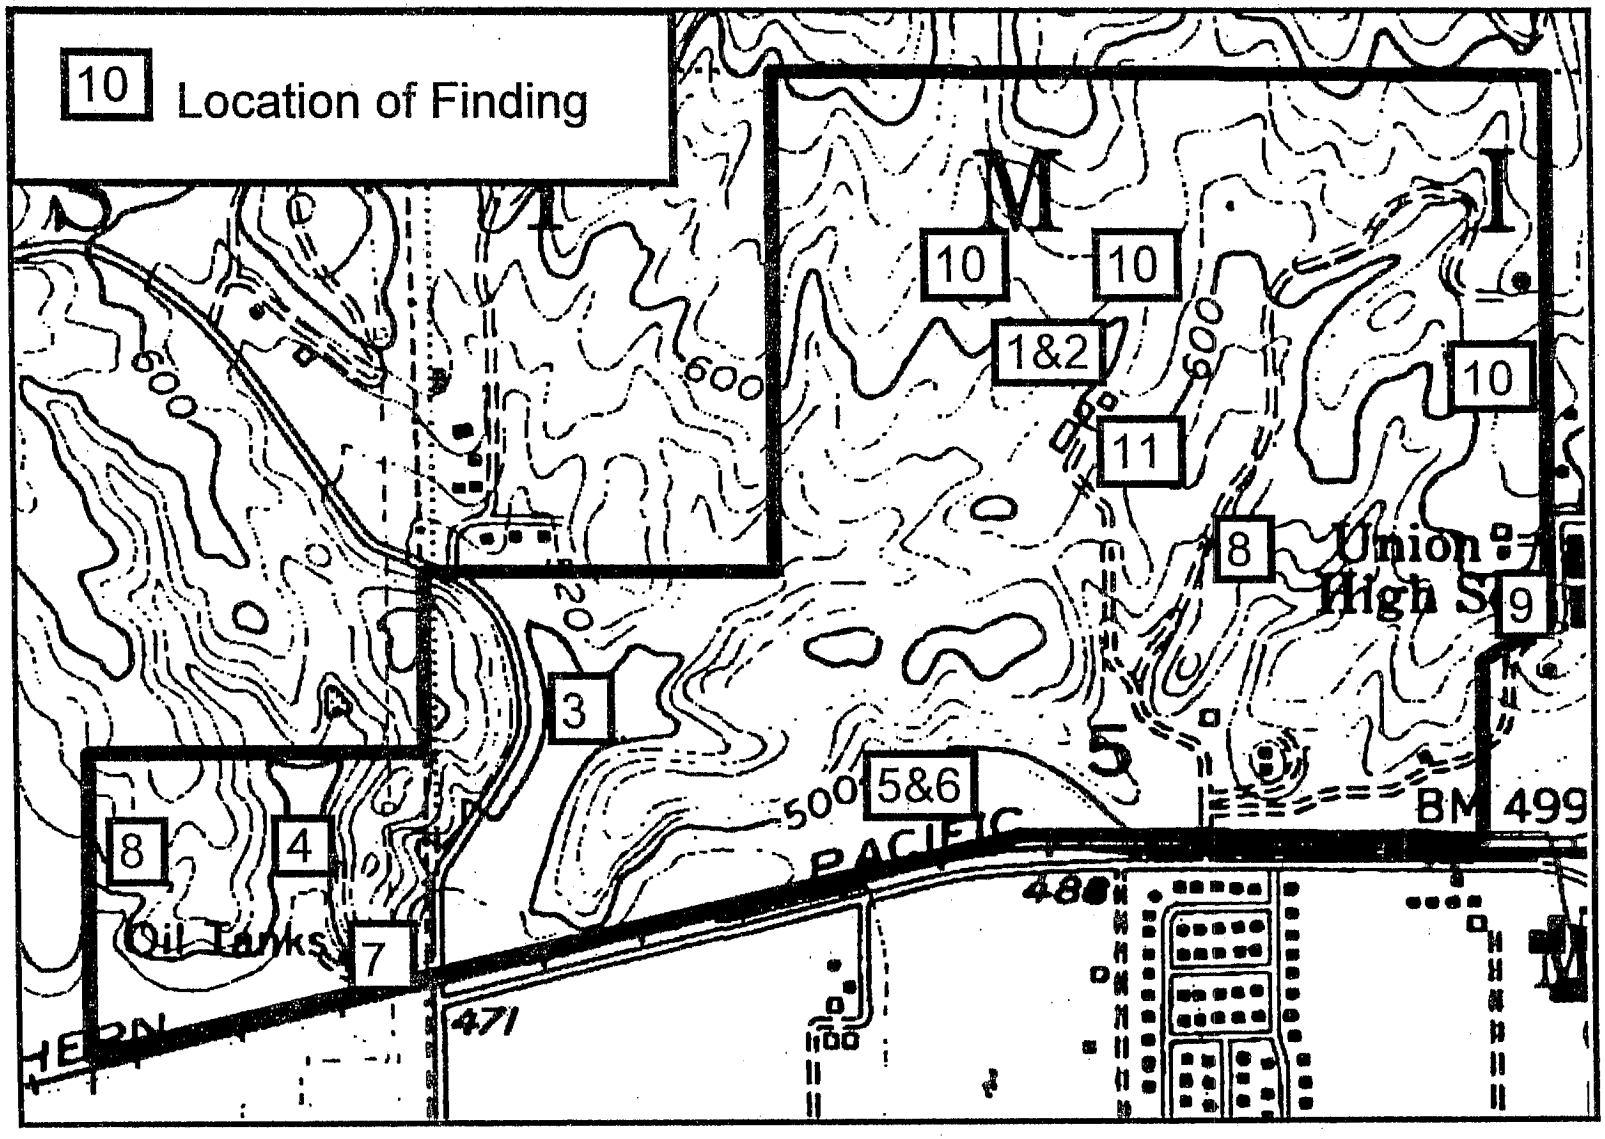
PHOTOGRAPH 5 - View looking west along the north Site boundary, located just north of the dirt road. Most the land south of the dirt road was historically planted with orchards. The land north of the Site is undeveloped.

PHOTOGRAPH 6 - View looking west at the concrete pads and foundations in the central portion of the Site reported to have been used for storage and apricot pitting and drying. The small dark objects seen on the concrete are nails remaining from the former structures after a fire. The red tile roofs seen in the distance are part of the rural residences off-Site, west of the west Site boundary.



PHOTOGRAPH 7 - View looking northeast at another of the concrete pads in the central portion of the Site. Based on the apparent troughs and water pipe, they are assumed to be part of the former hog pens.

PHOTOGRAPH 8 – View looking south from the northwest corner of the Site along the west boundary of the main portion of the Site. The south Site boundary and Poindexter Avenue are over (beyond) the low hill in the center of the view. The Site extends to the west along the south side of the rural residences. The area of green bushes at the base of the slope on this side of the hill is the location of one of the on-Site water wells (see Photograph 9).



PHOTOGRAPH 9 – View of the water well on the southwest portion of the Site. The well is identified as 5F1 on the VCWRD photograph (Plate 2), but well 5F1 is listed as Can't Locate Indeterminable on the VCWRD well table (Attachment D) and well 5F2 is listed as active. During the Site visit no well was observed in the area where well 5F2 was plotted on the photograph. The well information should be corrected when the application for a well destruction permit is submitted to the VCWRD.

PHOTOGRAPH 10 – View looking north from the southwest corner of the Site (the approximate 35 acres of the Site west of Gabbert Road). The west boundary is near the line of power poles. The legs of two electric transmission towers are in the foreground.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The report meets the government records search requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-00. Search distances are per ASTM standard or custom distances requested by the user.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

EXECUTIVE SUMMARY

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL ASTM STANDARD

RCRAInfo: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System(RCRIS). The database includes selective information on sites which generate, transport, store , treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month Large quantity generators generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-SQG list, as provided by EDR, and dated 08/11/2005 has revealed that there are 19 RCRA-SQG sites within approximately 0.75 miles of the target property.

CORTESE: This database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment program, sites with USTs having a reportable release and all solid waste disposal facilities from which there is known migration. The source is the California Environmental Protection Agency/Office of Emergency Information.

A review of the Cortese list, as provided by EDR, has revealed that there are 9 Cortese sites within approximately 1 mile of the target property.

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, and dated 12/31/2003 has revealed that there are 31

EXECUTIVE SUMMARY

HAZNET sites within approximately 0.5 miles of the target property.
